- A condition with the internal components of the fuel tank assembly

  For more information, refer to:
- Fuel Hose/Pipes Routing Diagram.
- Evaporative Emissions Hose Routing Diagram.
- Fuel System Description.
- Evaporative Emission Control System Description.

Fuel Odour

- Saturated EVAP canister. Refer to Evaporative Emission Control System Description
- A condition with the internal components of the fuel tank assembly. Refer to Fuel System Description.

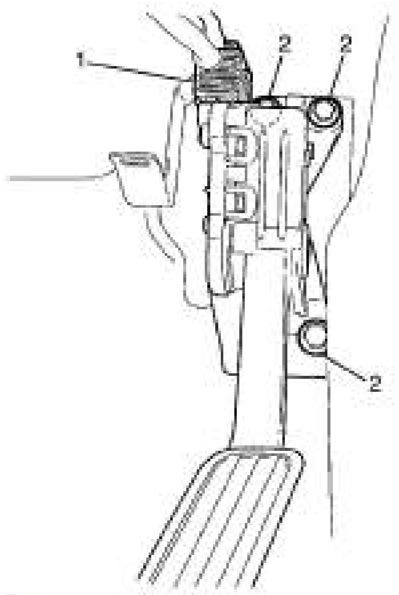
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1993408**

Accelerator Pedal Position Sensor Replacement

Removal Procedure

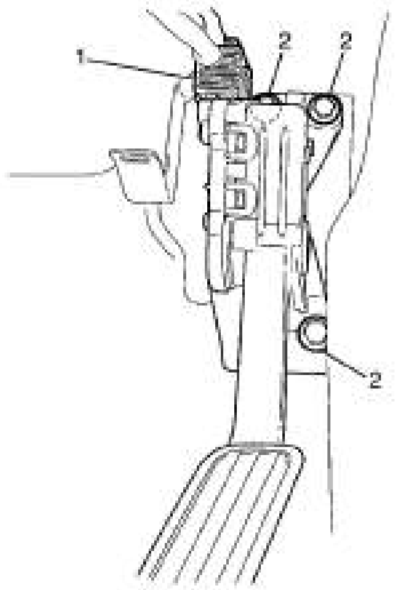
1. Remove the closeout/insulator panel from under the dashboard on the drivers side. Refer to Instrument Panel Insulator Panel Replacement - Left Side.

   Notice: Handle the electronic throttle control components carefully. Use cleanliness in order to prevent damage. Do not drop the electronic throttle control components. Do not roughly handle the electronic throttle control components. Do not immerse the electronic throttle control components in cleaning solvents of any type.



2. Disconnect the accelerator pedal position (APP) sensor electrical connector (1) from the accelerator pedal module.
3. Remove the APP sensor mounting screws (2).
4. Remove the APP sensor from the vehicle.

Installation Procedure



1. If previously removed, install the APP sensor bracket to the front of dash.

   Notice: Refer to Fastener Notice in the Preface section.

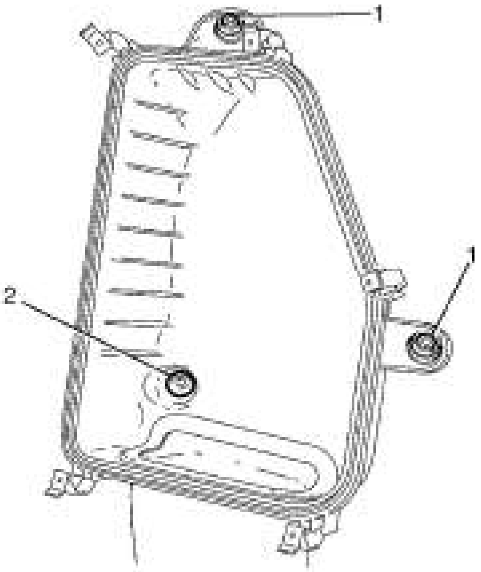
2. Install the APP sensor.

   Tighten
   Tighten the APP sensor bracket screws (2) to 9 N·m (80 lb in).

3. Connect the APP sensor electrical connector (1).
4. Operate the accelerator pedal and observe the APP angles using a scan tool. The accelerator pedal should operate freely, without binding between closed throttle and wide open throttle.
5. Install the closeout/insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Left Side.

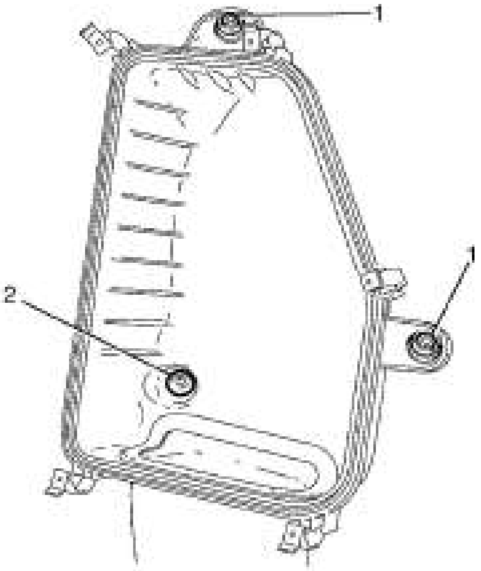
Air Cleaner Assembly Replacement

Removal Procedure



1. Remove the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement .
2. Remove air cleaner element refer to Air Cleaner Element Replacement
3. Remove the air cleaner to chassis retaining bolts (1).
4. Remove the air cleaner assembly from the vehicle.

Installation Procedure



1. Install the air cleaner to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the air cleaner to chassis retaining bolts (1).

   Tighten
   Tighten the air cleaner to chassis bolts to 9 N·m (78 lb in).

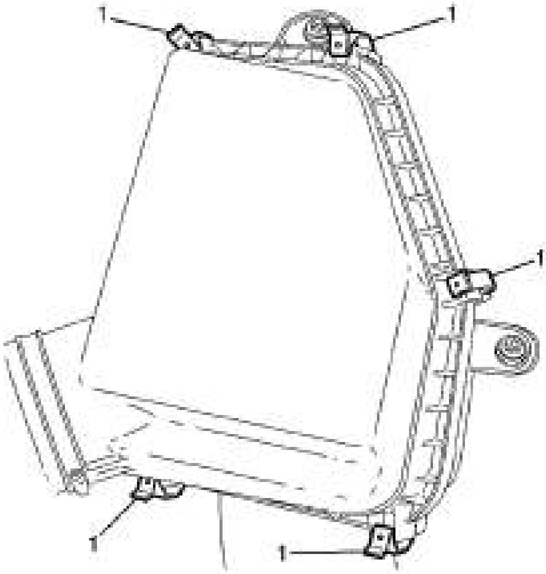
3. Install the air cleaner element Refer to Air Cleaner Element Replacement
4. Install the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1993407

Air Cleaner Element Replacement

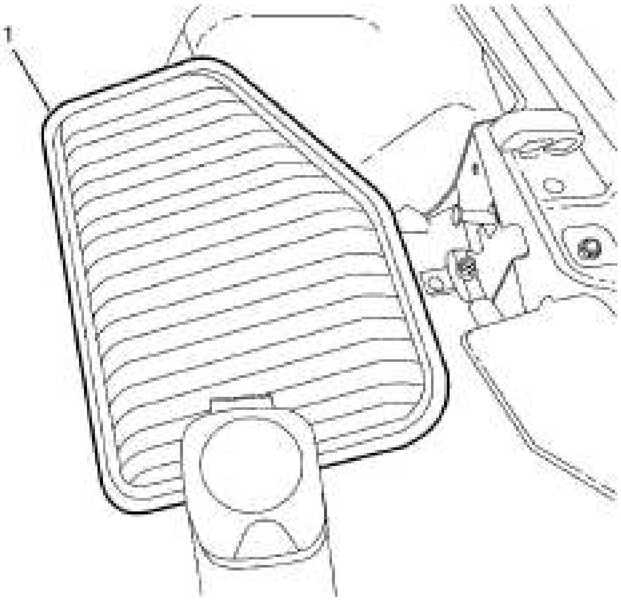
Removal Procedure

1. Remove the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.

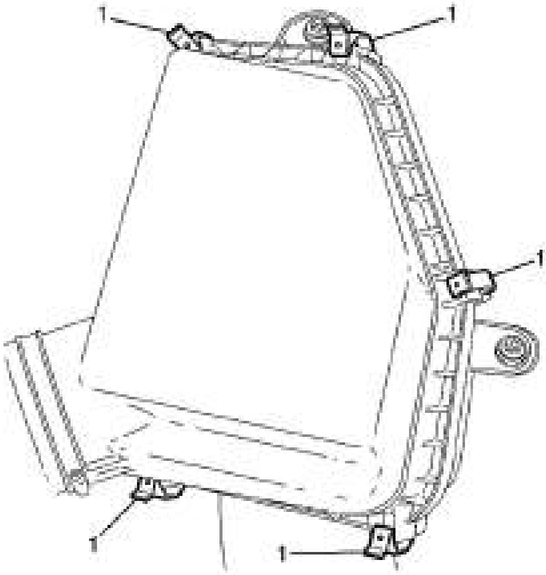


2. Release the air cleaner cover retaining clips (1) and remove the air cleaner element from the air filter assembly.

Installation Procedure



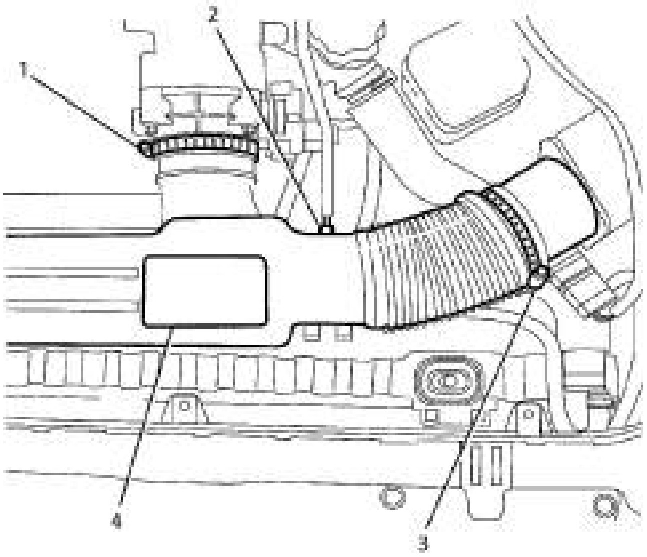
1. Install the air cleaner element (1) to the air cleaner assembly.



2. Install the air cleaner cover retaining clips (1) .
3. Install the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.

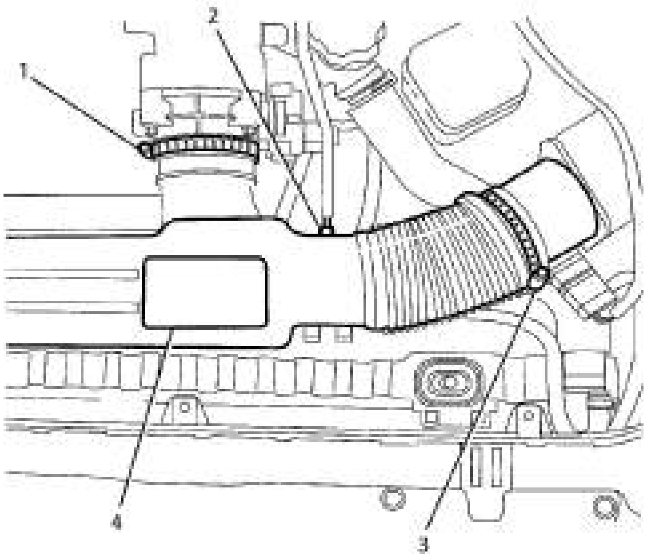
Air Cleaner Inlet Duct Replacement

Removal Procedure



1. Remove the positive crankcase ventilation (PCV) hose (2) from the air cleaner duct resonator (4).
2. Remove the air cleaner duct to throttle body retaining clamp (1).
3. Remove the air cleaner duct to air cleaner assembly clamp (3)
4. Remove the air cleaner duct (4).

Installation Procedure



1. Install the air cleaner intake duct (4) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

2. Tighten the air cleaner duct clamps.
3. Install the air cleaner duct to throttle body retaining clamp (1).

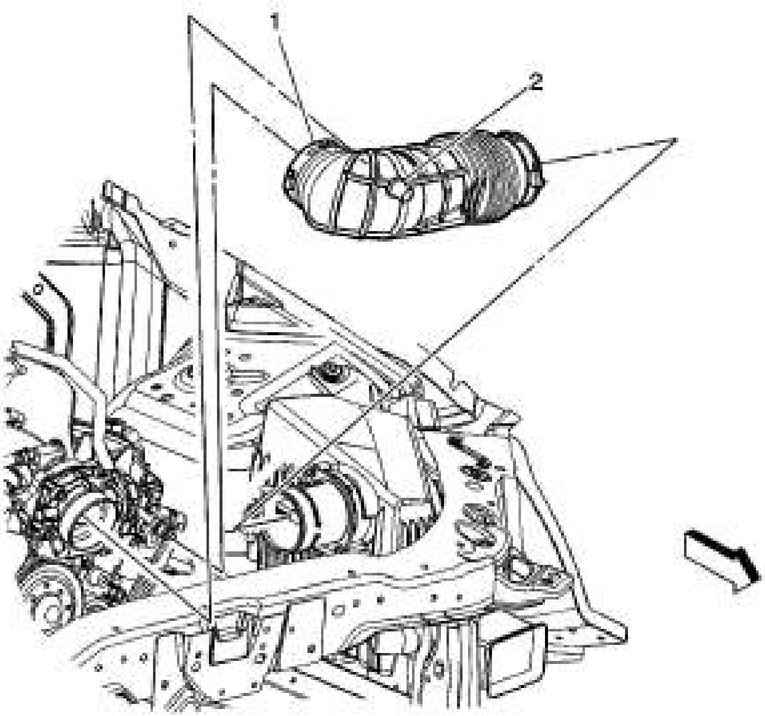
   Tighten
   Tighten the air cleaner duct clamps to 4 N·m (35 lb in).

4. Install the air cleaner duct to air cleaner assembly clamp (3)

   Tighten
   Tighten the air cleaner duct clamps to 4 N·m (35 lb in).

5. Install the PCV hose (2) to the intake duct resonator.

Air Cleaner Outlet Duct Replacement (LLT)



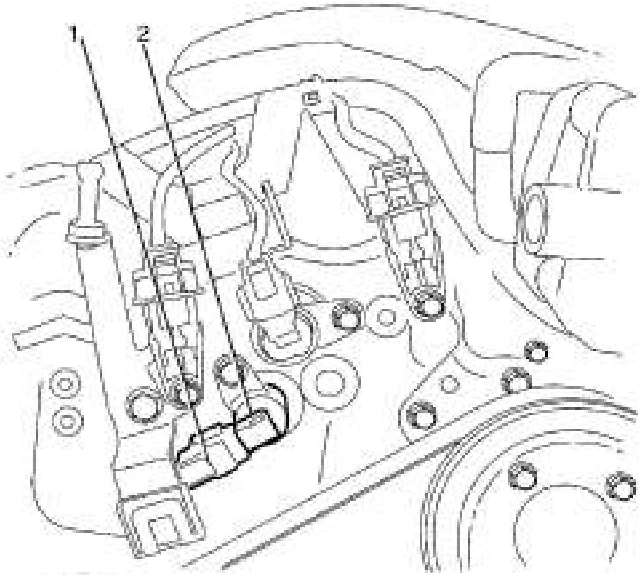
Callout	Component Name
Preliminary Procedure Remove the fuel injector sight shield. Refer to Fuel Injector Sight Shield Replacement.	
1	Clamp (Qty: 2) **Caution:** Refer to Fastener Caution in the Preface section. **Tighten** 4 N·m (35 lb in)
2	Air Cleaner Duct **Procedure** Align the air cleaner duct with the PCV vent tube during installation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1976183

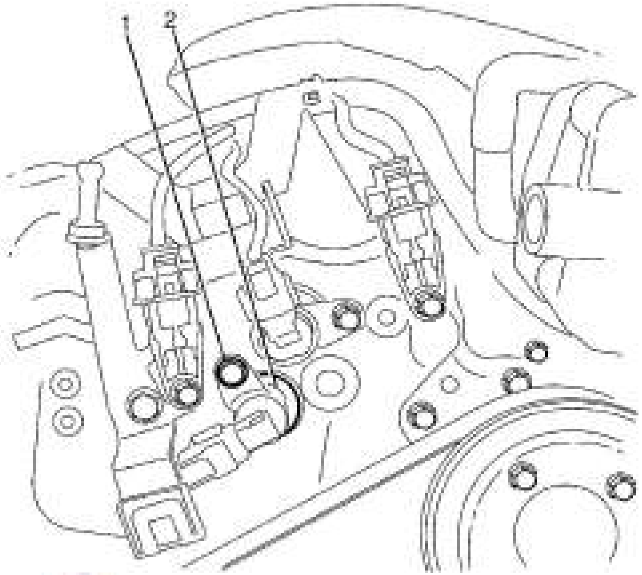
Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust

Removal Procedure

1. Turn the ignition OFF.



2. Remove the camshaft position (CMP) actuator valve electrical connector (1) from the CMP (2).

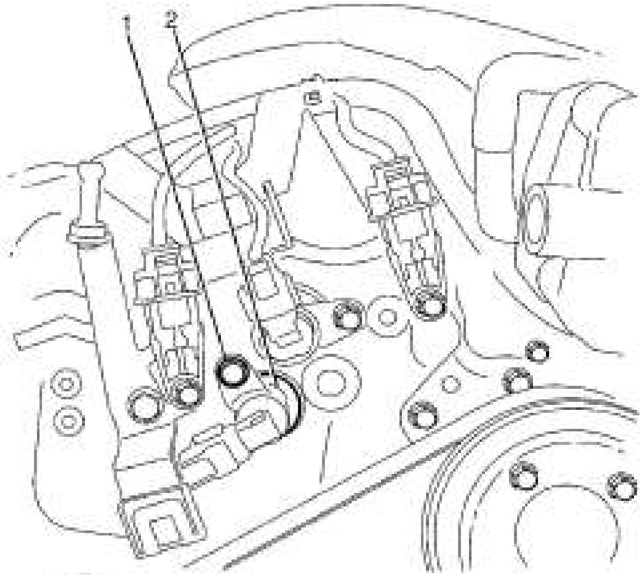


3. Remove the CMP actuator solenoid valve to engine front cover retaining bolt (1).

4. Remove the CMP actuator valve (2).
5. Inspect the CMP actuator valve seal and replace as necessary.

Installation Procedure

1. Inspect the CMP actuator valve seal for damage. Replace the seal if necessary.

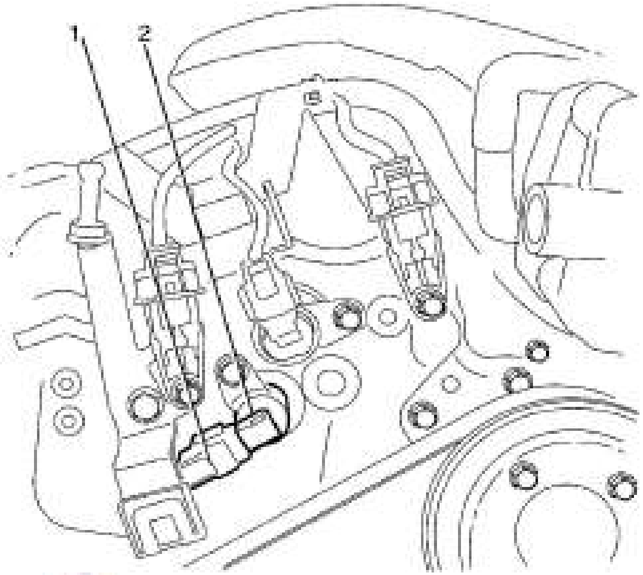


2. Install the CMP actuator valve (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the CMP actuator solenoid valve to engine front cover retaining bolt (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



4. Install the CMP valve electrical connector (1) to the CMP actuator valve.

Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake

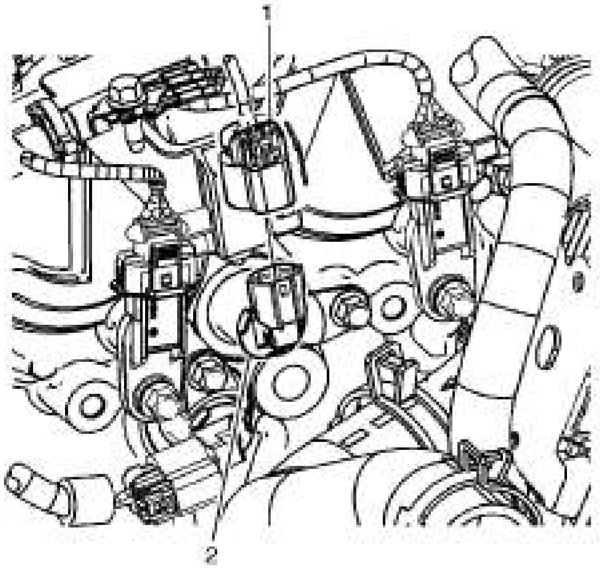
Removal Procedure

1. Turn the ignition OFF.

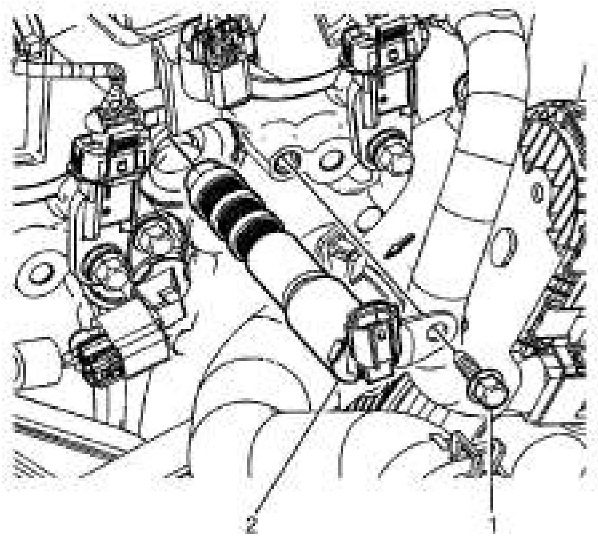
   Important: Do not remove the engine Control Module (ECM) from the ECM bracket .

   Do not remove the ECM redundant ground wire from the ECM.

2. Remove the remote earth post bracket to engine front cover retaining bolts.



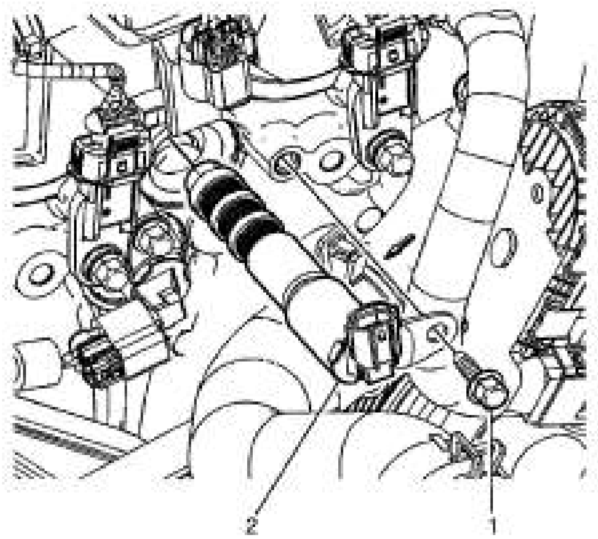
3. Remove the camshaft position (CMP) actuator valve electrical connector (1) from the CMP sensor (2).



4. Remove the CMP actuator solenoid valve to engine front cover retaining bolt (1).
5. Remove the CMP actuator valve (2) from the engine front cover.
6. Inspect the CMP actuator valve seal and replace as necessary.

Installation Procedure

1. Inspect the CMP actuator valve seal for damage. Replace the seal if necessary.

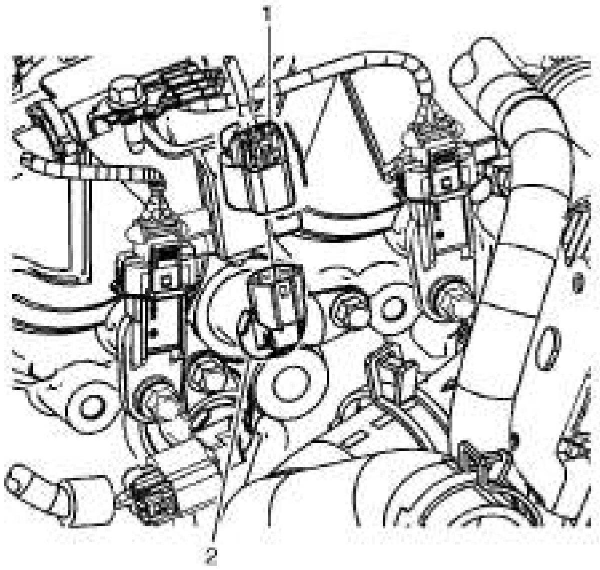


2. Install the CMP actuator valve (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the CMP actuator solenoid valve to engine front cover retaining bolt (1).

Tighten
Tighten the bolt to 10 N·m (89 lb in).



4. Install the CMP actuator valve electrical connector (1) to the CMP sensor (2).
5. Install the remote earth post bracket to engine front cover retaining bolts.

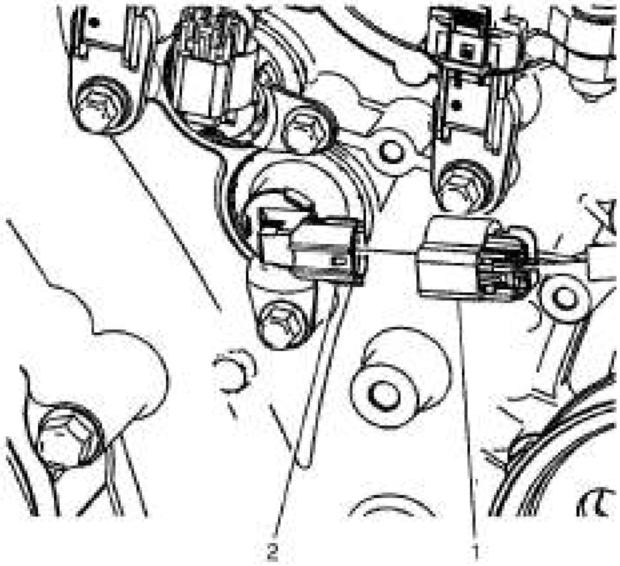
Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust

Removal Procedure

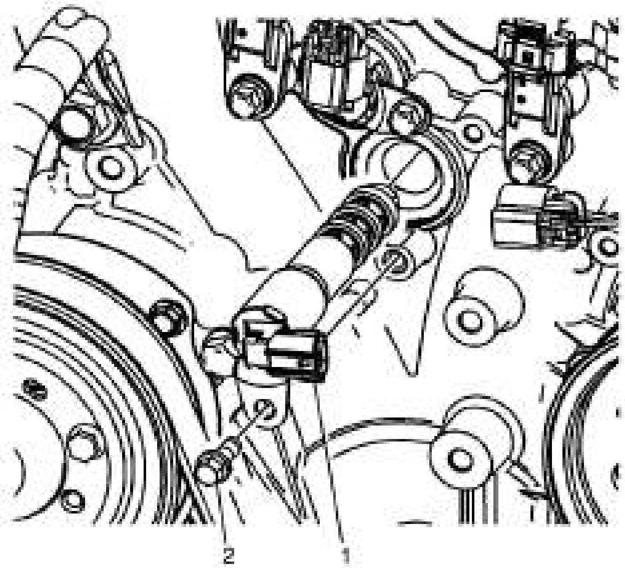
1. Turn the ignition OFF.

   Important: Do not disconnect the power steering fluid lines/hoses from the reservoir.

2. Remove the power steering fluid reservoir bolts and reposition the power steering fluid reservoir in order to provide access. Refer to Power Steering Fluid Reservoir Replacement .



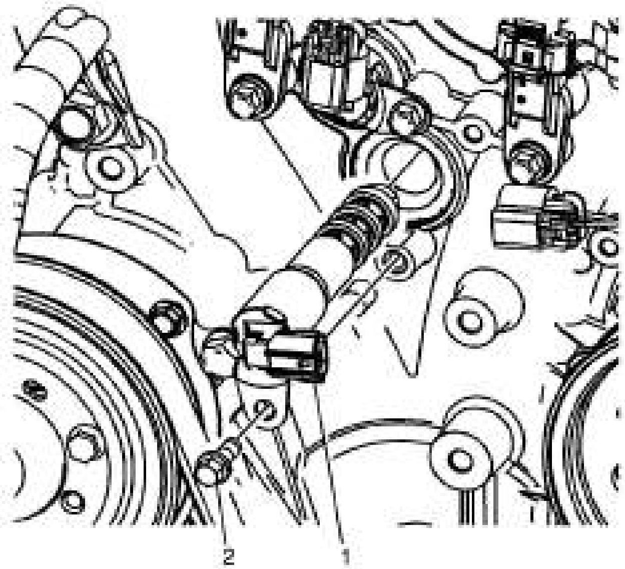
3. Remove the camshaft position (CMP) actuator valve electrical connector (1) from the CMP actuator valve (2).



4. Remove the CMP actuator solenoid valve to engine front cover retaining bolt (1).
5. Remove the CMP actuator valve (2) from the engine front cover.
6. Inspect the CMP actuator valve seal for damage and replace as necessary.

Installation Procedure

1. Inspect the CMP actuator valve seal for damage. Replace the seal if necessary.



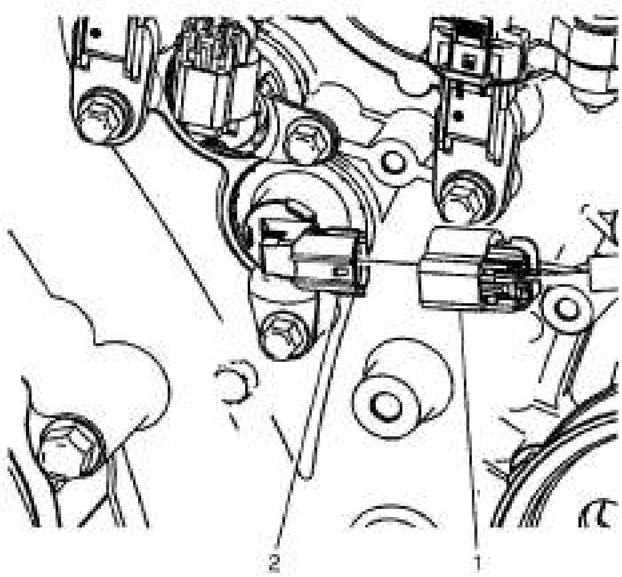
2. Install the CMP actuator valve (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the CMP actuator solenoid valve to engine front cover retaining bolt (1).

Tighten

Tighten the bolt to 10 N·m (89 lb in).



4. Install the CMP actuator valve electrical connector (1) to the CMP actuator valve (2).
5. Install the power steering fluid reservoir. Refer to Power Steering Fluid Reservoir Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976184**

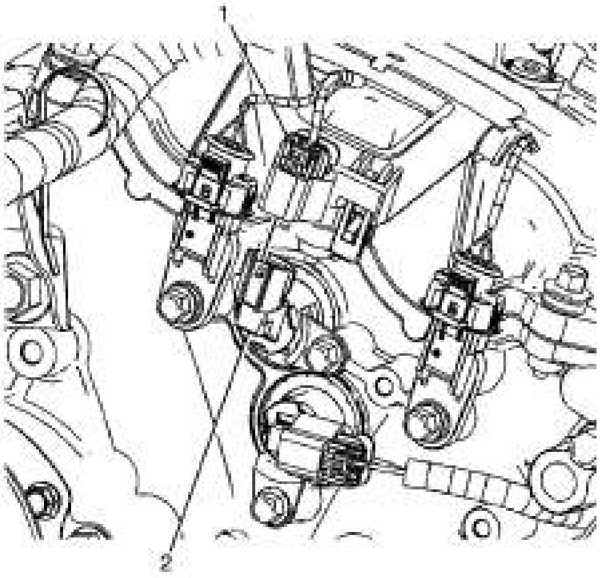
Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake

Removal Procedure

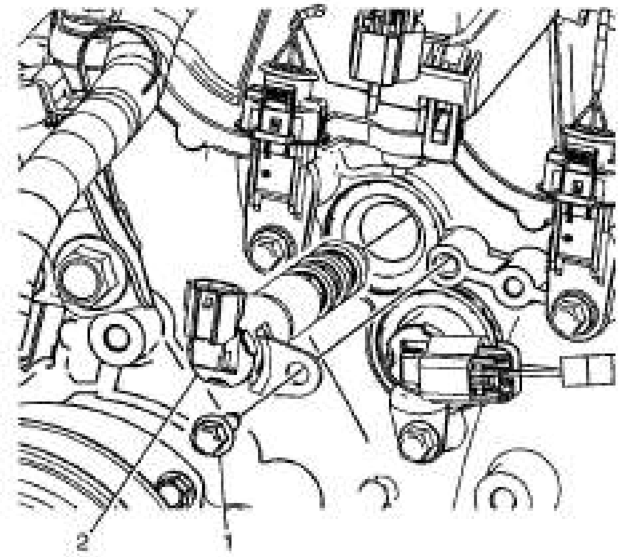
1. Turn the ignition OFF.

   Important: Do not disconnect the power steering fluid lines/hoses from the reservoir.

2. Remove the power steering fluid reservoir bolts and reposition the power steering fluid reservoir in order to provide access. Refer to Power Steering Fluid Reservoir Replacement .



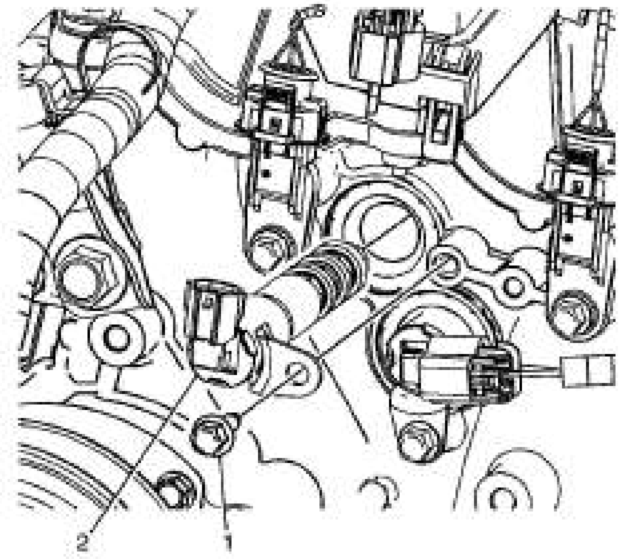
3. Remove the camshaft position (CMP) actuator valve electrical connector (1) from the CMP actuator (2).



4. Remove the CMP actuator solenoid valve to engine front cover retaining bolt (1).
5. Remove the CMP actuator valve (2) from the engine front cover.
6. Inspect the CMP actuator valve seal for damage and replace as necessary.

Installation Procedure

1. Inspect the CMP actuator valve seal for damage. Replace the seal if necessary.

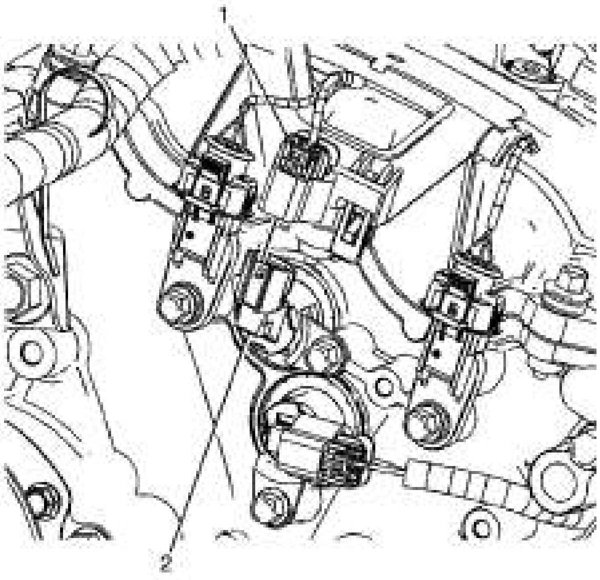


2. Install the CMP actuator valve (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the CMP actuator solenoid valve to engine front cover retaining bolt (1).

Tighten
Tighten the bolt to 10 N·m (89 lb in).



4. Install the CMP actuator valve electrical connector (1) to the CMP actuator valve (2).
5. Install the power steering fluid reservoir. Refer to Power Steering Fluid Reservoir Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1993390**

Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust

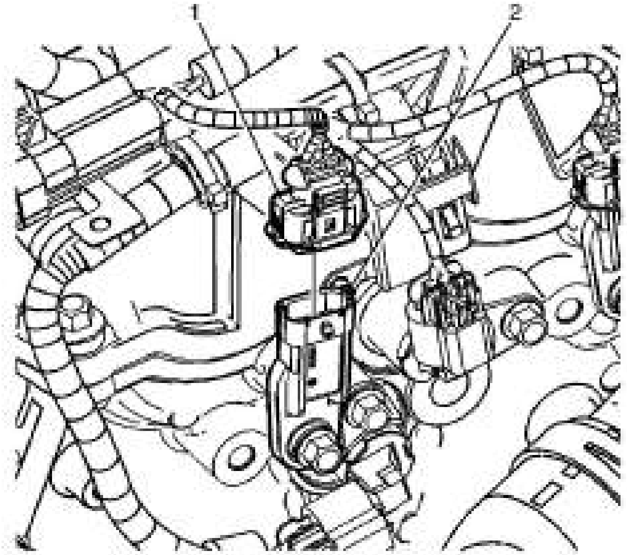
Removal Procedure

1. Turn the ignition OFF.

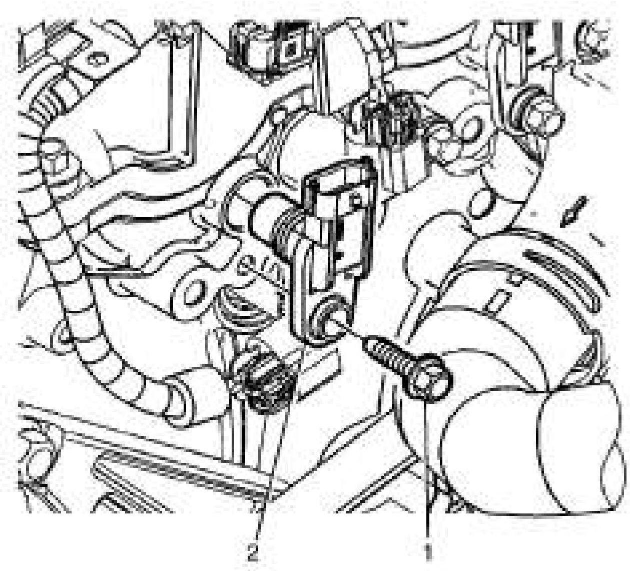
   Important: Do not remove the engine Control Module (ECM) from the ECM bracket.

   Do not remove the ECM redundant ground wire from the ECM.

2. Remove the remote earth post bracket to engine front cover retaining bolts and reposition the remote earth post bracket in order to provide access.

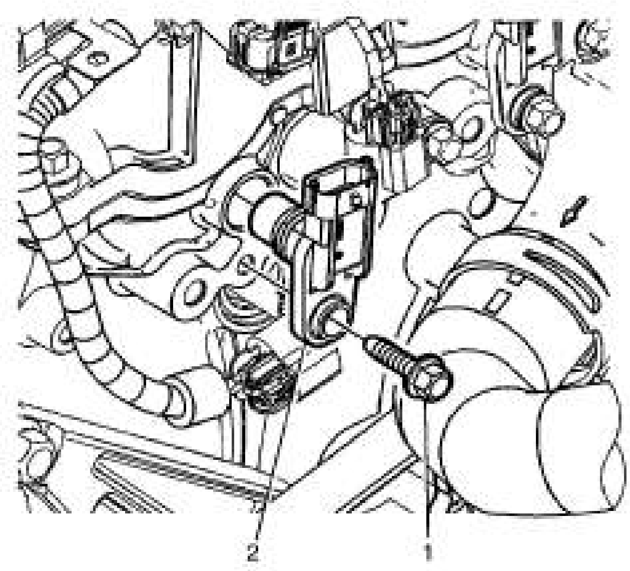


3. Remove the camshaft position (CMP) sensor electrical connector (1) from the CMP sensor (2).



4. Remove the the CMP sensor to engine front cover retaining bolt (1).
5. Remove the CMP sensor (2) from the engine front cover.

Installation Procedure

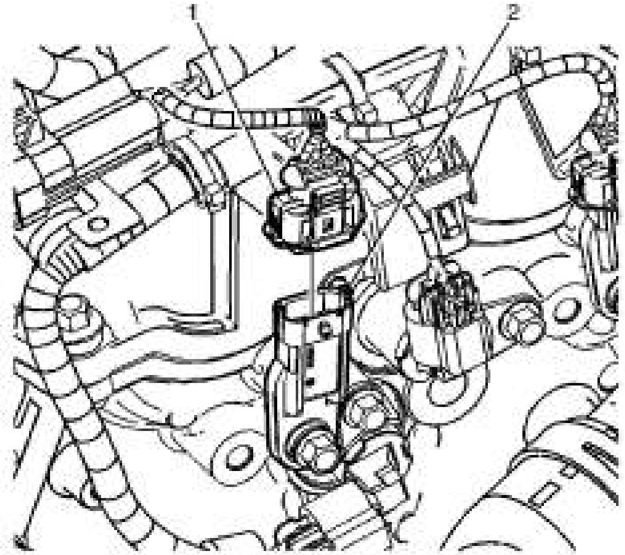


1. Install the CMP sensor (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CMP sensor to engine front cover retaining bolt (1).

Tighten
Tighten the bolt (1) to 10 N·m (89 lb in).



3. Install the CMP sensor electrical connector (1) to the CMP sensor (2) .
4. Install the remote earth post bracket to engine front cover retaining bolts.

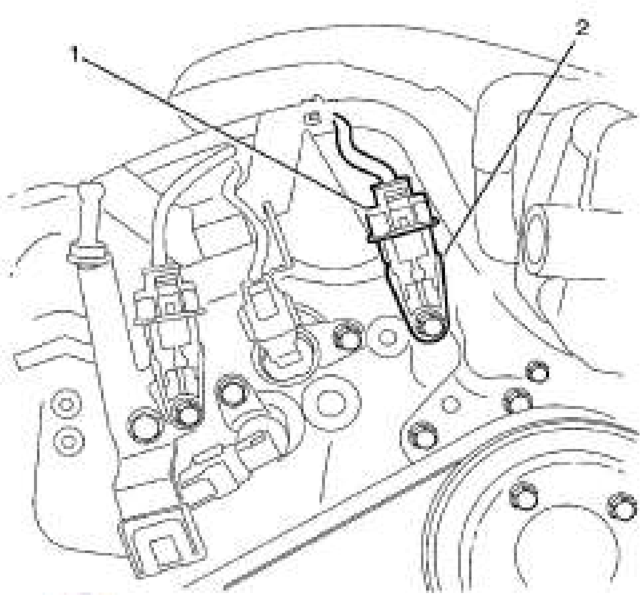
Tighten
Tighten the remote earth post bracket bolts to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976178**

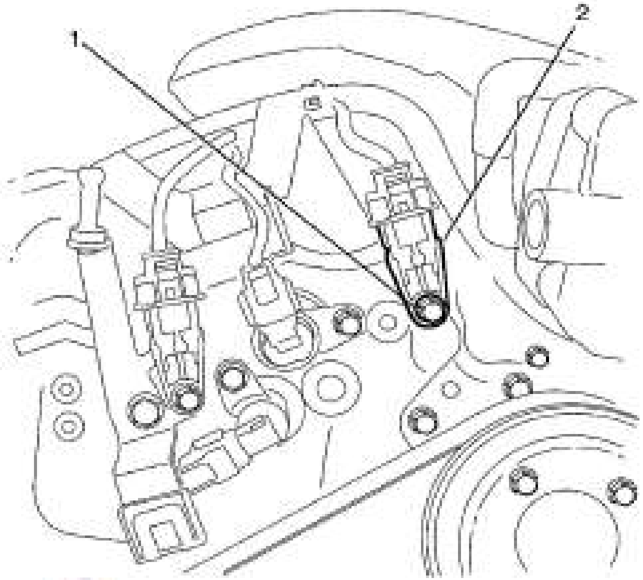
Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake

Removal Procedure

1. Turn the ignition OFF.



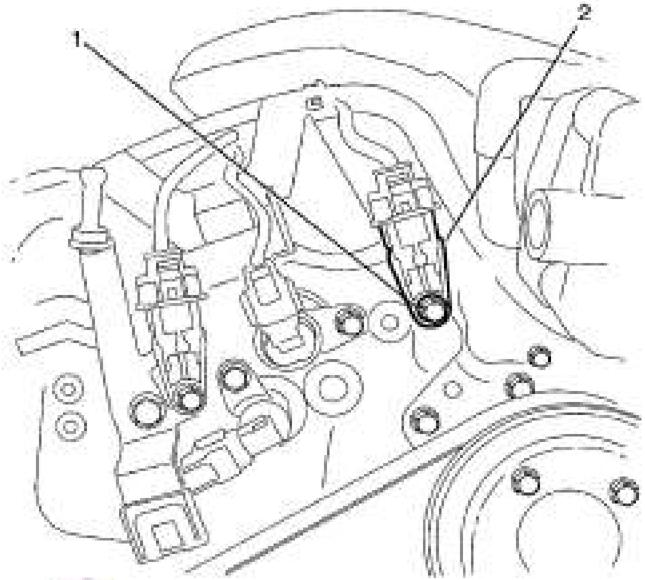
2. Remove the camshaft position (CMP) sensor electrical connector (1) from the CMP sensor (2).



3. Remove the the CMP sensor to engine front cover retaining bolt (1).

4. Remove the CMP sensor from the engine front cover (2).

Installation Procedure

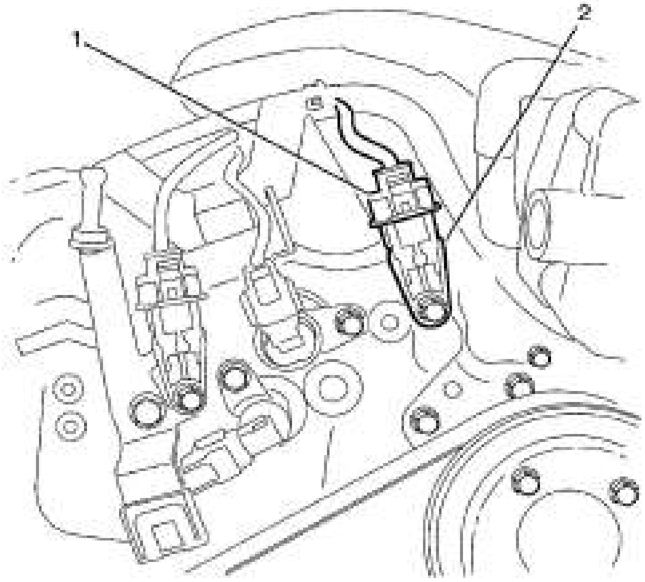


1. Install the CMP sensor (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CMP sensor to engine front cover retaining bolt (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



3. Install the CMP sensor electrical connector (1) to the CMP sensor.

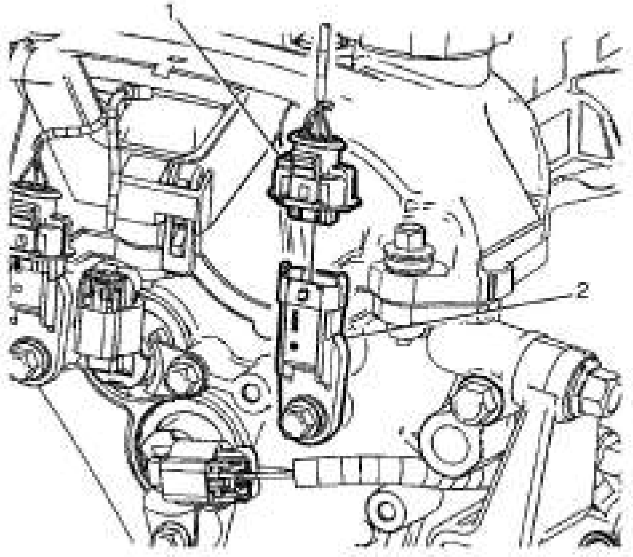
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1993389

Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust

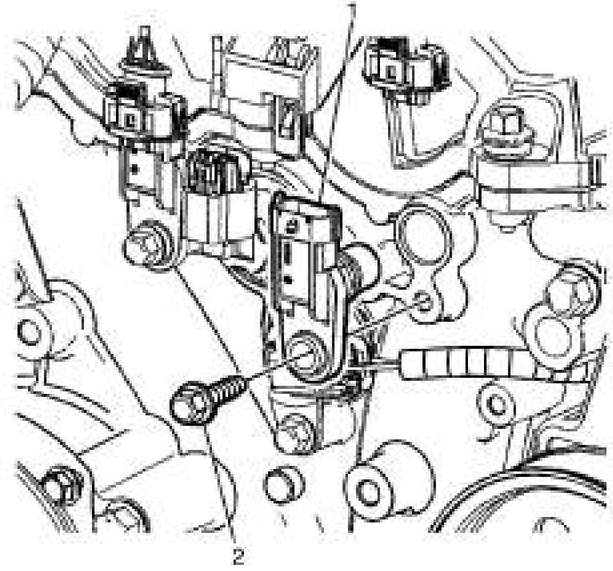
Removal Procedure

Important: Do not disconnect the power steering fluid lines/hoses from the reservoir.

1. Remove the power steering fluid reservoir bolts and reposition the power steering fluid reservoir in order to provide access. Refer to Power Steering Fluid Reservoir Replacement .

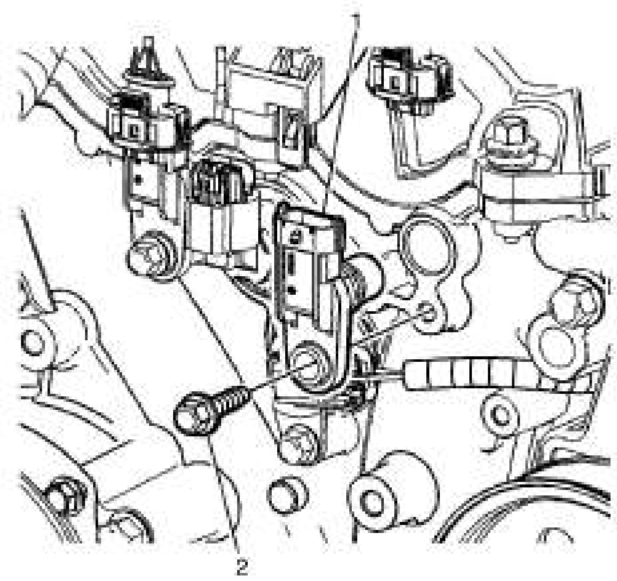


2. Remove the camshaft position (CMP) sensor electrical connector (1) from the CMP sensor (2).



3. Remove the CMP sensor to engine front cover retaining bolt (1).
4. Remove the CMP sensor (2) from the engine front cover.

Installation Procedure

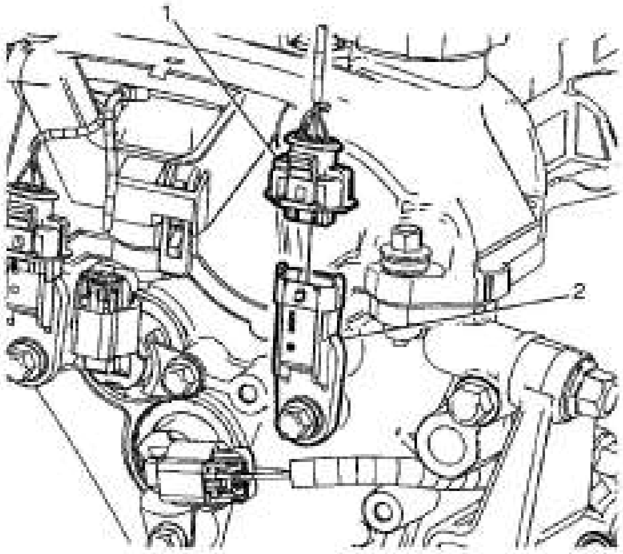


1. Install the CMP sensor to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CMP sensor to engine front cover retaining bolt (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



3. Install the CMP sensor electrical connector (1) to the CMP sensor (2).
4. Install the power steering fluid reservoir. Refer to Power Steering Fluid Reservoir Replacement .

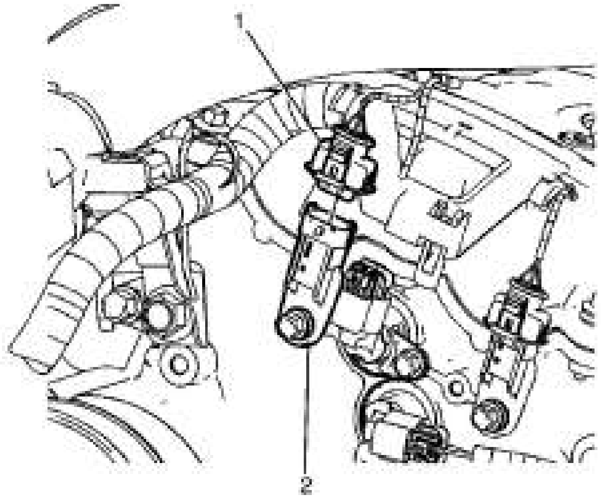
Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake

Removal Procedure

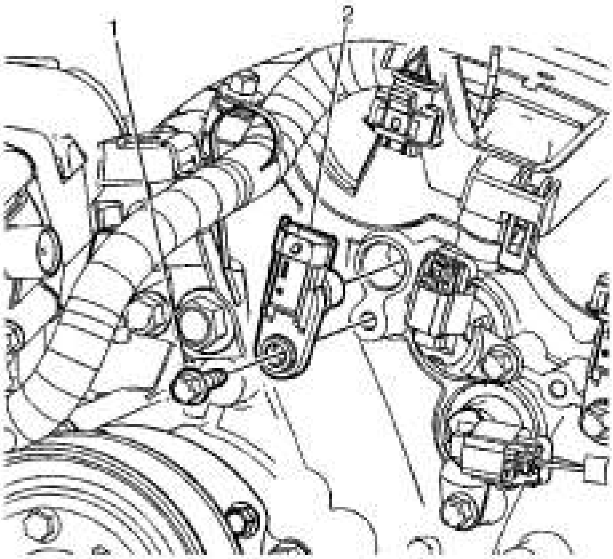
1. Turn the ignition OFF.

   Important: Do not disconnect the power steering fluid lines/hoses from the reservoir.

2. Remove the power steering fluid reservoir bolts and reposition the power steering fluid reservoir in order to provide access. Refer to Power Steering Fluid Reservoir Replacement .

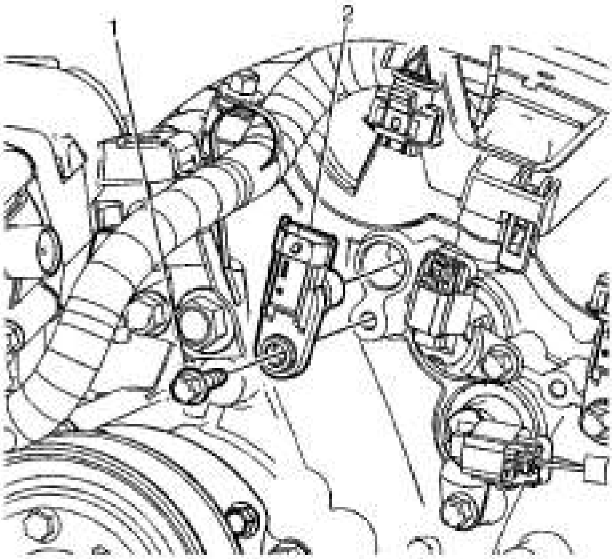


3. Remove the camshaft position (CMP) sensor electrical connector (1) from the CMP sensor (2).



4. Remove the the CMP sensor to engine front cover retaining bolt (1).
5. Remove the CMP sensor (2) from the engine front cover.

Installation Procedure

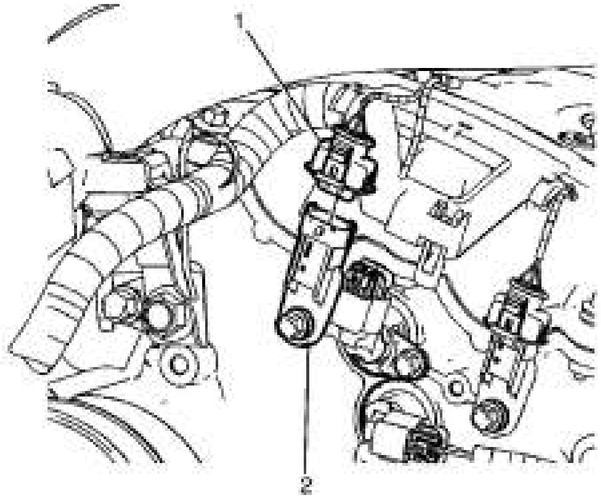


1. Install the CMP sensor (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CMP sensor to engine front cover retaining bolt (1).

Tighten
Tighten the bolt to 10 N·m (89 lb in).



3. Install the CMP sensor electrical connector (1) to the CMP sensor (2).
4. Install the power steering fluid reservoir. Refer to Power Steering Fluid Reservoir Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1993406**

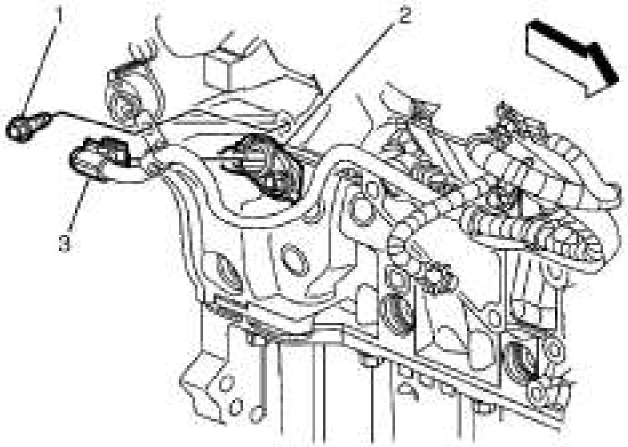
Crankshaft Position Sensor Replacement

Removal Procedure

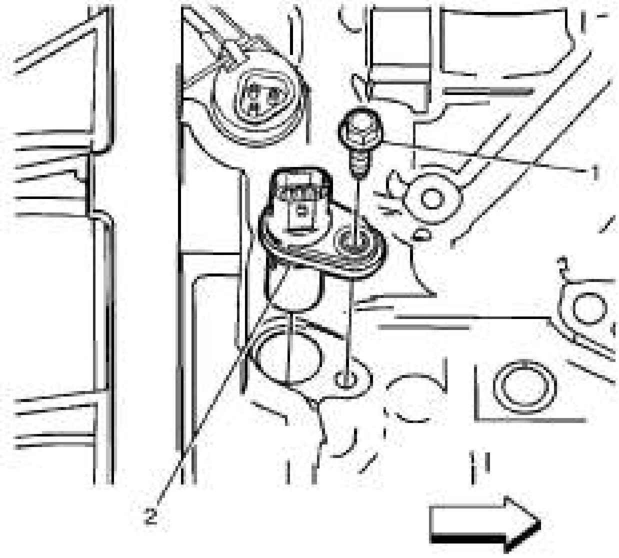
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the ignition OFF.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

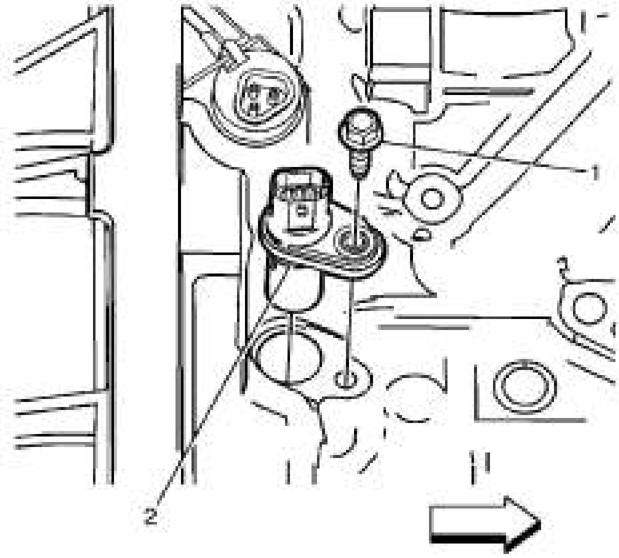


3. Reposition the wiring harness heat shield to obtain access.
4. Disconnect the crankshaft position (CKP) harness connector (3) from the CKP.



5. Remove the CKP to engine block retaining bolt (1) from the CKP sensor (2).
6. Remove the CKP sensor (2) from the engine block.

Installation Procedure

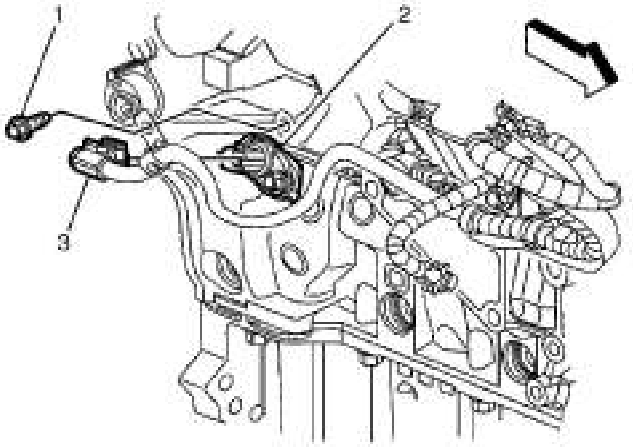


1. Install the CKP sensor (2) to the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CKP sensor to engine block retaining bolt (1).

   Tighten
   Tighten the crankshaft position sensor bolt to 10 N·m (89 lb in).



3. Connect the CKP electrical connector (3) to the CKP sensor.
4. Lower the vehicle.

Engine Control Module Replacement (RHD)

Pre-Removal Procedure

If the engine control module (ECM) is replaced, the following procedures must be performed:

> **Important:** When replacing the ECM, the ECM must be reset prior to removal. Failure to perform this procedure will result in the inability to:
> - Test the ECM for warranty purposes.
> - Install the ECM into other vehicles.

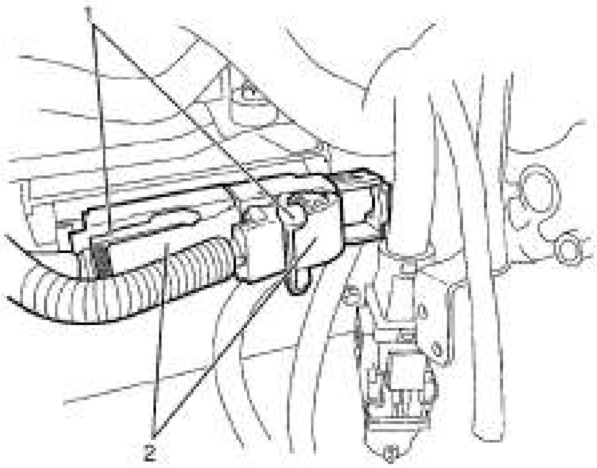
1. ECM reset procedure.
2. ECM reprogramming - Refer to Service Programming System (SPS) Notice .
3. Theft Deterrent programming - Refer to Theft Deterrent Control Module Programming and Setup .

Removal Procedure

> **Caution:** Refer to Safety Glasses Caution in the Preface section.

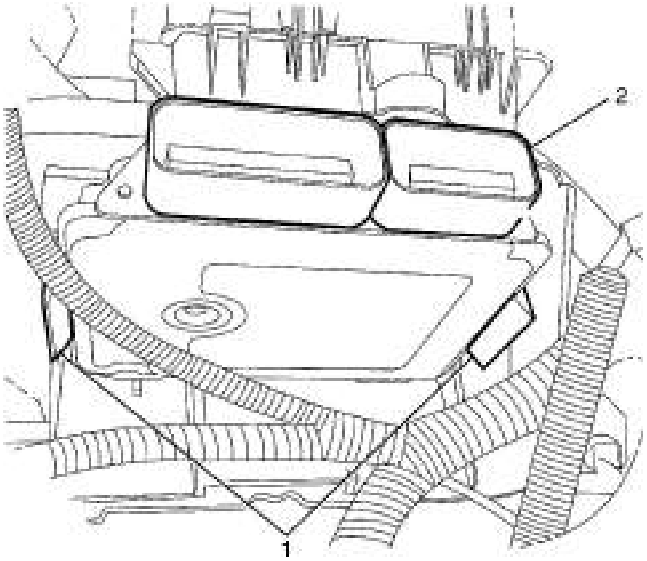
> **Notice:** Always turn the ignition off when installing or removing the ECM connectors in order to prevent damage to the components.

1. Turn the ignition OFF.
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .



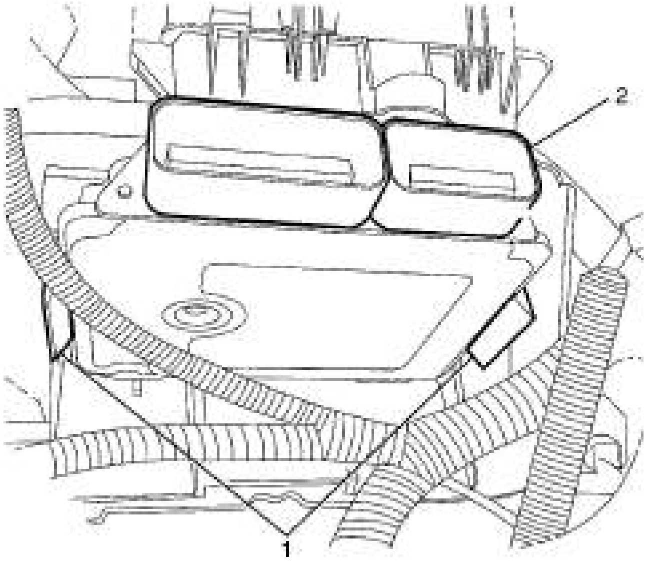
Important: Disconnect the rear electrical connector from the ECM first.

4. Unlock the ECM electrical connector lock levers (1) and disconnect the ECM electrical connectors (2).

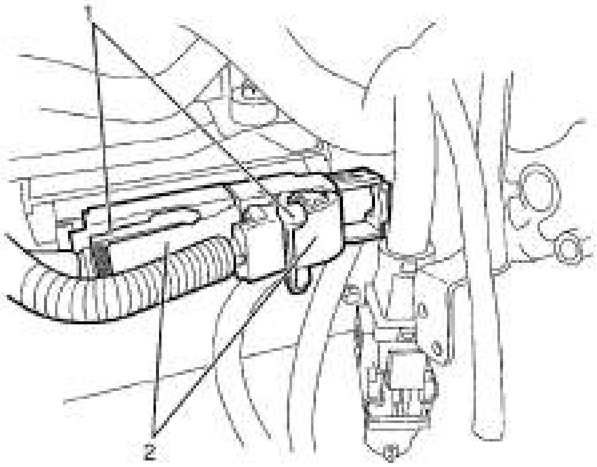


5. Remove the ECM (2) from the ECM housing by pushing both ECM retaining clips (1) outwards.

Installation Procedure



1. Install the ECM (2) to the ECM housing, make sure the ECM retaining clips (1) are located correctly.



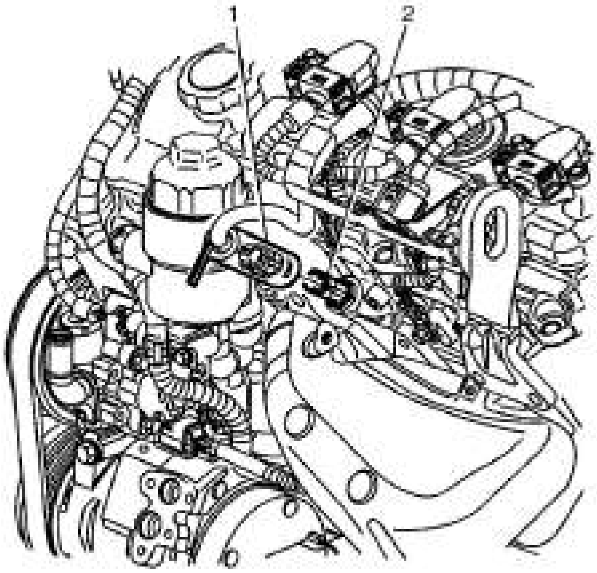
2. Connect the ECM electrical connectors (2) and lock the connector lock levers (1) into place.
3. Connect the battery negative cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
5. Program the ECM. Refer to Engine Control Module Programming and Setup .
6. If you encounter an ECM programming error, with a display message of "Starting Disabled, Remove Key" on the driver information centre, with a diagnostic test code (DTC) of P1631, perform the "10-Minute Relearn Procedure" found in Programming Theft Deterrent Control Module Programming and Setup. Refer to Theft Deterrent Control Module Programming and Setup .
7. Turn OFF the ignition for at least 5 seconds after the programming event is complete.
8. Perform the idle learn procedure. Refer to Idle Learn .
9. Use the scan tool to clear all DTCs.

Engine Coolant Temperature Sensor Replacement

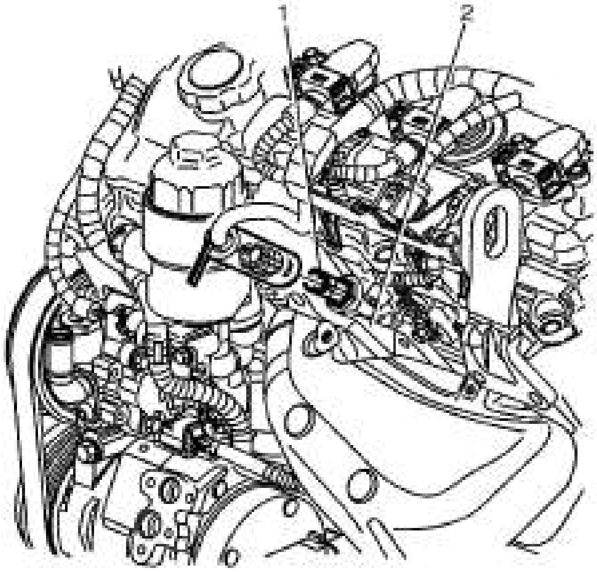
Removal Procedure

Caution: Allow sufficient time for the engine to cool before removing the ECT sensor. A hot engine may cause an excessive coolant loss or a personal injury.

1. Turn the ignition OFF.



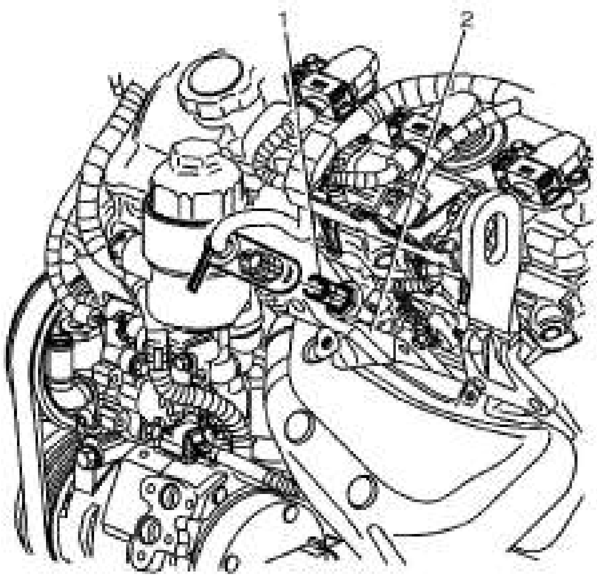
2. Remove the engine coolant temperature sensor harness connector (1) from the coolant temperature sensor (2).



3. Remove the engine coolant temperature sensor (1) from the engine (2).

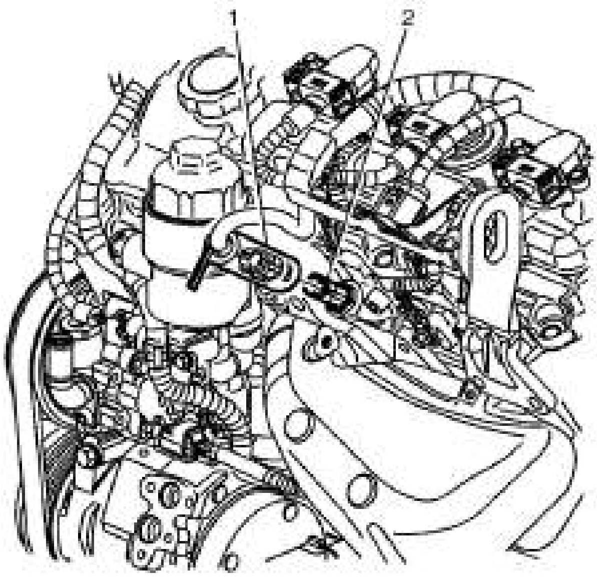
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the coolant temperature sensor (1) to the engine.

Tighten
Tighten the coolant temperature sensor to 22 N·m (16 lb ft).



2. Install the coolant temperature sensor electrical connector (1) to the coolant temperature sensor.
3. Inspect and fill the cooling system as necessary. Refer to Cooling System Draining and Filling.

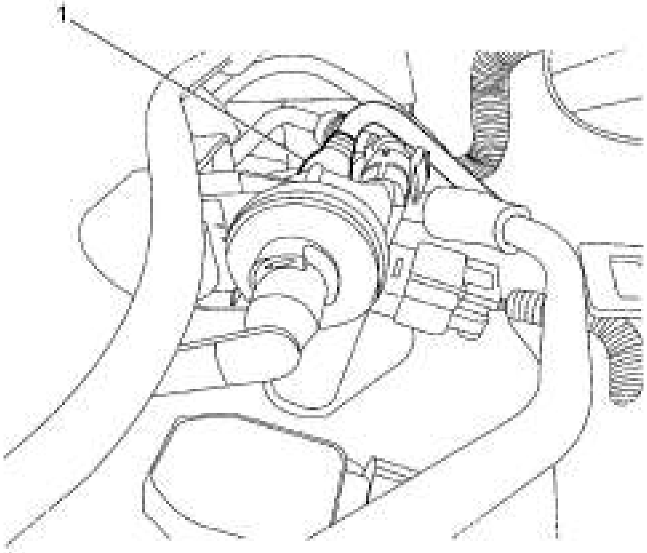
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1997201**

Evaporative Emission Canister Purge Solenoid Valve Replacement

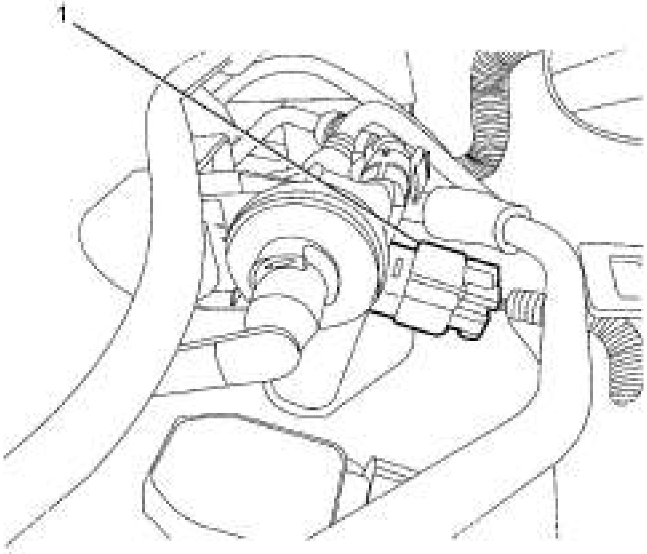
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

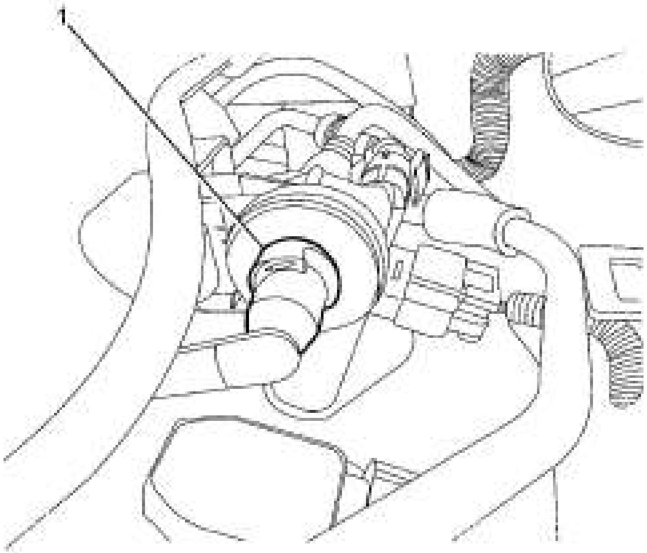
1. Turn the ignition OFF.



2. Disconnect the purge line (1) from the purge valve solenoid.

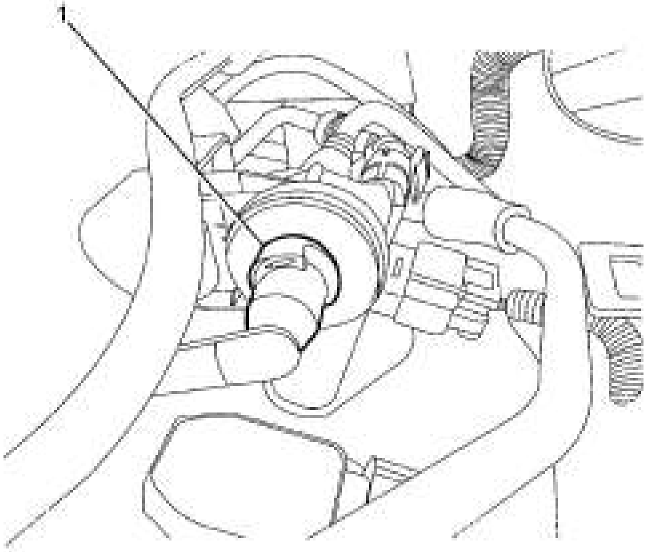


3. Disconnect the purge valve solenoid electrical connector (1).

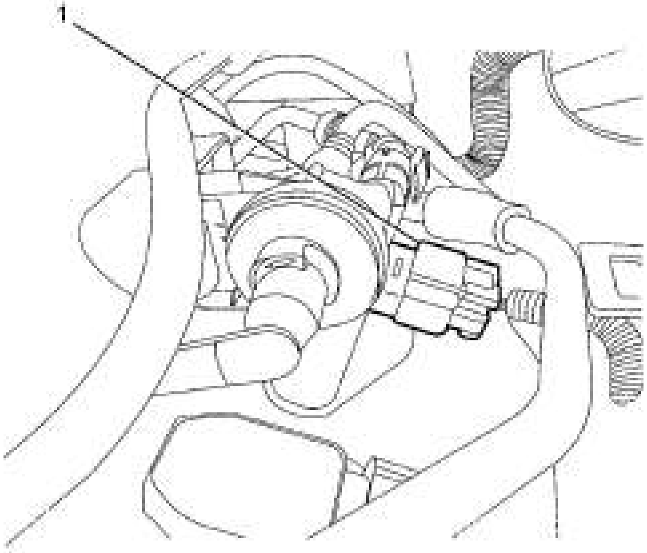


4. Disconnect the purge line (1) from the manifold side of the purge valve solenoid.
5. Remove the purge valve solenoid.

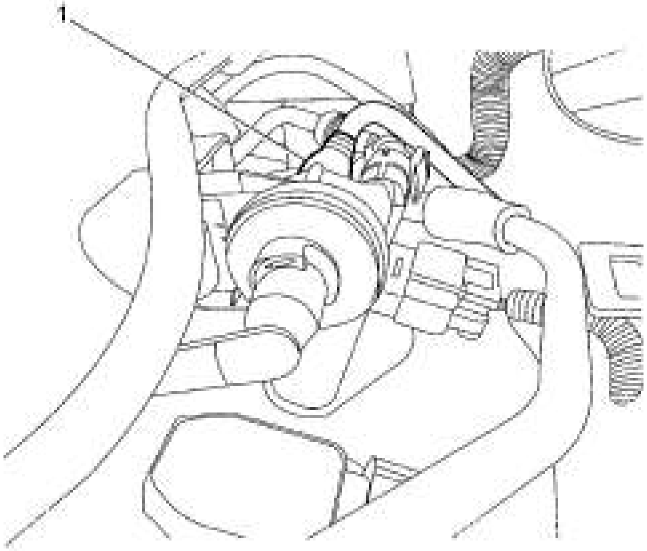
Installation Procedure



1. Install the purge valve solenoid.
2. Connect the purge line (1) from the manifold side of the purge valve solenoid.



3. Connect the purge valve solenoid electrical connector.



4. Connect the purge line (1) to the purge valve solenoid.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976141**

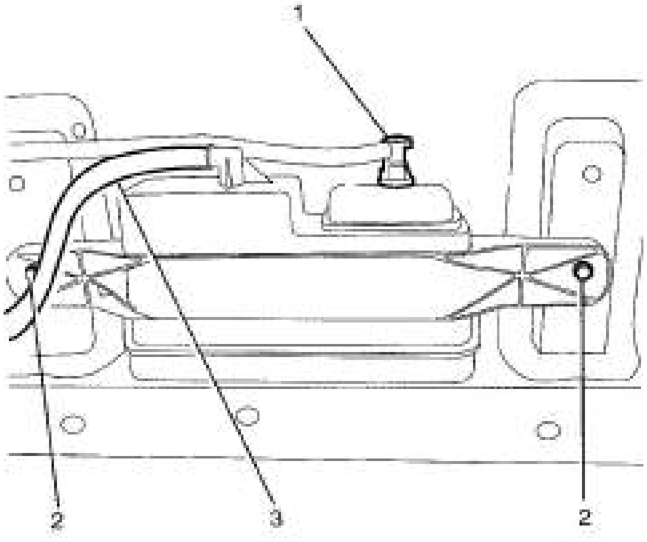
Evaporative Emission Canister Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

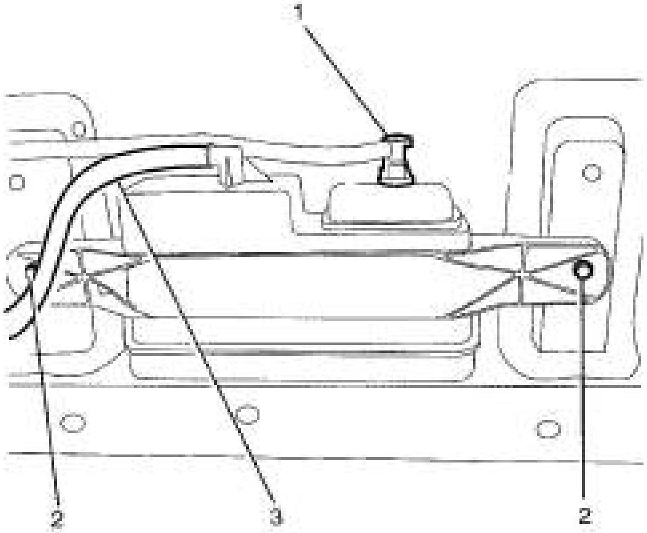
1. Remove the rear frame. Refer to Rear Frame Replacement.



2. Disconnect the evaporative emission (EVAP) hoses (1&3) from the EVAP canister.
3. Remove the purge canister to chassis retaining bolts (2).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the purge canister to chassis retaining bolts (2).

   Tighten
   Tighten the EVAP canister retaining nuts to 6 N·m (53 lb in).

2. Connect the evaporative emission (EVAP) hoses (1&3) from the EVAP canister.
3. Install the rear frame. Refer to Rear Frame Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976193**

Evaporative Emission Hoses/Pipes Replacement - Chassis/Canister

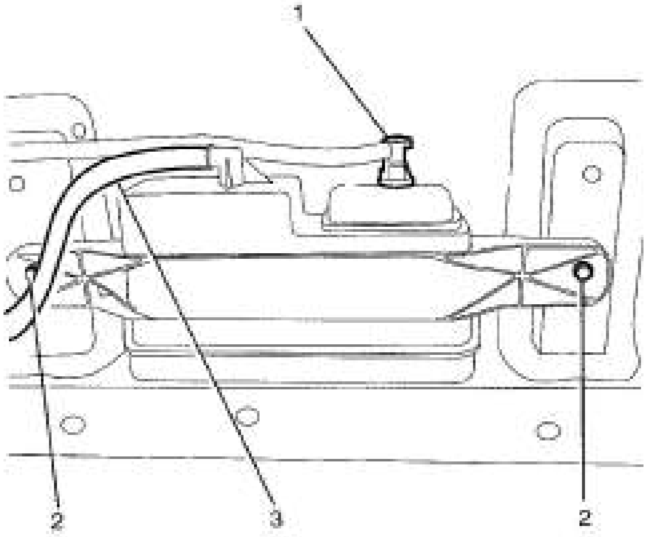
Removal Procedure

- Do not attempt to repair sections of nylon pipes. Replace damaged nylon pipes.
- Replace the vapour hoses/pipes with original equipment or parts that meet original specifications.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear frame. Refer to Rear Frame Replacement .
3. Remove the fuel tank. Refer to Fuel Tank Replacement .



4. Disconnect the canister purge pipe (1) from the canister.
5. Remove the canister vent pipe (3) from the canister by twisting and pulling it away from the canister.
6. Remove the canister to under body retaining bolts (2).
7. Remove the evaporative emission canister from the vehicle.
8. Remove the EVAP hose from the fuel tank.

Installation Procedure

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2132043**

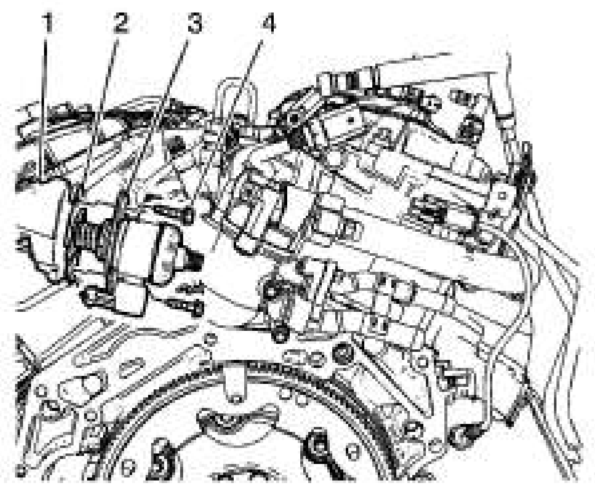
Fuel Pump Replacement (LLT)

Special Tools

EN-48896 HP Fuel Pump Installation Alignment Gage

Removal Procedure

1. Relieve the low and high side fuel system pressure. Refer to Fuel Pressure Relief.
2. Remove the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.
3. Remove the high pressure fuel pump shield. Refer to Fuel Pipe Shield Replacement.
4. Remove the intake manifold. Refer to Intake Manifold Replacement.
5. Remove the wiper module. Refer to Windshield Wiper Motor Replacement.

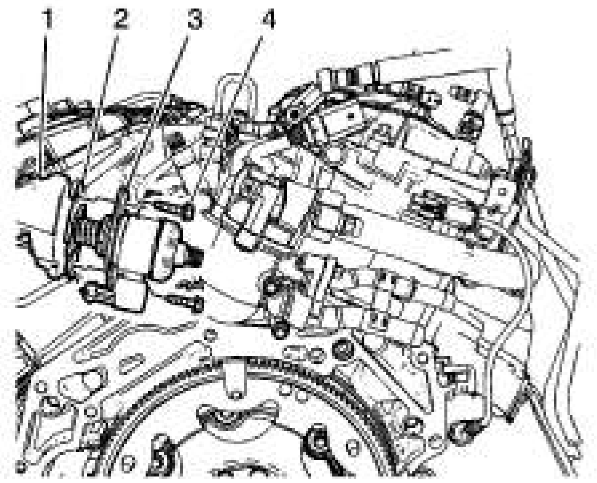


6. Disconnect the engine wiring harness electrical connector from the high pressure fuel pump.
7. Remove the radiator surge tank outlet pipe. Refer to Radiator Surge Tank Outlet Hose/Pipe Replacement
8. Remove the low pressure feed pipe. Refer to Fuel Feed Pipe Replacement.
9. Remove the high pressure pipe. Refer to Fuel Feed Intermediate Pipe Replacement. Discard this pipe.
10. Remove and discard the high pressure fuel pump bolts (4).
11. Remove the high pressure fuel pump (3).
12. Remove and discard the high pressure fuel pump gasket (2).
13. Remove and discard the high pressure fuel pump O-ring.
14. Remove the high pressure fuel pump roller lifter.

Installation Procedure

Note: The camshaft must be in the base circle position before the high pressure fuel pump is installed.

1. Use the EN-48896 to ensure that the camshaft lobe is in the base circle position. At base circle the tool will be flush with the head.
2. Lubricate the high pressure fuel pump cylinder head bore and roller lifter with camshaft prelube GM P/N 12345501 (Canadian P/N 992704) or equivalent.
3. Install high pressure fuel pump roller lifter.
4. Install a NEW high pressure fuel pump O-ring.



Note: The high pressure fuel pump gasket has a retaining feature to hold the pump retaining bolts in place.

5. Position the NEW high pressure fuel pump gasket (2) and bolts (4) to the fuel pump.
6. Install the high pressure fuel pump (3) to the cylinder head (1). Force will be required while hand tightening the bolts.

Caution: Refer to Fastener Caution in the Preface section.

7. Tighten the high pressure fuel pump retaining bolts to **15 N·m (11 lb ft)**.
8. Ensure the high pressure fuel pump and fuel rail fittings are clean prior to assembly.
9. Install a NEW high pressure fuel pipe. Refer to Fuel Feed Intermediate Pipe Replacement.
10. Install the fuel feed pipe to the high pressure fuel pump. Refer to Fuel Feed Pipe Replacement.
11. Connect the high pressure fuel pump wiring harness.
12. Install the radiator surge tank outlet pipe. Refer to Radiator Surge Tank Outlet Hose/Pipe Replacement.
13. Install the fuel tank cap.

Note: If a fuel leak accrues at the fuel rail, the fuel rail will need to be replaced.

14. Inspect for leaks using the following procedure:
    - 14.1. Turn ON the ignition, with the engine OFF for 2 seconds.
    - 14.2. Turn OFF the ignition, for 10 seconds.
    - 14.3. Turn ON the ignition, with the engine OFF.

    4. Inspect for fuel leaks.

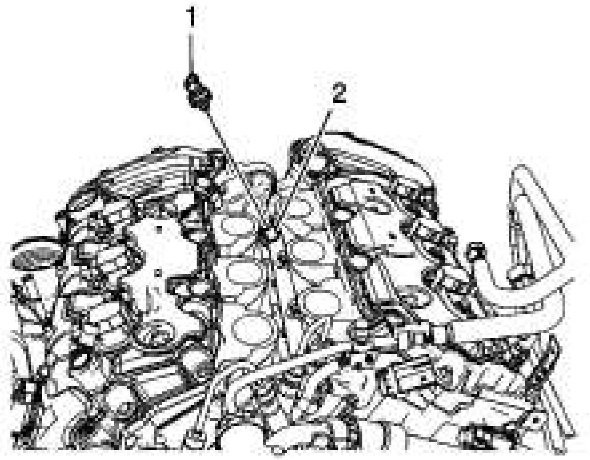
15. Install the pressure relief cap to the fuel feed pipe.
16. Install the wiper module. Refer to Windshield Wiper Motor Replacement.
17. Install the intake manifold. Refer to Intake Manifold Replacement.
18. Install the high pressure fuel pump shield. Refer to Fuel Pipe Shield Replacement.
19. Install the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2131941**

Fuel Pressure Sensor Replacement (LLT)

Removal Procedure

1. Relieve the fuel system pressure. Refer to Fuel Pressure Relief.
2. Remove the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.
3. Remove the intake manifold. Refer to Intake Manifold Replacement
4. Remove the foam insulator from the fuel rails.



Note: Applying force to the plastic housing of the sensor will destroy the sensor. To tighten or loosen, only apply force to the attached hexagon.

5. Using a 27 mm socket, remove the fuel pressure sensor (1) from the fuel injection fuel rail (2). Discard the fuel pressure sensor.
6. Allow any fuel to drain from the fuel rail and pressure sensor location.
7. Dry the sealing cone in the fuel rail and the area around the sensor joint with a lint free cloth.
8. Inspect the sealing cone in the fuel rail. The surface should be free of fuel, debris, and burrs.

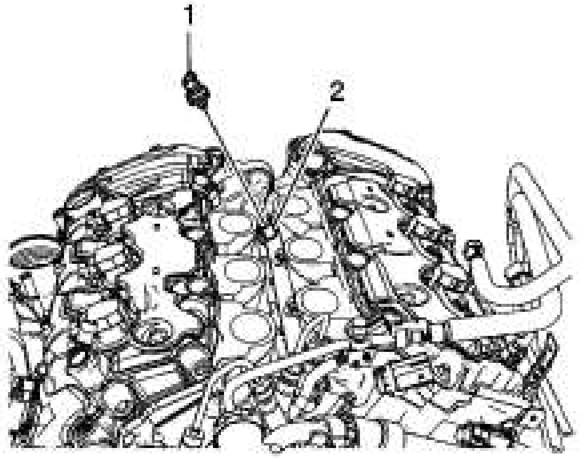
Installation Procedure

Note: Applying force to the plastic housing of the sensor will destroy the sensor. To tighten or loosen, only apply force to the attached hexagon.

Note: Ensure that the fuel rail threads have been cleaned of any excess fuel, or the NEW fuel injection fuel rail fuel pressure sensor will NOT seal properly.

1. Lubricate the threads and the sealing cone in the fuel rail with silicon free engine oil GM P/N 12345610 (Canadian P/N 993193) or equivalent.
2. Lubricate the threads and sealing cone on the NEW fuel injection fuel rail fuel pressure sensor

with silicon free engine oil GM P/N 12345610 (Canadian P/N 993193) or equivalent.



3. Install the NEW fuel pressure sensor (1) to the fuel injection fuel rail (2) hand tight.
4. Remove the NEW fuel injection fuel rail fuel pressure sensor, re-lubricate following steps 1 and 2 above.

Caution: Refer to Fastener Caution in the Preface section.

5. Install the NEW fuel pressure sensor (1) to the fuel injection fuel rail (2) and tighten to **33 N·m (25 lb ft)**.
6. Install the foam insulator from the fuel rails.
7. Install the intake manifold. Refer to Intake Manifold Replacement

Note: If a fuel leak accrues at the fuel rail, the fuel rail will need to be replaced.

8. Inspect for fuel leaks using the following procedure:
   - 8.1. Turn ON the ignition, with the engine OFF for 2 seconds.
   - 8.2. Turn OFF the ignition, for 10 seconds.
   - 8.3. Turn ON the ignition, with the engine OFF.
   - 8.4. Inspect for fuel leaks.
9. Install the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.

Fuel Pressure Relief (With High Pressure Pump - LLT)

Warning: Fuel that flows out at high pressure can cause serious injury to the skin and eyes. ALWAYS depressurize the fuel system before removing components that are under high fuel pressure.

> **Note:** If a scan tool is not available, WAIT at LEAST 2 hours after the engine has been run, before removing the high pressure fuel line.

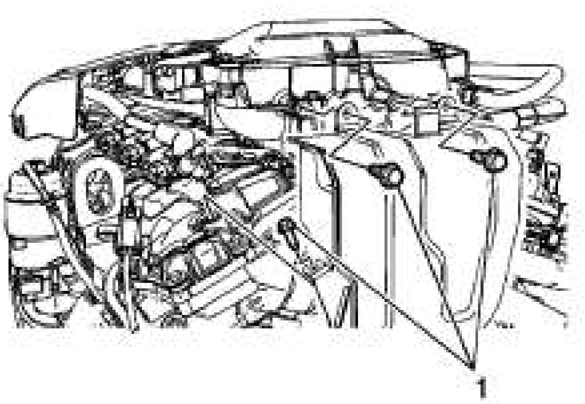
1. Install a scan tool to the vehicle and command the fuel pump relay OFF, allowing the low pressure fuel pump to shut off.
2. Start the vehicle and allow the engine to idle until the engine stops. The engine will stop in approximately 20-30 seconds.
3. Turn the ignition OFF.
4. Using the scan tool, verify that there is little to no fuel pressure, if there still is fuel pressure repeat step 2.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2132038**

Fuel Pipe Shield Replacement (LLT)

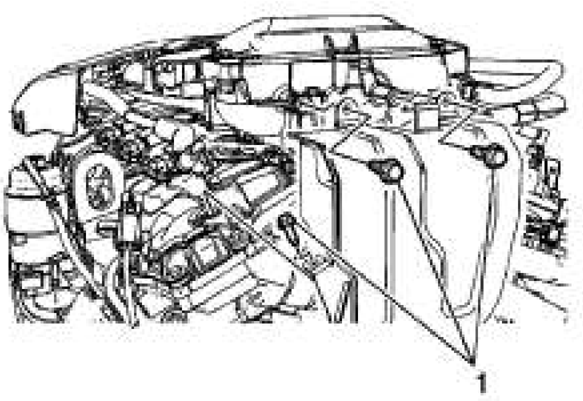
Removal Procedure

1. Remove the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.
2. Remove the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement
3. Remove the intake manifold insulator.
4. Remove the wiper transmission. Refer to Windshield Wiper Transmission Replacement.



5. Remove the fuel pipe shield to intake manifold bolts (1).
6. Remove the fuel pipe shield to cylinder bolt (1).
7. Carefully remove the fuel pipe shield from the vehicle. Take care not to damage the insulation behind the shield.

Installation Procedure



1. Position the fuel pipe shield behind the high pressure fuel pump. Take care not to damage the insulation behind the shield.
2. Install the fuel pipe shield to cylinder bolt (1). Hand tighten at this time.

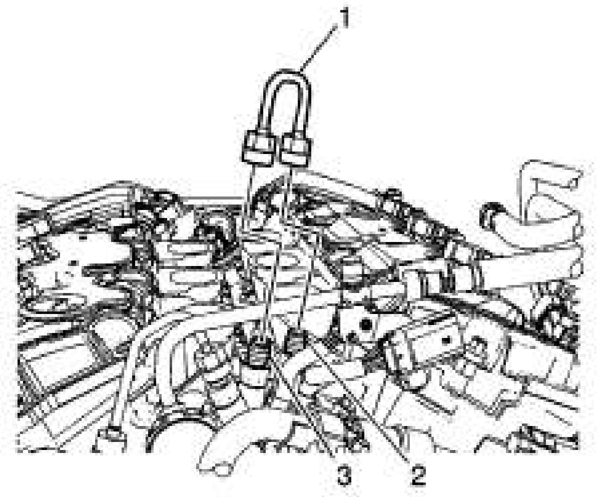
   Caution: Refer to Fastener Caution in the Preface section.

3. Install the fuel pipe shield to intake manifold bolts (1).
   - 3.1. Tighten the fuel pipe shield to manifold bolts to **23 N·m (17 lb ft)**.
   - 3.2. Tighten the fuel pipe shield to head bolt to **10 N·m (89 lb in)**.
4. Instal the wiper transmission. Refer to Windshield Wiper Transmission Replacement.
5. Install the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement
6. Install the cross vehicle brace. Refer to Cross Vehicle Brace Replacement.

Fuel Injection Fuel Rail Crossover Tube Replacement (LLT)

Removal Procedure

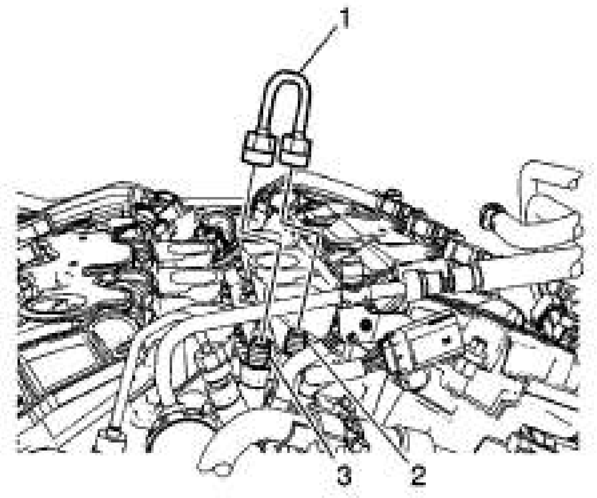
1. Remove the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.
2. Remove the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
3. Relieve the fuel system pressure. Refer to Fuel Pressure Relief.
4. Remove the intake manifold. Refer to Intake Manifold Replacement.



5. Loosen the fuel rail crossover pipe (1) fitting to the right fuel rail (2).
6. Loosen the fuel rail crossover pipe (1) fitting to the right fuel rail (3).
7. Remove the fuel rail crossover pipe (1) from the vehicle. Discard the pipe.

Installation Procedure

1. Ensure that the fuel rail crossover pipe, right fuel rails fittings and left fuel rail fittings are clean and dry prior to assembly.
2. Lubricate the pipes with silicon free engine oil GM P/N 12345610 (Canadian P/N 993193) or equivalent.



3. Position the fuel rail crossover pipe (1) to the right fuel rails fitting (2) and left fuel rail fitting (3).

Caution: Refer to Fastener Caution in the Preface section.

4. Tighten the fuel rail crossover pipe fittings.
   4.1. Tighten the fittings first pass to **16 N·m (12 lb ft)**.
   4.2. Tighten the fittings final pass to **32 N·m (24 lb ft)**.

Note: If a fuel leak accrues at the right fuel rail fitting (2) or left fuel rail fitting (3), that component will need to be replaced.

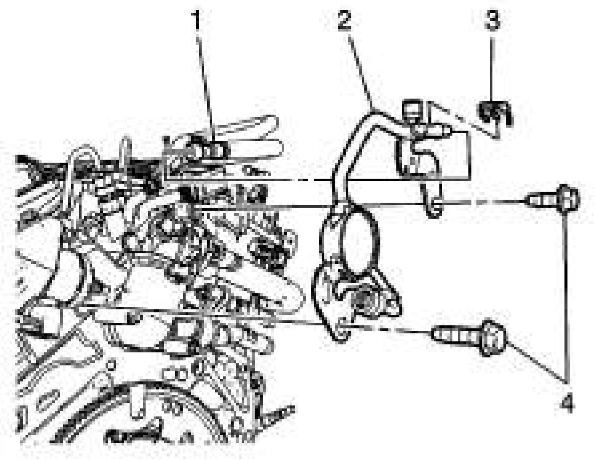
5. Inspect for leaks using the following procedure:
   5.1. Turn ON the ignition, with the engine OFF for 2 seconds.
   5.2. Turn OFF the ignition, for 10 seconds.
   5.3. Turn ON the ignition, with the engine OFF.
   5.4. Inspect for fuel leaks.
6. Install the low side fuel pressure service port cap.
7. Install the fuel tank cap.
8. Install the intake manifold. Refer to Intake Manifold Replacement.
9. Install the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
10. Install the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2131942**

Fuel Feed Pipe Replacement (LLT)

Removal Procedure

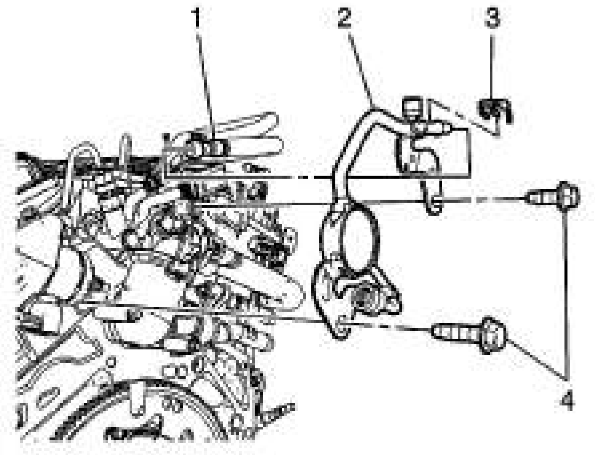
1. Remove the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.
2. Remove the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
3. Relieve the low side fuel system pressure. Refer to Fuel Pressure Relief.
4. Remove the radiator surge tank outlet pipe. Refer to Radiator Surge Tank Outlet Hose/Pipe Replacement.



5. Disconnect the fuel feed line quick connect fitting from the fuel feed pipe (2). Refer to Metal Collar Quick Connect Fitting Service.
6. Loosen the fuel feed pipe fitting to the high pressure fuel pump.
7. Remove the fuel feed pipe bolts (4) from the cylinder heads.
8. Remove the fuel feed pipe from the engine and high pressure fuel pump.

Installation Procedure

1. Ensure that the fuel feed pipe and fuel pump fittings are clean and dry prior to assembly.
2. Lubricate the pipes with silicon free engine oil GM P/N 12345610 (Canadian P/N 993193) or equivalent.



3. Position the fuel feed pipe (2) to the cylinder head and high pressure fuel pump.
4. Install the fuel feed pipe fitting to the high pressure fuel pump hand tight.

Caution: Refer to Fastener Caution in the Preface section.

5. Install the fuel feed pipe bolts (4).
   - Tighten the bolts to **50 N·m (37 lb ft)**.
   - Tighten the fitting to **28 N·m (20 lb ft)**.
6. Connect the fuel feed line quick connect fitting to the fuel feed pipe (2). Refer to Fuel Pipe Shield Replacement.

Note: If a fuel leak accrues at the high pressure fuel pump, the pump will need to be replaced.

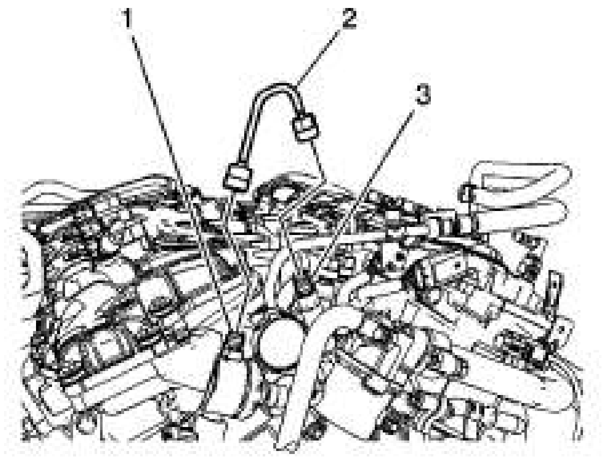
7. Inspect for leaks using the following procedure:
   7.1. Turn ON the ignition, with the engine OFF for 2 seconds.
   7.2. Turn OFF the ignition, for 10 seconds.
   7.3. Turn ON the ignition, with the engine OFF.
   7.4. Inspect for fuel leaks.
8. Install the low side fuel pressure service port cap.
9. Install the fuel tank cap.
10. Install the radiator surge tank outlet pipe. Refer to Radiator Surge Tank Outlet Hose/Pipe Replacement.
11. Install the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
12. Install the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2132029**

Fuel Feed Intermediate Pipe Replacement (LLT)

Removal Procedure

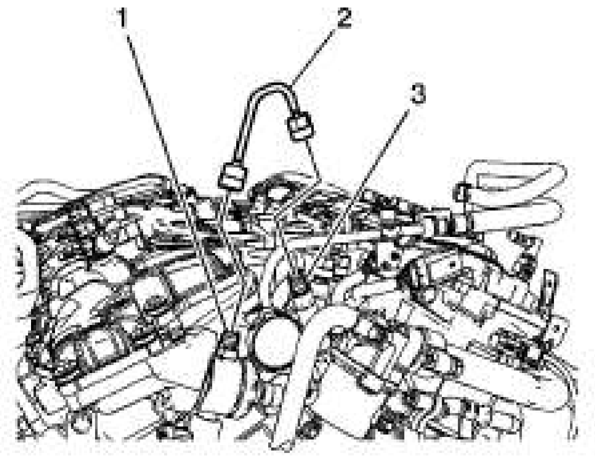
1. Remove the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.
2. Remove the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
3. Relieve fuel system pressure. Refer to Fuel Pressure Relief.



4. Remove the foam insulator from the pipes.
5. Loosen the high pressure pipe fitting to the high pressure fuel pump (1).
6. Loosen the high pressure pipe fitting to the left fuel rail (3).
7. Remove the high pressure fuel pipe (2) from the vehicle. Discard the pipe.

Installation Procedure

1. Ensure that the high pressure fuel pipe, fuel rail fitting and fuel pump fitting are clean and dry prior to assembly.
2. Lubricate the pipes with silicon free engine oil GM P/N 12345610 (Canadian P/N 993193) or equivalent.



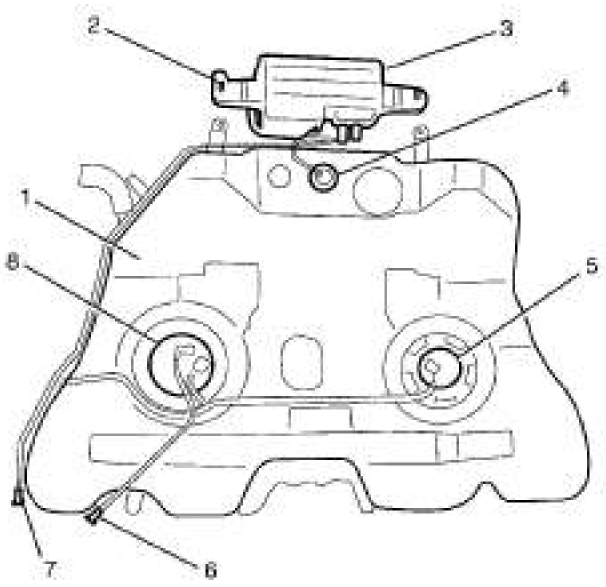
3. Position the high pressure fuel pipe (2) to the high pressure fuel pump fitting (1) and left fuel rail (3). hand tighten the fitting.

   Caution: Refer to Fastener Caution in the Preface section.

4. Tighten the high pressure fuel pipe fitting.
   1. Tighten the fitting a first pass to **16 N·m (12 lb ft)**.
   2. Tighten the fitting a final pass to **32 N·m (24 lb ft)**.

   Note: If a fuel leak accrues at the high pressure fuel pump or the fuel rail, that component will need to be replaced.

5. Inspect for leaks using the following procedure:
   1. Turn ON the ignition, with the engine OFF for 2 seconds.
   2. Turn OFF the ignition, for 10 seconds.
   3. Turn ON the ignition, with the engine OFF.
   4. Inspect for fuel leaks.
6. Install the low side fuel pressure service port cap.
7. Install the fuel tank cap.
8. Install the high pressure pump shield. Refer to Fuel Pipe Shield Replacement.
9. Install the fuel injection sight shield. Refer to Fuel Injector Sight Shield Replacement.



1. Position the EVAP hose to the fuel tank.
2. Install the chassis to canister EVAP hose to the following:
   - The body retainer (1)
   - The 3 retaining features (2) on the fuel tank
   - The retainer clip (3)
3. Install the fuel tank. Refer to Fuel Tank Replacement .
4. Install the rear frame. Refer to Rear Frame Replacement .
5. Lower the vehicle.

Filler Tube Replacement

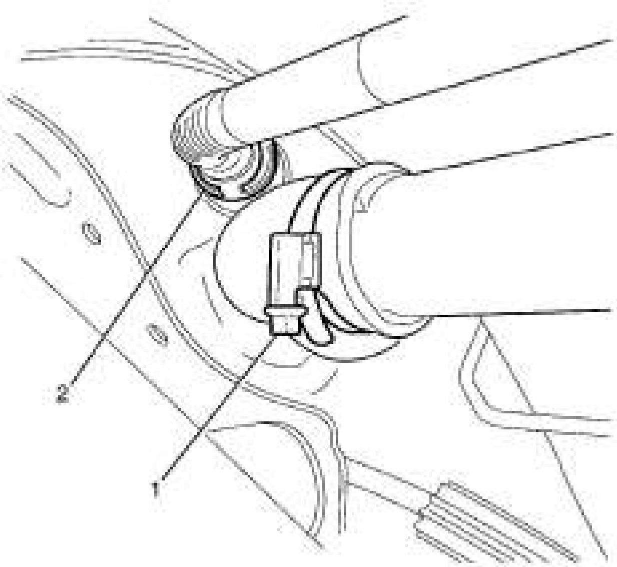
Removal Procedure

1. Remove the fuel filler cap.

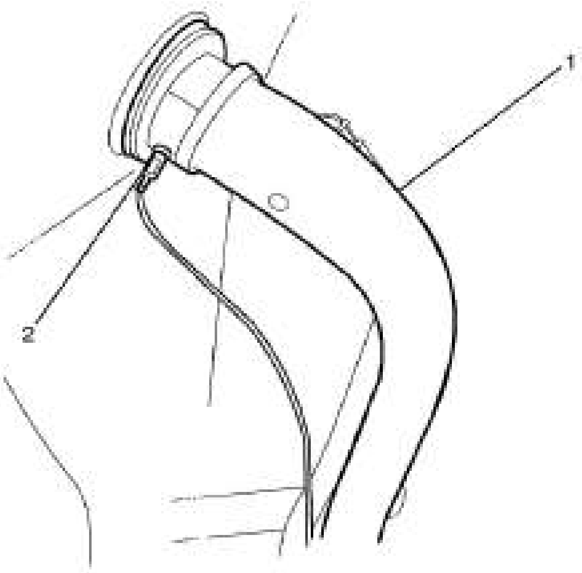
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

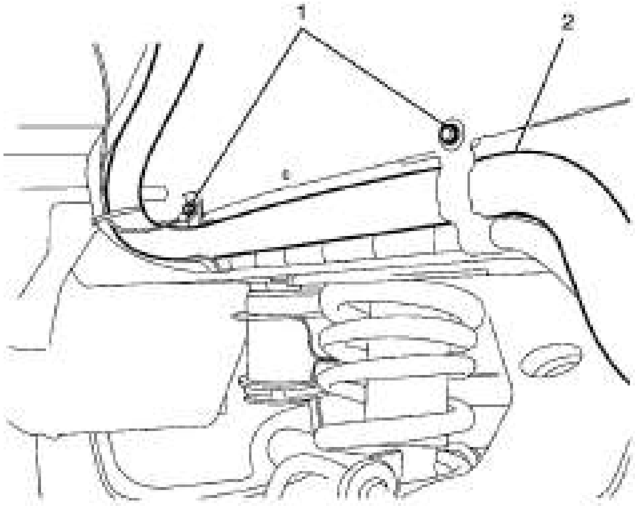
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Drain the fuel tank below the level of the fuel filler hose. Refer to Fuel Tank Draining .



4. Remove the right rear wheel. Refer to Tire and Wheel Removal and Installation .
5. Remove the Wheelhouse Liner Replacement - Rear. Refer to Rear Wheelhouse Panel Liner Replacement .
6. Remove the rear bumper fascia. Refer to Rear Bumper Fascia Replacement .
7. Disconnect the filler tube from the fuel tank (1).
8. Disconnect the evaporative emission (EVAP) line (2), by squeezing both sides of the line and pulling it toward the rear of the vehicle.



9. Remove rubber seal surround from the filler tube .
10. Remove the earth lead (2) from the filler tube (1).

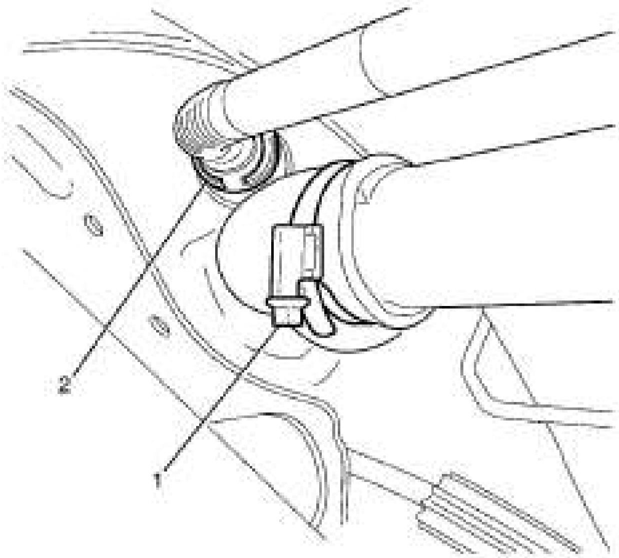


11. Remove the filer tube to chassis retaining bolts (1 from filler tube (2).
12. Remove the fuel filler tube from the vehicle (2).

Installation Procedure

1. Position the fuel filler tube to the vehicle.

Notice: Refer to Component Fastener Tightening Notice in the Preface section.

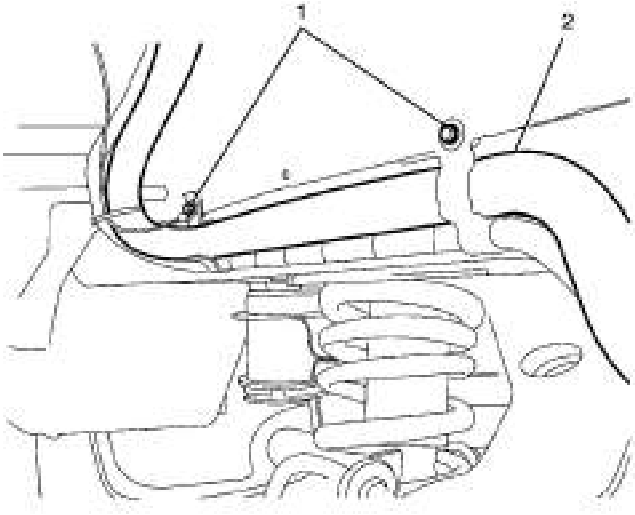


2. Connect the filler hose (1) to the fuel tank.

   Tighten
   Tighten the fuel filler tube hose clamp (3) to 3.5 N·m (31 lb in).

3. Install the evaporative emission (EVAP) line (2), listen for an audible click to confirm fitting.

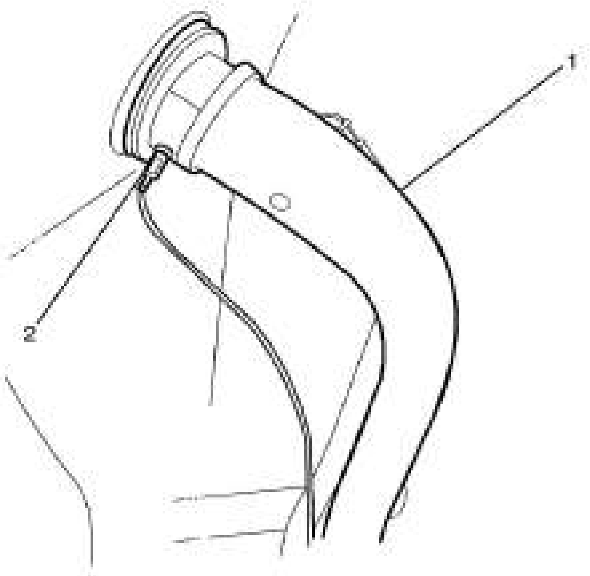
   Notice: Refer to Fastener Notice in the Preface section.



4. Install the fuel filler tube to chassis retaining bolts.

   Tighten

Tighten the bolts to 9 N·m (80 lb in).



5. Install rubber seal surround to the filler tube (1).
6. Install the earth lead to the filler tube (2).
7. Install the rear bumper fascia. Refer to Rear Bumper Fascia Replacement .
8. Install the Wheelhouse Liner Replacement - Rear. Refer to Rear Wheelhouse Panel Liner Replacement .
9. Lower the vehicle.
10. Add fuel to the fuel tank.
11. Inspect for fuel leaks.
12. Install the fuel filler cap.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2038741**

Fuel Filter Replacement (Petrol)

Removal Procedure - Up to xx/xx

The fuel filter is an integral part of the fuel pump assembly and must be replaced as an assembly. For replacement refer to Primary Fuel Tank Module Replacement.

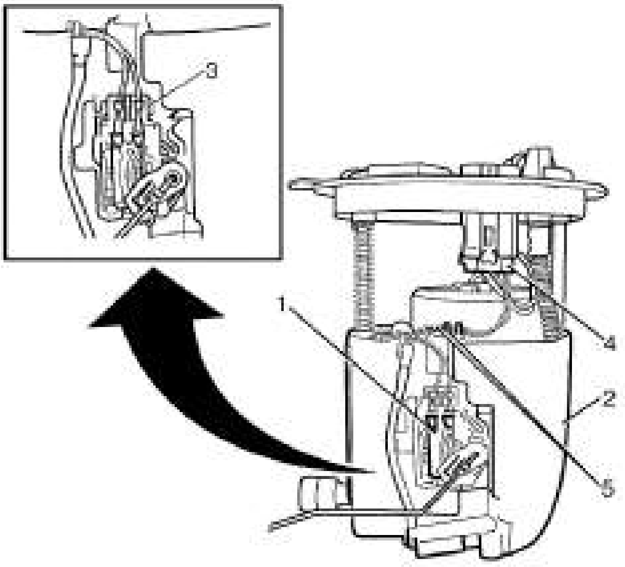
Removal Procedure - From xx/xx

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

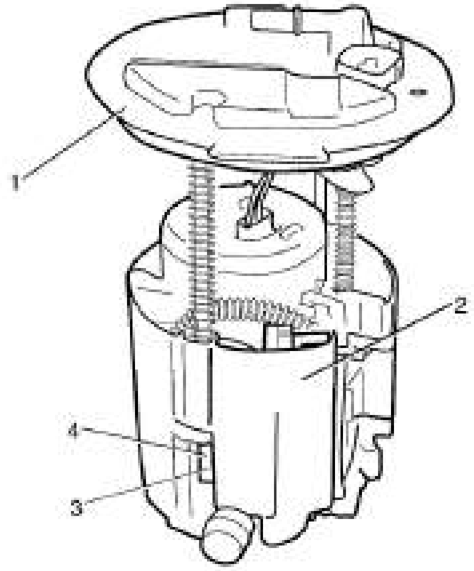
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

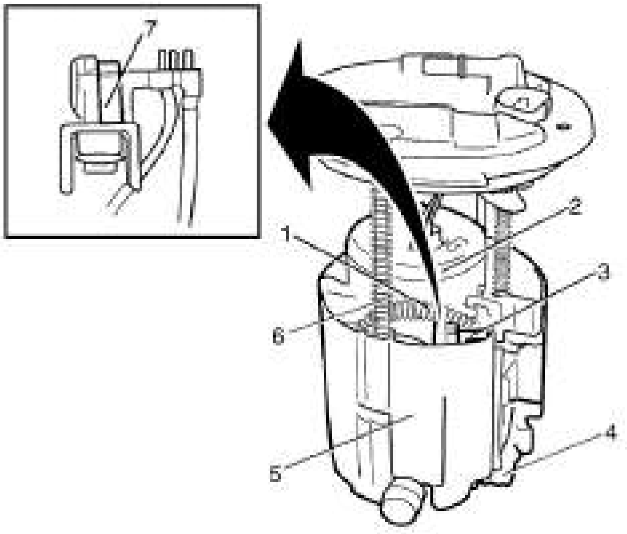
1. Remove the fuel tank. Refer to Fuel Tank Replacement.
2. Remove the primary fuel tank module assembly from the fuel tank. Refer to Primary Fuel Tank Module Replacement.



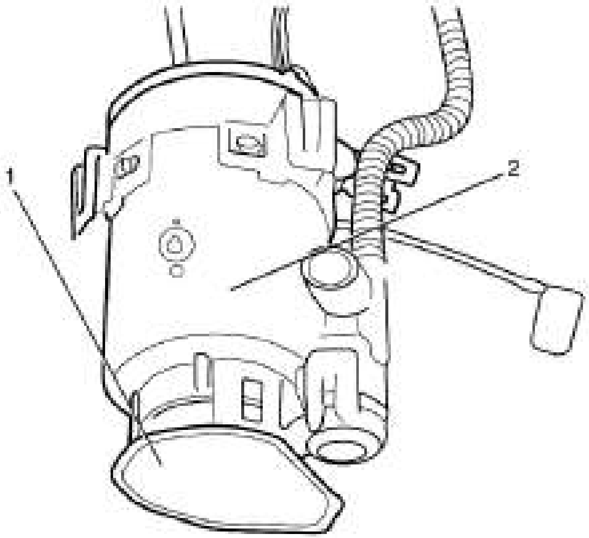
3. Disconnect the fuel level sensor connector (4) and unclip the wiring from the harness securing clips (5).
4. Unlock the locking clip (3) and gently push the fuel level sensor upwards.
5. Remove the fuel level sensor (1) from the lower half of the primary fuel tank module assembly (2).



6. Press down on the primary fuel tank module assembly upper half and remove the circlip (3) from the shaft (4).
7. Separate the upper halve (1) and lower halve (2) of the primary fuel tank module assembly.

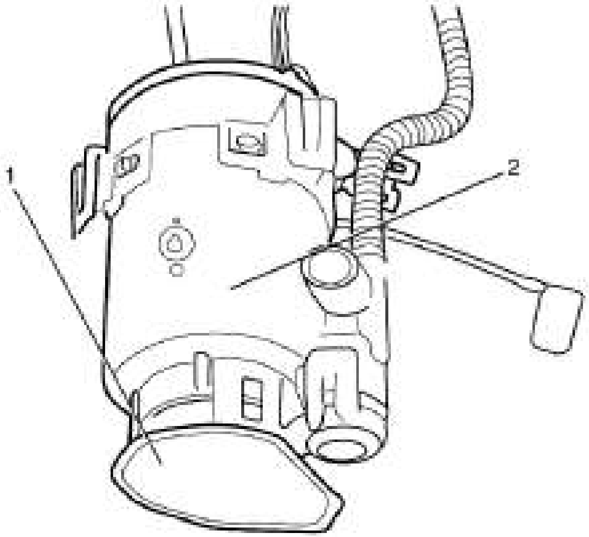


8. Remove the spring (6) from the primary fuel tank module assembly (5).
9. Unclip the piping (4) with a suitable tool.
10. Unclip the connector (7) with a suitable tool.
11. Make a note of the routing of the pipes (1) and (3).
12. Carefully remove the fuel pump housing (2) from the primary fuel tank module assembly (5).

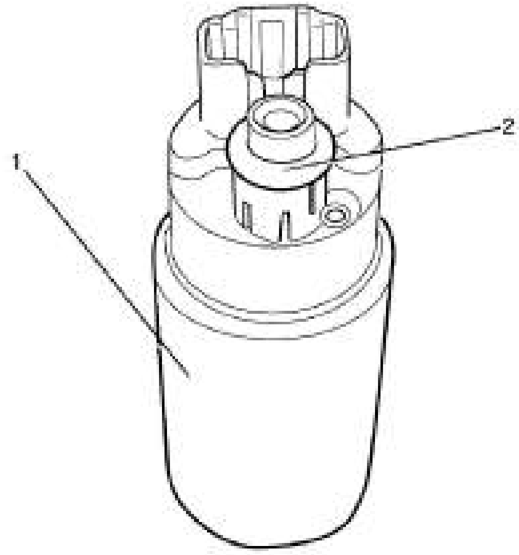


13. Carefully pry the fuel filter (2) from the fuel pump housing (3).

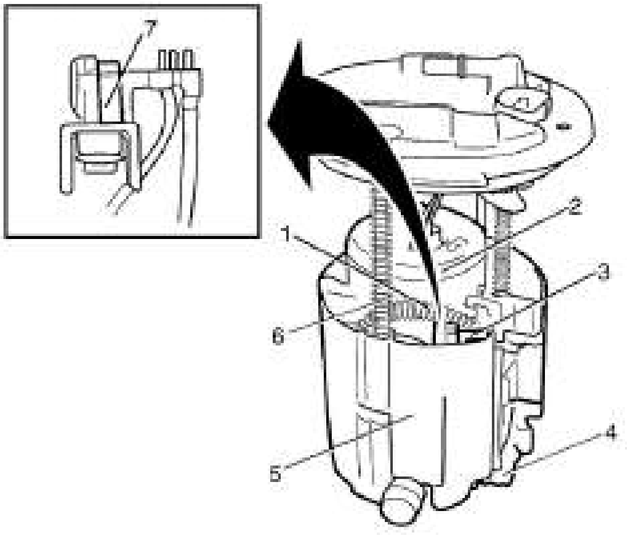
Installation Procedure - From xx/xx



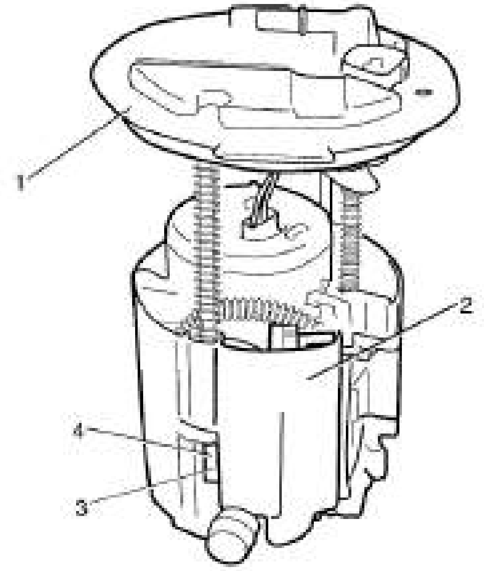
1. Locate and attach the fuel filter (1) to the fuel pump housing (3).



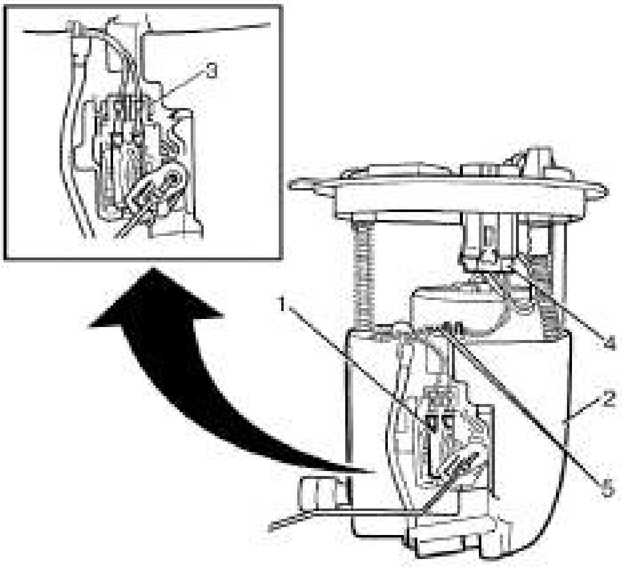
2. Fit a NEW O-ring seal (1) to the fuel outlet (2) and lubricate the NEW O-ring seal with an approved lubricant.



3. Route pipes (1) and (3) as noted earlier.
4. Press down on connector and listen for an audible click to confirm fitment.
5. Locate and install the fuel pump housing (2) into the primary fuel tank module assembly (5).
6. Locate and install the piping (4) to the primary fuel tank module assembly (5). Listen for audible click to confirm fitment.
7. Install the spring (6) to the fuel tank module assembly (5).



8. Assemble the primary fuel tank module assembly (1) and (2).
9. Press down on the primary fuel tank module assembly and install the circlip (3) to the shaft (4).



10. Locate and install the fuel tank level sensor (1) to the primary fuel tank module assembly (2). Make sure that the locking clip (3) engages.
11. Connect the fuel level sensor connector (4) and route the wiring through the harness securing clips (5).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1976138

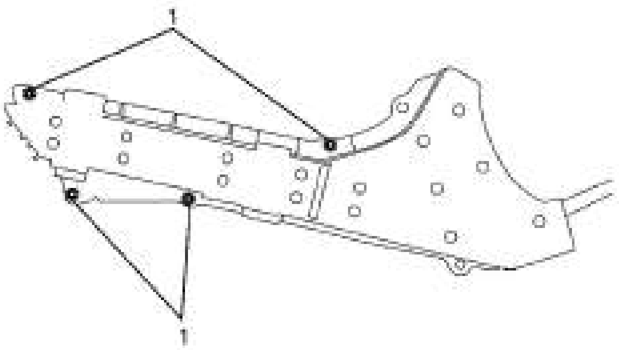
Fuel Hose/Pipes Replacement - Chassis

Removal Procedure

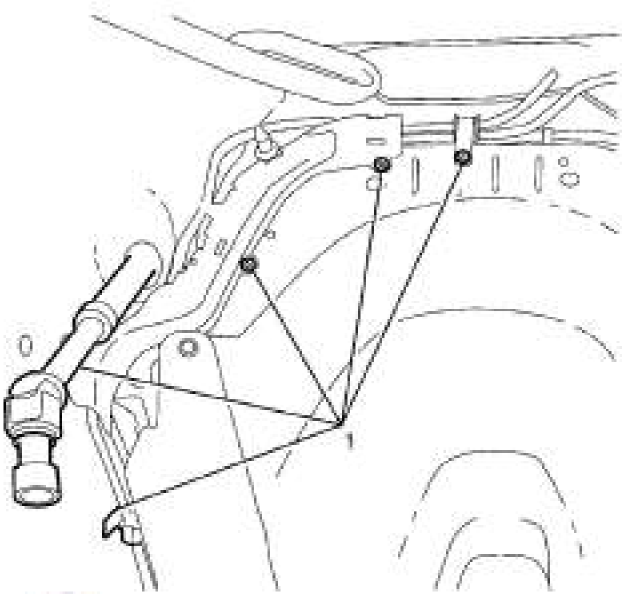
Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Important: The fuel system hose/pipes are serviceable individually or as a complete fuel/brake bundle assembly, the following procedure is servicing the fuel hose/pipes individually.

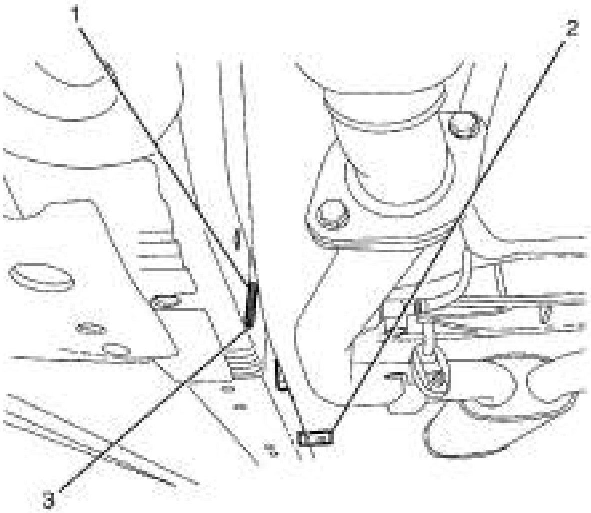
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Before you service any fuel system connection, relieve the fuel system pressure. Refer to the Fuel Pressure Relief .
3. Remove the exhaust and exhaust heat shields. Refer to Exhaust System Replacement
4. Remove the engine. Refer to Engine Replacement
5. Disconnect the fuel and EVAP lines at the fuel tank. Refer to Fuel Tank Replacement
6. Disconnect the fuel and evaporative emission (EVAP) lines at the engine compartment.



7. Remove the retaining bolts (1) and the retaining nuts (1) securing the rear stone guard.



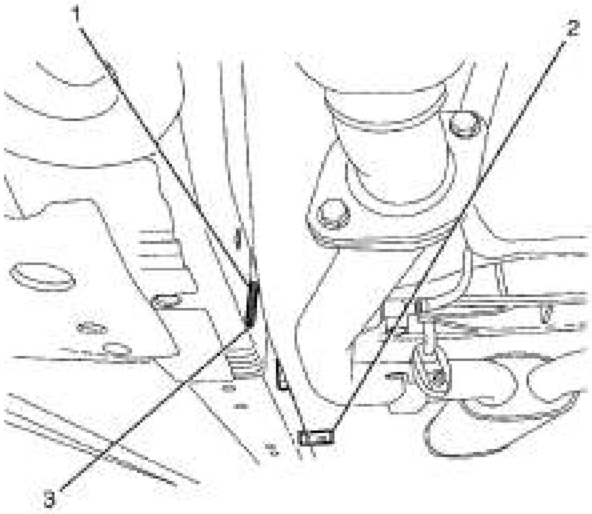
8. Remove all the fuel line bracket pop rivets securing the fuel and EVAP pipes to the vehicle body.



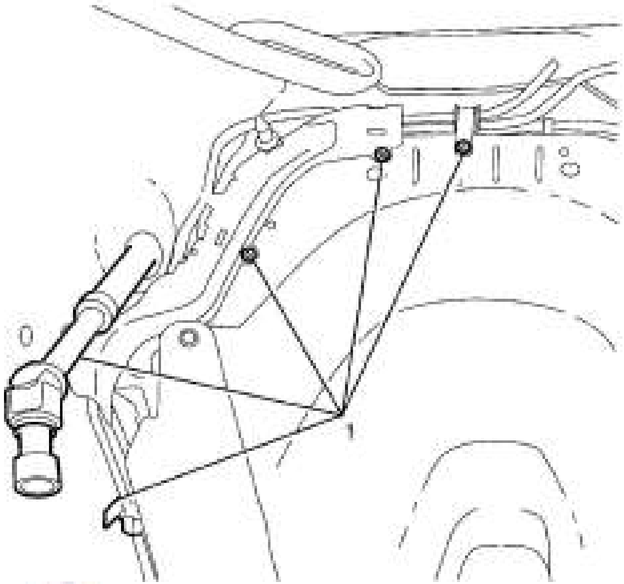
9. Remove all the fuel line bracket pop rivets securing the fuel and EVAP pipes to the body tunnel.
10. Remove the fuel and EVAP lines from the vehicle.

Installation Procedure

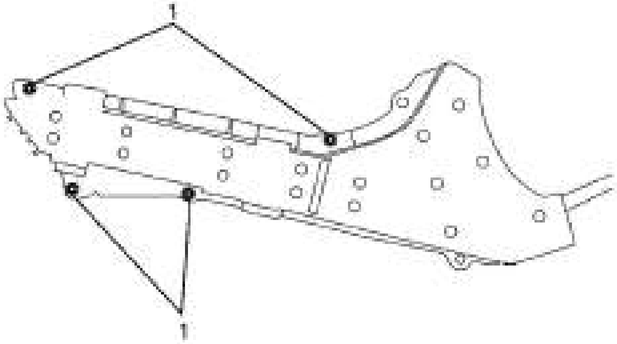
1. Install the fuel and EVAP lines to the vehicle.



2. Install all the fuel line bracket pop rivets securing the fuel and EVAP pipes to the body tunnel.



3. Install all the fuel line bracket pop rivets securing the fuel and EVAP pipes to the vehicle body.



4. Install the retaining bolts (1) and the retaining nuts (1) securing the rear stone guard.
5. Connect the fuel and evaporative emission (EVAP) lines at the engine compartment.
6. Connect the fuel and EVAP lines at the fuel tank. Refer to Fuel Tank Replacement .
7. Install the engine. Refer to Engine Replacement .
8. Install the exhaust and exhaust heat shields. Refer to Exhaust System Replacement .
9. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

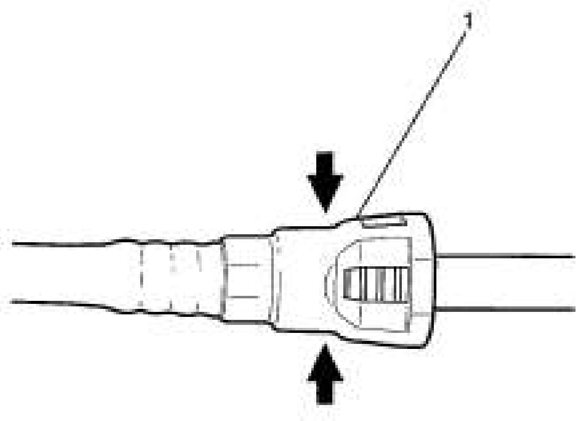
Fuel Injector and Fuel Rail Replacement

Removal Procedure

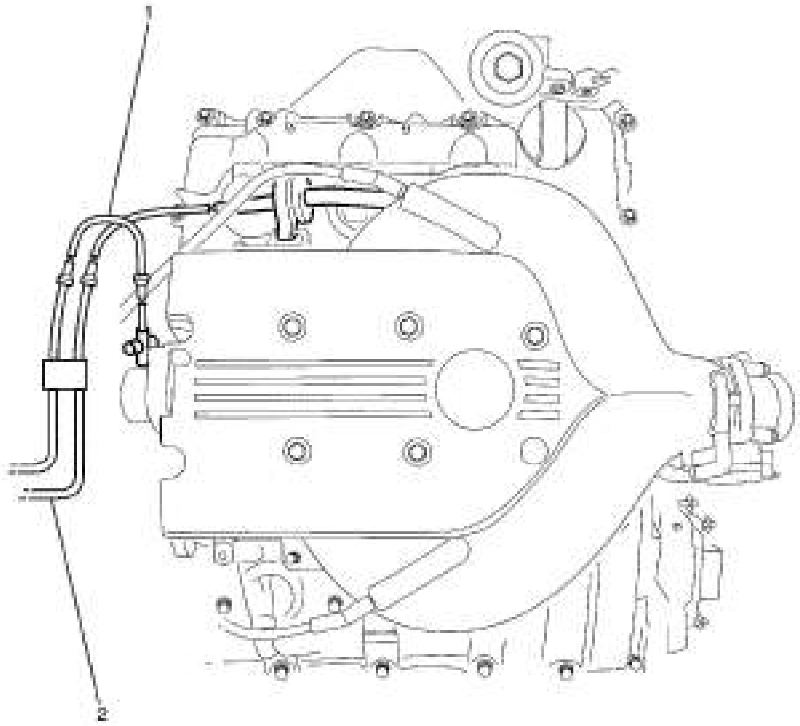
Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Relieve the fuel system pressure. Refer to Fuel Pressure Relief.
2. Remove the upper intake manifold with the lower intake manifold. Refer to Upper Intake Manifold Replacement



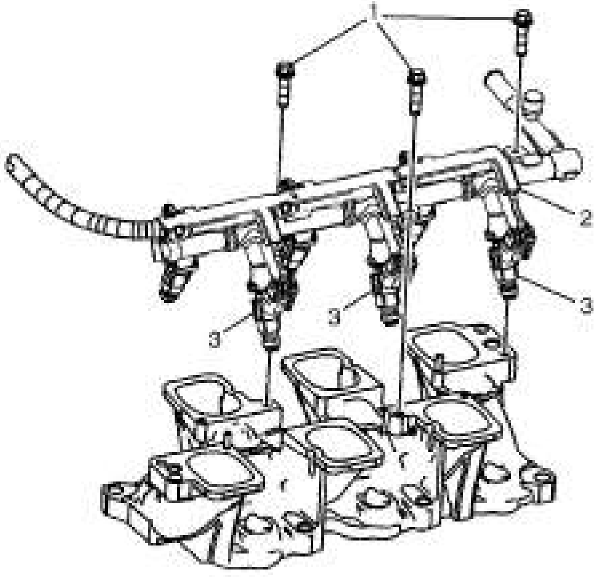
3. Remove the fuel pipe retaining clip (1).



4. Disconnect the fuel feed line pipe (2) from the fuel injector rail. Refer to Metal Collar Quick Connect Fitting Service.

   Caution: Refer to Safety Glasses and Compressed Air Caution in the Preface section.

5. Use compressed air in order to remove debris from the area where the fuel injectors enter the intake manifold.

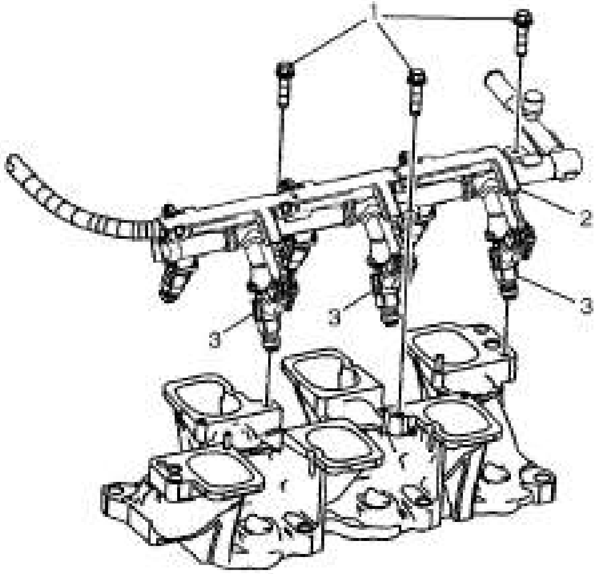


6. Remove the fuel rail to lower inlet manifold retaining bolts (1).

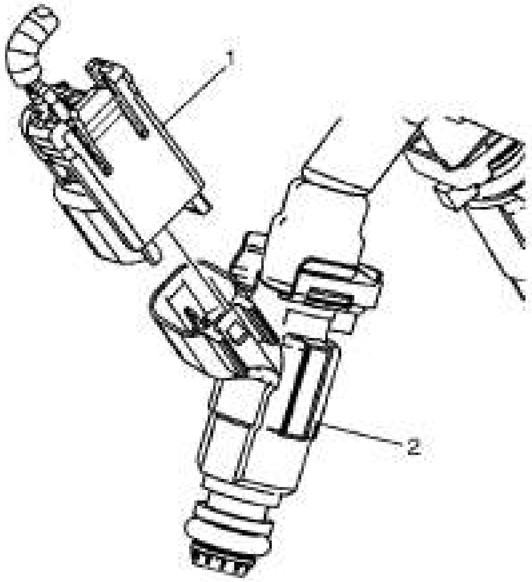
Notice:

- Remove the fuel rail assembly carefully in order to prevent damage to the injector electrical connector terminals and the injector spray tips. Support the fuel rail after the fuel rail is removed in order to avoid damaging the fuel rail components.
- Cap the fittings and plug the holes when servicing the fuel system in order to prevent dirt and other contaminants from entering open pipes and passages.

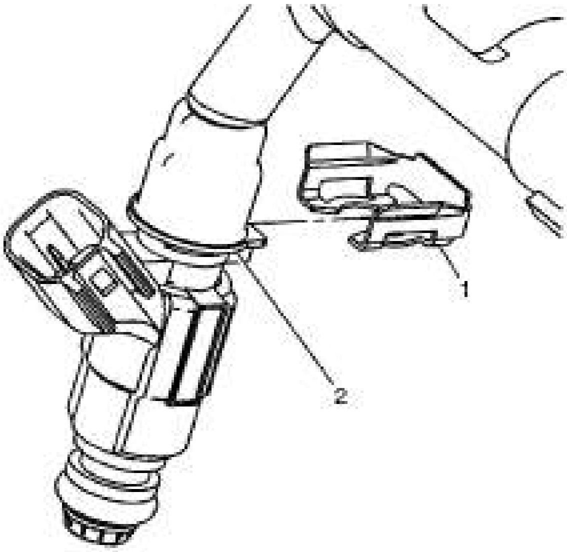
7. Remove the fuel rail (2) and the fuel injectors (3) from the manifold.



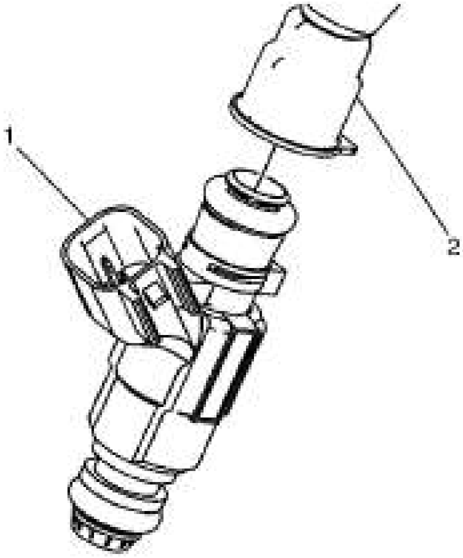
8. Disengage the fuel injector electrical connector lock (1).



9. Disconnect the fuel injector electrical connector (1) from the fuel injector (2).



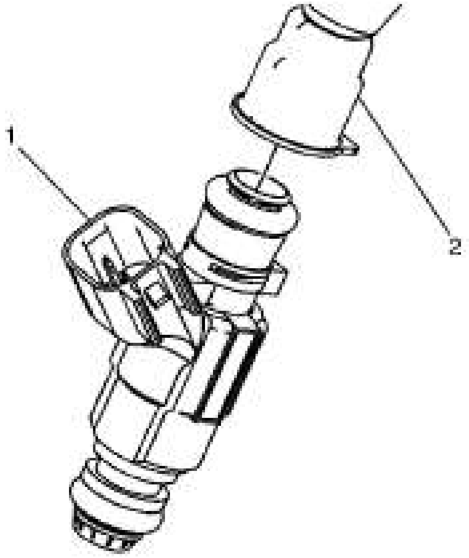
10. Remove the fuel injector retainer clip (1) from the fuel rail (2).



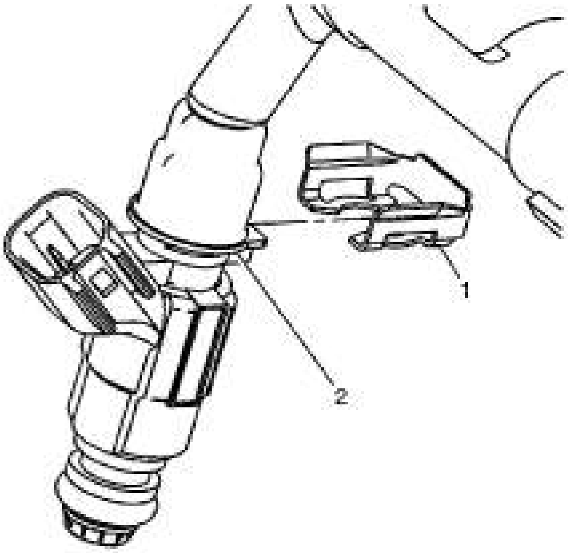
11. Remove the fuel injector (1) from the fuel rail (2).
12. Remove and discard the fuel injector seals.

Installation Procedure

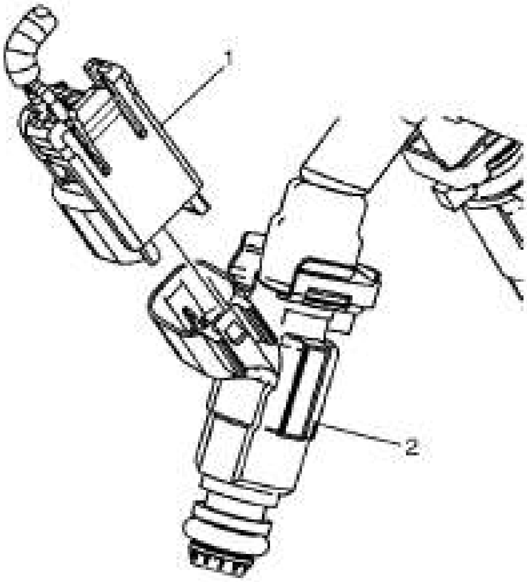
1. Install NEW fuel injector seals.



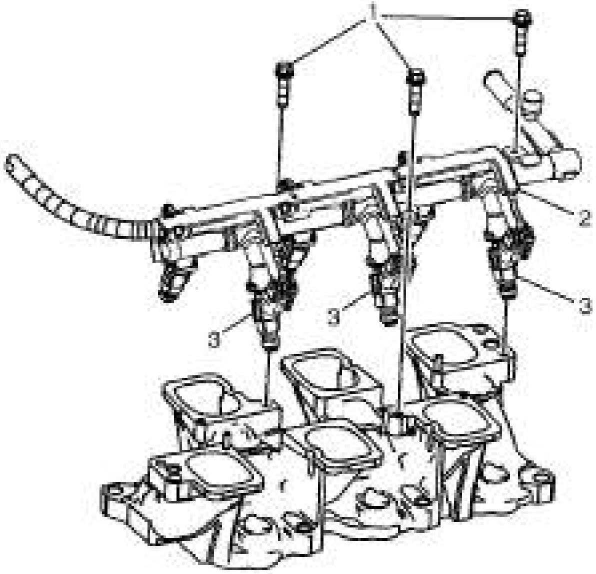
2. Install the fuel injector (1) to the fuel rail (2).



3. Install the fuel injector retainer clip (1) to the fuel rail (2).



4. Install the fuel injector electrical connector (1) to the fuel injector (2).
5. Engage the fuel injector electrical connector lock.

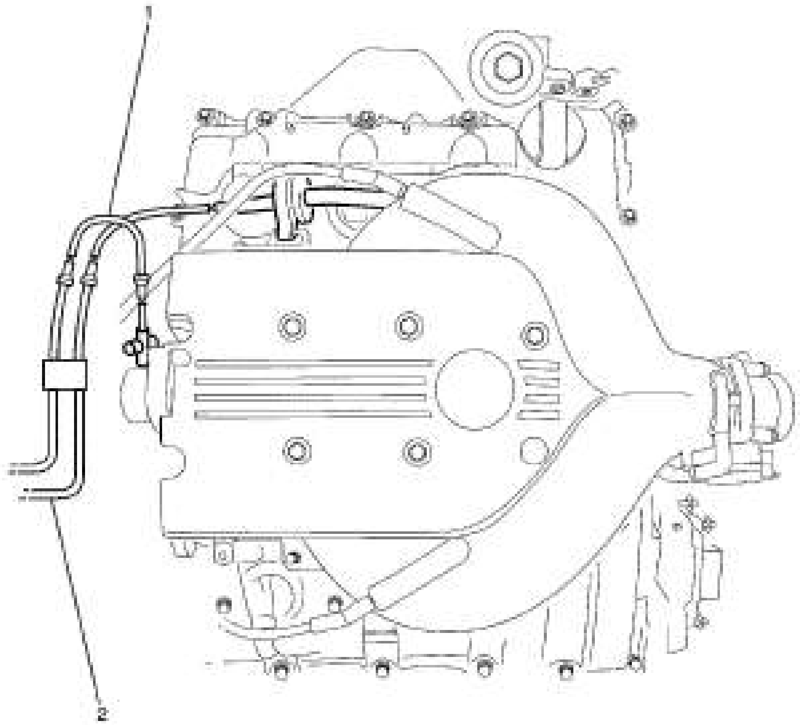


6. Install the fuel rail (2) with the fuel injectors (1) to the lower manifold.

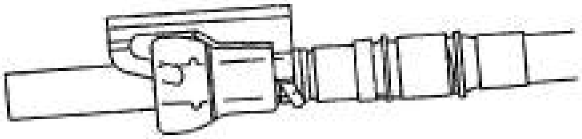
   Notice: Refer to Fastener Notice in the Preface section.

7. Install the fuel rail to lower manifold retaining bolts (1).

   Tighten
   Tighten the fuel rail bolts to 10 N·m (89 lb in).



8. Connect the fuel feed line (1) to the fuel rail. Refer to Metal Collar Quick Connect Fitting Service.



9. Install the fuel pipe retaining clip.
10. Install the upper intake manifold. Refer to Upper Intake Manifold Replacement

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2006682

Fuel Injector Replacement (LPG)

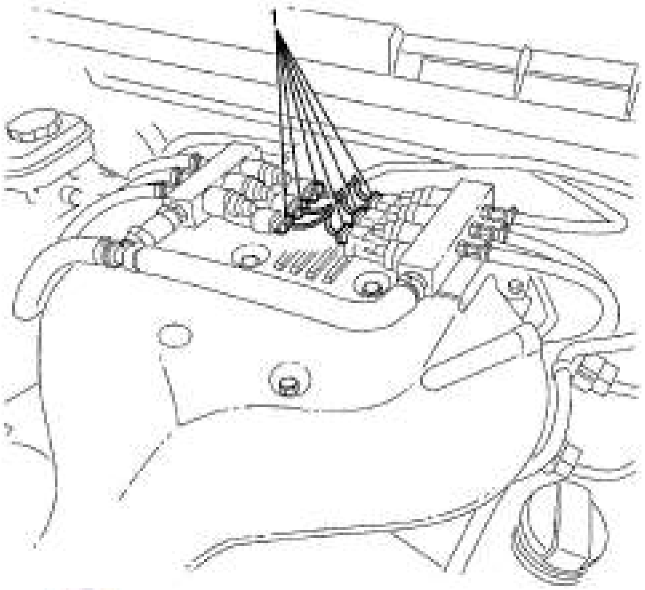
Removal Procedure

Caution: Refer to General Repair Instructions in the Preface section.

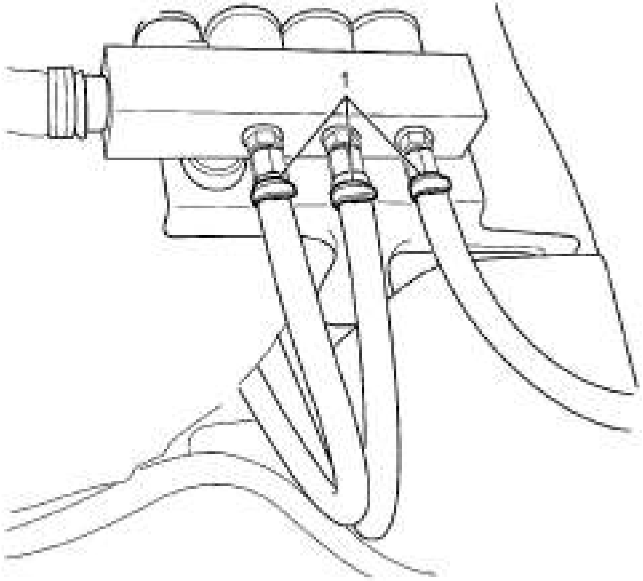
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Fuel Pressure Relief in the Preface section.

1. Relieve the fuel system pressure. Refer to Fuel Pressure Relief.



2. Disconnect the LPG injector electrical connectors (1).

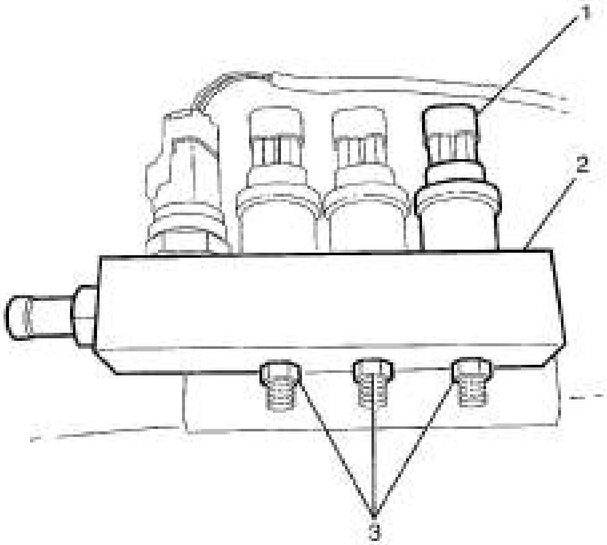


Important: The hose clamps (1) require special pliers to remove and fit.

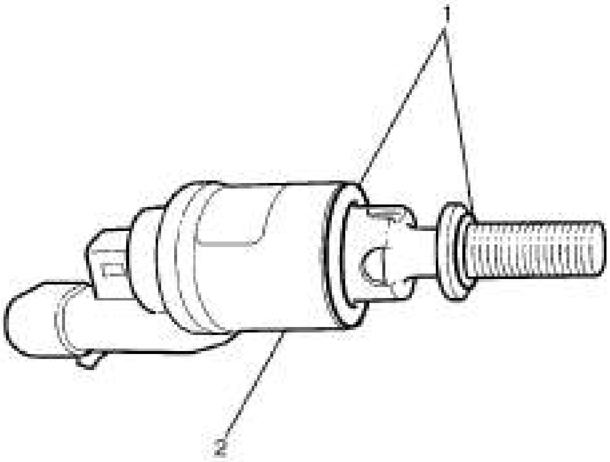
3. Remove the hose clamps (1) from the LPG injector hoses.

   Discard the clamps

4. Disconnect the LPG injector hoses from the fuel rail.



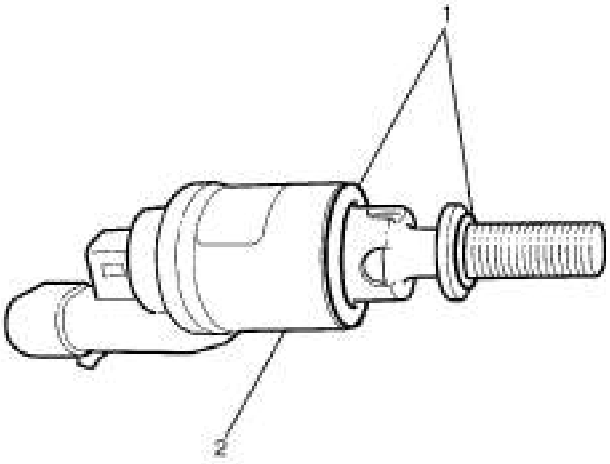
5. Remove the LPG injector to fuel rail retaining nuts (3).
6. Remove the LPG injectors (1) from the fuel rail (2).



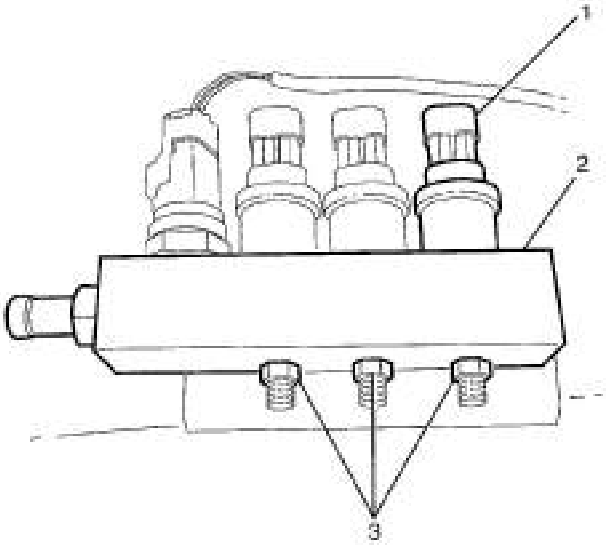
7. Remove the O-rings (1) from the LPG injector (2).

   Discard the O-rings.

Installation Procedure



1. Install the NEW O-rings (1) to the NEW LPG injector (2).

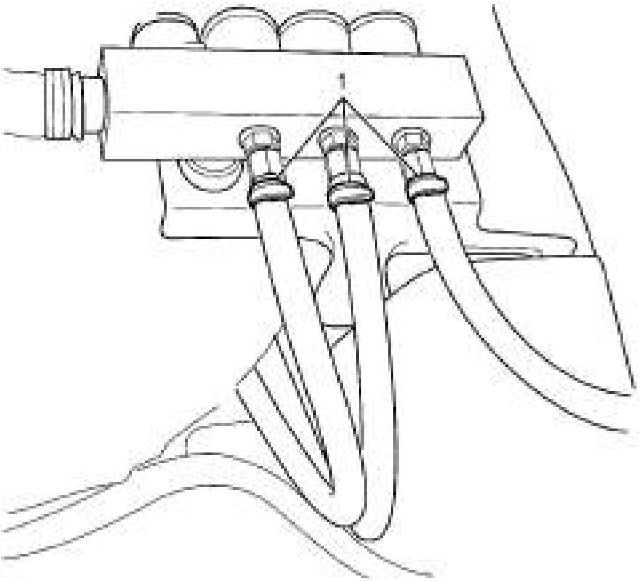


2. Position the NEW LPG injector (1) to the fuel rail (2).

   Notice: Refer to Fastener Notice in the Preface section.

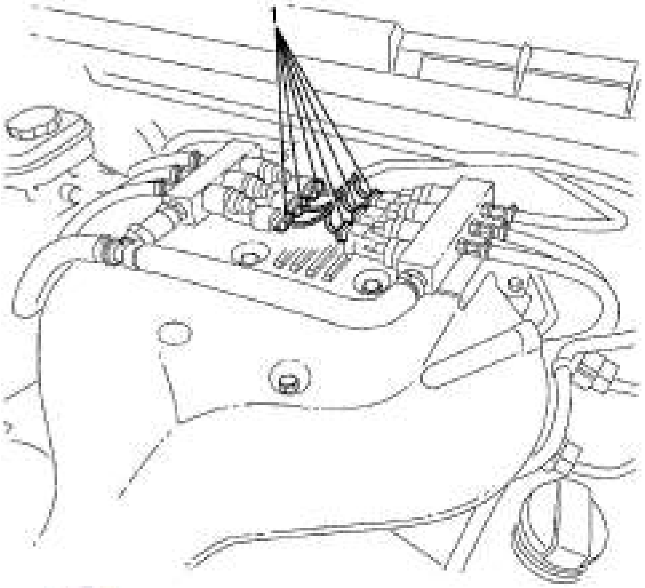
3. Install the NEW LPG injector to fuel rail retaining nuts (3).

   Tighten
   Tighten the nuts to 5 N·m (44 lb in).



Important: The hose clamps (1) require special pliers to remove and fit.

4. Secure the NEW LPG injector hose clamps (1).



5. Install the LPG injector electrical connectors (1).
6. Start the vehicle and inspect for LPG fuel leaks at the serviced fitting's using the combustible gas detector or an equivalent liquid leak detector.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2053073**

Fuel Level Sensor Replacement

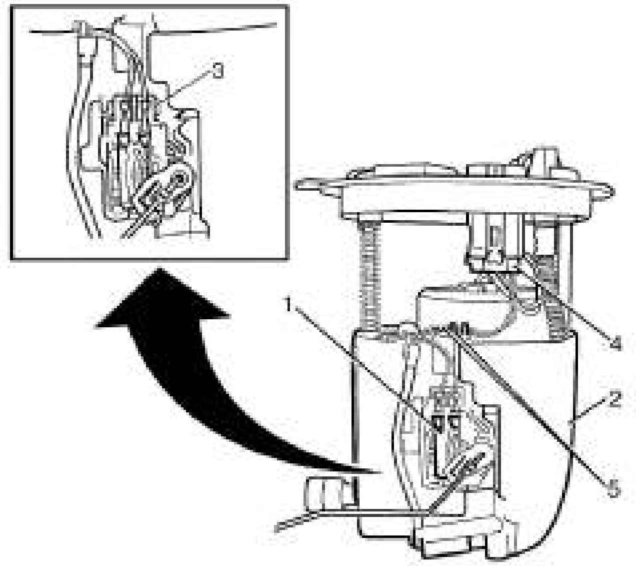
Removal Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

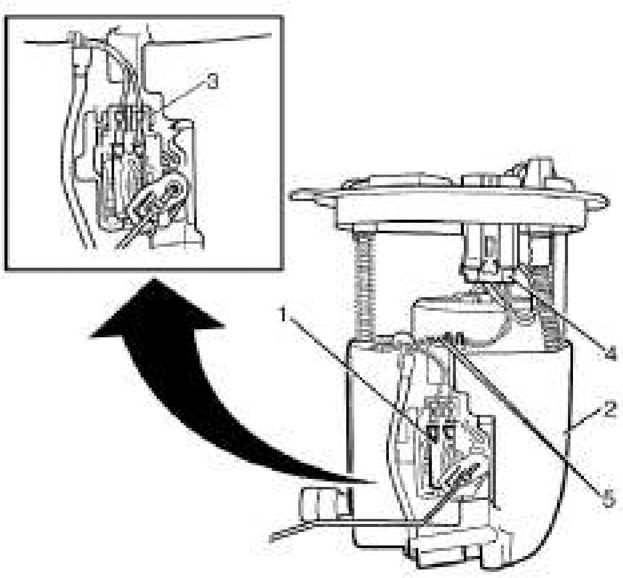
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the fuel tank. Refer to Fuel Tank Replacement .
2. Remove the primary fuel tank module assembly from the fuel tank. Refer to Primary Fuel Tank Module Replacement .



3. Disconnect the fuel level sensor connector (4) and unclip the wiring from the harness securing clips (5).
4. Remove the fuel level sensor from the primary fuel tank module assembly.
5. Unlock the locking clip (3) and gently push the fuel level sensor upwards.
6. Remove the fuel level sensor from the primary fuel tank module assembly.

Installation Procedure



1. Locate and install the fuel tank level sensor (1) to the primary fuel tank module assembly (2). Make sure that the locking clip (3) engages.
2. Connect the fuel level sensor connector (4) and route the wiring through the harness securing clips (5).
3. Install the fuel level sensor to the primary fuel tank module assembly.
4. Install the primary fuel tank module assembly to the fuel tank. Refer to Primary Fuel Tank Module Replacement .
5. Install the fuel tank. Refer to Fuel Tank Replacement .

Fuel Pressure Gage Installation and Removal

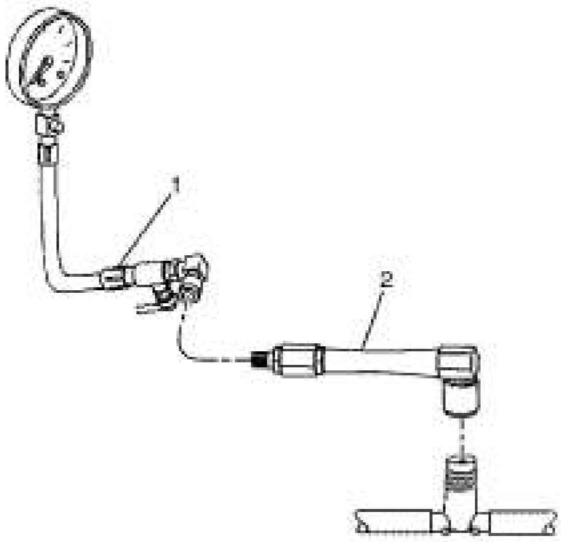
Tools Required

AU-338 Fuel Pressure Gauge

AU-465 Fuel Pressure Gauge Hose Adapter

Removal Procedure

1. Turn OFF the ignition.
2. Command the fuel pump OFF with the scan tool.
3. Open the bleed valve on the fuel pressure gauge in order to bleed the remaining fuel from the fuel pressure gauge.
4. Remove the bleed hose from the fuel pressure gauge.



5. Disconnect the AU-338 (2) fuel pressure gauge from the AU-465 (1). Wrap a shop towel around the fitting while connecting the gauge in order to avoid spillage.
6. Disconnect the AU-465 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the AU-465 (1) in order to avoid spillage.
7. Install the fuel pressure service connection dust cap to the fuel rail.
8. Install the engine covers. Refer to Engine Cover Replacement .

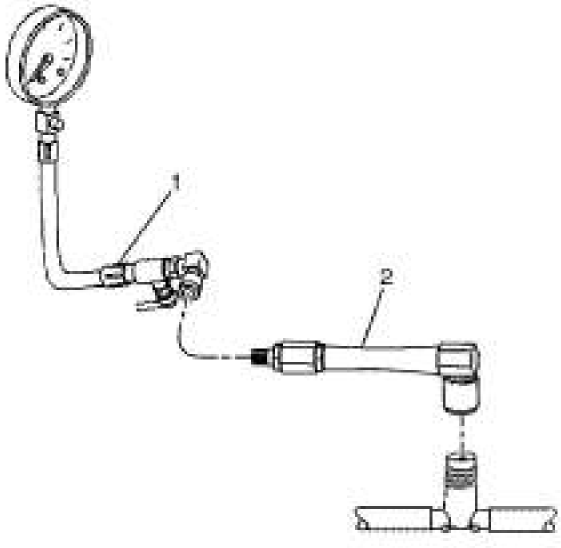
Installation Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Notice: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

1. Remove the engine covers. Refer to Engine Cover Replacement .



2. Remove the fuel pressure service connection dust cap from the fuel rail.
3. Connect the AU-465 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the AU-465 (1) in order to avoid spillage.
4. Connect the AU-338 (2) fuel pressure gauge to the AU-465 (1). Wrap a shop towel around the fitting while connecting the gauge in order to avoid spillage.
5. Turn ON the ignition.

Caution: Do not drain the fuel into an open container. Never store the fuel in an open container due to the possibility of a fire or an explosion.

6. Place the bleed hose of the fuel pressure gauge into a suitable container.
7. Open the bleed valve on the fuel pressure gauge in order to bleed the air from the fuel pressure gauge.
8. Command the fuel pump ON with a scan tool.
9. Close the bleed valve on the fuel pressure gauge.
10. Inspect for fuel leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1993365**

Fuel Pressure Relief (Petrol)

Tools Required

- J 34730-1A Fuel Pressure Gauge
- AU-453 Fuel Pressure Test Hose Adapter

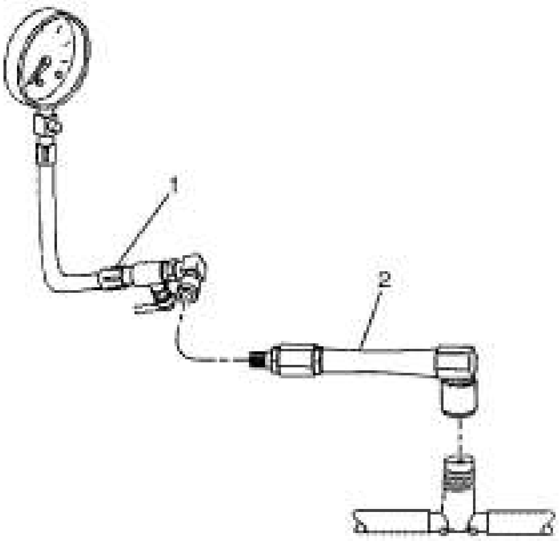
Caution: Gasoline or gasoline vapors are highly flammable. A fire could occur if an ignition source is present. Never drain or store gasoline or diesel fuel in an open container, due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.

Caution: Relieve the fuel system pressure before servicing fuel system components in order to reduce the risk of fire and personal injury.

After relieving the system pressure, a small amount of fuel may be released when servicing the fuel lines or connections. In order to reduce the chance of personal injury, cover the regulator and the fuel line fittings with a shop towel before disconnecting. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the ignition OFF.
2. Disconnect the negative battery cable in order to avoid possible fuel discharge if an accidental attempt is made to start the engine. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the fuel injector sight shield.



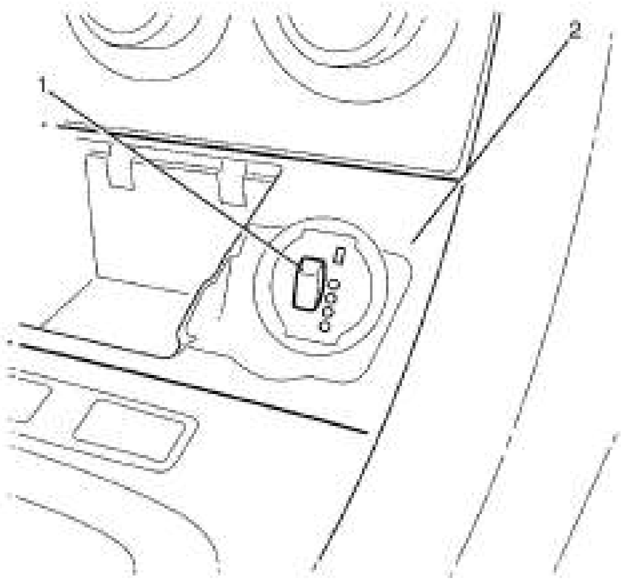
4. Connect the AU-453 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the AU-453 (1) in order to avoid spillage.
5. Connect the J 34730-1A (2) fuel pressure gauge to the AU-453 (1). Wrap a shop towel

around the fitting while connecting the gauge in order to avoid spillage.

6. Install the bleed hose into an approved container.
7. Open the valve in order to bleed the system pressure. Fuel connections are now safe for servicing.
8. Drain any fuel remaining in the gauge into an approved container.
9. Install the fuel injector sight shield.
10. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

Fuel Selector Switch Replacement

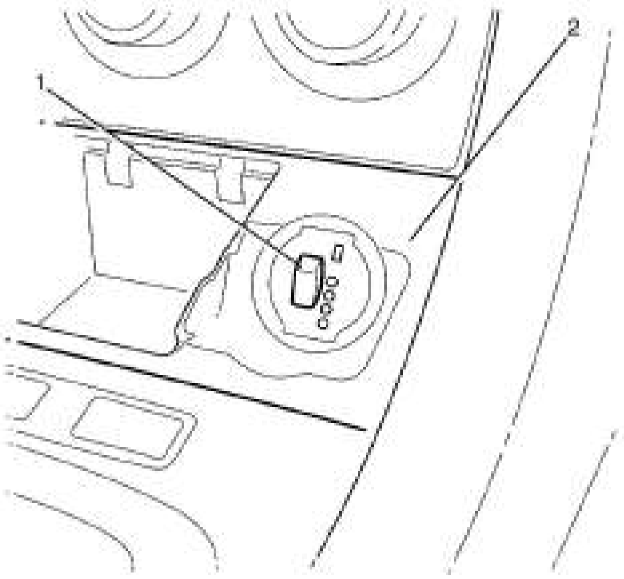
Removal Procedure



1. Remove the LPG switch/gauge (1) assembly from the panel (2).
2. Disconnect the LPG switch/gauge assembly electrical connector.
3. Remove the LPG switch/gauge (1) assembly from the vehicle.

Installation Procedure

1. Position the LPG switch/gauge assembly to the panel.
2. Connect the LPG switch/gauge assembly electrical connector.



3. Install the LPG switch/gauge assembly (1) to panel (2).

Fuel System Cleaning

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Important: The following procedure covers the disassembly and the inspection of the complete fuel supply system. If the fuel system is contaminated, the fuel system can be cleaned. You can usually determine the extent of the fuel system contamination during the disassembly.

1. Inspect the fuel system for contamination of the fuel lines if the lines are contaminated.
2. Remove the fuel module assemblies. Refer to Primary Fuel Tank Module Replacement and Secondary Fuel Tank Module Replacement .
3. Locate the tank in a suitable work area away from any heat, any flame, or any other source of ignition.
4. Perform the following procedures:
   - Inspect the fuel sender strainer. Replace the primary fuel tank module if the strainer is contaminated.
   - Inspect the secondary fuel tank module for debris. Clean the secondary fuel tank module if debris is found.

   Caution: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

   - Use compressed air in order to apply air pressure to the transfer tube.

Important: When flushing the fuel tank, handle the fuel and water mixture as a hazardous material. Handle the fuel and water in accordance with all applicable local, state, and federal laws and regulations.

5. Flush the fuel tank with running hot water for at least five minutes. Pour the water out of the fuel sender assembly opening. Rock the tank in order to make sure that the removal of the water from the tank is complete.
6. Refer to Metal Collar Quick Connect Fitting Service to disconnect the following quick connect fittings from the fuel rail:

   The feed hose/pipe

7. Use compressed air in order to apply air pressure to the fuel lines in the opposite direction from the normal fuel flow.
8. Remove the fuel injectors and fuel rail. Refer to Fuel Injector and Fuel Rail Replacement .
9. Clean and inspect the fuel injectors and fuel rail.

Installation Procedure

1. Assemble the fuel system as follows:

   Install the fuel injectors and fuel rail. Refer to Fuel Injector and Fuel Rail Replacement .

2. Install the fuel module assemblies. Refer to Primary Fuel Tank Module Replacement and

Secondary Fuel Tank Module Replacement .

3. Refer to Metal Collar Quick Connect Fitting Service to connect the following quick connect fittings to the fuel rail:

   The feed hose/pipe

Fuel Tank Draining

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

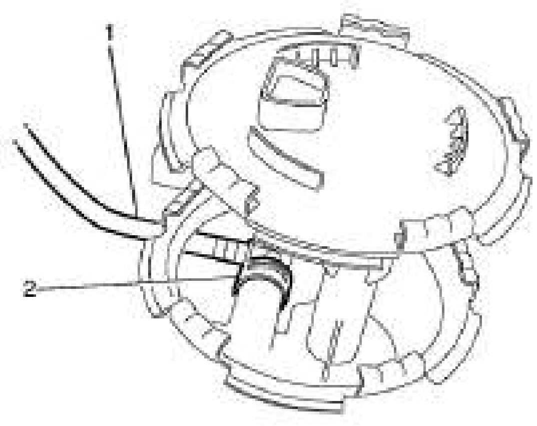
Caution: Never drain or store fuel in an open container. Always use an approved fuel storage container in order to reduce the chance of fire or explosion.

Caution: Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.

1. Remove the fuel filler cap.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



3. Disconnect the fuel feed line (1) from the fuel feed pipe (2). Refer to Plastic Collar Quick Connect Fitting Service .

   Important: Up to 26 Litres (7 gallons) of residual fuel may remain in the secondary side of the fuel tank.

4. Connect a commercially available fuel pump to the fuel feed line (1).
5. Operate the commercially available fuel pump and drain the fuel into an approved fuel container.
6. Disconnect the commercially available fuel pump from the fuel feed line (1).
7. If the tank is not being removed, connect the fuel feed line (1) to the fuel feed pipe (2). Refer to Plastic Collar Quick Connect Fitting Service .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1996241**

Fuel Tank Replacement (LWB SWB)

Removal Procedure

Tools Required

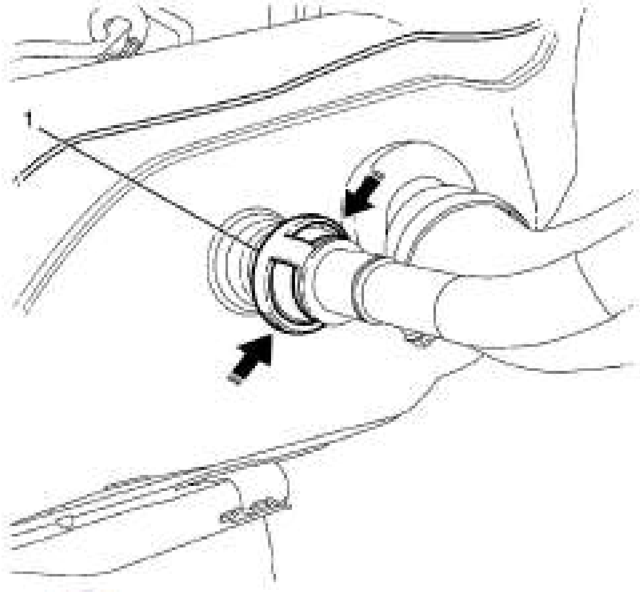
EN-48536 Frame Support Tool (Engine Lower 65 mm Kit)

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

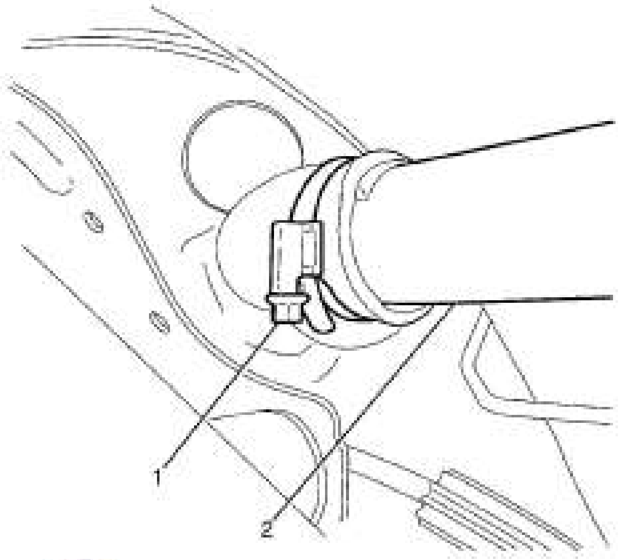
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

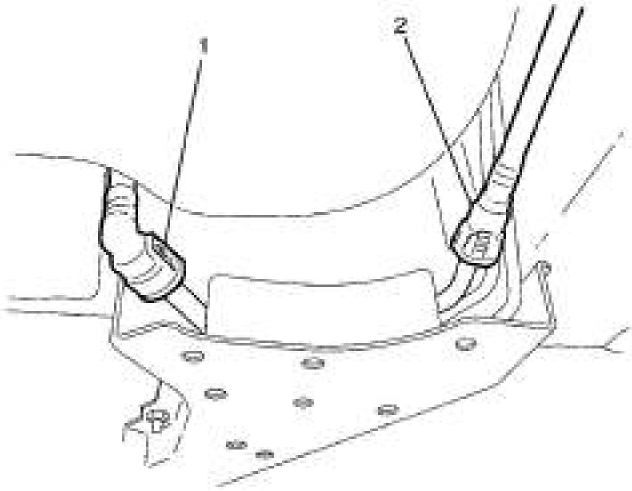
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Drain the fuel tank. Refer to Fuel Tank Draining .
3. Relieve the fuel system pressure. Refer to Fuel Pressure Relief .
4. Remove the exhaust system. Refer to Exhaust System Replacement .
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
6. Remove the right rear wheel. Refer to Tire and Wheel Removal and Installation .



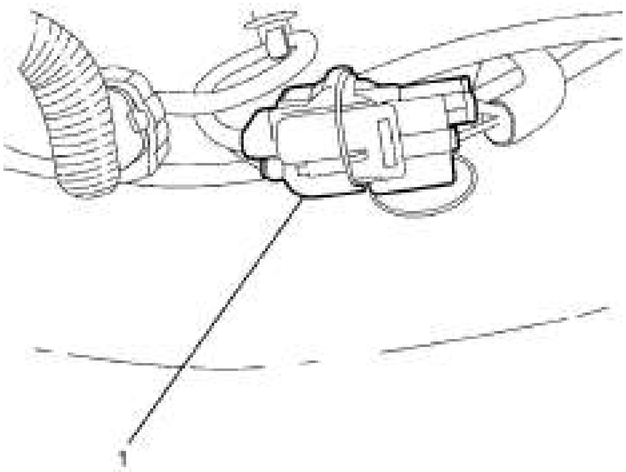
7. Disconnect the evaporative emission (EVAP) line (1), by squeezing both sides of the line (as indicated in the illustration) and pulling it toward the rear of the vehicle.



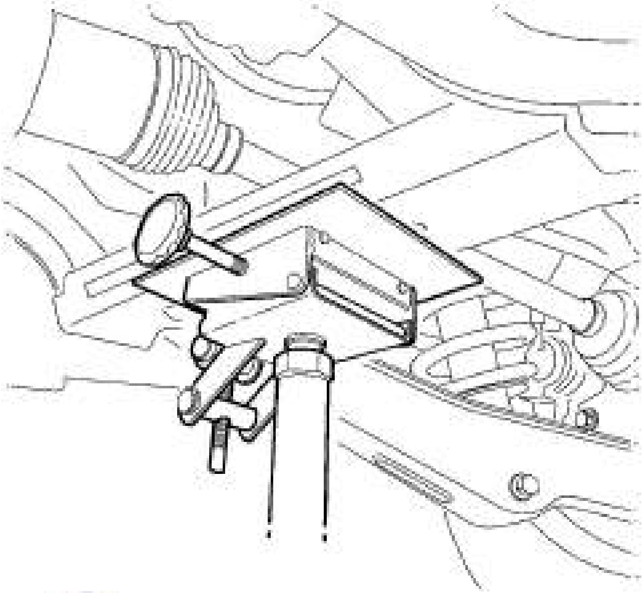
8. Release the worm drive hose clamp (1) and remove the filler tube (2).



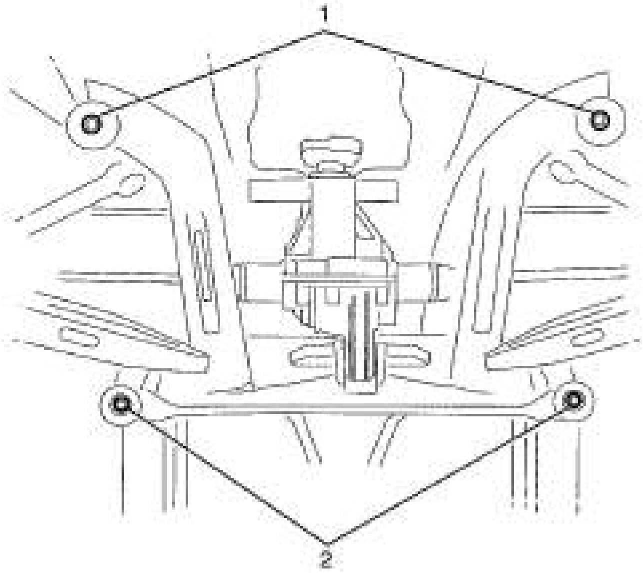
9. Disconnect the fuel feed line (1) and evaporative emission (EVAP) line (2). Refer to Plastic Collar Quick Connect Fitting Service .



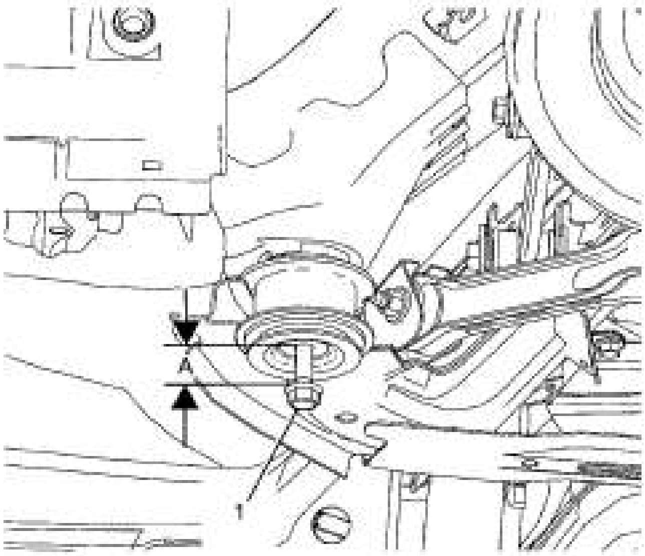
10. Disconnect the fuel tank electrical connector (1).



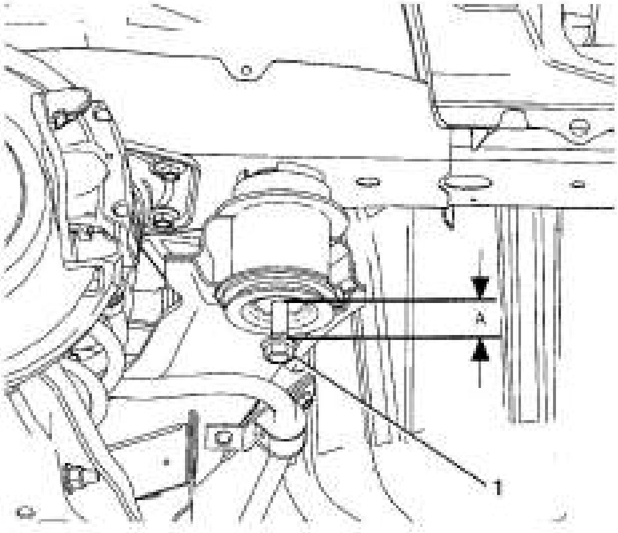
11. Support the rear frame assembly using a suitable tool.



12. Remove the rear frame to chassis retaining bolts (1) and (2) and discard.

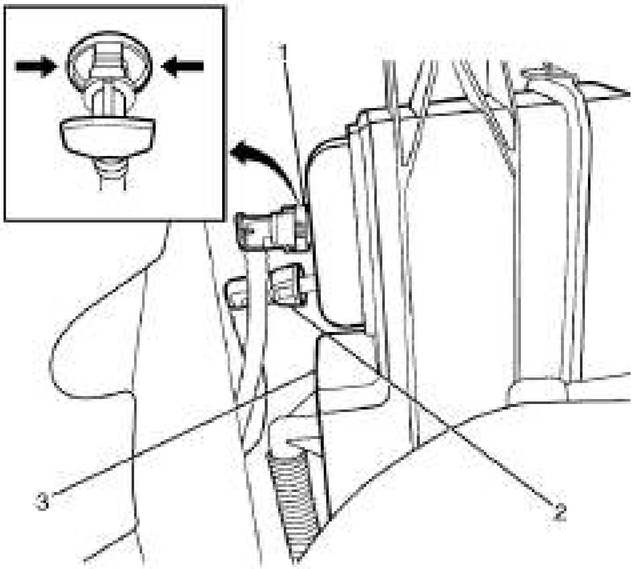


13. Support the rear frame using the bolt (1) from the EN-48536 special tool kit . Repeat for the opposite side.



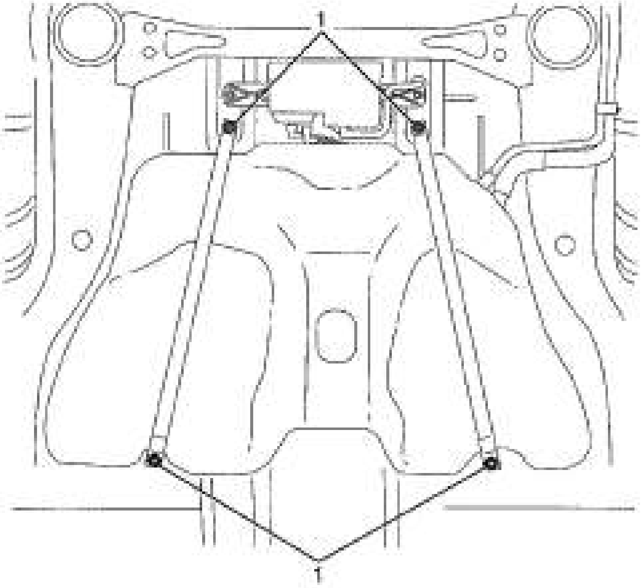
Important: When lowering the rear frame use care not to over extend the rear brake hoses.

14. Support the rear frame using the bolt (1) from the EN-48536 special tool kit . Repeat for the opposite side.
15. Lower the rear frame approximately 50 millimetre's (2 in) (A) at the rear mounting surface between the rear frame and the chassis.
16. This will allow clearance to access the fuel tank strap bolts.
17. Remove the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement .
18. Disconnect the park brake rear cables from the park brake front cable equalizer bracket assembly. Refer to Parking Brake Front Cable Replacement .



19. Disconnect the evapouritive emission line (2) from the evapourative emission canister (3).

Refer to Plastic Collar Quick Connect Fitting Service .



20. Remove the fuel tank strap to chassis retaining bolts (1).
21. Position the fuel tank straps away from the fuel tank.
22. Carefully bend the fuel tank straps enough to allow the fuel tank to be removed.

Important: Make sure the following are free from the surrounding components while lowering the fuel tank:

- The fuel tank wiring harness.
- The fuel hoses at the chassis pipes.

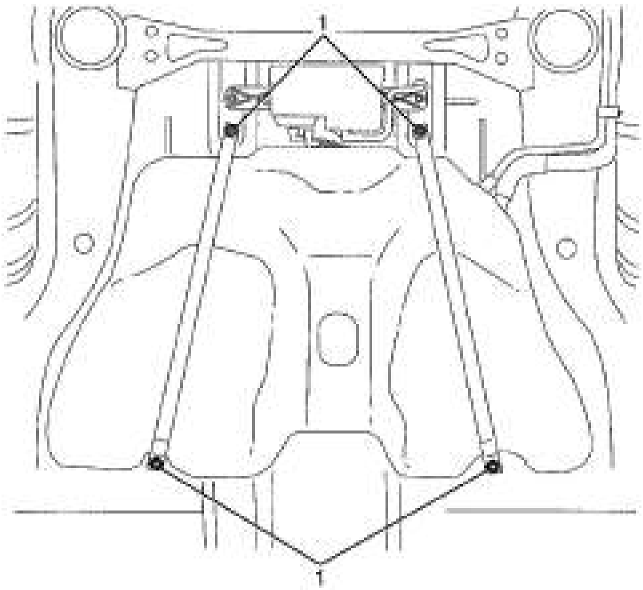
23. With the aid of an assistant, carefully lower the fuel tank from the vehicle.
24. Remove the following components if replacing just the fuel tank.
    - The primary fuel tank module - Refer to Primary Fuel Tank Module Replacement .
    - The secondary fuel tank module - Refer to Secondary Fuel Tank Module Replacement .

Installation Procedure

1. Install the following components if fuel tank replacement was necessary.
    - The primary fuel tank module--Refer to Primary Fuel Tank Module Replacement .
    - The secondary fuel tank module--Refer to Secondary Fuel Tank Module Replacement .

Important: Make sure the following are properly routed while raising the fuel tank:

- The fuel tank wiring harness.
- The fuel hoses at the chassis pipes.



2. With the aid of an assistant, carefully raise the fuel tank to the vehicle.

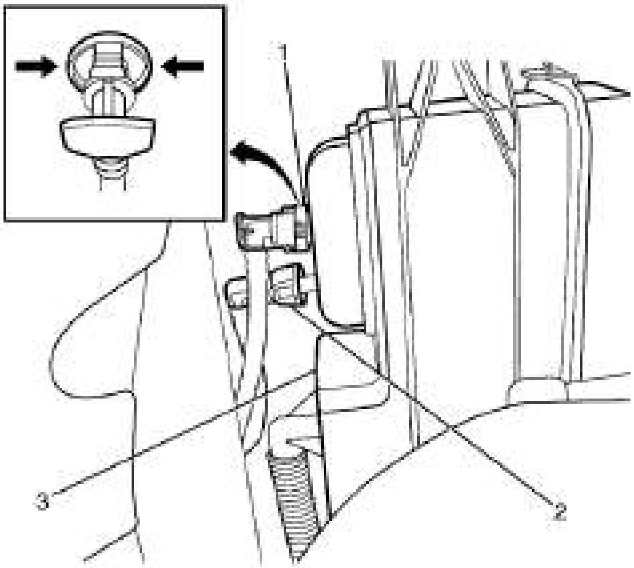
   Important: Make sure the fuel tank straps are not pressed into the fuel tank.

3. Carefully install the fuel tank straps back to their original form.
4. Position the fuel tank straps around the rear frame and upward into position, aligning the holes in the straps with the threaded holes in the chassis.

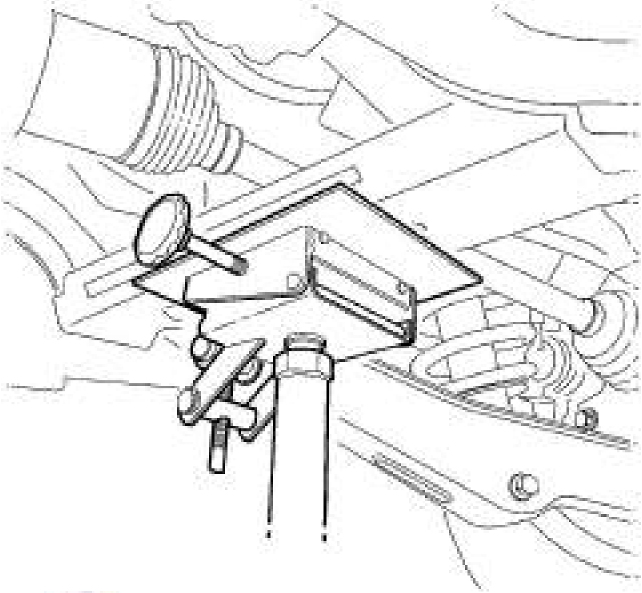
   Notice: Refer to Fastener Notice in the Preface section.

5. Install the fuel tank strap bolts.

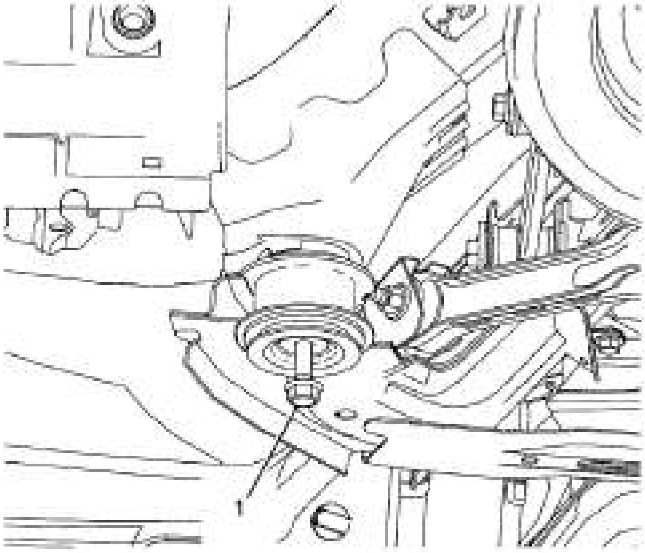
   Tighten
   Tighten the fuel tank strap bolts to 20 N·m (15 lb ft).



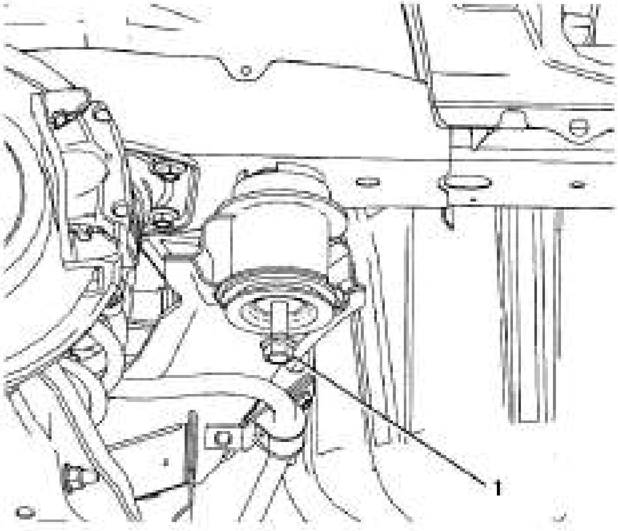
6. Connect the evapourative emission line (2) to the evapourative emission canister (3). Refer to Plastic Collar Quick Connect Fitting Service .



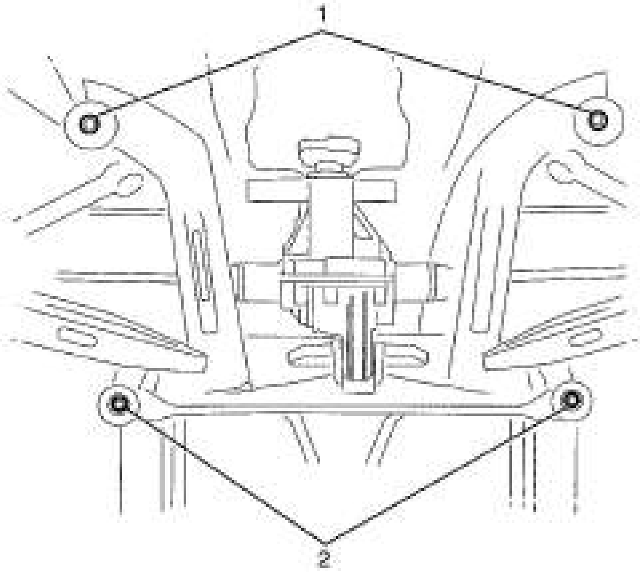
7. Raise the rear frame assembly using suitable tool.



8. Remove the special tool EN-48536 bolt (1) from the rear frame. Repeat for the opposite side.



9. Remove the special tool EN-48536 bolt (1) from the rear frame. Repeat for the opposite side.
10. Using a suitable tool clean the threaded holes in the rear chassis.



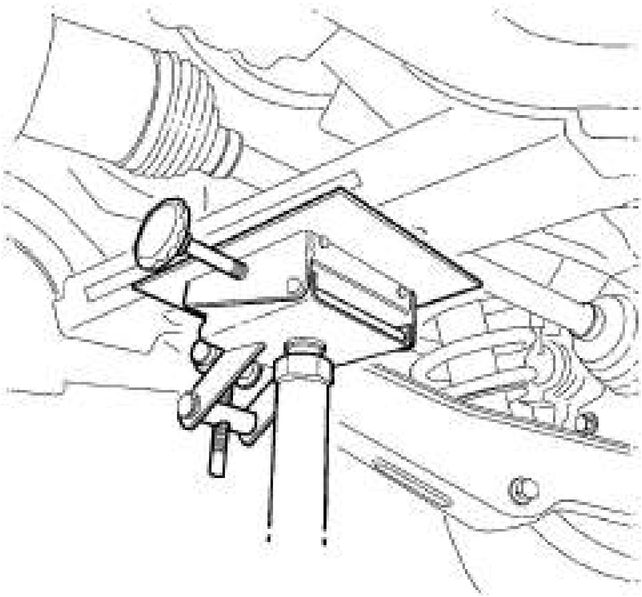
Important: Rear frame retaining bolts must not to be fully tightened at this stage.

11. Install the NEW rear frame to chassis retaining bolts (2).

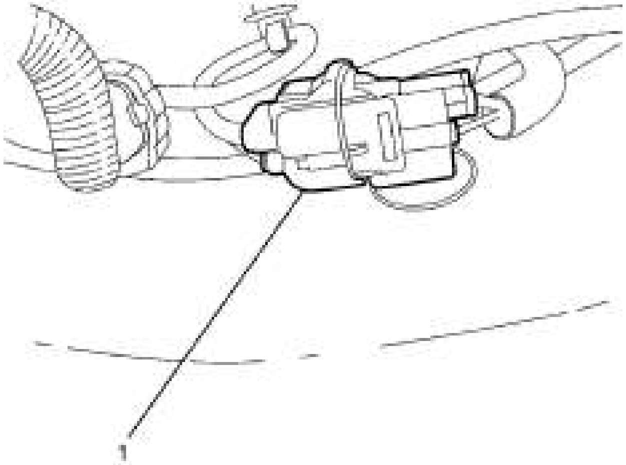
    Do not fully tighten at this stage.

12. After retaining bolts (1 and 2) are installed tighten to.

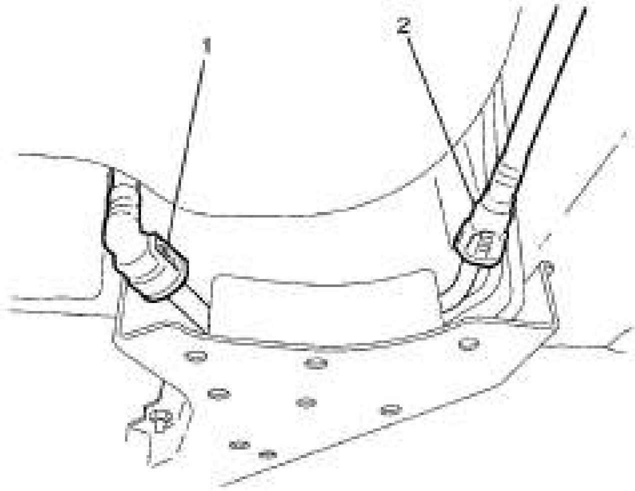
    Tighten
    - First Pass: Tighten the bolts to 65 N·m (48 lb ft)
    - Final Pass: Tighten the bolts a further 125 degrees.



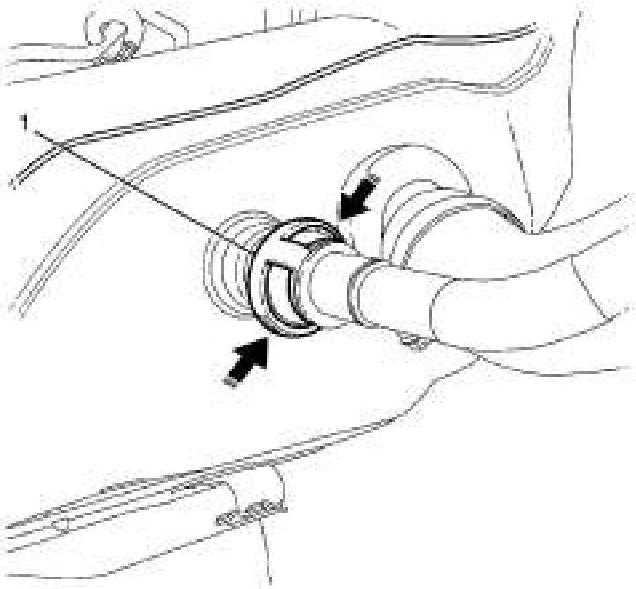
13. Remove the support tool.



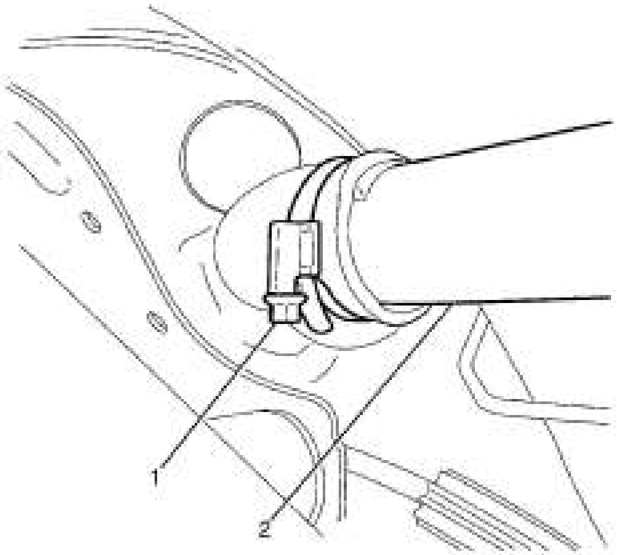
14. Connect the fuel tank electrical connector (1).



15. Refer to Plastic Collar Quick Connect Fitting Service , in order to connect the following to the chassis bundle:
    - The fuel feed line
    - The fuel EVAP hose



16. Install the evaporative emission (EVAP) line (1), listen for an audible click to confirm fitting.



17. Connect the filler hose (2) to the fuel tank.

    Tighten
    Tighten the fuel filler tube hose clamp (1) to 4 N·m (35 lb in).

18. Connect the park brake rear cables to the park brake front cable equalizer bracket assembly. Refer to Parking Brake Front Cable Replacement .
19. Install the propeller shaft. Refer to Propeller Shaft Replacement .
20. Install the exhaust system. Refer to Exhaust System Replacement .
21. Install the right rear wheel. Refer to Tire and Wheel Removal and Installation .
22. Refill the fuel tank.
23. Inspect for fuel leaks.

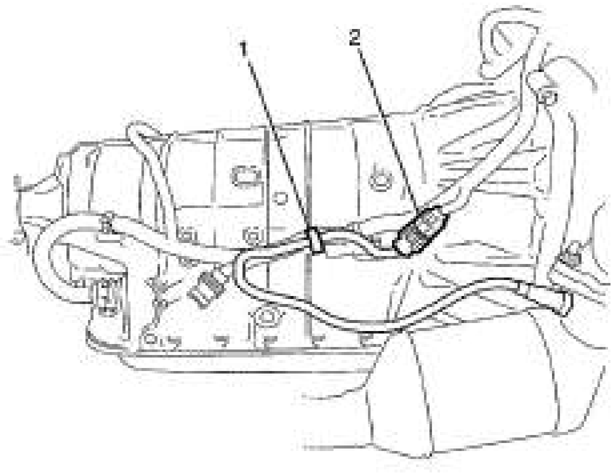
Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 (NT3)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

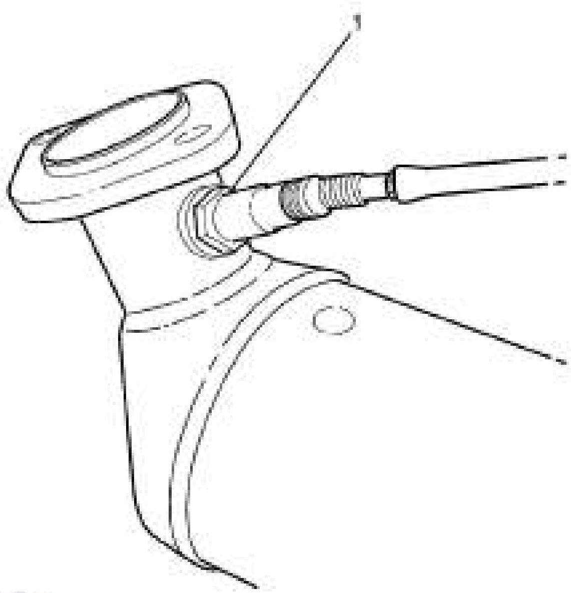
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Ignition OFF.



2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Disconnect the heated oxygen sensor (HO2S) from the electrical connector retaining clip (1).
4. Disconnect the heated oxygen sensor (HO2S) electrical connector (2) from the harness connector on the transmission case.
5. Remove the catalytic converter. refer to Catalytic Converter Replacement - Right Side.

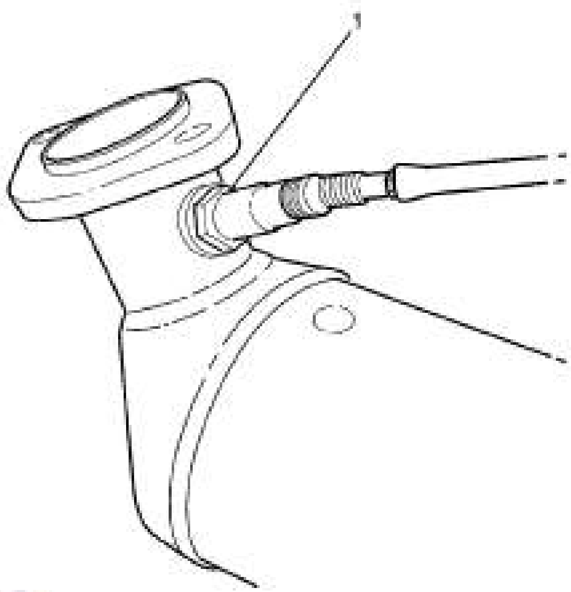
Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



6. Remove the HO2S (1) from the catalytic converter.

Installation Procedure

Notice: Refer to Component Fastener Tightening Notice in the Preface section.

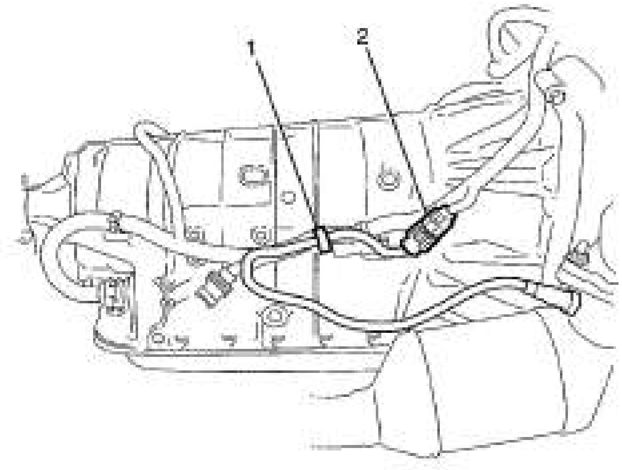


Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S to the catalytic converter.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).

2. Install the catalytic converter to the vehicle. Refer to Catalytic Converter Replacement - Right Side.



3. Connect the heated oxygen sensor (HO2S) electrical connector (2) to the harness connector on the transmission case.
4. Connect the heated oxygen sensor (HO2S) to the electrical connector retaining clip (1).
5. Lower the vehicle.

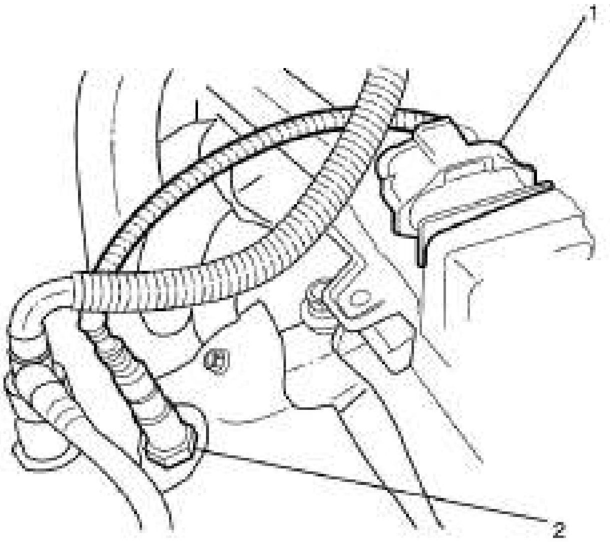
Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 (NT4)

Removal Procedure

1. Ignition OFF.

   Caution: Refer to Battery Disconnect Warning in the Preface section.

2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine cover. Refer to Engine Cover Replacement .



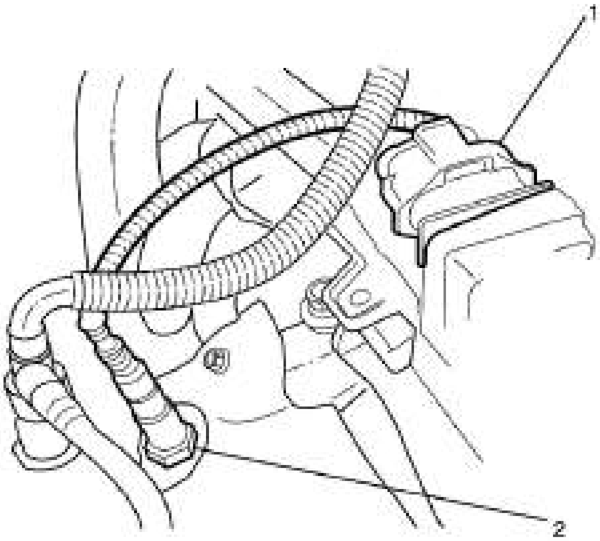
4. Disconnect the heated oxygen sensor (HO2S) electrical connector (1).

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

5. Remove the HO2S (2) from the exhaust manifold.

Installation Procedure

Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S (2) into the exhaust manifold.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).

2. Connect the HO2S electrical connector (1).
3. Install the engine cover. Refer to Engine Cover Replacement.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2195289

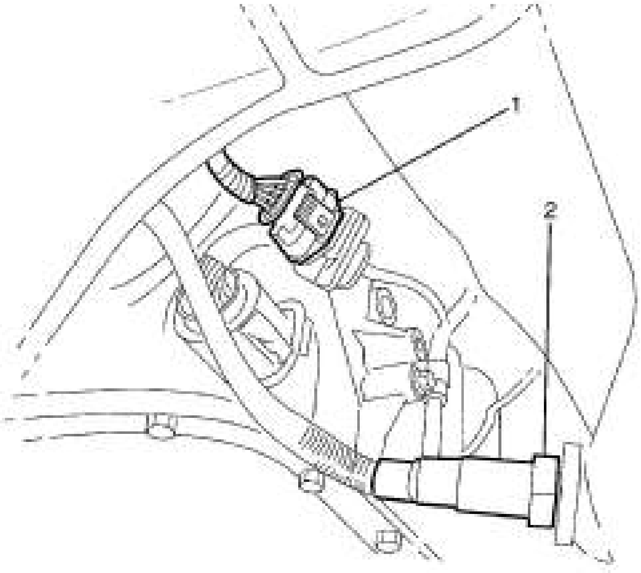
Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 (NT3)

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

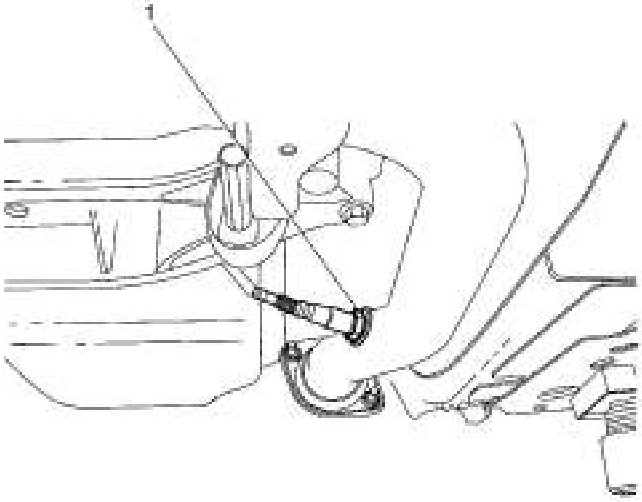
Removal Procedure

1. Turn the ignition OFF.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



3. Disconnect the heated oxygen sensor (HO2S) electrical connector (1) from the harness connector.

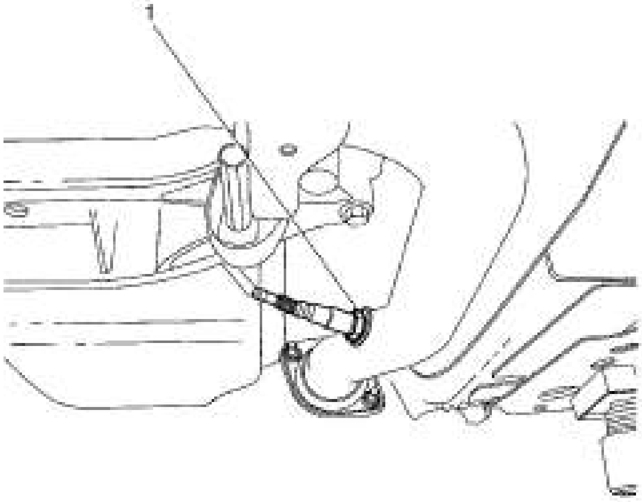
   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



4. Remove the HO2S (1) from the exhaust pipe.

Installation Procedure

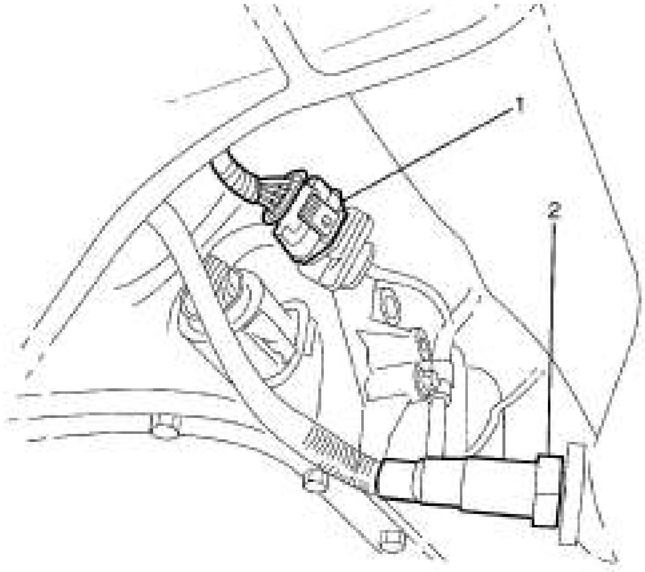
Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize to the sensor threads.

1. Install the HO2S (1) to the exhaust pipe.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).



2. Connect the HO2S electrical connector (1) to the harness connector.
3. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2195290**

Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 (NT4)

Removal Procedure

1. Ignition OFF.

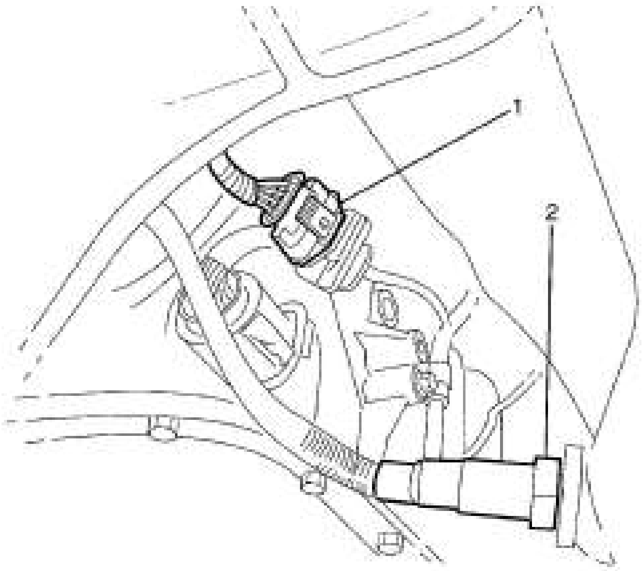
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



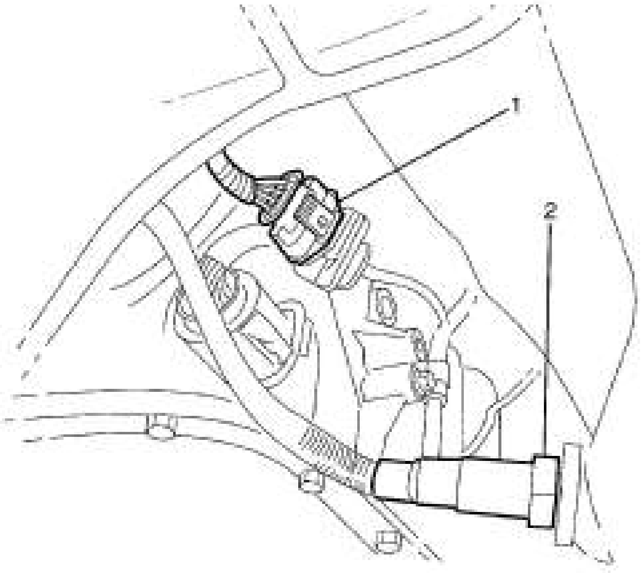
4. Disconnect the heated oxygen sensor (HO2S) electrical connector (1) from the harness connector.

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

5. Remove the HO2S (2) from the exhaust pipe.

Installation Procedure

Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S (2) into the exhaust pipe.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).

2. Connect the HO2S electrical connector (1) to the harness connector.
3. Lower the vehicle.
4. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2195291

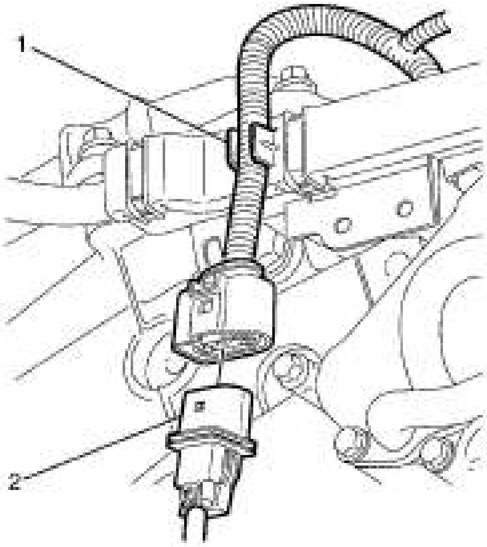
Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 (NT3)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

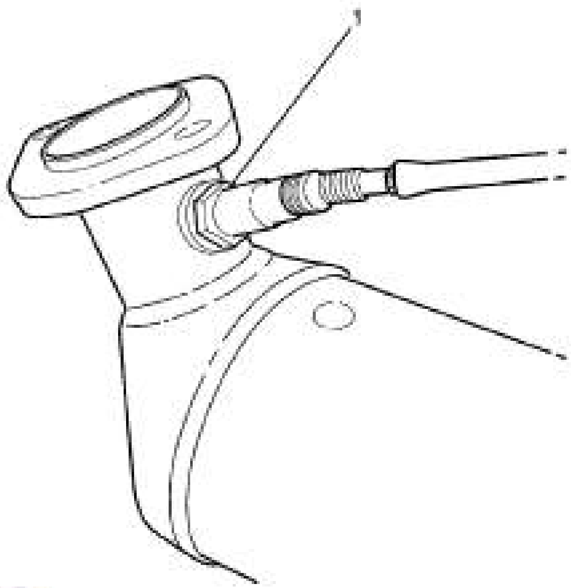
1. Ignition Off.



2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the HO2S electrical connector from the wiring harness bracket (1).

Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

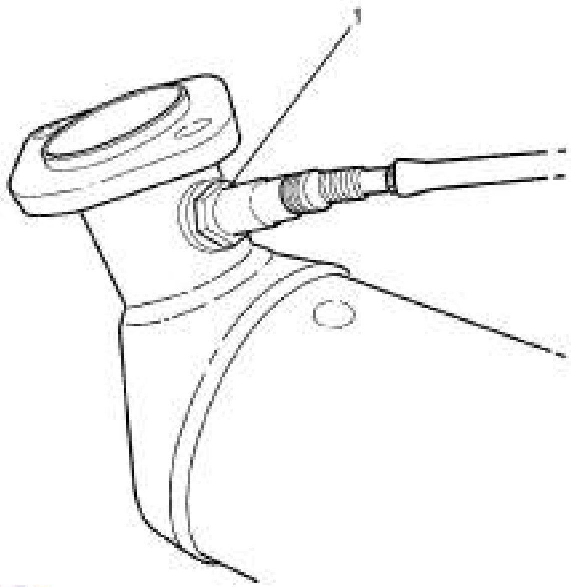
4. Disconnect the heated oxygen sensor (HO2S) electrical connector (2).



5. Remove the HO2S (1) from the catalytic converter.

Installation Procedure

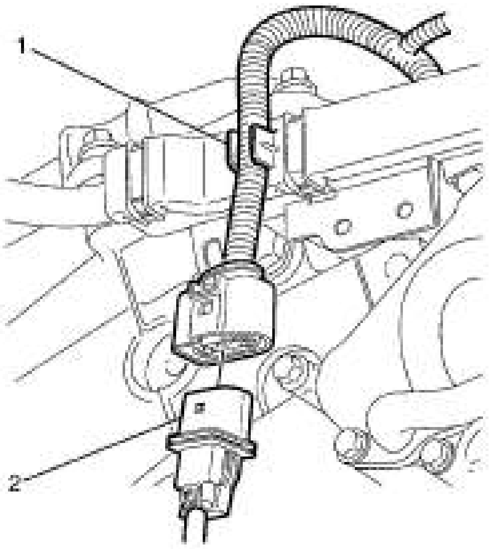
Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved compound to the sensor threads.

1. Install the HO2S (1) to the catalytic converter.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).



2. Connect the HO2S electrical connector (2) to the harness connector.
3. Install the HO2S electrical connector to the wiring harness bracket (1).
4. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2195293

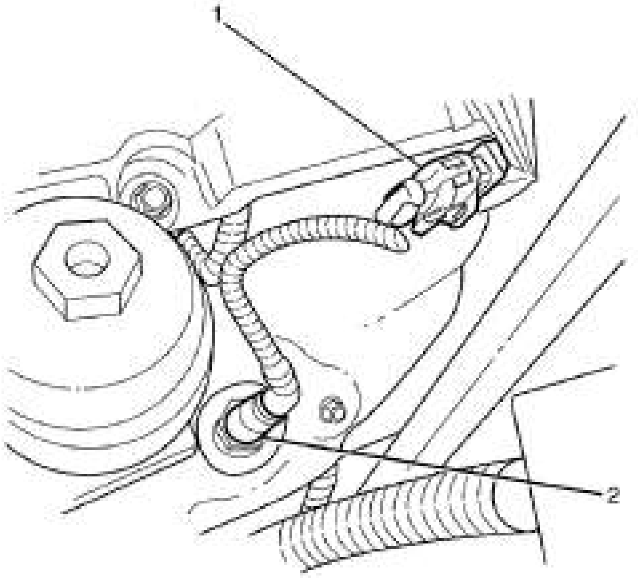
Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 (NT4)

Removal Procedure

1. Ignition OFF.

   Caution: Refer to Battery Disconnect Warning in the Preface section.

2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine cover. Refer to Engine Cover Replacement.



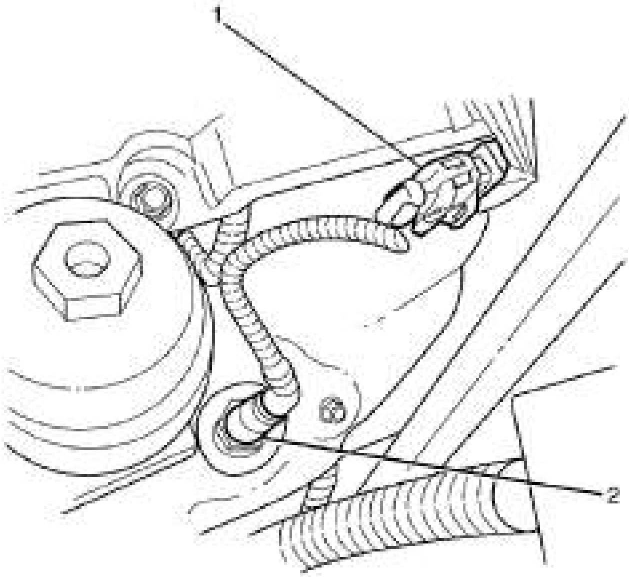
4. Disconnect the heated oxygen sensor (HO2S) electrical connector (1).

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

5. Remove the HO2S (2) from the exhaust manifold.

Installation Procedure

Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S (2) into the exhaust manifold.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).

2. Connect the HO2S electrical connector (1).
3. Install the engine cover. Refer to Engine Cover Replacement.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

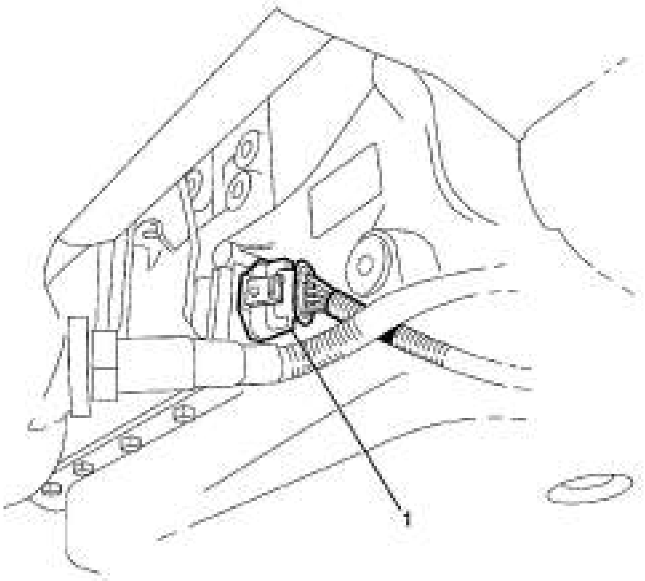
Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 (NT3)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

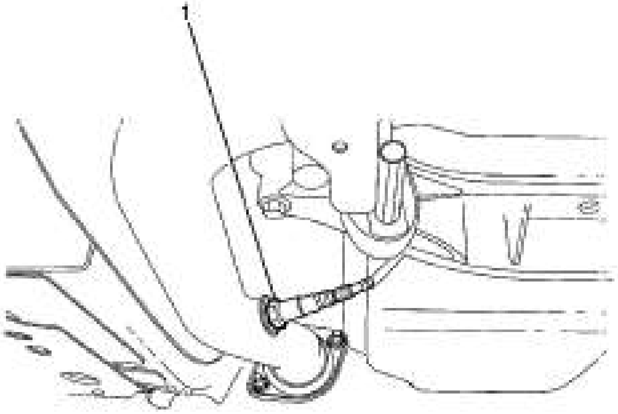
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Ignition Off.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



3. Disconnect the heated oxygen sensor (HO2S) electrical connector (1) from the wiring harness.
4. Remove the HO2S wiring harness from the transmission case.

Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

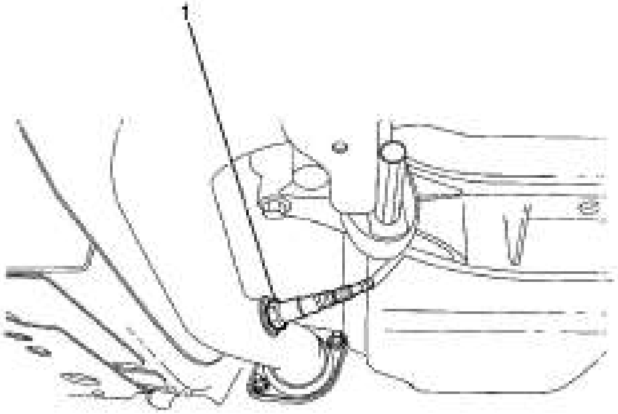


Important: Removal of the oxygen sensor is easier when the engine temperature is above 48°C (120°F).

5. Remove the HO2S (1) from the exhaust pipe.

Installation Procedure

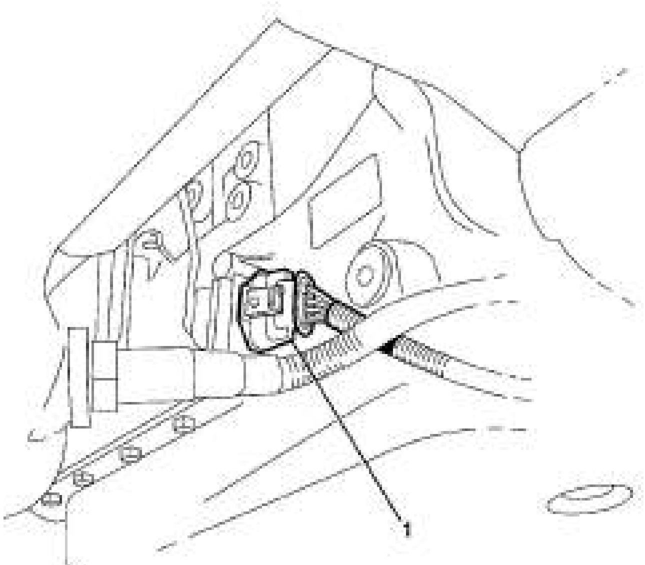
Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).



2. Connect the HO2S electrical connector (1) to the harness connector.
3. Install the HO2S wiring harness to the transmission case.
4. Lower the vehicle.

Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 (NT4)

Removal Procedure

1. Ignition OFF.

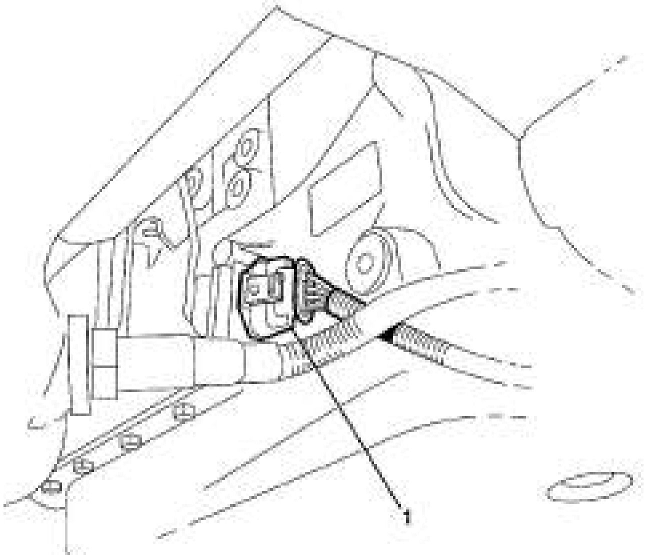
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

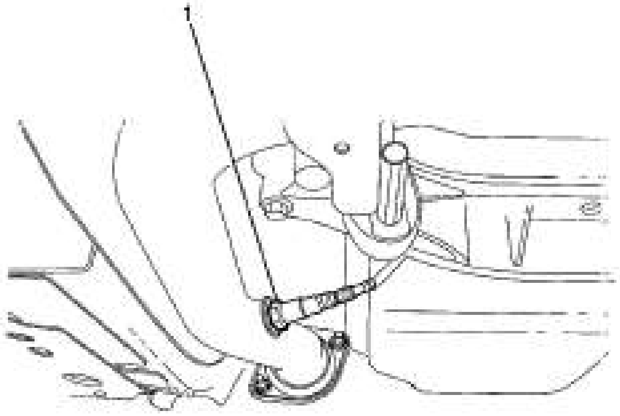
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



4. Disconnect the heated oxygen sensor (HO2S) electrical connector (1) from the wiring harness.
5. Detach the HO2S wiring harness from the transmission case.

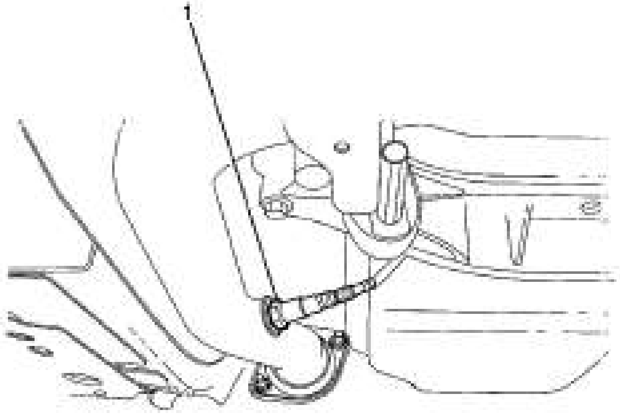
   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



6. Remove the HO2S (1) from the exhaust pipe.

Installation Procedure

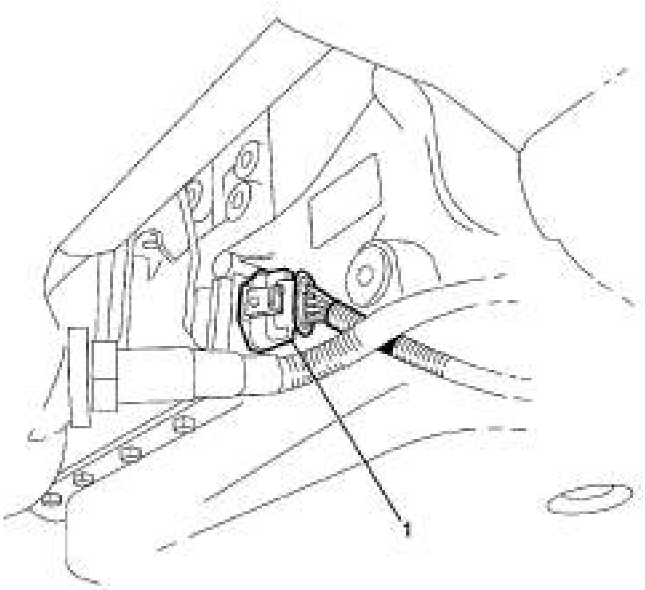
Notice: Refer to Component Fastener Tightening Notice in the Preface section.



Important: New oxygen sensors should have a special anti-seize compound already applied to the sensor threads. If you are installing the original sensor, apply an approved anti-seize compound to the sensor threads.

1. Install the HO2S (1) into the exhaust pipe.

   Tighten
   Tighten the HO2S to 40 N·m (30 lb ft).



2. Connect the HO2S electrical connector (1) to the harness connector.
3. Attach the HO2S wiring harness to the transmission case.
4. Lower the vehicle.
5. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Idle Learn

Description

The engine Control Module (ECM) learns the idle position of the throttle body to enable the correct idle operation. Any time the ECM or the throttle body is replaced, the ECM must learn the idle position. The engine idle may be unstable or DTC's may set if the idle position is not learned.

Conditions for Running the Idle Learn Procedure

- DTCs P0121, P0122, P0123, P0221, P0222, P0223, P0638, P2100, P2101, P2105, P2107, and P2119 are not set.
- The engine speed is less than 40 RPM.
- The vehicle speed is 0 km/h (0 mph).
- The accelerator pedal position is less than 14.9 percent.
- The ignition 1 voltage is more than 10 volts.
- The engine coolant temperature is between 5-85°C (41-185°F).
- The intake air temperature is between 5-60°C (41-140°F).

Idle Learn Procedure

1. Turn OFF the ignition for 30 seconds.
2. Turn ON the ignition, with the engine OFF for 60 seconds.
3. Make sure the above conditions are met before proceeding with this procedure.
4. Do not perform this procedure if a throttle position (TP) sensor or other throttle actuator control (TAC) system DTCs are set other than P2176. The ECM will not perform the idle learn procedure with these DTC's set.
5. Turn OFF the ignition.
6. Turn ON the ignition, with the engine OFF.
7. Clear the DTCs with a scan tool.

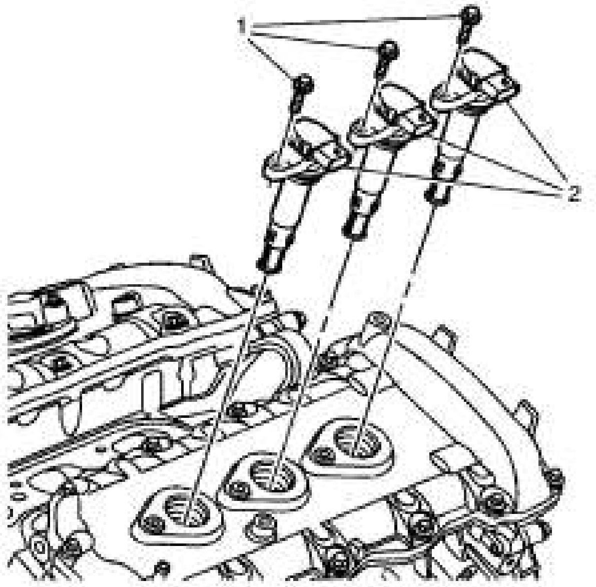
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976173**

Ignition Coil Replacement - Bank 1

Removal Procedure

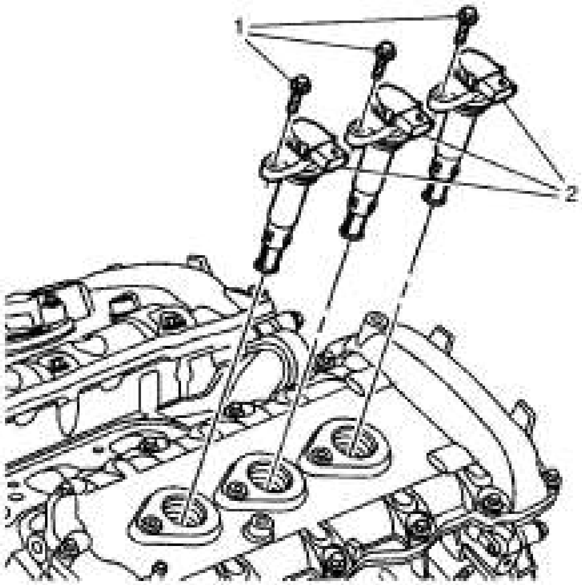
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the ignition OFF.
2. Remove the engine cover. Refer to Engine Cover Replacement.
3. Remove the upper intake manifold Refer to Upper Intake Manifold Replacement



4. Remove the ignition coil harness connector from the ignition coil.
5. Remove the ignition coil to camshaft cover retaining bolts (1).
6. Remove the ignition coils (2) from the vehicle.

Installation Procedure



1. Install the ignition coil (2) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the ignition coil to camshaft cover retaining bolts (1).

   Tighten
   Tighten the ignition coil bolt(s) to 10 N·m (89 lb in).

3. Install the ignition coil harness connector to the ignition coil.
4. Install the upper intake manifold Refer to Upper Intake Manifold Replacement
5. Install the engine cover. Refer to Engine Cover Replacement.

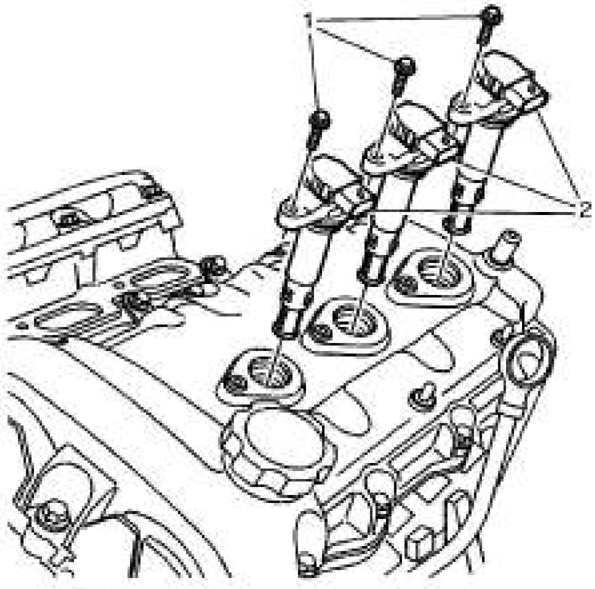
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976174**

Ignition Coil Replacement - Bank 2

Removal Procedure

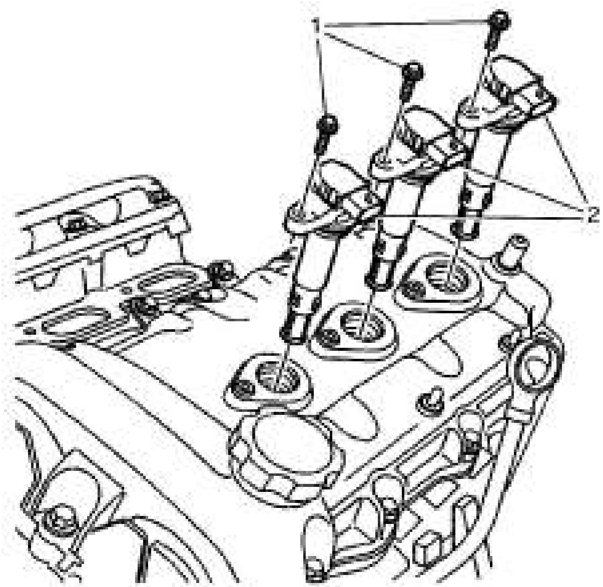
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the ignition OFF.
2. Remove the engine cover. Refer to Engine Cover Replacement.
3. Remove the upper intake manifold Refer to Upper Intake Manifold Replacement.



4. Remove the ignition coil harness connector from the ignition coil.
5. Remove the ignition coil to camshaft cover retaining bolts (1).
6. Remove the ignition coil from the vehicle (2).

Installation Procedure



1. Install the ignition coils (2) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

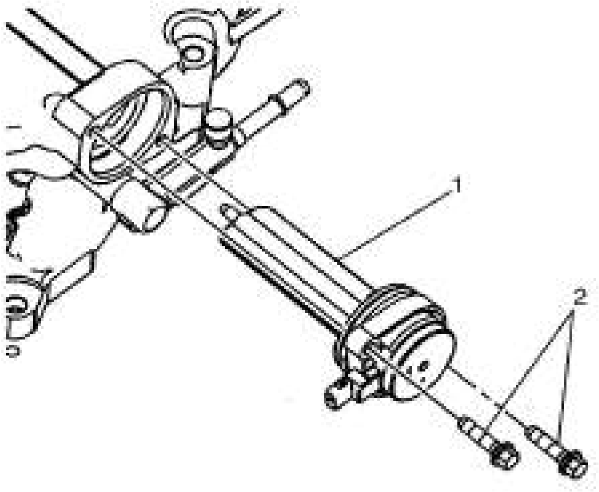
2. Install the ignition coil to camshaft cover retaining bolts (1).

   Tighten
   Tighten the ignition coil bolt(s) to 10 N·m (89 lb in).

3. Install the ignition coil harness connector to the ignition coil.
4. Install the upper intake manifold Refer to Upper Intake Manifold Replacement
5. Install the engine cover. Refer to Engine Cover Replacement.

Intake Manifold Runner Control Solenoid Replacement

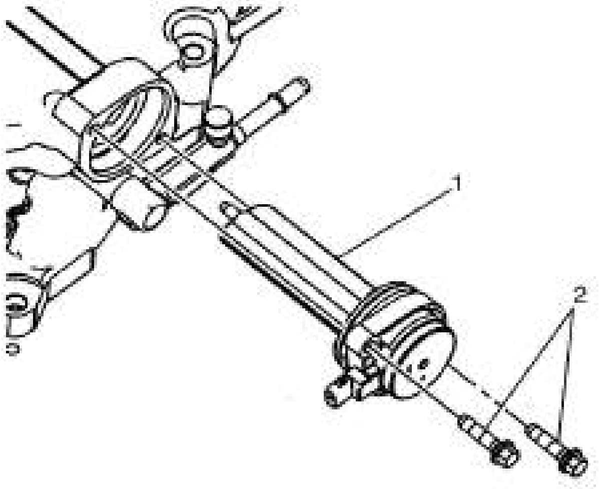
Removal Procedure



Important: DO NOT separate the upper intake manifold from the lower intake manifold.

1. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
2. Remove the intake manifold runner control solenoid to intake manifold retaining bolts (2) from the intake manifold runner control solenoid (1).
3. Remove the intake manifold runner control solenoid (1) from the manifold.

Installation Procedure



1. Install the intake manifold runner control solenoid (1) to the manifold.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the intake manifold runner control solenoid to manifold retaining bolts (2) to intake manifold runner control solenoid.

   Tighten
   Tighten the intake manifold runner control solenoid bolts (2) to 10 N·m (89 lb in).

3. Install the upper intake manifold. Refer to Lower Intake Manifold Replacement.

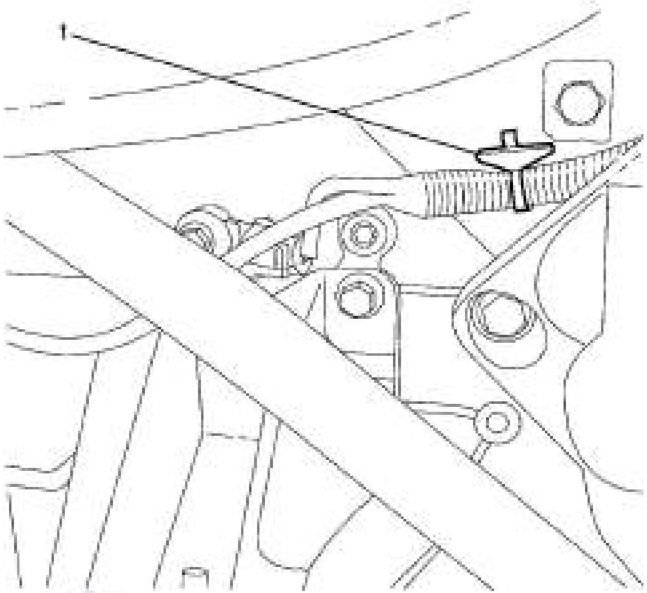
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1976147

Knock Sensor Replacement - Bank 1

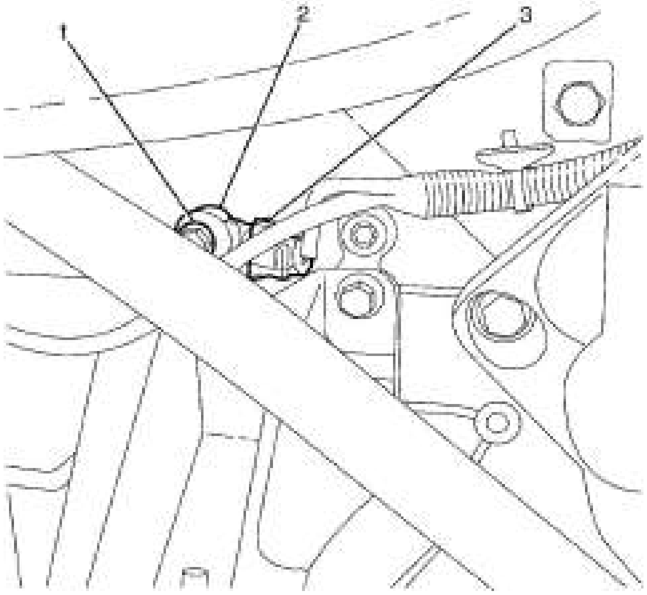
Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.



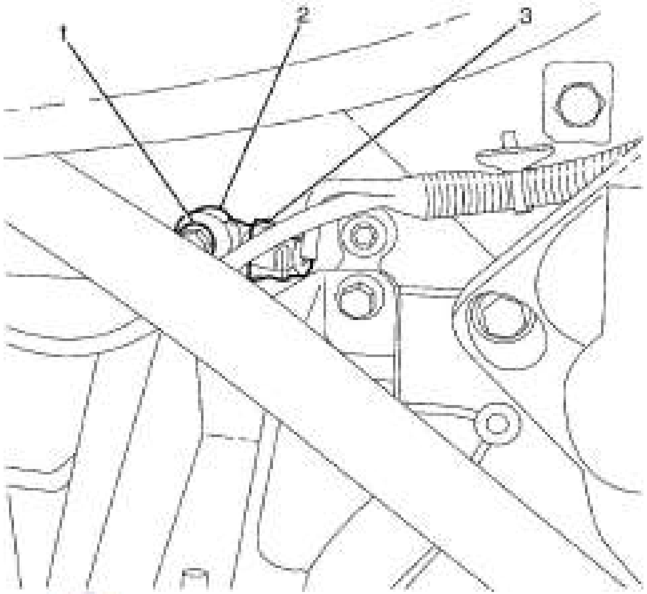
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Disconnect the wiring harness retaining clip (1).



3. Remove the knock sensor (KS) electrical (1) connector from the KS (2)
4. Remove the KS (3) to engine block retaining bolt (2).

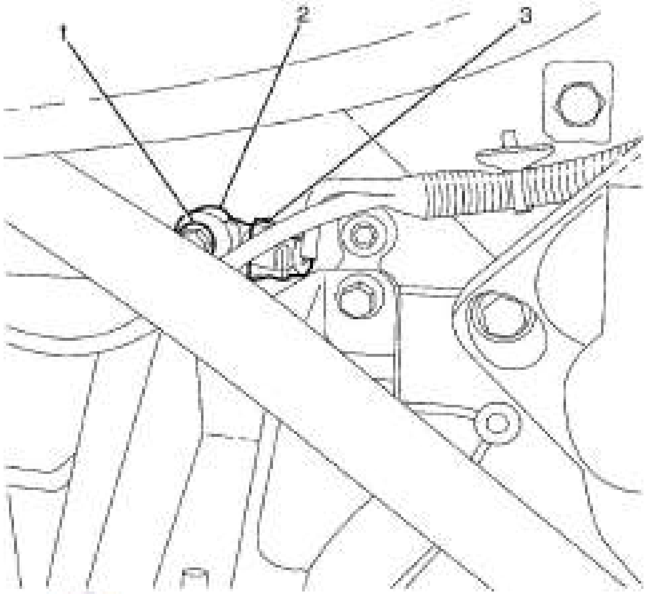
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the KS (3) to engine block retaining bolt (2).

   Tighten
   Tighten the KS bolt to 23 N·m (17 lb ft).

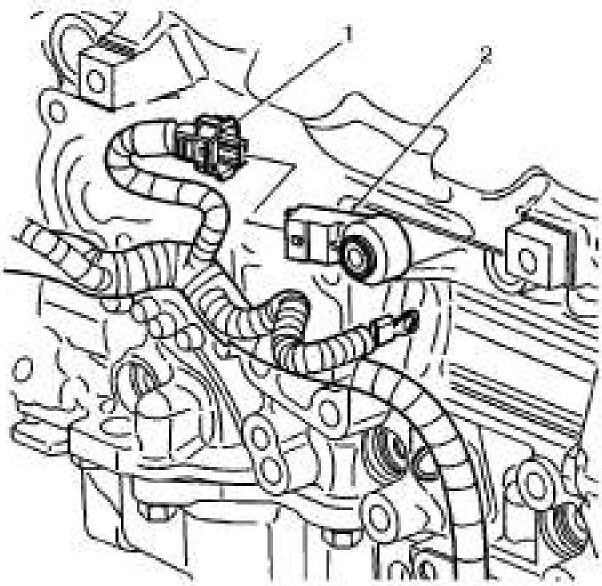


2. Install the knock sensor (KS) electrical (1) connector to the KS (2)
3. Lower the vehicle.

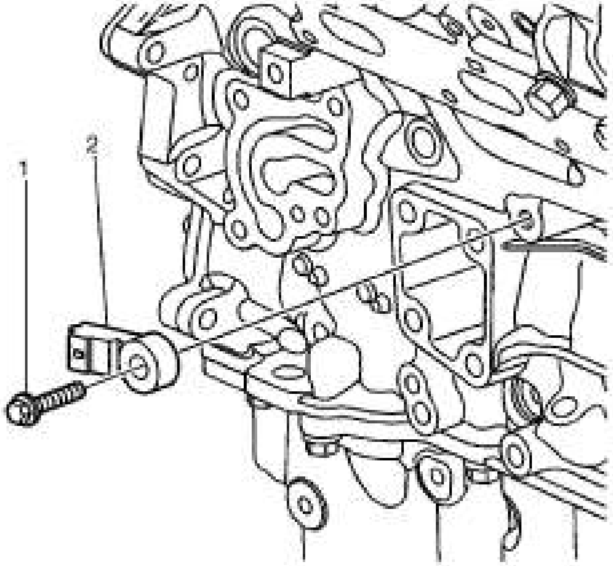
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976152**

Knock Sensor Replacement - Bank 2

Removal Procedure

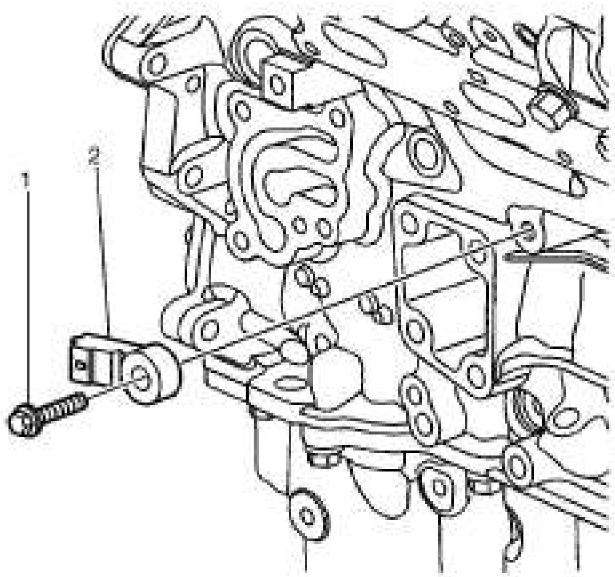


1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the knock sensor (KS) electrical connector (1) from the KS (2).



3. Remove the KS to engine block retaining bolt (1) from the KS sensor.
4. Remove the KS (2) from the engine.

Installation Procedure

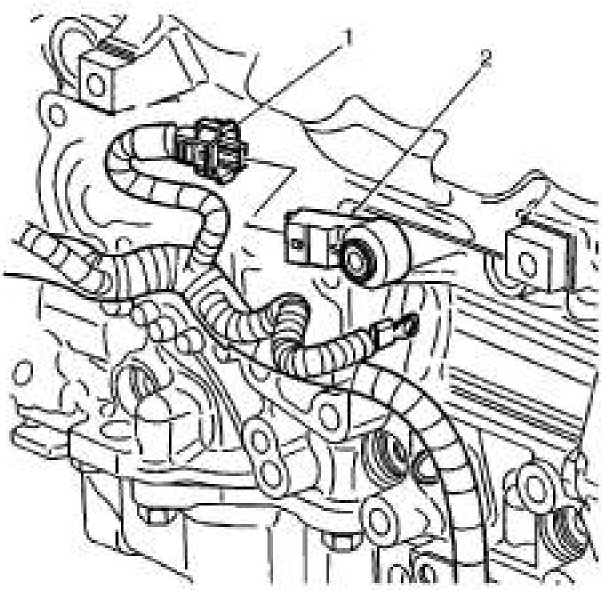


1. Install the KS (2) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the KS to engine block retaining bolt (1).

   Tighten
   Tighten the KS bolt (1)to 23 N·m (17 lb ft).



3. Install the KS electrical connector (1) to the K sensor (2).
4. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2006701**

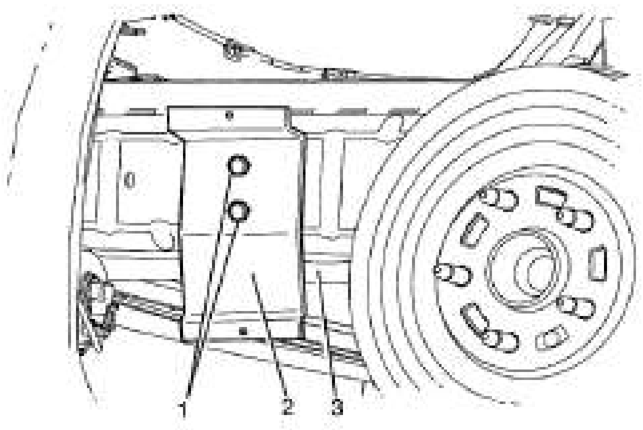
Liquefied Petroleum Gas Control Module Bracket Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

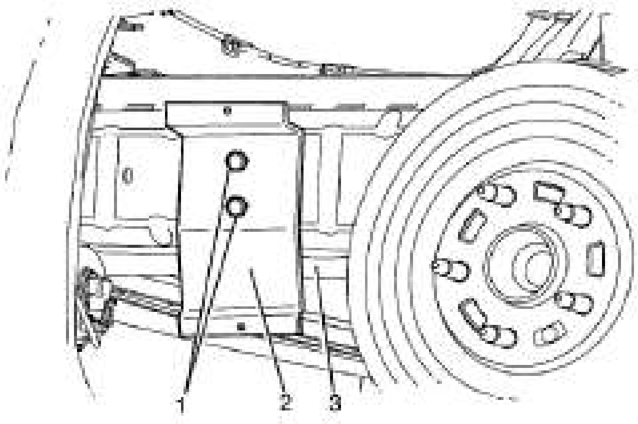
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the left front wheel. Refer to Tire and Wheel Removal and Installation.
3. Remove the left front wheel house liner. Refer to Front Wheelhouse Liner Replacement.
4. Remove the LPG control module. Refer to Liquefied Petroleum Gas Control Module Replacement.



Important: Use a suitable tool to drill out the rivets.

5. Remove the LPG control module bracket to body retaining rivets (1).
6. Remove the LPG control module bracket (2) from the vehicle (3).

Installation Procedure



1. Position the LPG control module bracket (2) to the vehicle (3).
2. Install the LPG control module bracket to body retaining rivets (1).
3. Install the LPG control module. Refer to Liquefied Petroleum Gas Control Module Replacement.
4. Install the left front wheel house liner. Refer to Front Wheelhouse Liner Replacement.
5. Install the left front wheel. Refer to Tire and Wheel Removal and Installation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2006688

Liquefied Petroleum Gas Control Module Replacement

Removal Procedure

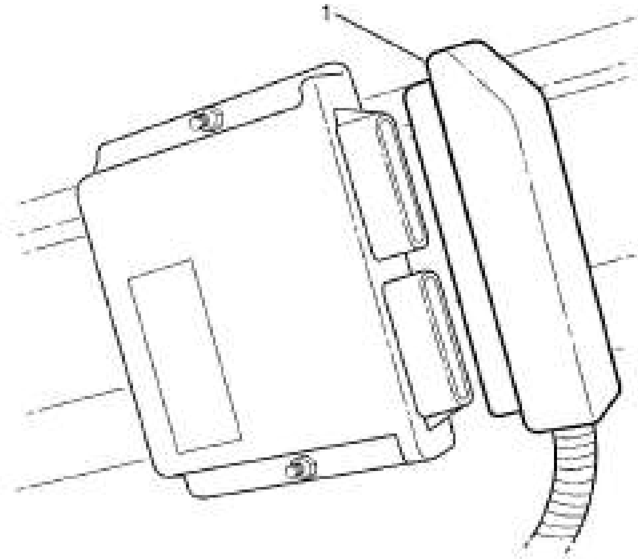
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Battery Disconnect Caution in the Preface section.

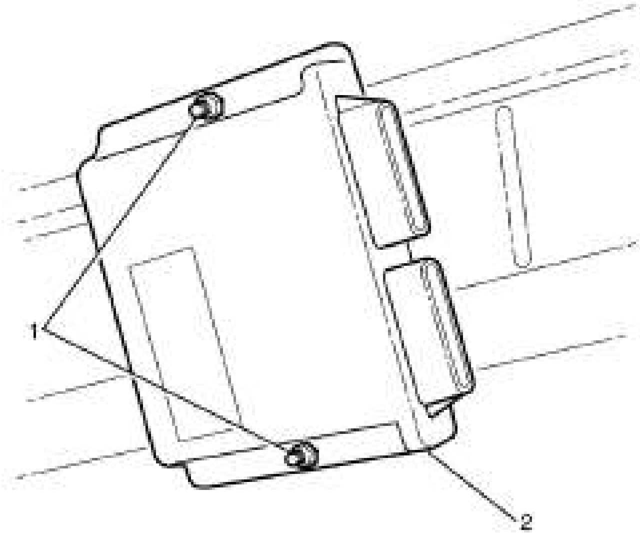
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the left front wheel. Refer to Tire and Wheel Removal and Installation.
4. Remove the left front wheel house liner. Refer to Front Wheelhouse Liner Replacement.

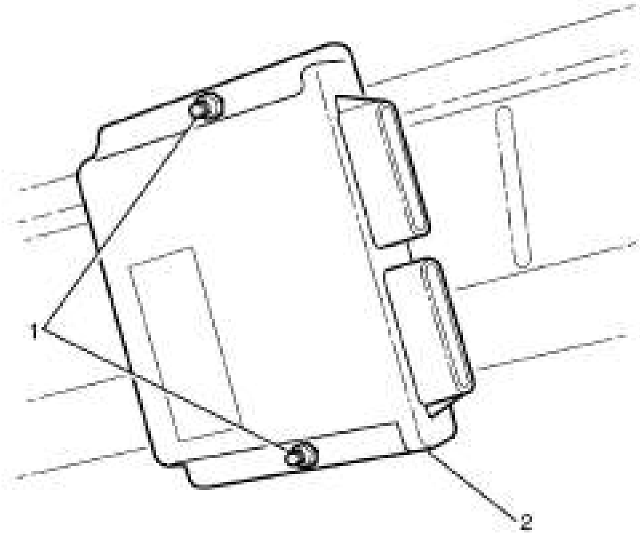


5. Disconnect the LPG control module electrical connector (1).



6. Remove the LPG control module to LPG control module bracket retaining nuts (1).
7. Remove the LPG control module (2) from the vehicle.

Installation Procedure

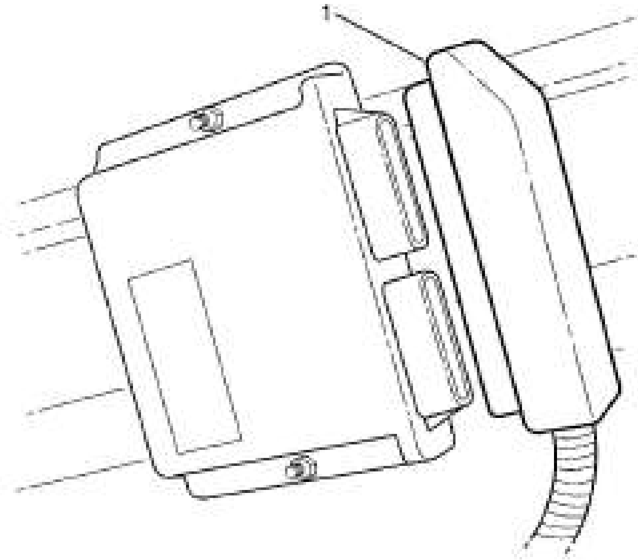


1. Position the LPG control module (2) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the LPG control module to LPG control module bracket retaining nuts (1).

Tighten
Tighten the nuts to 5 N·m (44 lb in).



3. Connect the LPG control module electrical connector (1).
4. Install the left front wheel house liner. Refer to Front Wheelhouse Liner Replacement.
5. Install the left front wheel. Refer to Tire and Wheel Removal and Installation.
6. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2006647**

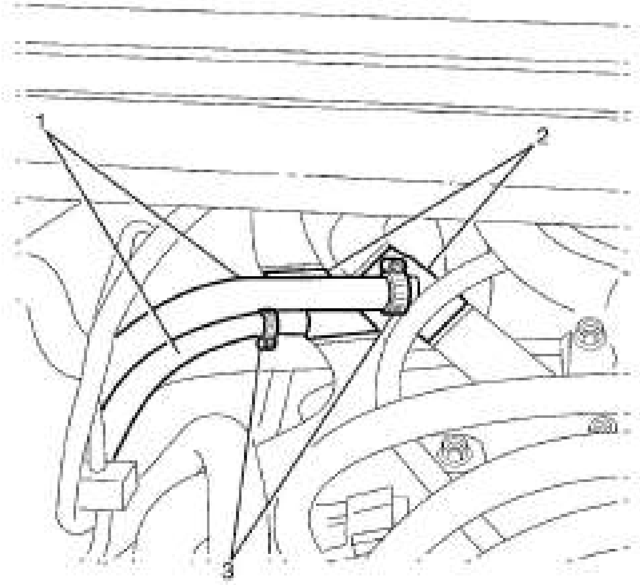
Liquefied Petroleum Gas Tank Filler Hose Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

1. Remove the radiator cap.

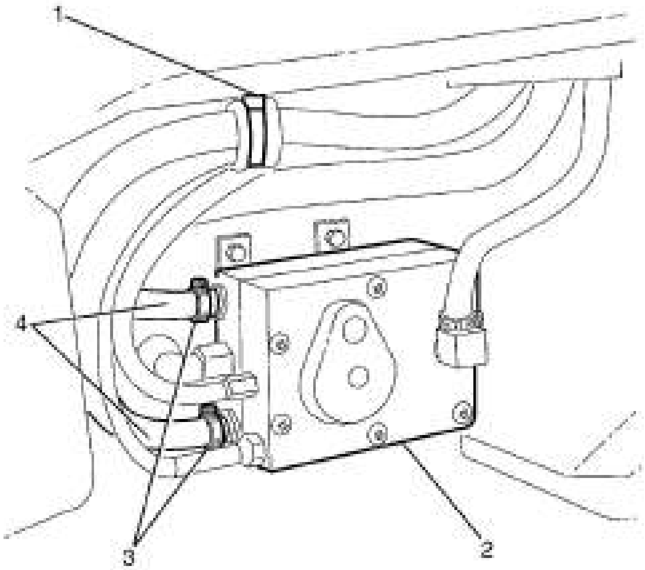


Important: Place a suitable container underneath the vehicle to collect draining coolant.

2. Release the LPG coolant hose clamps (3).
3. Disconnect the LPG coolant hoses (1) from the 'T' fittings (2).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the right front wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the right front wheel house liner. Refer to Front Wheelhouse Liner Replacement.

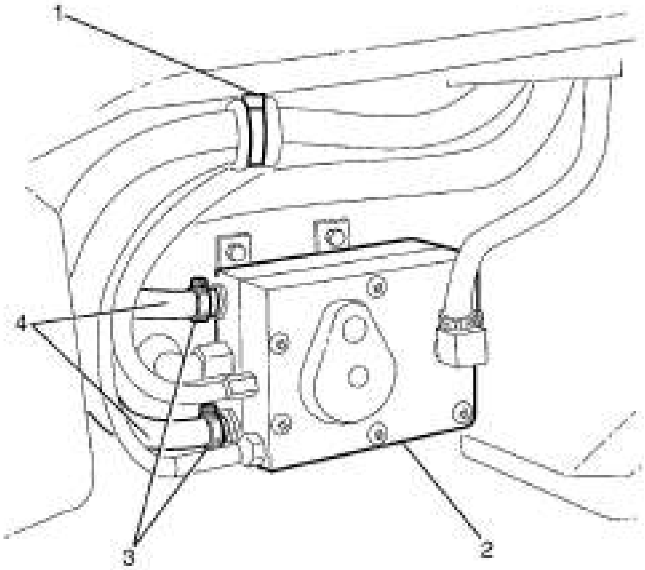


7. Remove the LPG coolant hose to body retaining clip (1).
8. Release the LPG coolant hose clamps (3) at the LPG convertor (2).

Important: Take care as coolant will leak when the LPG coolant hoses (4) are removed.

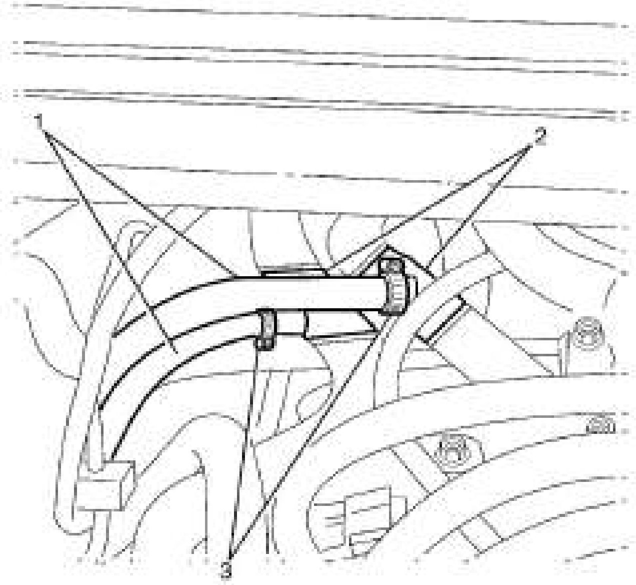
9. Disconnect the LPG coolant hoses (4) from the LPG convertor (2).
10. Remove the LPG coolant hoses (4) from the vehicle.

Installation Procedure



1. Position the LPG coolant hoses (4) to the vehicle.
2. Fit LPG coolant hose clamps (3) to the LPG coolant hoses (4).

3. Connect the LPG coolant hoses (4) to the LPG convertor (2).
4. Secure the LPG coolant hose clamps (3).
5. Secure the LPG coolant hose to body retaining clip (1).



6. Connect the LPG coolant hoses (1) to the LPG coolant hose (2) 'T' fittings.
7. Secure the LPG coolant hose clamps (3) ensuring that the clamp fastens the hose to the 'T' fittings (2).
8. Fill the cooling system. Refer to Cooling System Draining and Filling.
9. Install the radiator cap.
10. Inspect the cooling system for leaks.
11. Install the right front wheel house liner. Refer to Front Wheelhouse Liner Replacement.
12. Install the right front wheel. Refer to Tire and Wheel Removal and Installation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2038717**

Liquefied Petroleum Gas Tank Filler Valve Receptacle Replacement

Removal Procedure

Caution: Refer to General Repair Instructions in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Fuel Pressure Relief in the Preface section.

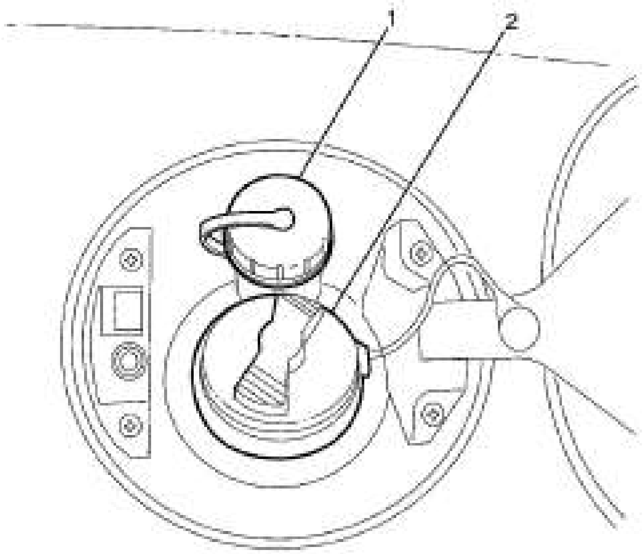
1. Park the vehicle in a well ventilated area, away from any ignition source.

Caution: Refer to Battery Disconnect Caution in the Preface section.

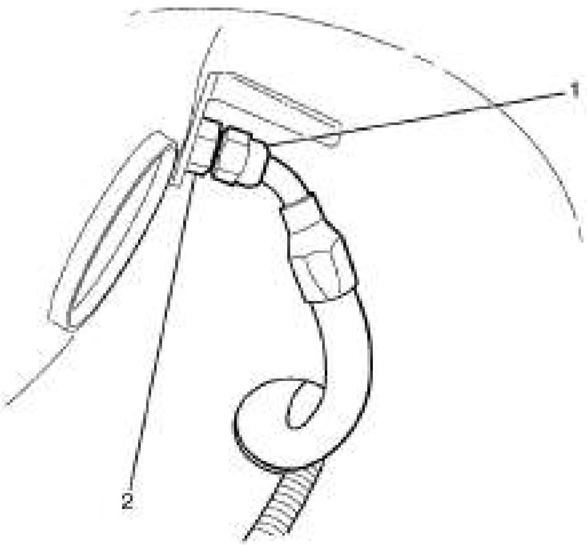
2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove the right rear wheel. Refer to Tire and Wheel Removal and Installation.
5. Remove the right rear wheel house liner. Refer to Rear Wheelhouse Panel Liner Replacement.



6. Remove the petrol fill tube (2) to allow access to the LPG fill valve (1) retaining nut. Refer to Filler Tube Replacement.



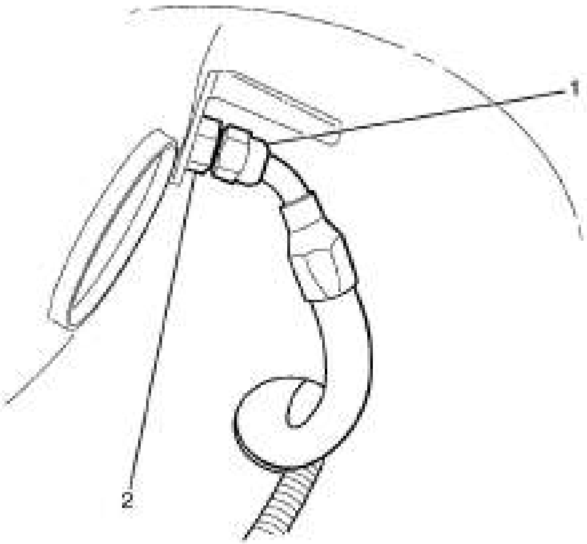
Important: Hold the LPG fill valve at (2) when detaching the fitting (1).

7. Remove the LPG fill line fitting (1) from LPG fill valve (2).
8. Remove the LPG fill valve to body retaining nut (2).
9. Remove the LPG fill valve from the vehicle.

Installation Procedure

1. Position the LPG fill valve to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

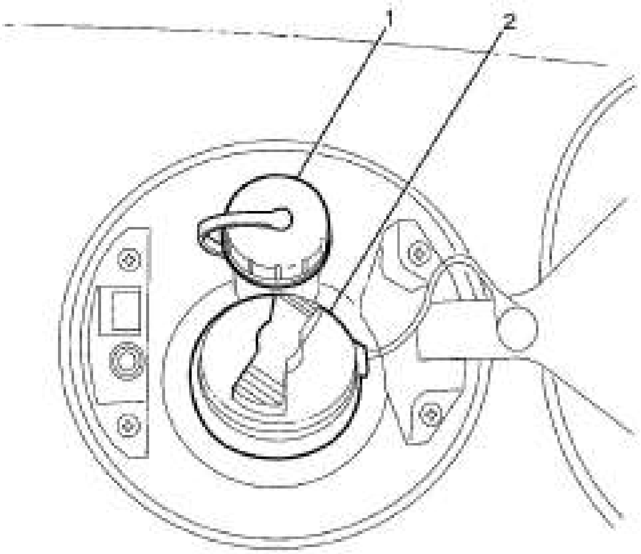


2. Install the LPG fill valve to body retaining nut (2).

   Tighten
   Tighten the nut to 18 N·m (13 lb ft).

3. Install the fitting (1) to the LPG fill valve (2).

   Tighten
   Tighten the fitting to 18 N·m (13 lb ft).



4. Install the petrol fill tube (2). Refer to Filler Tube Replacement.

   Important: Make sure that both of the filler caps can be removed.

5. Check clearance between the LPG fill valve (1) and the petrol filler tube (2).
6. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
7. Install a small amount of LPG to pressurise the fill line and inspect for LPG fuel leaks at the serviced fitting's and fill valve using the combustible gas detector or an equivalent liquid leak detector.
8. Install the right rear wheel house liner. Refer to Rear Wheelhouse Panel Liner Replacement.
9. Install the right rear wheel. Refer to Tire and Wheel Removal and Installation.

Liquefied Petroleum Gas Tank Unloading

Caution: Refer to General Repair Instructions in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Fuel Pressure Relief in the Preface section.

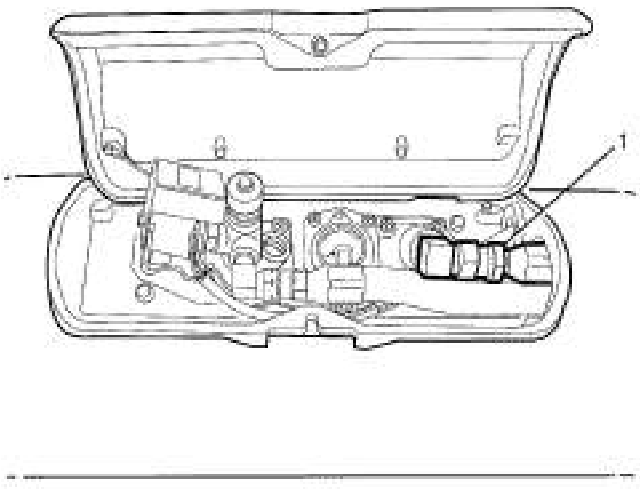
1. Park the vehicle in a well ventilated area, away from any ignition source.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

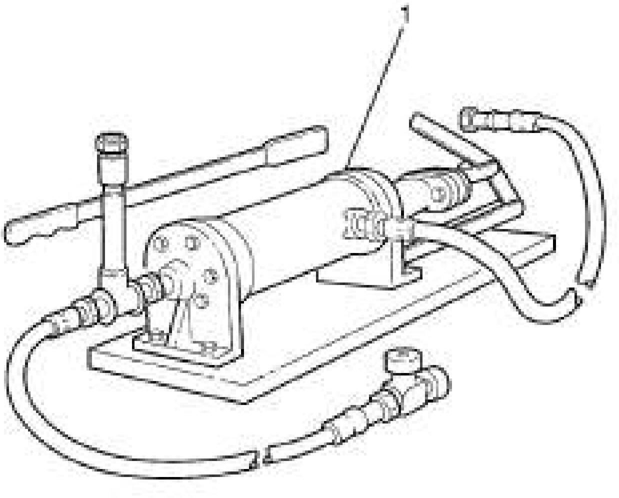
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



Important: Support the LPG tank fitting when removing the fill line fitting (1).

4. Disconnect the fill line fitting (1) from the LPG tank.



5. Connect an Apollo LPG pump (1) or equivalent to the manual service valve assembly connection.
6. Open the manual service valve and pump-out the LPG tank, following the instructions provided by the LPG pump manufacturer.
7. Pump-out the LPG tank until completely empty.
8. When the LPG tank is completely empty, close the manual service and disconnect the pump.

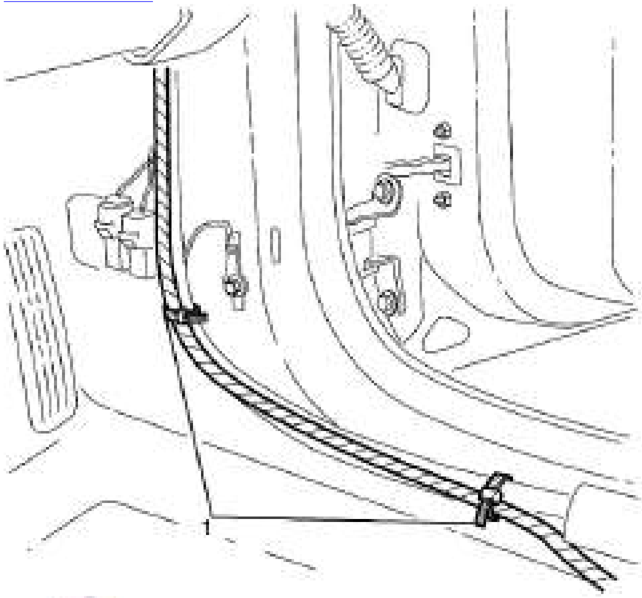
Liquefied Petroleum Gas Wiring Harness Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

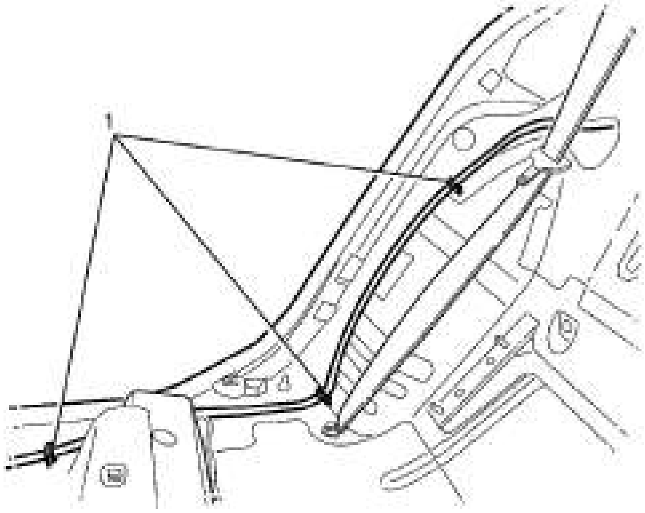
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.



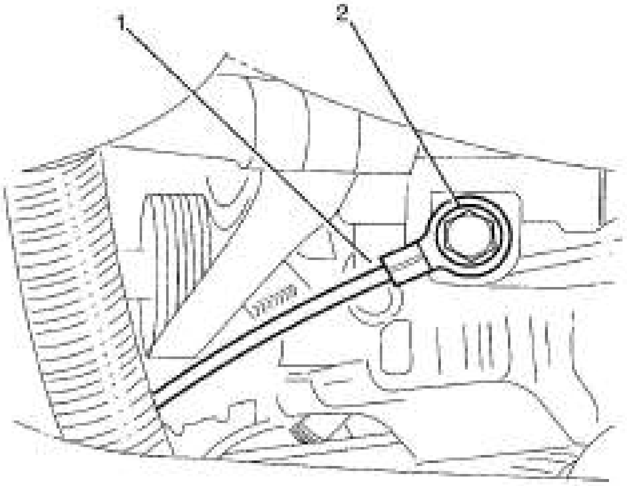
Important: The LPG wiring harness is retained with cable ties.

2. Remove the LPG wiring harness retainers (1) from inside the vehicle.

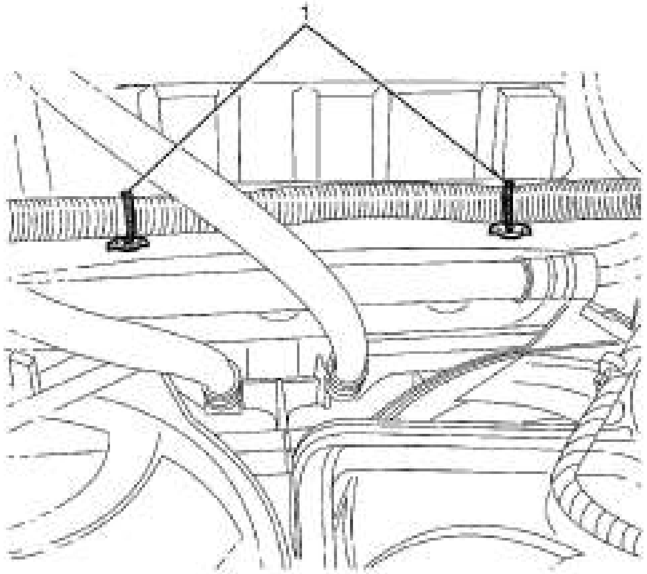


Important: The LPG wiring harness is retained with cable ties.

3. Remove the LPG wiring harness retainers (1) from inside the vehicle.

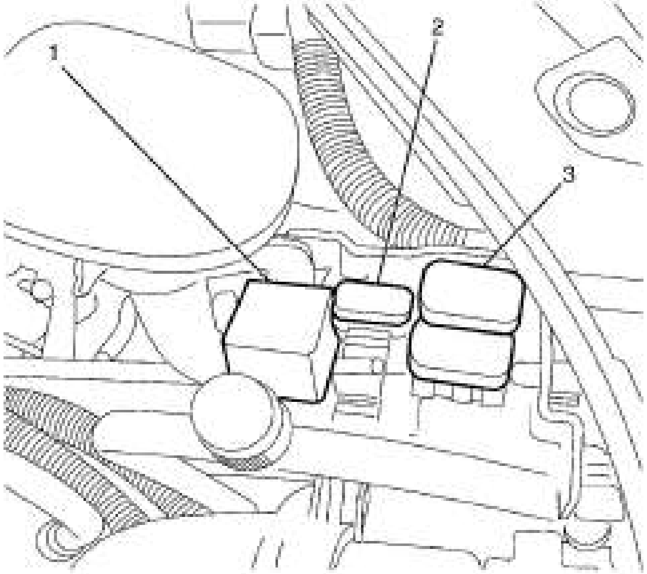


4. Remove the LPG wiring harness earth cable (1) from the lower bolt (2) of the air conditioning compressor.

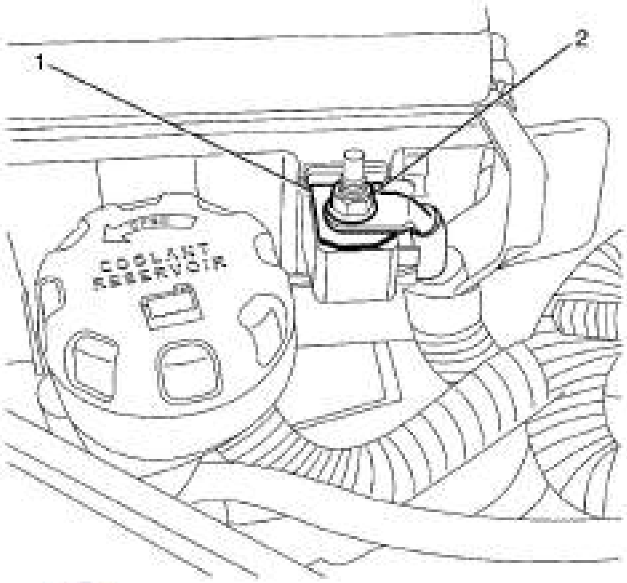


Important: The retaining connectors are located near the bottom of the radiator.

5. Remove the LPG wiring harness retaining connectors (1) from inside the engine bay.



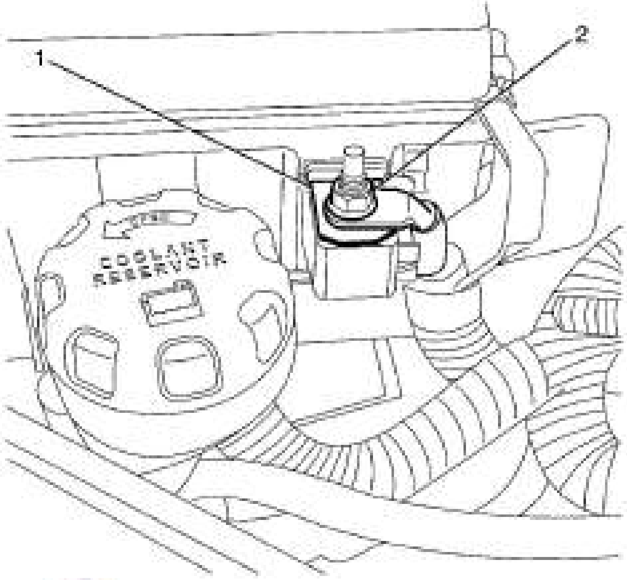
6. Remove the LPG fuses (3), relay (1) and diagnostic connector (2).



7. Remove the LPG wiring harness power cable (1) retaining nut (2).
8. Remove the wiring harness from the vehicle.

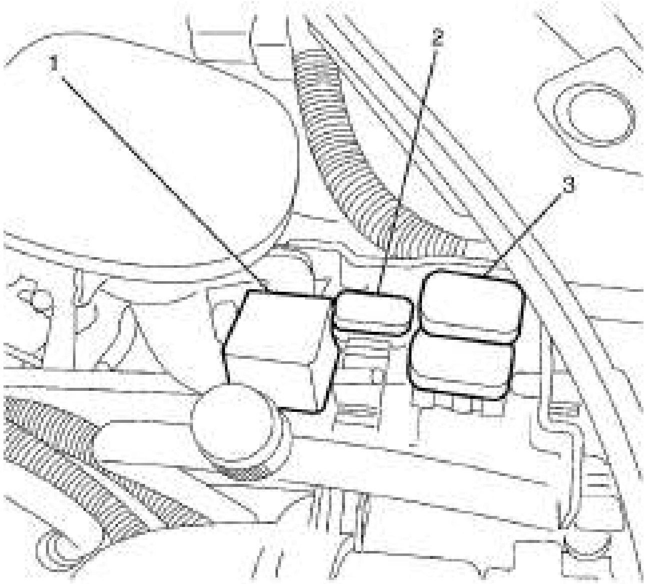
Installation Procedure

1. Position the LPG wiring harness in the vehicle.



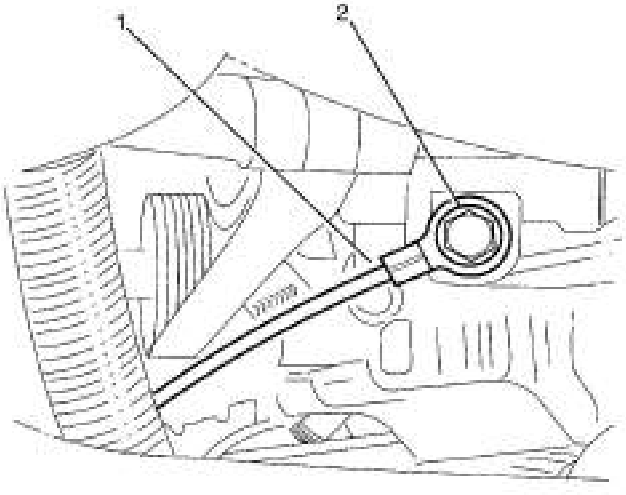
2. Install the LPG wiring harness power cable (1) to the power source.
3. Install the LPG wiring harness power cable (1) retaining nut (2).

   Tighten
   Tighten the nut to xx N·m (xx lb ft).



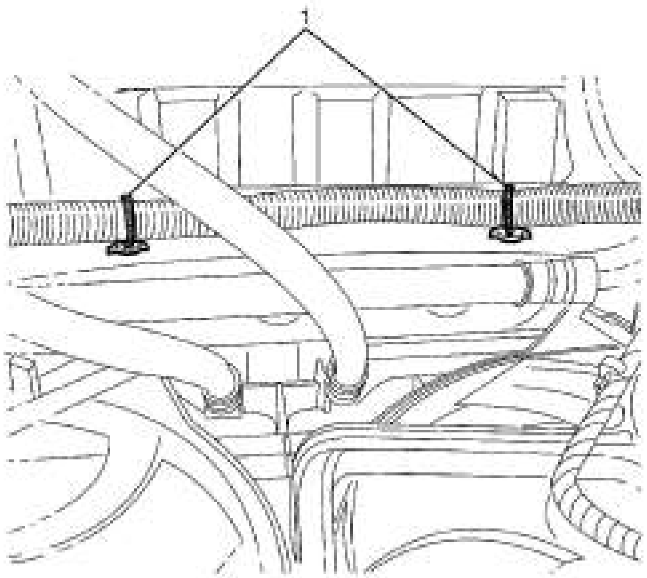
4. Install the LPG fuses (3), relay (1) and diagnostic connector (2).

   Notice: Refer to Fastener Notice in the Preface section.

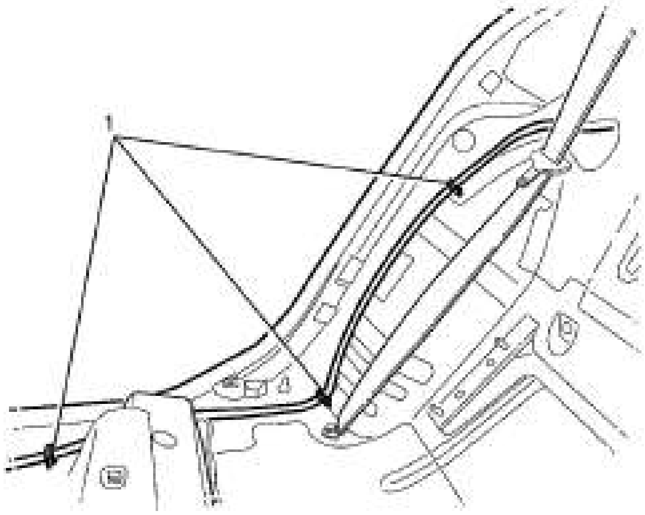


5. Install the LPG wiring harness earth cable (1) to the lower bolt (2) on the air conditioning compressor.

   Tighten
   Tighten the nuts to 22 N·m (16 lb ft).

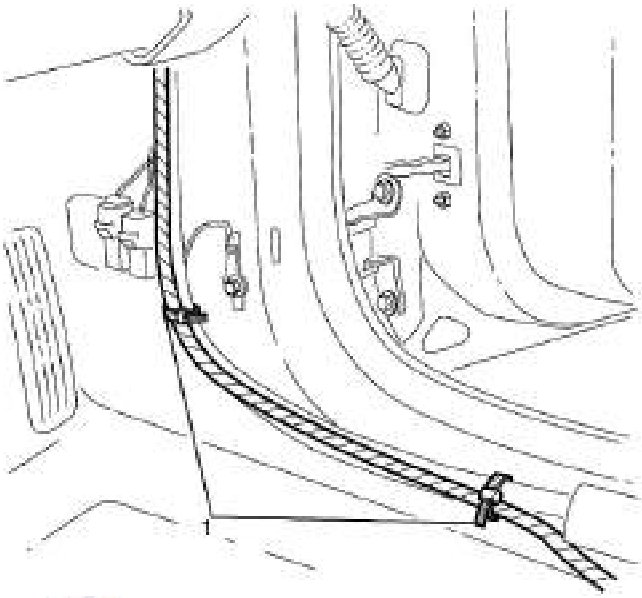


6. Install the LPG wiring harness electrical retaining connectors (1) to the inside of the engine bay.



Important: Cable tie the LPG wiring harness to the vehicle wiring harness.

7. Install the LPG wiring harness retainers (1) to the inside of the vehicle.



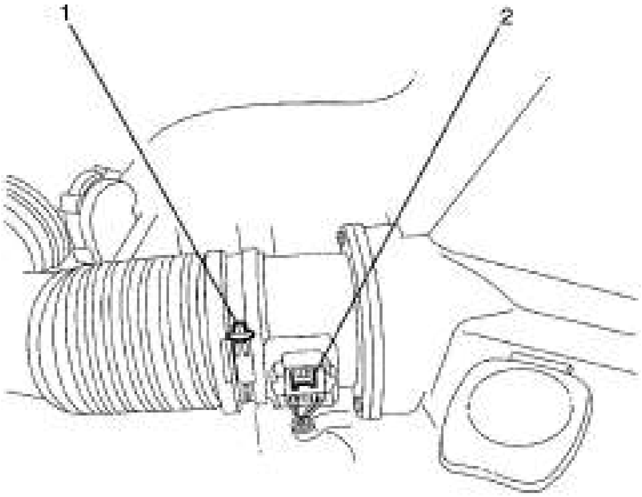
Important: Cable tie the LPG wiring harness to the vehicle wiring harness.

8. Install the LPG wiring harness retainers (1, 2) to inside the vehicle.
9. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

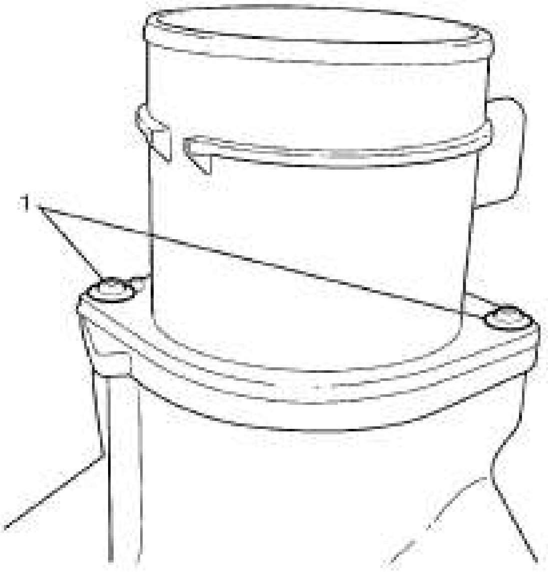
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 1976225

Mass Airflow Sensor with Intake Air Temperature Sensor Replacement

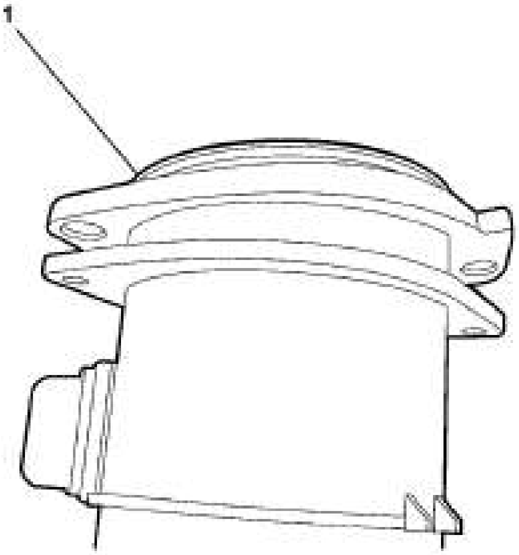
Removal Procedure



1. Ignition OFF.
2. Remove the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.
3. Remove the mass air flow (MAF) harness connector (2) from the MAF sensor.
4. Remove the MAF sensor air box retaining clamps (1) .

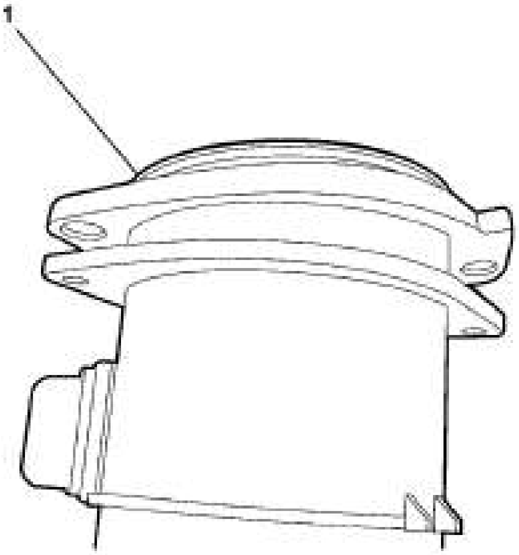


5. Remove the MAF sensor to air box retaining screws (1).



6. Remove the MAF sensor seal and discard the seal.

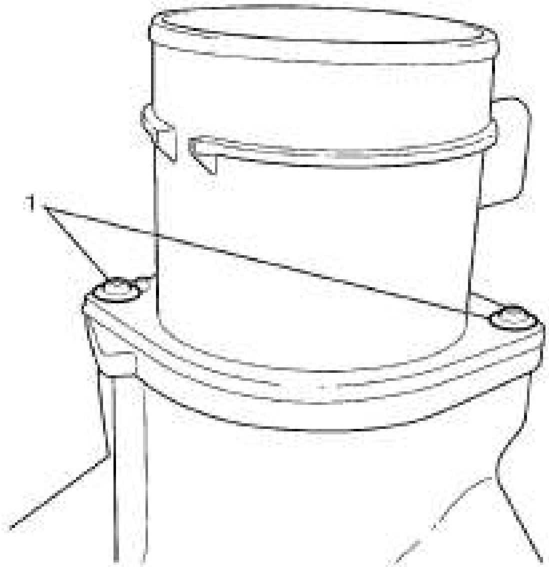
Installation Procedure



Important: Make note of the MAF sensor orientation when fitting to the air induction tube ensuring, arrow pointing toward the engine.

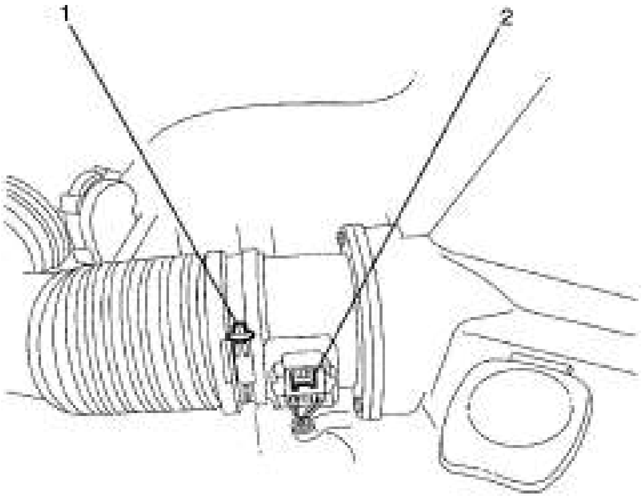
1. Install the new MAF sensor seal (1) locating the seal in the location holes and the MAF sensor.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the MAF sensor to air box retaining screws (1).

   Tighten
   Tighten the MAF sensor screws to 4 N·m (35 lb in).



3. Install the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.

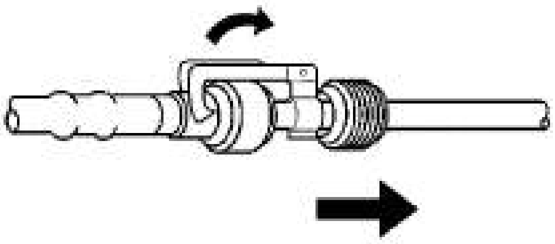
4. Install the mass air flow (MAF) harness connector (2).
5. Install the MAF sensor clamps (1) to the MAF sensor.

Metal Collar Quick Connect Fitting Service

Tools Required

- 7370 Fuel Line Quick Connect Separator
- 7371 Fuel Line Quick Connect Separator
- J 37088-A Fuel Line Quick Connect Separator

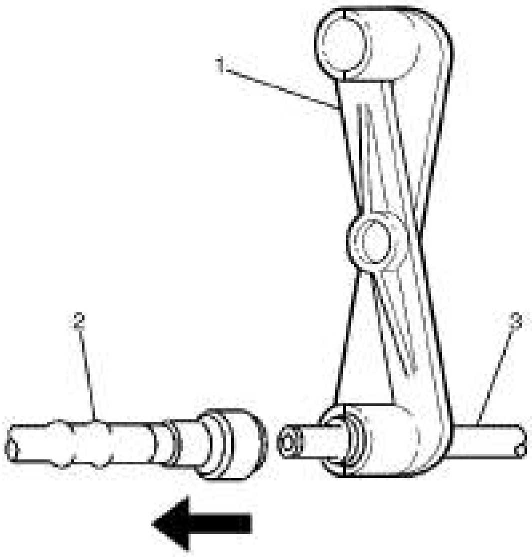
Removal Procedure



1. Before you service any fuel system connection, relieve the fuel system pressure Refer to the Fuel Pressure Relief .
2. Slide the dust cover from the quick-connect fitting if fitted.
3. Disconnect the fuel hose clip verifier from the quick connect fitting.

Caution: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

4. Use compressed air in order to blow any dirt from the fitting.

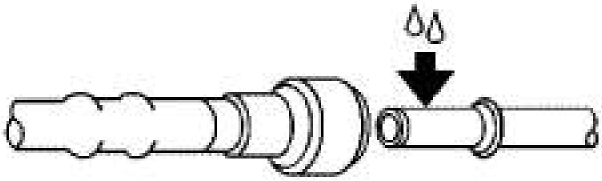


5. Choose the correct tool (1) for the size of the fitting from J 37088-A , 7370 or 7371 . Insert the selected tool into the male connector (3), then push inward in order to release the locking tabs.
6. Pull the female connector (2) away from the male connector.
7. Remove the J 37088-A , 7370 or 7371 from the male connector.

Notice: If necessary, remove rust or burrs from the fuel pipes with an emery cloth. Use a radial motion with the fuel pipe end in order to prevent damage to the O-ring sealing surface. Use a clean shop towel in order to wipe off the male tube ends. Inspect all the connections for dirt and burrs. Clean or replace the components and assemblies as required.

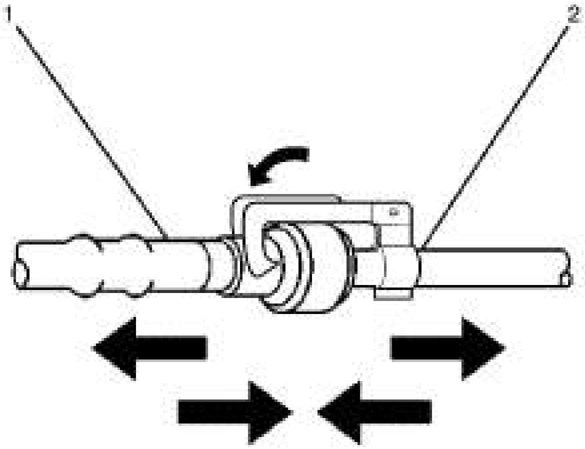
8. Using a clean shop towel, wipe off the male pipe end.
9. Inspect both ends of the fitting for dirt and for burrs. Clean or replace the components as required.

Installation Procedure

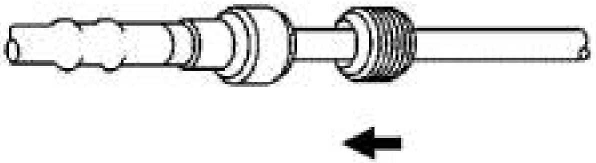


Caution: Always apply a few drops of clean engine oil to the male pipe ends before connecting the fuel pipe fittings in order to reduce the risk of fire and personal injury. This will ensure proper reconnection and prevent a possible fuel leak. During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.

1. Apply a few drops of clean engine oil to the male pipe end.
2. Push both sides of the fitting together in order to cause the retaining tabs to snap into place.



3. Pull and push repeatedly on both sides (1 and 2) of the fitting to make sure the connection is secure.
4. Connect the fuel hose clip verifier from the quick connect fitting.



5. Reposition the dust cover over the quick-connect fitting if fitted.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2038741**

Fuel Filter Replacement (Petrol)

Removal Procedure - Up to xx/xx

The fuel filter is an integral part of the fuel pump assembly and must be replaced as an assembly. For replacement refer to Primary Fuel Tank Module Replacement.

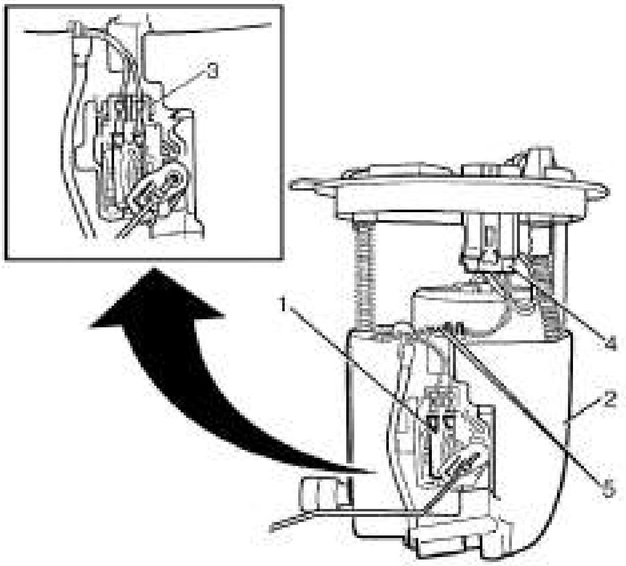
Removal Procedure - From xx/xx

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

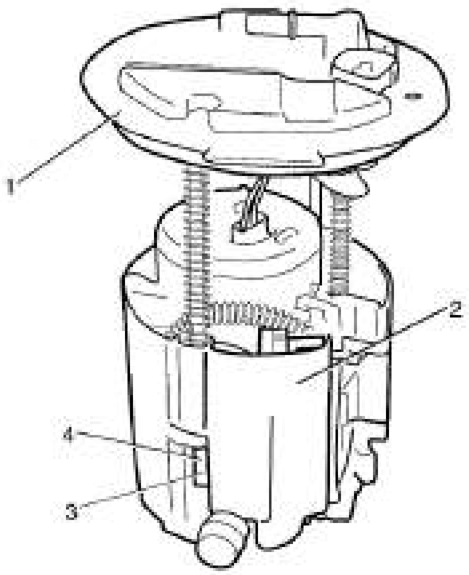
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

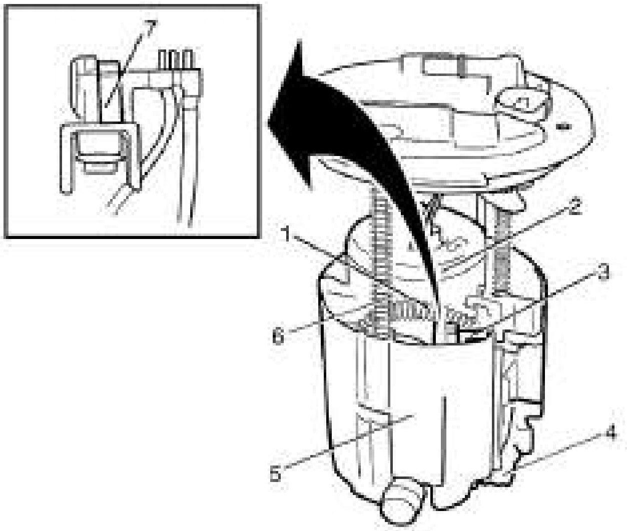
1. Remove the fuel tank. Refer to Fuel Tank Replacement.
2. Remove the primary fuel tank module assembly from the fuel tank. Refer to Primary Fuel Tank Module Replacement.



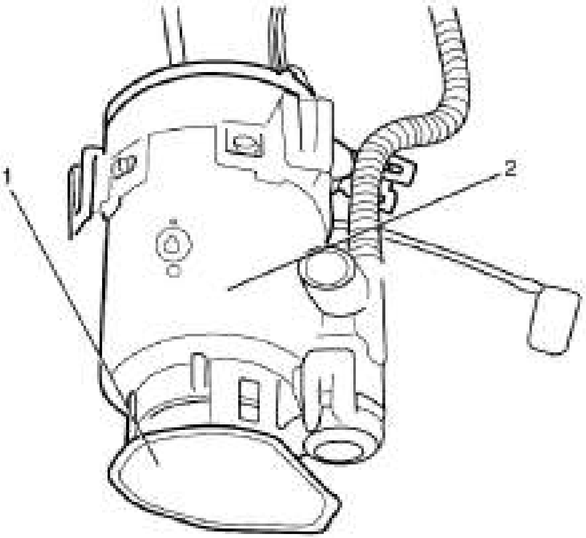
3. Disconnect the fuel level sensor connector (4) and unclip the wiring from the harness securing clips (5).
4. Unlock the locking clip (3) and gently push the fuel level sensor upwards.
5. Remove the fuel level sensor (1) from the lower half of the primary fuel tank module assembly (2).



6. Press down on the primary fuel tank module assembly upper half and remove the circlip (3) from the shaft (4).
7. Separate the upper halve (1) and lower halve (2) of the primary fuel tank module assembly.

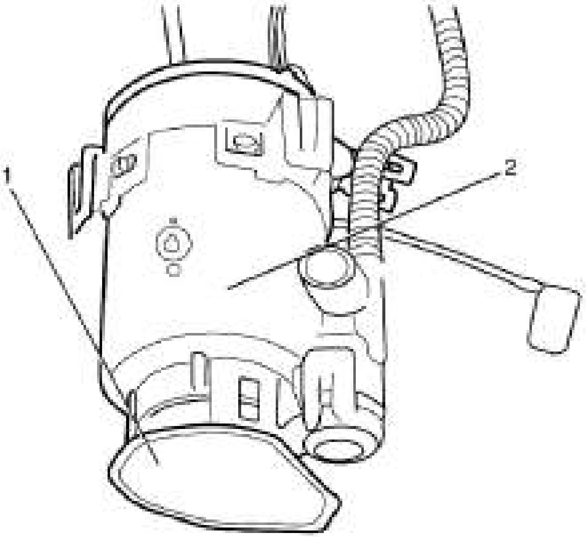


8. Remove the spring (6) from the primary fuel tank module assembly (5).
9. Unclip the piping (4) with a suitable tool.
10. Unclip the connector (7) with a suitable tool.
11. Make a note of the routing of the pipes (1) and (3).
12. Carefully remove the fuel pump housing (2) from the primary fuel tank module assembly (5).

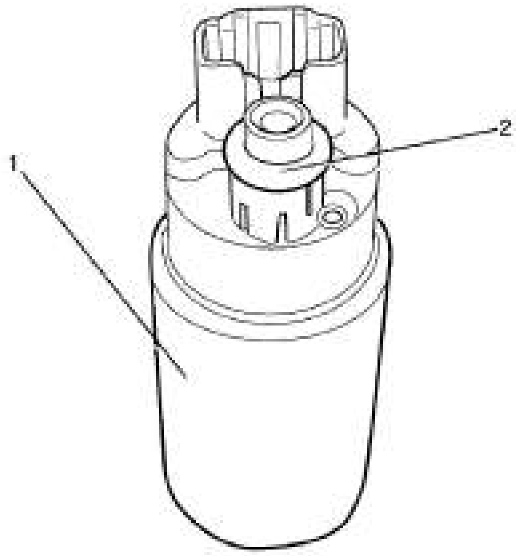


13. Carefully pry the fuel filter (2) from the fuel pump housing (3).

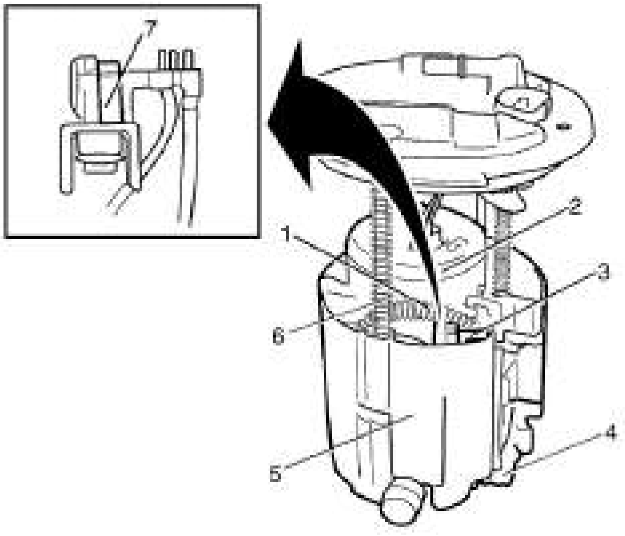
Installation Procedure - From xx/xx



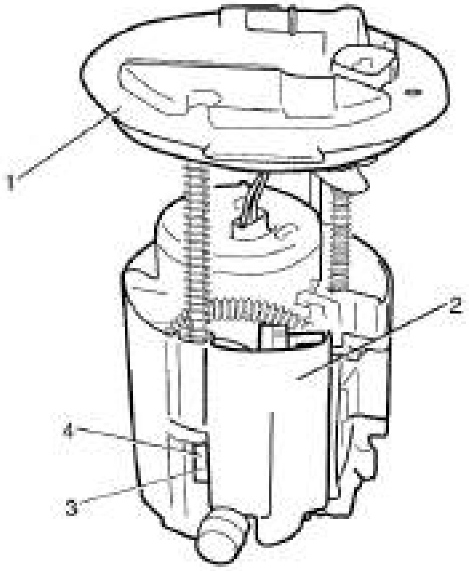
1. Locate and attach the fuel filter (1) to the fuel pump housing (3).



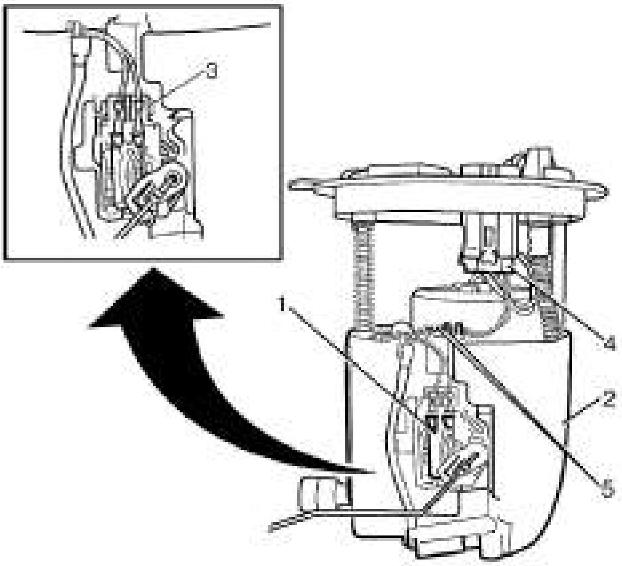
2. Fit a NEW O-ring seal (1) to the fuel outlet (2) and lubricate the NEW O-ring seal with an approved lubricant.



3. Route pipes (1) and (3) as noted earlier.
4. Press down on connector and listen for an audible click to confirm fitment.
5. Locate and install the fuel pump housing (2) into the primary fuel tank module assembly (5).
6. Locate and install the piping (4) to the primary fuel tank module assembly (5). Listen for audible click to confirm fitment.
7. Install the spring (6) to the fuel tank module assembly (5).



8. Assemble the primary fuel tank module assembly (1) and (2).
9. Press down on the primary fuel tank module assembly and install the circlip (3) to the shaft (4).



10. Locate and install the fuel tank level sensor (1) to the primary fuel tank module assembly (2). Make sure that the locking clip (3) engages.
11. Connect the fuel level sensor connector (4) and route the wiring through the harness securing clips (5).

Primary Fuel Level Sensor Replacement

The fuel level sensor is an integral part of the fuel pump assembly and must be replaced as an assembly. For replacement refer to Primary Fuel Tank Module Replacement.

Primary Fuel Tank Module Replacement

Tools Required

J 45747 Fuel Tank Sender Wrench.

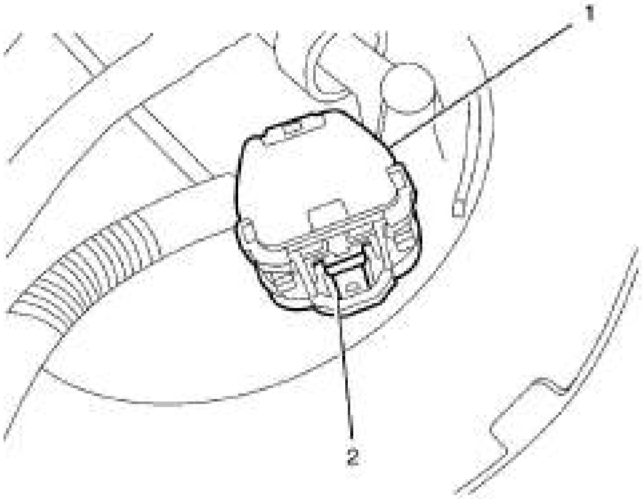
Removal Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

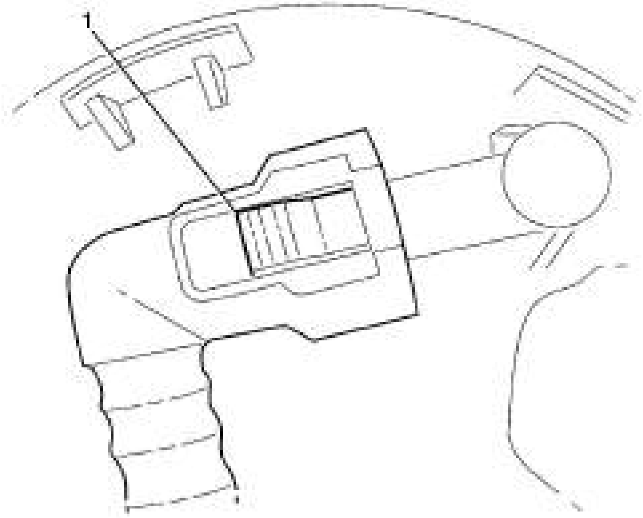
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the fuel tank. Refer to Fuel Tank Replacement .

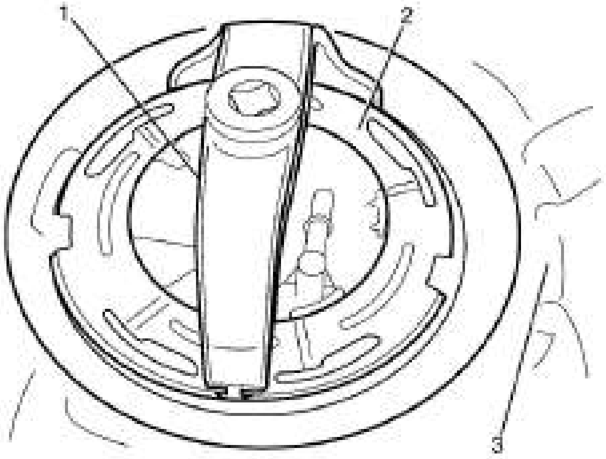


Important: Press release tab (2) on the electrical connector to release.

2. Disconnect the electrical connector (1) from the primary fuel tank module.



3. Remove the fuel supply tube . Refer to Plastic Collar Quick Connect Fitting Service .

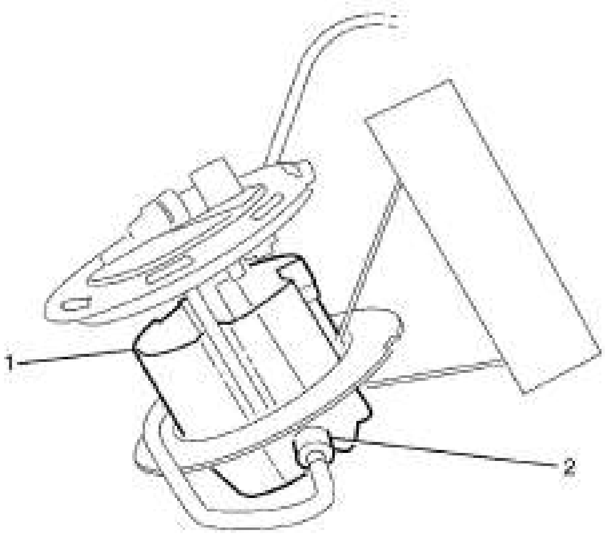


Important: Do not allow the tool to come in contact with the fuel pipes while unlocking the cam lock ring.

4. Rotate the cam lock ring (1) counter-clockwise using the J 45747 .

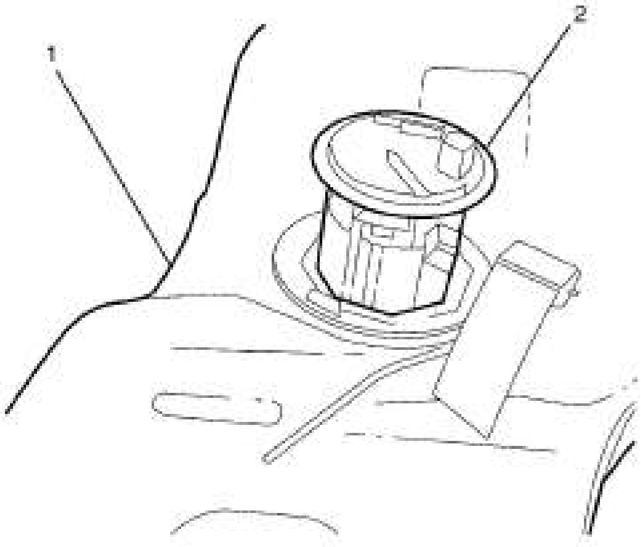
Important: The cam lock ring (1) is a single use part and therefore must be discarded after removal.

5. Remove the cam lock ring (1) from the fuel tank.

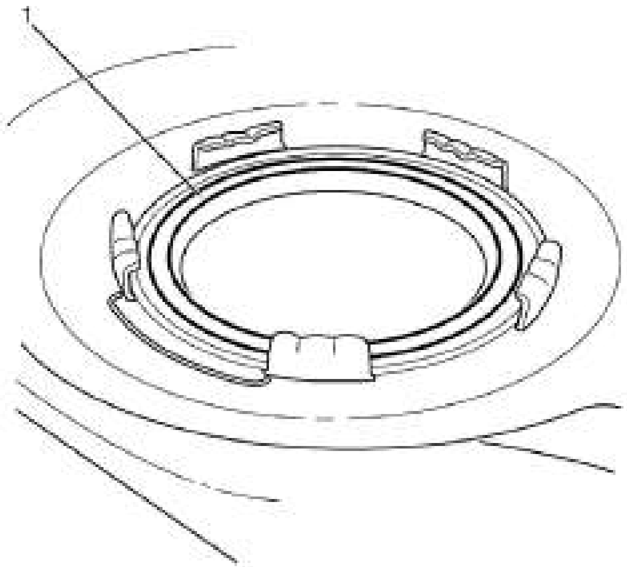


Important: The primary fuel tank module (1) is vertical in the installed position, but pivots for removal.

6. Carefully lift the primary fuel tank module (1) from the fuel tank only enough to access the transfer tube (2).
7. Disconnect the fuel transfer tube from the module assembly (2).



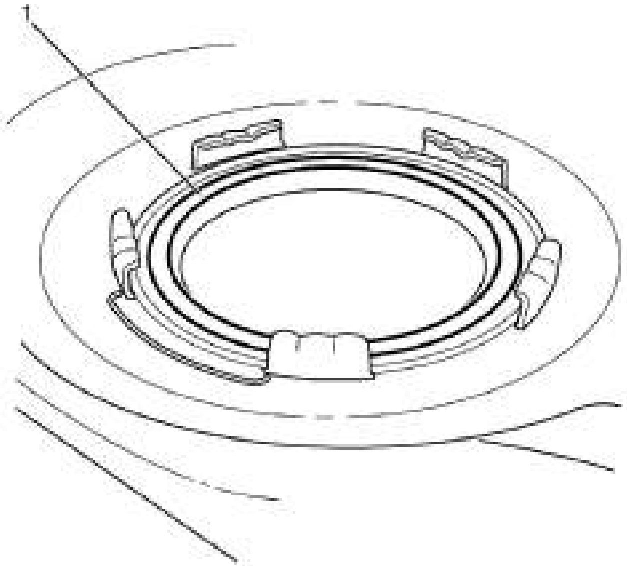
8. Remove the primary fuel tank module (1) from the fuel tank (2).



9. Remove the primary fuel tank module seal (1) from the primary fuel tank module.

   Discard the primary fuel tank module seal.

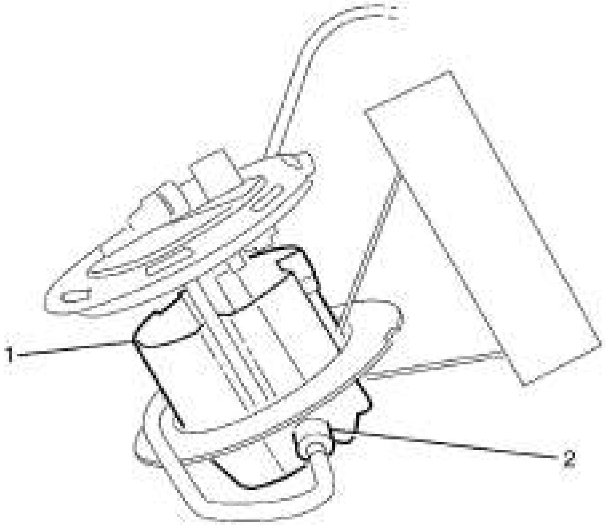
Installation Procedure



Important: Make sure the seal bead is facing the fuel tank.

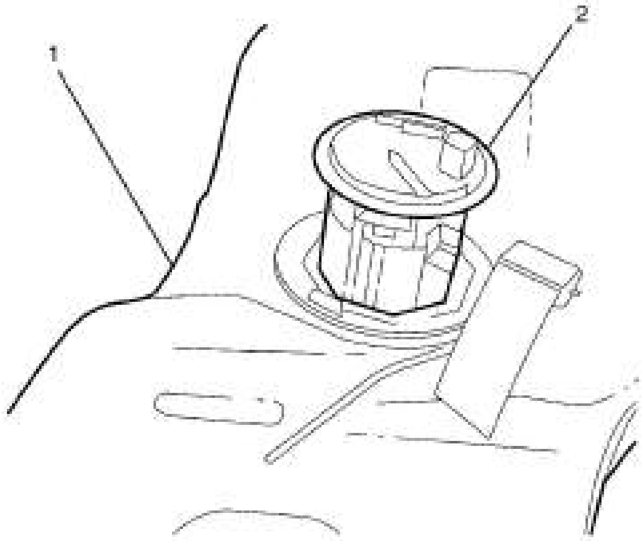
Important: Lubricate the seal before installation with an approved lubricant.

1. Place a NEW primary fuel tank module seal (1) over the primary fuel tank module (2).

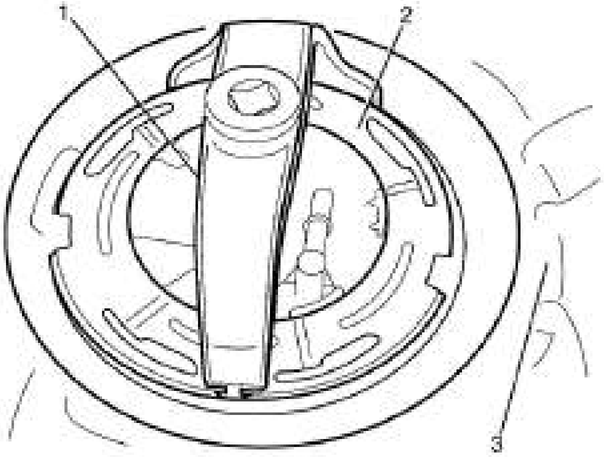


Important: The primary fuel tank module (1) is vertical in the installed position, but pivots for installation/removal.

2. Carefully install the primary fuel tank module (1) to the fuel tank only enough to access the transfer tube (2).
3. Connect the fuel transfer tube to the primary fuel tank module assembly (2).



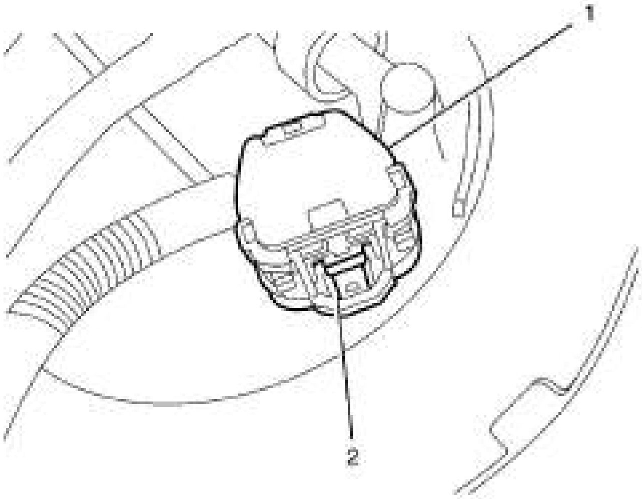
4. Install the primary fuel tank module (1) to the fuel tank (2).



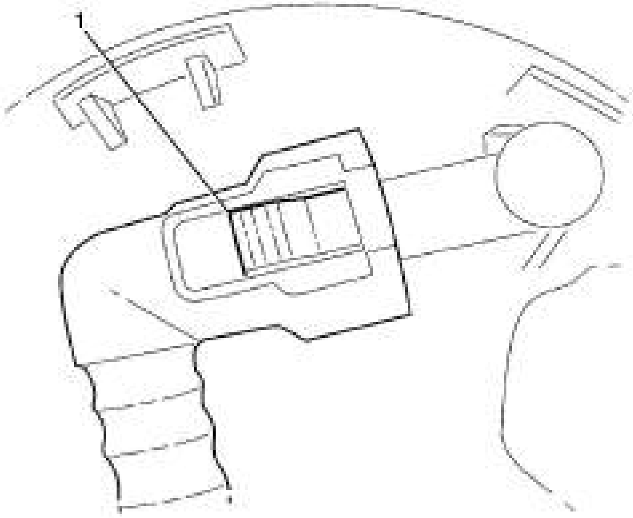
5. Install a NEW cam lock ring (1) to the fuel tank.

   Important: Do not allow the tool to come in contact with the fuel pipes while locking the cam lock ring.

6. Rotate the cam lock ring (1) clockwise using the J 45747 until fully seated.



7. Connect the electrical connector (1) to the primary fuel tank module.



8. Install the fuel supply tube to the fuel tank module. Refer to Plastic Collar Quick Connect Fitting Service .
9. Install the fuel tank. Refer to Fuel Tank Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | Document ID: 2141562

Secondary Fuel Tank Module Replacement

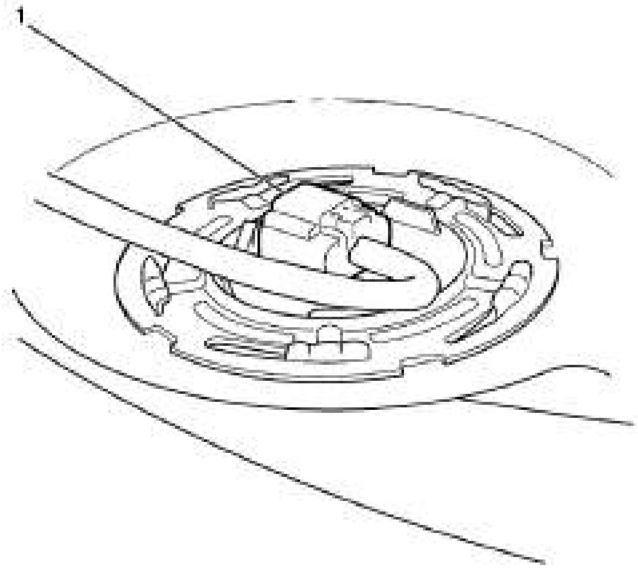
Tools Required

CH-48482 Fuel Tank Sender Wrench

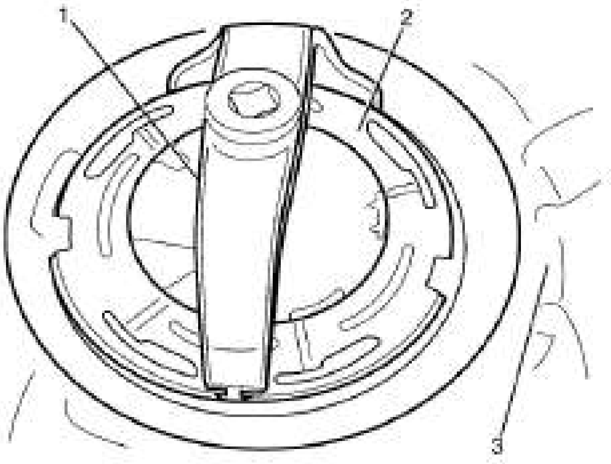
Removal Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

1. Remove the fuel tank. Refer to Fuel Tank Replacement.



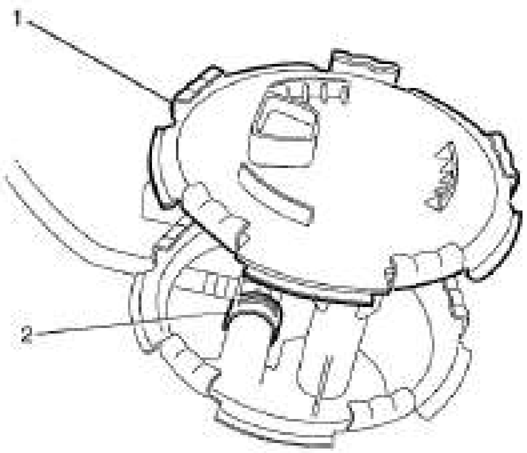
2. Disconnect the secondary fuel tank module electrical connector (1).



3. Rotate the cam lock ring (2) counter-clockwise using the CH-48482 (1).

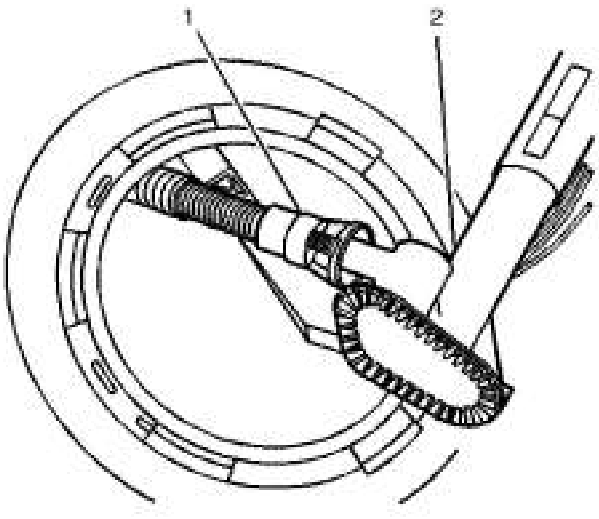
   Important: The cam lock ring (1) is a single use part and therefore must be discarded after removal.

4. Remove the cam lock ring (2) from the fuel tank.

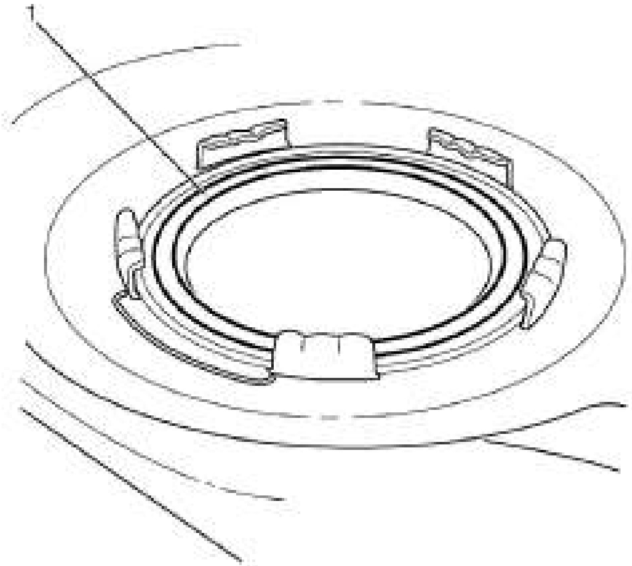


Important: The secondary fuel tank module (1) is vertical in the installed position, but pivots for removal.

5. Carefully lift the secondary fuel tank module (1) from the fuel tank only enough to access the transfer tube (2).



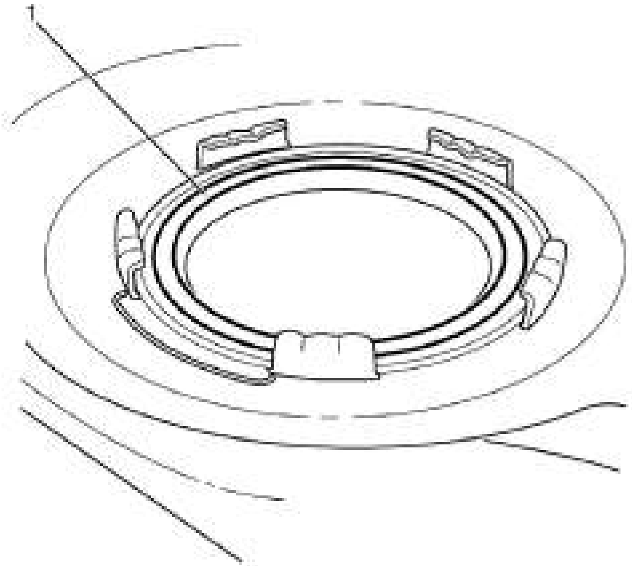
6. Remove the fuel supply tube (1). Refer to Plastic Collar Quick Connect Fitting Service.
7. Remove the secondary fuel tank module (2) from the fuel tank.



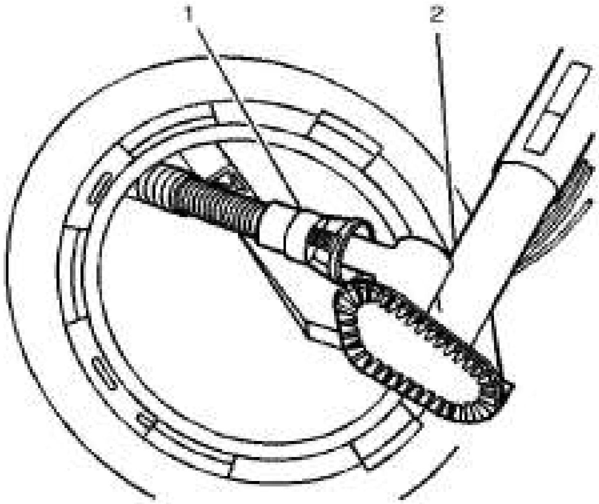
8. Remove the secondary fuel tank module seal (1) from the fuel tank.

   Do not reuse the seal.

Installation Procedure



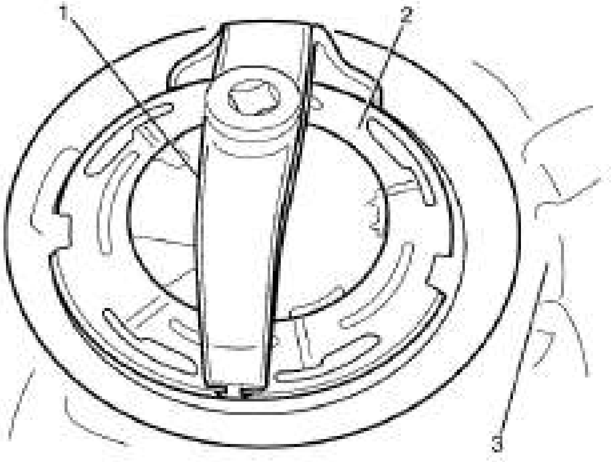
1. Place the new secondary fuel tank module seal (1) in the locating groove on the fuel tank.



2. Complete the following in order to connect the transfer tube (1) to the secondary fuel tank module (2).
   - 2.1. Grasp the transfer tube (1) from inside the fuel tank.
   - 2.2. Position the module (2) near the module opening.
   - 2.3. Connect the transfer tube (1) to the module (2).

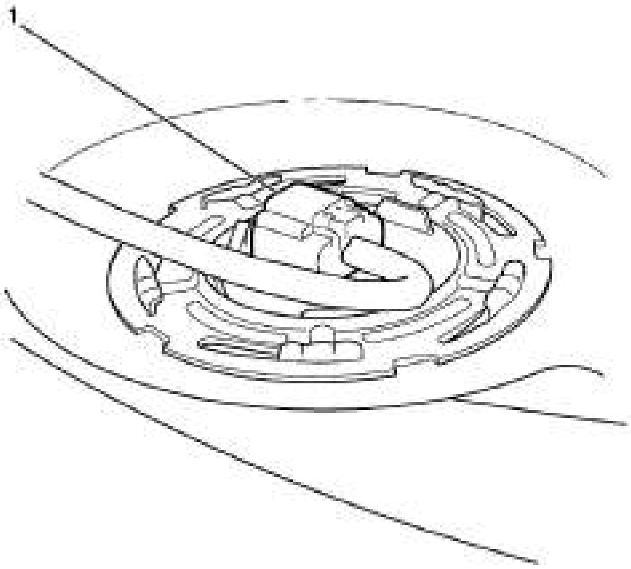
Important: Make sure the fuel level float is free from binding while inserting the module (2).

3. Carefully insert the secondary fuel tank module (2) into the fuel tank.
4. Press the secondary fuel tank module (2) downward, aligning the module to the encapsulated ring.



5. Install a NEW cam lock ring (2) to the fuel tank (3).

6. Rotate the cam lock ring (2) clockwise using the CH-48482 (1) until fully seated.



7. Connect the secondary fuel tank module electrical connector (1).
8. Install the fuel tank. Refer to Fuel Tank Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 1976142**

Spark Plug Inspection

Spark Plug Operation

1. Worn or dirty spark plugs may operate well at idle speeds, but frequently fail at higher load. Bad spark plugs are often responsible for the following conditions:
    - Power loss
    - Poor fuel economy
    - Loss of speed
    - Hard starting
    - Poor engine performance
    - Oil getting past worn piston rings
    - Breaking in a new or recently overhauled engine.
2. Misfiring is a general term that applies to a poor running engine. With misfiring, the ignition spark is not igniting the air/fuel mixture at the proper time. While other possible causes must be investigated, the spark plugs should be inspected first. Spark voltage should not reach ground before jumping across the gap at the tip of the spark plug. This leaves the air/fuel mixture unburned, causing misfiring. Pre-ignition misfiring occurs when the spark plug tip overheats, igniting the mixture before the spark jumps.
3. Carbon fouling of the spark plug is indicated by dry carbon deposits on the portion of the spark plug inside of the cylinder. Excess idling and driving at slower speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Rich fuels or poor ignition system output may also cause carbon fouling.
4. Normal spark plug operation results in brown to grayish tan deposits on the area of the spark plug that enters the cylinder. A small amount of reddish brown, yellow, and white powdery residue may also be present on the insulator tip around the centre electrode. These deposits are normal combustion by-products of fuels and lubricating oils which contain additives.
5. Deposit fouling of the spark plug occurs when the normal reddish brown, yellow, or white deposits of combustion by-products become sufficient enough to cause misfiring. In some cases, these deposits melt and form a shiny glaze on the insulator around the centre electrode. If the fouling is found only in one or two of the cylinders, valve stem clearances or the intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the intake valve side of the spark plug.
6. Excess gap means that the air space between the centre and side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to incorrect gap adjustment or to excess wear of the electrodes during use. A gap that is too small may cause idling instability. Excess gap wear might indicate vehicle operation at continual high speeds or with high engine loads. This causes the spark plugs to run too hot. Lean fuel mixtures may also cause the wear.
7. incorrect torque or seating can cause a spark plug to run hot, eventually leading to excess gap wear. In extreme cases, an over-tightened or under-tightened spark plug can cause exhaust blow-by. The cylinder head seats must make good contact for sufficient heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep the spark plug from seating even though the proper torque is applied. Once the spark plugs are properly seated, tighten the spark plugs properly.
8. Cracked or broken insulators and insulator tips may be the result of incorrect installation or heat shock. Heat shock is a rapid increase in the insulator tip temperature which causes the insulator material to crack. The upper insulators can be broken when a poorly-fitting tool is used during servicing, or when the spark plug is hit from the outside. Cracks in the upper insulator may be inside the shell or invisible. The breakage may result in oil or water

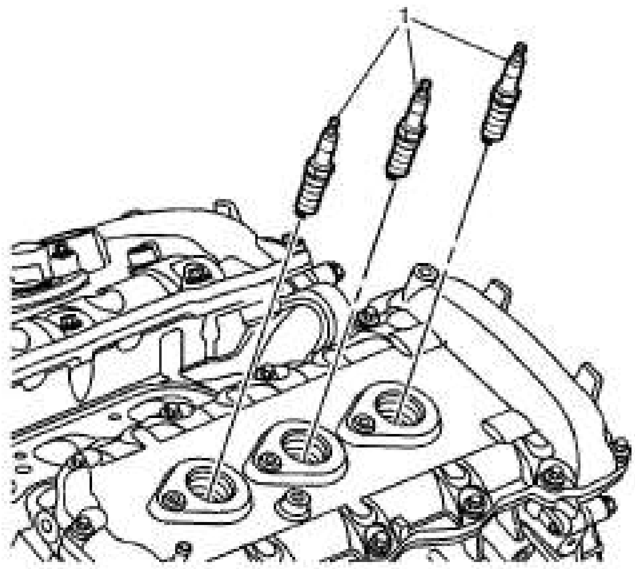
penetration causing failure. Heat shock breakage in the lower insulator tip generally occurs during extreme engine operating conditions such as higher RPM or heavy loading. Over advanced timing or low grade fuels may also cause heat shock breakage. Always replace spark plugs with broken or cracked insulators.

9. Damage during gaping can occur when the tool is pushed against the centre electrode or the surrounding insulator, causing the insulator to crack. When gaping a spark plug, bend only the outside electrode. Keep tools free of any other parts.
10. Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gaped, then returned to service. If there is any doubt about the serviceability of a spark plug, replace the spark plug.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions | **Document ID: 2038715**

Spark Plug Replacement

Removal Procedure



1. Turn the ignition OFF.
2. Remove the ignition coil. Refer to Ignition Coil Replacement - Bank 1 and/or Ignition Coil Replacement - Bank 2.

   Caution: Refer to Safety Glasses and Compressed Air Caution in the Preface section.

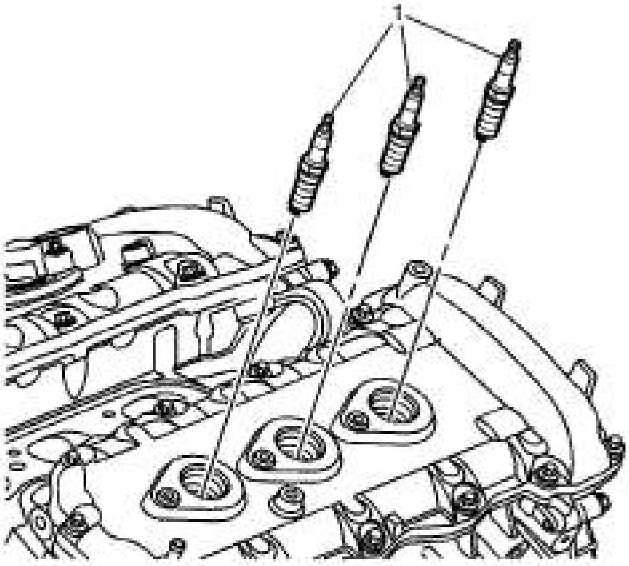
   Notice: Clean the spark plug recess area before removing the spark plug. Failure to do so could result in engine damage because of dirt or foreign material entering the cylinder head, or by the contamination of the cylinder head threads. The contaminated threads may prevent the proper seating of the new plug. Use a thread chaser to clean the threads of any contamination.

3. Use compressed air in order to remove debris from the spark plug cavity.

   Notice: Allow the engine to cool before removing the spark plugs. Attempting to remove the spark plugs from a hot engine may cause the plug threads to seize, causing damage to cylinder head threads.

4. Remove the spark plugs (1) from the cylinder head.

Installation Procedure



Notice: Use only the spark plugs specified for use in the vehicle. Do not install spark plugs that are either hotter or colder than those specified for the vehicle. Installing spark plugs of another type can severely damage the engine.

Notice: Check the gap of all new and reconditioned spark plugs before installation. The pre-set gaps may have changed during handling. Use a round feeler gage to ensure an accurate check. Installing the spark plugs with the wrong gap can cause poor engine performance and may even damage the engine.

1. Make sure that the spark plug gap is equivalent to the spark plug gap specification. Refer to Ignition System Specifications.

   Notice: Be sure that the spark plug threads smoothly into the cylinder head and the spark plug is fully seated. Use a thread chaser, if necessary, to clean threads in the cylinder head. Cross-threading or failing to fully seat the spark plug can cause overheating of the plug, exhaust blow-by, or thread damage.

2. Install the spark plug.

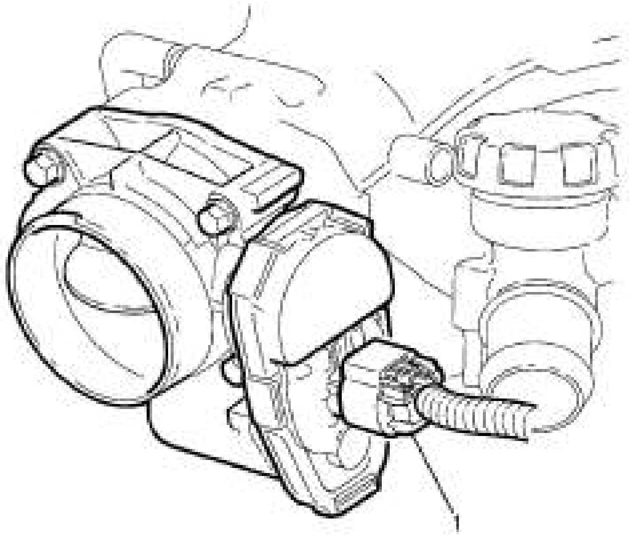
   Tighten
   Tighten the spark plug to 20 N·m (15 lb ft).

3. Install the ignition coil. Refer to Ignition Coil Replacement - Bank 1 and/or Ignition Coil Replacement - Bank 2

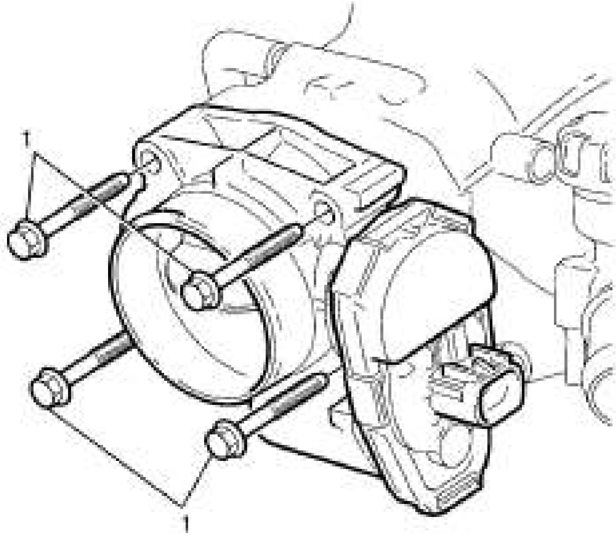
Throttle Body Assembly Replacement

Removal Procedure

1. Turn the ignition OFF.
2. Remove the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.



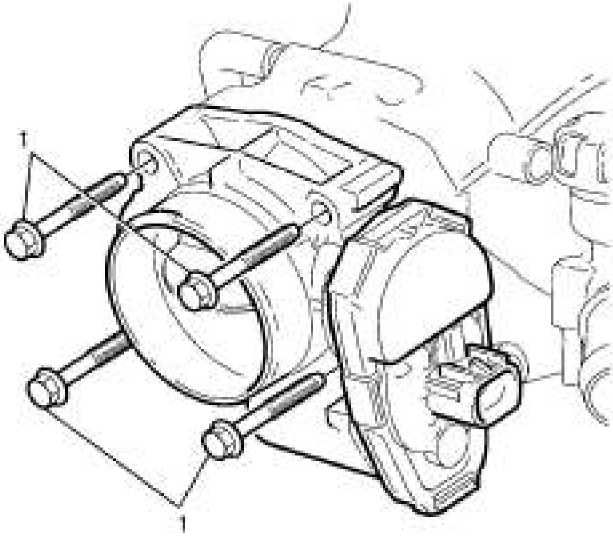
3. Remove the throttle body electrical connector (1) from the throttle body.



4. Remove the the throttle body bolts to upper intake manifold retaining bolts (1)
5. Remove the throttle body and gasket from the vehicle.

Installation Procedure

1. Carefully clean the throttle body mounting surfaces of any gasket and/or sealing material.

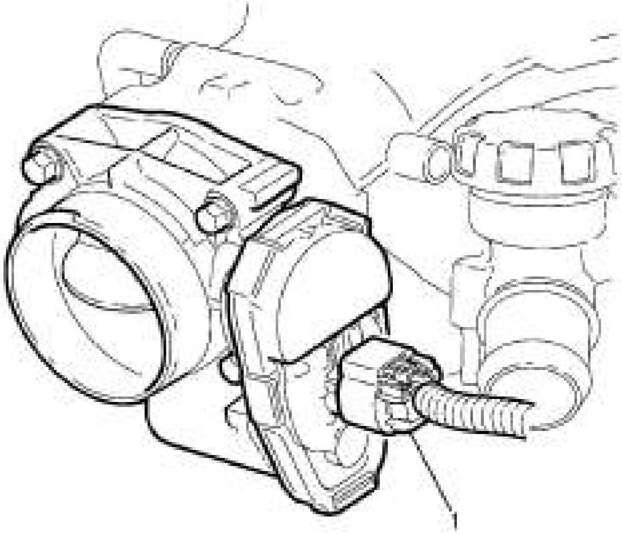


2. Install the throttle body and NEW gasket to the vehicle

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the throttle body bolts to upper intake manifold retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



4. Install the throttle body electrical connector (1) to the throttle body.
5. Install the air cleaner intake duct. Refer to Air Cleaner Inlet Duct Replacement.
6. Perform the idle learn procedure. Refer to Idle Learn
7. Use the scan tool to clear all DTCs.

Throttle Body Inspection and Cleaning

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
2. Fully open the throttle valve in order to Inspect the throttle body bore and the throttle valve plate for any deposits.

   Notice: Do not subject a throttle body assembly which contains the following components to an immersion cleaner or a strong solvent:

   - Throttle position (TP) sensor
   - Idle air control (IAC) valve
   - Sealed throttle shaft bearings

   The cleaners will damage the electric components or sensors.

   The cleaners will damage some of these components that contain seals or O-rings.

   Solvents can wash away or break down the grease used on non-serviceable throttle shaft bearings.

   Never use a wire brush or scraper to clean the throttle body. A wire brush or sharp tools may damage the throttle body components.

   Do not use a cleaner that contains methyl ethyl ketone. This extremely strong solvent may damage components and is not necessary for this type of cleaning.

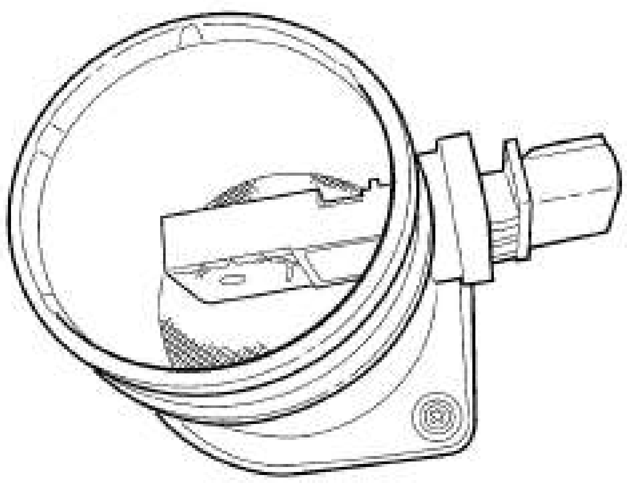
3. Use a clean shop towel and an approved Top Engine Cleaner. Clean the throttle body bore and the throttle valve plate.

   If necessary, use a parts cleaning brush in order to remove heavy deposits.

4. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.

Air Intake System Description

Mass Air Flow Sensor



The MAF sensor measures the amount of air coming into the engine. This direct airflow measurement is more accurate than the calculated airflow information obtained from the other sensor inputs. The MAF sensor also houses an integrated intake air temperature (IAT) sensor. The MAF sensor uses the following circuits:

- An ignition 1 voltage circuit
- A 5-volt reference circuit
- A low reference circuit
- A signal circuit
- IAT signal circuit

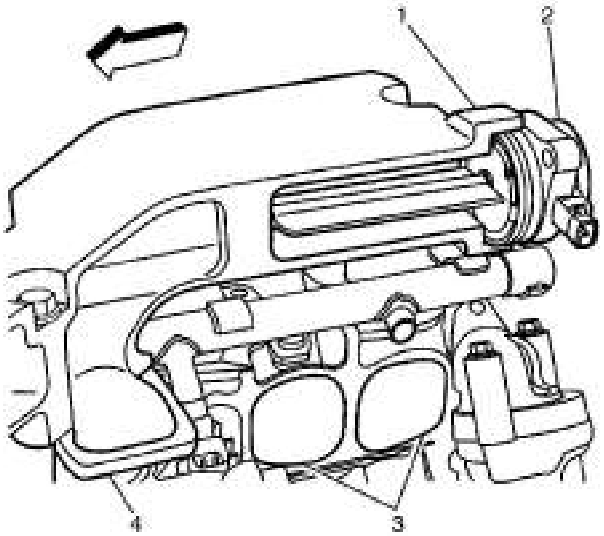
The MAF sensor that is used on this vehicle measures the air flow rate. The MAF output voltage is a function of the power required to keep the air flow sensing elements at a fixed temperature above the ambient temperature. The air flowing through the sensor cools the sensing elements. The amount of cooling is proportional to the amount of air flow. As the air flow increases, more current is needed in order to maintain the hot film at a constant temperature. The MAF sensor converts the changes in the current draw to a voltage signal that the ECM monitors. The ECM calculates the air flow based on this signal.

The ECM monitors the MAF sensor signal voltage and can determine if the sensor signal voltage is too low or too high. The ECM can also detect airflow that is inappropriate for a given operating condition based on the signal voltage.

The scan tool displays the MAF value and displays the value in grams per second (g/s). Values should change rather quickly on acceleration, but should remain fairly stable at any given engine speed. If the ECM detects a condition with the MAF sensor circuits, the following DTCs set:

- P0101 Mass Air Flow (MAF) Sensor Performance
- P0102 Mass Air Flow (MAF) Sensor Circuit Low Voltage
- P0103 Mass Air Flow (MAF) Sensor Circuit High Voltage

Intake Manifold Runner Control (IMRC) Solenoid



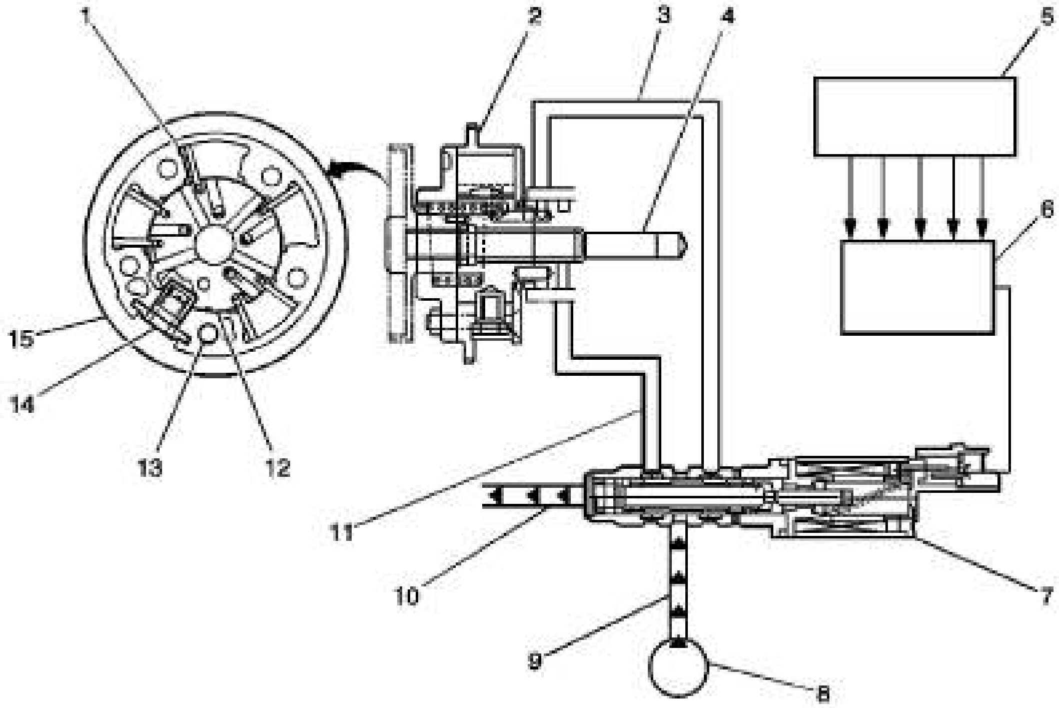
The characteristic torque curve of a normally aspirated engine depends mainly on how the engines average pressure changes over the engine speed band. The average pressure is proportional to the volume of the air mass present in the cylinder when the inlet valve is closed. The design of the inlet system determines how large an air mass can be drawn into a cylinder at a given engine speed.

An intake manifold runner control (IMRC) valve (2) is used to change the intake manifold runner configuration. When the IMRC valve is open, the intake manifold is configured to one large plenum (4). When the IMRC valve is closed, the intake manifold is configured to two smaller plenums (3). The two intake manifold runner sizes result in different torque curves which improves performance at low and high engine speeds. The IMRC valve is located in the intake manifold (1). The IMRC valve solenoid is supplied with ignition 1 voltage and is controlled by the engine Control Module (ECM).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Description and Operation | Document ID: 1992794

Camshaft Actuator System Description

Camshaft Actuator System Overview



(1) Camshaft Actuator Vane
(2) Timing Chain Sprocket
(3) Engine Oil Pressure-For retarding the camshaft
(4) Camshaft
(5) Input Signals from Engine Sensors
(6) Engine Control Module (ECM)
(7) Camshaft Actuator Solenoid
(8) Engine Oil Pump
(9) Engine Oil Pressure Supply
(10) Engine Oil Drain
(11) Engine Oil Pressure-For advancing the camshaft
(12) Camshaft Actuator Rotor
(13) Camshaft Position Sensor Reluctor
(14) Camshaft Actuator Lock Pin
(15) Camshaft Actuator Housing

The camshaft actuator system enables the engine Control Module (ECM) to change camshaft timing of all 4 camshafts while the engine is operating. The CMP actuator assembly (15) varies the camshaft position in response to directional changes in oil pressure. The CMP actuator solenoid valve controls the oil pressure that is applied to advance or retard a camshaft. Modifying camshaft timing under changing engine demand provides better balance between the following performance concerns:

- Engine power output
- Fuel economy
- Lower tail pipe emissions

The CMP actuator solenoid valve (7) is controlled by the ECM. The crankshaft position (CKP) sensor and the CMP sensors are used to monitor changes in camshaft positions. The ECM uses the following information in order to calculate the desired camshaft positions:

- The engine coolant temperature (ECT) sensor
- The calculated engine oil temperature (EOT)
- The mass air flow (MAF) sensor
- The throttle position (TP) sensor
- The vehicle speed sensor (VSS)
- The volumetric efficiency

Operation

The CMP actuator assembly has an outer housing that is driven by an engine timing chain. Inside the assembly is a rotor with fixed vanes that is attached to the camshaft. Oil pressure that is applied to the fixed vanes will rotate a specific camshaft in relationship to the crankshaft. The movement of the intake camshafts will advance the intake valve timing up to a maximum of 50 crankshaft degrees. The movement of the exhaust camshafts will retard the exhaust valve timing up to a maximum of 50 crankshaft degrees. When oil pressure is applied to the return side of the vanes, the camshafts will return to 0 crankshaft degrees, or top dead center (TDC). The CMP actuator solenoid valve directs the oil flow that controls the camshaft movement. The ECM commands the CMP solenoid to move the solenoid plunger and spool valve until oil flows from the advance passage (11). Oil flowing thru the CMP actuator assembly from the CMP solenoid advance passage applies pressure to the advance side of the vanes in the CMP actuator assembly. When the camshaft position is retarded, the CMP actuator solenoid valve directs oil to flow into the CMP actuator assembly from the retard passage (3). The ECM can also command the CMP actuator solenoid valve to stop oil flow from both passages in order to hold the current camshaft position.

The ECM operates the CMP actuator solenoid valve by pulse width modulation (PWM) of the solenoid coil. The higher the PWM duty cycle, the larger the change in camshaft timing. The CMP actuator assembly also contains a lock pin (14) that prevents movement between the outer housing and the rotor vane assembly. The lock pin is released by oil pressure before any movement in the CMP actuator assembly takes place. The ECM is continuously comparing CMP sensor inputs with CKP sensor input in order to monitor camshaft position and detect any system malfunctions. If a condition exists in either the intake or exhaust camshaft actuator system, the opposite bank, intake or exhaust, camshaft actuator will default to 0 crankshaft degrees.

CMP Actuator System Operation

Driving Condition	Change in Camshaft Position	Objective	Result

Idle	No Change	Minimize Valve Overlap	Stabilize Idle Speed
Light Engine Load	Retard Valve Timing	Decrease Valve Overlap	Stable Engine Output
Medium Engine Load	Advance Valve Timing	Increase Valve Overlap	Better Fuel Economy with Lower Emissions
Low to Medium RPM with Heavy Load	Advance Valve Timing	Advance Intake Valve Closing	Improve Low to Mid-range Torque
High RPM with Heavy Load	Retard Valve Timing	Retard Intake Valve Closing	Improve Engine Output

Electronic Ignition (EI) System Description

The electronic ignition (EI) system produces and controls a high-energy secondary spark. This spark is used to ignite the compressed air/fuel mixture at precisely the correct time. This provides optimal performance, fuel economy, and control of exhaust emissions. This ignition system uses an individual coil for each cylinder. The ignition coils are mounted in the center of each camshaft cover with short integrated boots connecting the coils to the spark plugs. The driver modules within each ignition coil are commanded ON/OFF by the engine Control Module (ECM). The ECM primarily uses engine speed, the MAF sensor signal, and position information from the crankshaft position (CKP) and the camshaft position (CMP) sensors. This controls the sequence, dwell, and timing of the spark. The EI system consists of the following components:

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor works in conjunction with a 58 tooth reluctor wheel on the crankshaft. The engine Control Module (ECM) monitors the voltage between the CKP sensor signal circuits. As each reluctor wheel tooth rotates past the sensor, the sensor creates an analog signal. This analog signal is processed by the ECM. The reluctor wheel teeth are 6 degrees apart. Having only 58 teeth leaves a 12 degree span that is uncut. This creates a signature pattern that enables the ECM to determine the CKP. The ECM can determine which pair of cylinders is approaching top dead center based on the CKP signal alone. The camshaft position (CMP) sensor signals are used in order to determine which of these 2 cylinders is on a firing stroke, and which is on the exhaust stroke. The ECM uses this to properly synchronize the ignition system, the fuel injectors, and the knock control. This sensor is also used in order to detect misfire.

Camshaft Position (CMP) Sensor

This engine uses 4 camshaft position (CMP) sensors, one for each camshaft. The CMP sensor signals are a digital ON/OFF pulse, output 4 times per revolution of the camshaft. The CMP sensor does not directly affect the operation of the ignition system. The CMP sensor information is used by the engine Control Module (ECM) to determine the position of the 4 camshafts relative to the crankshaft position. By monitoring the CMP and crankshaft position (CKP) signals the ECM can accurately time the operation of the fuel injectors. The ECM supplies the CMP sensor with a 5-volt reference circuit and a low reference circuit. The CMP sensor signals are an input to the ECM. These signals are also used to detect camshaft alignment with the crankshaft.

Ignition Coils

Each ignition coil contains a solid state driver module as its primary element. The engine Control Module (ECM) signals the coil driver to initiate a firing event by applying ignition control (IC) circuit voltage for the appropriate time, or dwell. When the voltage is removed the coil fires the spark plug. The ignition coils use the following circuits:

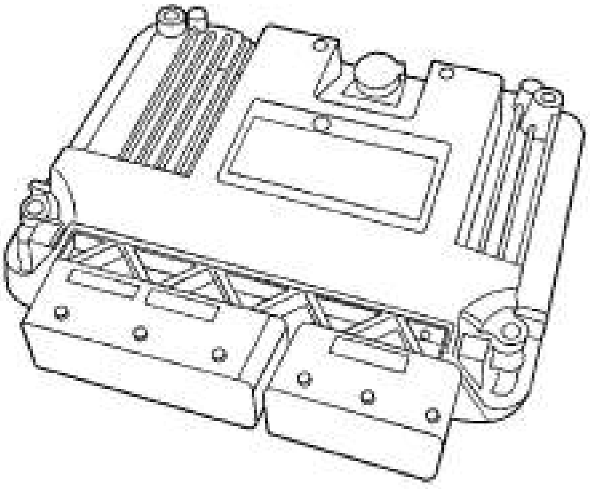
- An ignition 1 voltage supply circuit
- An IC circuit
- Two ground circuits

Engine Control Module (ECM)

The engine Control Module (ECM) controls all ignition system functions, and constantly corrects the spark timing. The ECM monitors information from various sensor inputs that include the following components:

- The throttle position (TP) sensor
- The engine coolant temperature (ECT) sensor
- The mass air flow (MAF) sensor
- The intake air temperature (IAT) sensor
- The vehicle speed sensor (VSS)
- The transmission gear position or range information sensors
- The engine knock sensors (KS)
- Ambient pressure sensor (BARO)

Engine Control Module Description



The engine Control Module (ECM) interacts with many more emission related components and systems, and monitors emission related components and systems for deterioration. OBD II diagnostics monitor the system performance and a diagnostic trouble code (DTC) sets if the system performance degrades.

The malfunction indicator lamp (MIL) operation and the DTC storage are dictated by the DTC type. A DTC is ranked as a Type A or Type B if the DTC is emissions related. Type C is a non-emissions related DTC.

The ECM is in the engine compartment. The ECM is the control centre of the engine controls system. The ECM controls the following components:

- The fuel injection system
- The ignition system
- The emission control systems
- The on-board diagnostics
- The A/C and fan systems
- The throttle actuation control (TAC) system

The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect the vehicle performance and the emissions. The ECM also performs diagnostic tests on various parts of the system. The ECM can recognize operational errors and alert the driver via the MIL. When the ECM detects a malfunction, the ECM stores a DTC. The condition area is identified by the particular DTC that is set. This aids the technician in making repairs.

ECM Function

The ECM can supply 5 volts or 12 volts to the various sensors or switches. This is done through pull-up resistors to the regulated power supplies within the ECM. In some cases, even an ordinary shop voltmeter will not give an accurate reading because the resistance is too low. Therefore, a DMM with at least 10 megaohms input impedance is required in order to make sure accurate voltage readings.

The ECM controls the output circuits by controlling the ground or the power feed circuit through the transistors or a device called an output driver module.

EPROM

The electronically erasable programmable read only memory (EPROM) is a permanent memory that is physically part of the ECM. The EPROM contains program and calibration information that the ECM needs in order to control the powertrain operation.

Special equipment, as well as the correct program and calibration for the vehicle, are required in order to reprogram the ECM.

Theft Deterrent System Frequency Code Programming

This vehicle is equipped with a theft deterrent system which interfaces with the ECM. If the ECM is replaced, program the new ECM with the frequency code of the theft deterrent module that is currently on the vehicle. The vehicle will not start until this procedure is completed.

KS Module

The ECM employs an internal integrated circuit to continuously monitor the knock control evaluation circuit. The knock sensor (KS) module contains the circuitry that allows the ECM to utilize the knock sensor (KS) signals and diagnose the KS sensors and circuitry. If the ECM detects a fault in the ability of the KS module to sample these signals, a DTC sets.

Data Link Connector (DLC)

The data link connector (DLC) is a 16-pin connector that provides the technician a means of accessing serial data for aid in the diagnosis. This connector allows the technician to use a scan tool in order to monitor the various serial data parameters, and display the DTC information. The DLC is located inside of the drivers compartment, underneath the dash.

Malfunction Indicator Lamp (MIL)

The malfunction indicator lamp (MIL) is inside of the instrument panel cluster (IPC). The MIL is controlled by the ECM and illuminates when the ECM detects a condition that affects the vehicle emissions.

ECM Service Precautions

The ECM, by design, can withstand the normal current draws that are associated with the vehicle operations. However, care must be used in order to avoid overloading any of these circuits. When testing for opens or shorts, do not ground or apply voltage to any of the ECM circuits unless the diagnostic procedure instructs you to do so. These circuits should only be tested with a DMM.

Emissions Diagnosis For State I/M Programs

This OBD II equipped vehicle is designed to diagnose any conditions that may lead to incorrect levels of the following emissions:

- Hydrocarbons (HC)
- Carbon monoxide (CO)
- Oxides of nitrogen (NOx)
- Evaporative emission (EVAP) system losses

Should this vehicles on-board diagnostic system (ECM) detect a condition that may result in incorrect emissions, the ECM turns ON the MIL and stores a DTC that is associated with the condition.

Aftermarket (Add-On) Electrical And Vacuum Equipment

Notice: Do not attach add-on vacuum operated equipment to this vehicle. The use of add-on vacuum equipment may result in damage to vehicle components or systems.

Notice: Connect any add-on electrically operated equipment to the vehicle's electrical system at the battery (power and ground) in order to prevent damage to the vehicle.

Aftermarket, add-on, electrical and vacuum equipment is defined as any equipment installed on a vehicle after leaving the factory that connects to the vehicles electrical or vacuum systems. No allowances have been made in the vehicle design for this type of equipment.

Add-on electrical equipment, even when installed to these strict guidelines, may still cause the power-train system to malfunction. This may also include equipment not connected to the vehicle electrical system, such as portable telephones and radios. Therefore, the first step in diagnosing any power-train condition is to make sure all of the after-market electrical equipment is removed or disconnected from the vehicle. After this is done, if the problem still exists, the problem may be diagnosed in the normal manner.

Electrostatic Discharge (ESD) Damage

Important: In order to prevent possible electrostatic discharge damage to the ECM, DO NOT touch the connector pins on the ECM.

The electronic components that are used in the control systems are often designed to carry very low voltage. The electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

Emissions Control Information Label

The underhood Vehicle Emissions Control Information Label contains important emission specifications and setting procedures. This identifies the year, the manufacturing division of the engine, the displacement of the engine in Litres, the class of the vehicle, and type of fuel metering system. There is also an illustrated emission components and vacuum hose schematic.

This label is located in the engine compartment.

Underhood Inspection

Important: This inspection is very important and must be done carefully and thoroughly.

Perform a careful underhood inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a condition without further steps. Use the following guidelines when performing an inspection:

- Inspect all of the vacuum hoses for correct routing, pinches, cuts, or disconnects.
- Inspect any hoses that are difficult to see.
- Inspect all of the wires in the engine compartment for the following conditions:
  - Burned or chafed spots
  - Pinched wires
  - Contact with sharp edges
  - Contact with hot exhaust manifolds

Basic Knowledge Required

Notice: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in incorrect diagnostic performance or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary in order to effectively use this section of the Service Manual.

You must be familiar with some of the basics of engine operation and electrical diagnosis in order to use this section of the service manual.

- Basic electrical circuits--You should have an understanding of basic electricity and know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire, and you should be able to identify a shorted or open circuit by using a DMM. You should be able to read and understand a wiring diagram.
- Use of digital multimeter, You should be familiar with the DMM, particularly the essential tool . You should be able to use the meter in order to measure the voltage (volts), the resistance (ohms), the current (amps), intermittent (min/max), and frequency (Hertz).

- Use of circuit testing tools--You should not use a test lamp to diagnose the engine controls system unless you are specifically instructed to do so. You should know how to the use jumper wires in order to test the components and allow the DMM readings without damaging the terminals. You should know how to use the J 35616 connector test adapter kit and use the kit whenever the diagnostic procedures call for front probing any connector.

Evaporative Emission Control System Description

EVAP System Operation

The evaporative emission (EVAP) control system limits fuel vapors from escaping into the atmosphere. Fuel tank vapors are allowed to move from the fuel tank, due to pressure in the tank, through the vapor pipe, into the EVAP canister. Carbon in the canister absorbs and stores the fuel vapors. Excess pressure is vented through the vent line and EVAP vent valve to atmosphere. The EVAP canister stores the fuel vapors until the engine is able to use them. At an appropriate time, the control module will command the EVAP purge valve ON, open, allowing engine vacuum to be applied to the EVAP canister. With the EVAP vent valve OFF, open, fresh air will be drawn through the valve and vent line to the EVAP canister. Fresh air is drawn through the canister, pulling fuel vapors from the carbon. The air/fuel vapor mixture continues through the EVAP purge pipe and EVAP purge valve into the intake manifold to be consumed during normal combustion. The Control Module uses several tests to determine if the EVAP system is leaking.

Canister Vent Restriction Test

If the EVAP vent system is restricted, fuel vapors will not be properly purged from the EVAP canister. The Control Module tests this by commanding the EVAP purge valve ON, open; and commanding the EVAP vent valve OFF, open; and monitoring the FTP sensor for an increase in vacuum. If vacuum increases more than a calibrated value, DTC P0446 sets.

Purge Solenoid Leak Test

If the evaporative emission (EVAP) purge solenoid does not seal properly, fuel vapours may enter the engine at an undesired time, causing driveability concerns. The control module tests for this by commanding the EVAP purge solenoid OFF, closed; sealing the system, and monitoring the ECM for an increase in vacuum. If the control module detects that EVAP system vacuum increases above a calibrated value, DTC P0496 will set.

Check Gas Cap Message - If Equipped

The control module sends a serial data message to the driver information center (DIC) illuminating the Check Gas Cap message when a malfunction in the evaporative emission (EVAP) system and a large leak test fails.

EVAP System Components

The EVAP system consists of the following components:

EVAP Canister

The canister is filled with carbon pellets used to absorb and store fuel vapors. Fuel vapor is stored in the canister until the Control Module determines that the vapor can be consumed in the normal combustion process.

EVAP Purge Solenoid

The EVAP purge valve controls the flow of vapors from the EVAP system to the intake manifold. This normally closed valve is pulse width modulated (PWM) by the Control Module to precisely control the flow of fuel vapor to the engine. The valve will also be opened during some portions of the EVAP testing, allowing engine vacuum to enter the EVAP system.

Fuel System Description

System Overview

The fuel tank stores the fuel supply. An electric fuel pump, located in the fuel tank with the fuel sender assembly that pumps the fuel to the fuel rail assembly. The pump provides the fuel at a pressure greater than is needed by the injectors. The fuel pressure regulator, part of the fuel sender assembly, keeps the fuel available to the injectors at a regulated pressure. The fuel system is returnless.

Fuel Tank

The fuel storage tank is made of high density polyethylene. The fuel storage tank is held in place by 2 metal straps that are attached to the under body of the vehicle. The tank shape includes a sump in order to maintain a constant supply of fuel around the fuel pump strainer during low fuel conditions or during aggressive manoeuvres.

The fuel tank also contains a fuel vapor vent valve with a roll-over protection. The vent valve also features a 2-phase vent calibration which increases the fuel vapor flow to the canister when the operating temperatures increase the tank pressure beyond an established threshold.

On-Board ReFuelling Vapor Recovery (ORVR) System

The on-board refuelling vapour recovery (ORVR) system is an on-board vehicle system to recover fuel vapors during the vehicle reFuelling operation. The flow of liquid fuel down to the fuel tank filler neck provides a liquid seal. The purpose of ORVR is to prevent refuelling vapour from exiting the fuel tank filler neck. The ORVR components are listed below, with a brief description of their operation:

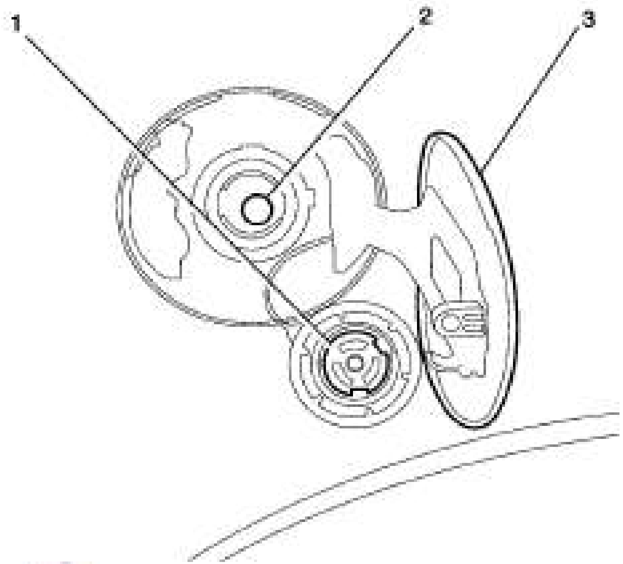
- The fuel tank--The fuel tank contains the modular fuel sender, the fuel limiter vent valve (FLVV), and 1 rollover valve.
- The fuel filler pipe--The fuel filler pipe carries fuel from the fuel nozzle to the fuel tank.
- The evaporative emission (EVAP) canister--The EVAP canister receives refuelling vapour from the fuel system, stores the vapour, and releases the vapour to the engine upon demand.
- The vapour lines--The vapor lines transport fuel viper from the tank assembly to the EVAP canister and engine.
- The check valve--The check valve limits fuel spit-back from the fuel tank during the refuelling operation by allowing fuel flow only into the fuel tank. The check valve is located at the bottom of the fuel filler pipe.
- The modular fuel sender assembly--The modular fuel sender assembly pumps fuel to the engine from the fuel tank.
- The fuel tank pressure (FTP) sensor is located on top of the fuel tank vapour dome.
- The FLVV--The FLVV acts as a shut-off valve. The FLVV is located in the fuel tank. This valve has the following functions:
  - Controlling the fuel tank fill level by closing the primary vent from the fuel tank
  - Preventing fuel from exiting the fuel tank via the vapour line to the canister

  - Providing fuel spillage protection in the event of a vehicle roll-over by closing the vapour path from the tank to the engine
- The pressure vacuum relief valve--The pressure vacuum relief valve provides venting of fuel tank pressure and vacuum. The valve is located in the fuel fill cap.
- The vapour re-circulation line--The vapour re-circulation line is used to transport vapour from the fuel tank to the top of the fill pipe during refuelling to reduce vapour loading to the enhanced EVAP canister.

Fuel Tank Filler Pipe

In order to prevent refuelling with leaded fuel, the fuel filler pipe has a built-in restrictor and a deflector. The opening in the restrictor will accept only the smaller unleaded gasoline fuel nozzle which must be fully inserted in order to bypass the deflector. The tank is vented during filling by an internal vent tube inside of the filler pipe.

Fuel Filler Cap



(1) Fuel Tank Filler Cap

(2) Fuel Tank Filler Pipe

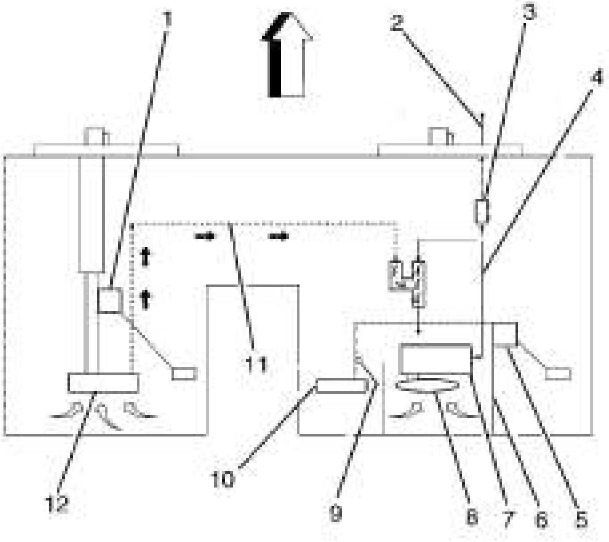
(3) Fuel Filler Door

Notice: If a fuel tank filler cap requires replacement, use only a fuel tank filler cap with the same features. Failure to use the correct fuel tank filler cap can result in a serious malfunction of the fuel and EVAP system.

The fuel tank filler pipe is equipped with a turn to vent screw on the type cap which incorporates a ratchet action in order to prevent over-tightening.

The turn to vent feature allows the fuel tank pressure relief prior to removal. Instructions for proper use are imprinted on the cap cover. A vacuum safety relief valve is incorporated into this cap.

Modular Fuel Sender



(1) Secondary Fuel Level Sensor - Left
(2) fuel feed line to Engine
(3) 2-Way Check Valve - Fuel Supply
(4) Siphon Jet Pump
(5) Primary Fuel Level Sensor - Right
(6) Fuel Reservoir/Bucket
(7) Fuel Pump
(8) Fuel Strainer/Pick up
(9) Return Fuel Check Valve for Reservoir
(10) Return Fuel Jet Pump
(11) Fuel Transfer Line
(12) Fuel Strainer/Pickup

The modular fuel sender assembly mounts to the threaded opening of the plastic fuel tank with a seal and a retainer ring. The reservoir, containing the exterior inlet strainer, the electric fuel pump and the pump strainer, maintains contact with the tank bottom. This design provides:

- Optimum fuel level in the integral fuel reservoir during all fuel tank levels and during driving conditions
- An accurate tank fuel level measuring accuracy
- An proper coarse straining and added pump inlet filtering
- More extensive internal fuel pump isolation for noiseless operation

The modular fuel sender assembly maintains an optimum fuel level in the reservoir (bucket). The fuel entering the reservoir is drawn in by the following components:

- The first stage of the fuel pump through the external strainer
  and/or
- The secondary umbrella valve
  or
- The return fuel line, whenever the level of fuel is below the top of the reservoir

Fuel Pump

The electric fuel pump is a turbine pump which is located inside of the modular fuel sender. The electric fuel pump operation is controlled by the engine control module (ECM) through the fuel pump relay.

Fuel Pressure Regulator Assembly

The fuel pressure regulator is a diaphragm-operated relief valve located in the modular fuel pump and sender assembly. Its principal function is to maintain a controlled pressure at the injectors at all times by regulating fuel flow into the fuel feed line. With the ignition ON and the engine OFF, system fuel pressure at the pressure test connection should be 380-440 kPa (55-64 psi).

Fuel Sender Strainers

The strainers act as a coarse filter to perform the following functions:

- Filter contaminants
- Separate water from fuel
- Provide a wicking action that helps draw fuel into the fuel pump

Fuel stoppage at the strainer indicates that the fuel tank contains an abnormal amount of sediment or water. Therefore, the fuel tank will need to be removed and cleaned, and the filter strainer should be replaced.

Fuel Filter Assembly

The fuel filter assembly is contained within the modular fuel pump and sender assembly reservoir and forms the containment housing for the fuel pump. The filter comprises a paper element which traps particles in the fuel that may damage the fuel injection system. The fuel filter is made to withstand maximum fuel system pressure, changes in temperature and exposure to fuel additives.

Fuel Level Sender Assemblies

The fuel level sender assembly comprises of two fuel level float and wire arm assemblies, a ceramic variable resistor card assembly , and a detachable nylon wiper. The ceramic resistor card is attached to a plastic card holder which attaches to the reservoir. A metal contact fork with brushes is connected to the detachable nylon wiper. This assembly provides a variable circuit resistance to the engine control module (ECM) depending on wiper contact position. Two circuit wires run from the resistor card and extend up to connect with the modular fuel pump to cover assembly wiring connector on the underside of the modular fuel pump and sender assembly cover. The ECM averages out any slosh variation in the fuel tank and sends this signal to the fuel level indicator on the instrument panel fuel gauge.

Quick-Connect Fittings

Quick-connect fittings provide a simplified means of installing and connecting fuel system components. The fittings consist of a unique female connector and a compatible male pipe end. "O" rings, located inside the female connector, provide the fuel seal. Integral locking tabs or fingers hold the fittings together.

Fuel Pipe O-Rings

"O" rings seal the threaded connections in the fuel system. The fuel system "O" ring seals are made of a special material. The fuel pipe "O" rings are not a serviceable item.

EVAP Pipes and Hoses

The evaporative emission (EVAP) tubes extend from the fuel tank module and the EVAP canister vent to the EVAP canister. These tubes are located on the top rear of the fuel tank. The EVAP purge tube/pipe extends from the EVAP canister on top of the fuel tank to the EVAP purge solenoid in the engine compartment. The chassis EVAP purge pipe is constructed of steel.

Fuel Rail

The fuel rail consists of 3 parts:

- The pipe that carries fuel to each injector
- The fuel pressure test port
- Six individual fuel injectors

The fuel rail is mounted on the intake manifold and distributes the fuel to each cylinder through the individual injectors.

Fuel Injectors

The fuel injector is a solenoid device that is controlled by the ECM. When the ECM energizes the injector coil, a normally closed ball valve opens, allowing the fuel to flow past a director plate to the injector outlet. The director plate has holes that control the fuel flow, generating a dual conical spray pattern of finely atomized fuel at the injector outlet. The fuel from the outlet is directed at both of the intake valves, causing the fuel to become further vaporized before entering the combustion chamber.

The fuel injectors will cause various driveability conditions if the following conditions occur:

- If the injectors will not open
- If the injectors are stuck open
- If the injectors are leaking
- If the injectors have a low coil resistance

Fuel Pump Electrical Circuit

When the ignition switch is in the ON position, before engaging the starter, the engine control module (ECM) energizes the fuel pump relay for two seconds, causing the fuel pump to pressurize the fuel system. If the ECM does not receive ignition reference pulses with the engine cranking or running within two seconds, the ECM shuts OFF the fuel pump relay, causing the fuel pump to stop.

Engine Fuelling

The engine is fuelled by six individual injectors, one for each cylinder, that are controlled by the ECM. The ECM controls each injector by energizing the injector coil for a brief period once every other engine revolution. The length of this brief period, or pulse, is carefully calculated by the ECM to deliver the correct amount of fuel for proper driveability and emissions control. The period of time when the injector is energized is called the pulse width and is measured in milliseconds, thousandths of a second.

While the engine is running, the ECM is constantly monitoring the inputs and recalculating the appropriate pulse width for each injector. The pulse width calculation is based on the injector flow rate, mass of fuel the energized injector will pass per unit of time, the desired air/fuel ratio, and actual air mass in each cylinder and is adjusted for battery voltage, short term, and long term fuel trim. The calculated pulse is timed to occur as each cylinders intake valves are closing to attain largest duration and most vaporization.

Fuelling during a crank is slightly different than fuelling during an engine run. As the engine begins to turn, a prime pulse may be injected to speed starting. As soon as the ECM can determine where in the firing order the engine is, the ECM begins pulsing the injectors. The pulse width during the crank is based on the coolant temperature and the engine load.

The Fuelling system has several automatic adjustments in order to compensate for the differences in the fuel system hardware, the driving conditions, the fuel used, and the vehicle aging. The basis for the fuel control is the pulse width calculation that is described above. Included in this calculation are an adjustment for the battery voltage, the short term fuel trim, and the long term fuel trim. The battery voltage adjustment is necessary since the changes in the voltage across the injector affect the injector flow rate. The short term and the long term fuel trims are fine and gross adjustments to the pulse width that are designed in order to maximize the driveability and emissions control. These fuel trims are based on the feedback from the oxygen sensors in the exhaust stream and are only used when the fuel control system is in a Closed Loop operation.

Under certain conditions, the Fuelling system will turn OFF the injectors for a period of time. This is referred to as fuel shut-off. Fuel shut-off is used in order to improve traction, save fuel, improve emissions, and protect the vehicle under certain extreme or abusive conditions.

In case of a major internal failure, the ECM may be able to use a back-up fuel strategy for limp in mode that will run the engine until service can be performed.

Sequential Fuel Injection (SFI)

The ECM controls the fuel injectors based on information that the ECM receives from several information sensors. Each injector is fired individually in the engine firing order, which is called sequential fuel injection. This allows precise fuel metering to each cylinder and improves the driveability under all of the driving conditions.

The ECM has several operating modes for fuel control, depending on the information that has been received from the sensors.

Starting Mode

With the ignition ON, before engaging the starter, the engine control module (ECM) energizes the fuel pump relay for two seconds allowing the fuel pump to build up pressure. The ECM first checks speed density, then switches to the mass air flow (MAF) sensor. The ECM also uses the engine coolant temperature (ECT), throttle position (TP), and manifold absolute pressure (MAP) sensors to determine the proper air/fuel ratio for starting. The ECM controls the amount of fuel delivered in the starting mode by changing the pulse width of the injectors. This is done by pulsing the injectors for very short times.

Clear Flood Mode

If the engine is flooded with fuel during starting and will not start, the Clear Flood Mode can be manually selected. To select Clear Flood Mode, push the accelerator to wide open throttle (WOT). With this signal, the ECM will completely turn OFF the injectors and will maintain this stage as long as the ECM indicates a WOT condition with engine speed below 1,000 RPM.

Run Mode

The Run Mode has 2 conditions: Open Loop operation and Closed Loop operation. When the engine is first started and the engine speed is above 480 RPM, the system goes into Open Loop operation. In Open Loop operation, the ECM ignores the signals from the oxygen sensors and calculates the required injector pulse width based primarily on inputs from the MAF, IAT and ECT sensors.

In Closed Loop, the ECM adjusts the calculated injector pulse width for each bank of injectors based on the signals from each oxygen sensor.

Acceleration Mode

The ECM monitors the changes in the TP and the MAF sensor signals in order to determine when the vehicle is being accelerated. The ECM will then increase the injector pulse width in order to provide more fuel for enhanced performance.

Deceleration Mode

The ECM monitors changes in TP and MAF sensor signals to determine when the vehicle is being decelerated. The ECM will then decrease injector pulse width or even shut OFF injectors for short periods to reduce exhaust emissions, and for better (engine braking) deceleration.

Battery Voltage Correction Mode

The ECM can compensate in order to maintain acceptable vehicle driveability when the ECM sees a low battery voltage condition. The ECM compensates by performing the following functions:

- Increasing the injector pulse width in order to maintain the proper amount of fuel being delivered
- Increasing the idle speed to increase the generator output

Fuel Cutoff Mode

The engine control module (ECM) cuts OFF fuel from the fuel injectors when the following conditions are met in order to protect the powertrain from damage and improve driveability:

- The ignition is OFF. This prevents engine run-on.
- The ignition is ON, but there is no ignition reference signal. This prevents flooding or backfiring.
- The engine speed is too high, above the red line.
- The vehicle speed is too high, above rated tire speed.
- During an extended, high speed, closed throttle coast down, this reduces emissions and increases engine braking.
- During extended deceleration, in order to prevent damage to the catalytic converters.
- The torque management enabled--Transmission shifts or abusive maneuvers.
- The traction control enabled--In conjunction with the front brakes applying

Fuel Trim

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy and emission control. The ECM monitors the heated oxygen sensor (HO2S) signal voltage while in Closed Loop and regulates the fuel delivery by adjusting the pulse width of the fuel injectors based on this signal. The ideal fuel trim values are around 0 percent for both short term and long term fuel trim. A positive fuel trim value indicates the ECM is adding fuel in order to compensate for a lean condition by increasing the pulse width. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition by decreasing the pulse width. A change made to the fuel delivery changes the short term and long term fuel trim values. The short term fuel trim values change rapidly in response to the HO2S signal voltage. These changes fine tune the engine fuelling. The long term fuel trim makes coarse adjustments to the fuelling in order to re-centre and restore control to short term fuel trim. A scan tool can be used to monitor the short term and long term fuel trim values. The long term fuel trim diagnostic is based on an average of several of the long term speed load learn cells. The ECM selects the cells based on the engine speed and engine load. If the ECM detects an lean or rich condition, the ECM will set a fuel trim DTC.

Fuel System Description (With LLT)

Fuel System Overview

The fuel tank stores the fuel supply. The fuel pump module, located in the fuel tank, supplies fuel through the fuel feed pipe to the high pressure fuel pump. The high pressure fuel pump supplies fuel to a variable-pressure fuel rail. Fuel enters the combustion chamber through precision multi-hole fuel injectors. The high pressure fuel pump, fuel rail pressure, fuel injection timing, and injection duration are controlled by the engine control module (ECM).

Fuel Tank

The fuel storage tank is made of high density polyethylene. The fuel storage tank is held in place by 2 metal straps that are attached to the under body of the vehicle. The tank shape includes a sump in order to maintain a constant supply of fuel around the fuel pump strainer during low fuel conditions or during aggressive maneuvers.

The fuel tank also contains a fuel vapor vent valve with a roll-over protection. The vent valve also features a 2-phase vent calibration which increases the fuel vapor flow to the canister when the operating temperatures increase the tank pressure beyond an established threshold.

On-Board Refueling Vapor Recovery (ORVR) System

The on-board refueling vapor recovery (ORVR) system is an on-board vehicle system to recover fuel vapors during the vehicle refueling operation. The flow of liquid fuel down to the fuel tank filler neck provides a liquid seal. The purpose of ORVR is to prevent refueling vapor from exiting the fuel tank filler neck. The ORVR components are listed below, with a brief description of their operation:

- The fuel tank--The fuel tank contains the modular fuel sender, the fuel limiter vent valve (FLVV), and 1 rollover valve.
- The fuel filler pipe--The fuel filler pipe carries fuel from the fuel nozzle to the fuel tank.
- The evaporative emission (EVAP) canister--The EVAP canister receives refueling vapor from the fuel system, stores the vapor, and releases the vapor to the engine upon demand.
- The vapor lines--The vapor lines transport fuel vapor from the tank assembly to the EVAP canister and engine.
- The check valve--The check valve limits fuel spit-back from the fuel tank during the refueling operation by allowing fuel flow only into the fuel tank. The check valve is located at the bottom of the fuel filler pipe.
- The modular fuel sender assembly--The modular fuel sender assembly pumps fuel to the engine from the fuel tank.
- The fuel tank pressure (FTP) sensor is located on top of the fuel tank vapor dome.
- The FLVV--The FLVV acts as a shut-off valve. The FLVV is located in the fuel tank. This valve has the following functions:
  - Controlling the fuel tank fill level by closing the primary vent from the fuel tank
  - Preventing fuel from exiting the fuel tank via the vapor line to the canister
  - Providing fuel spillage protection in the event of a vehicle rollover by closing the vapor path

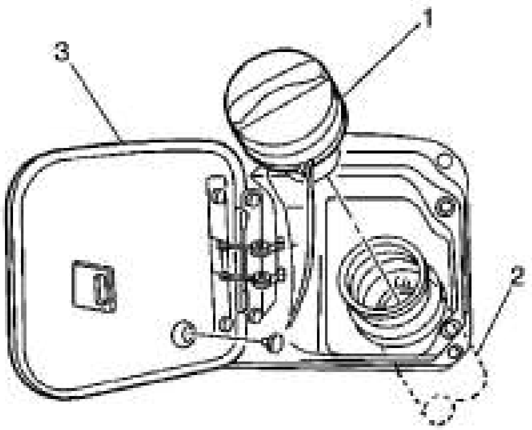
from the tank to the engine

- The pressure vacuum relief valve--The pressure vacuum relief valve provides venting of excessive fuel tank pressure and vacuum. The valve is located in the fuel fill cap.
- The vapor recirculation line--The vapor recirculation line is used to transport vapor from the fuel tank to the top of the fill pipe during refueling to reduce vapor loading to the enhanced EVAP canister.

Fuel Tank Filler Pipe

In order to prevent refueling with leaded fuel, the fuel filler pipe has a built-in restrictor and a deflector. The opening in the restrictor will accept only the smaller unleaded gasoline fuel nozzle which must be fully inserted in order to bypass the deflector. The tank is vented during filling by an internal vent tube inside of the filler pipe.

Fuel Filler Cap



(1) Fuel Tank Filler Cap
(2) Fuel Tank Filler Pipe
(3) Fuel Filler Door

Caution: Use a fuel tank filler pipe cap with the same features as the original when a replacement is necessary. Failure to use the correct fuel tank filler pipe cap can result in a serious malfunction of the fuel system.

The fuel tank filler pipe is equipped with a turn to vent screw on the type cap which incorporates a ratchet action in order to prevent over-tightening.

The turn to vent feature allows the fuel tank pressure relief prior to removal. Instructions for proper use are imprinted on the cap cover. A vacuum safety relief valve is incorporated into this cap.

Modular Fuel Sender

Fuel System Diagram

(13) Fuel Transfer Line
(14) Fuel Strainer/Pickup

The modular fuel sender assembly mounts to the threaded opening of the plastic fuel tank with a seal and a retainer ring. The reservoir, containing the exterior inlet strainer, the electric fuel pump and the pump strainer, maintains contact with the tank bottom. This design provides:

- Optimum fuel level in the integral fuel reservoir during all fuel tank levels and during driving conditions
- An improved tank fuel level measuring accuracy
- An improved coarse straining and added pump inlet filtering
- More extensive internal fuel pump isolation for noiseless operation

The modular fuel sender assembly maintains an optimum fuel level in the reservoir (bucket). The fuel entering the reservoir is drawn in by the following components:

- The first stage of the fuel pump through the external strainer

  and/or
- The secondary umbrella valve

  or
- The return fuel line, whenever the level of fuel is below the top of the reservoir

Fuel Pump

The electric fuel pump is a turbine pump which is located inside of the modular fuel sender. The electric fuel pump operation is controlled by the engine control module (ECM) through the fuel pump relay.

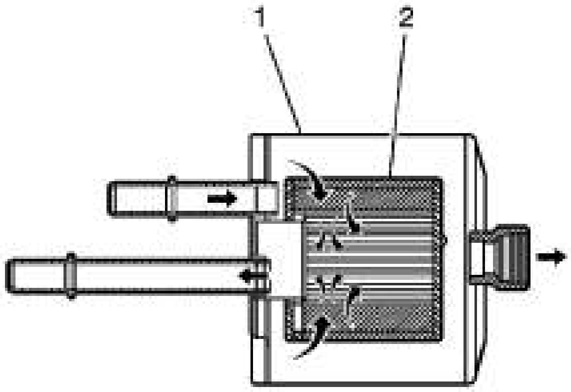
Fuel Sender Strainers

The strainers act as a coarse filter to perform the following functions:

- Filter contaminants
- Separate water from fuel
- Provide a wicking action that helps draw fuel into the fuel pump

Fuel stoppage at the strainer indicates that the fuel tank contains an abnormal amount of sediment or water. Therefore, the fuel tank will need to be removed and cleaned, and the filter strainer should be replaced.

In-Line Fuel Filter

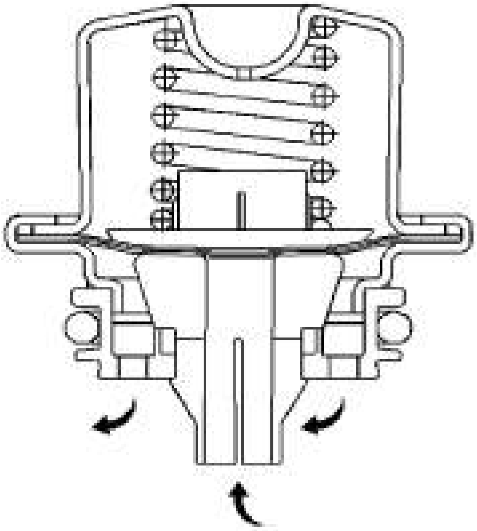


The fuel filter is located on the fuel feed pipe, between the fuel pump and the fuel rail. The electric fuel pump supplies fuel through the in-line fuel filter to the fuel injection system. The fuel pressure regulator keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned from the fuel filter to the fuel tank by a separate fuel return pipe. The paper filter element (2) traps particles in the fuel that may damage the fuel injection system. The filter housing (1) is made to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. There is no service interval for fuel filter replacement. Replace a restricted fuel filter.

EVAP Lines and Hoses

The EVAP line extends from the fuel tank vent valve to the EVAP canister and into the engine compartment. The EVAP line is made of nylon and connects to the EVAP canister with a quick connect fitting.

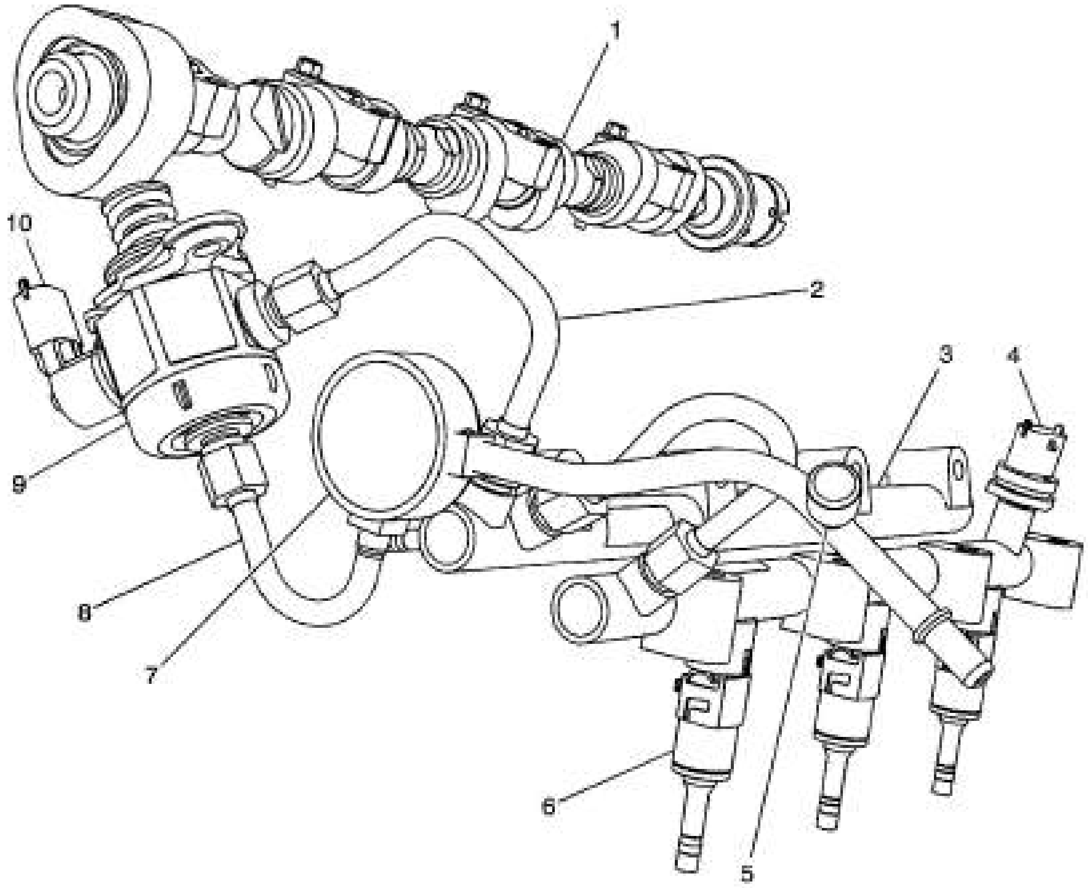
Fuel Pressure Regulator



The fuel pressure regulator attaches to the fuel return pipe on the fuel sender assembly. The fuel pressure regulator is a diaphragm-operated relief valve. A software bias compensates the injector on-time because the fuel pressure regulator is not referenced to manifold vacuum. The injector pulse width varies with the signal from the mass air flow (MAF)/intake air temperature (IAT) sensor.

With the engine running at idle, the system fuel pressure at the pressure test connection should be between 380-410 kPa (55-60 psi). With the system pressurized and the pump OFF the pressure should stabilize and hold. If the pressure regulator supplies a fuel pressure which is too low or too high, a driveability condition will result.

High Pressure Fuel Pump



The high pressure fuel pump (9) is a mechanical one cylinder design driven by an eccentric on the exhaust camshaft (1) of bank 2. High pressure fuel is regulated by the fuel rail pressure (FRP) regulator, which is a part of the high pressure fuel pump. The FRP regulator is a magnetic actuator which controls the inlet valve of the high pressure pump. The ECM provides battery voltage on the actuator high circuit and ground on the actuator low reference circuit. Both circuits are controlled by the ECM. When the ECM deactivates the FRP regulator, both circuits are disabled and the inlet valve is held open with spring pressure. When the ECM activates the FRP regualtor, the low circuit driver connects the low reference circuit to ground and the high circuit driver pulse-width modulates (PWM) the high circuit. The ECM uses the camshaft and crankshaft position sensor inputs to synchronize the FRP regulator with the position of the eccentric on the camshaft. The ECM regulates fuel pressure by adjusting the portion of each pump stroke that provides fuel to the rail. The high pressure fuel pump also contains an integrated pressure relief valve.

Fuel Rail Assembly

The fuel rail assembly (3) attaches to each cylinder head. The fuel rail distributes high pressure fuel to the fuel injectors. The fuel rail assembly consists of the following components:

- Six fuel injectors

- A fuel rail pressure (FRP) sensor

Fuel Injectors

The fuel injection system is a high pressure, direct injection, returnless on-demand design. The fuel injectors (6) are mounted in the cylinder head beneath the intake ports and spray fuel directly into the combustion chamber. Direct injection requires high fuel pressure due to the fuel injector's location in the combustion chamber. Fuel pressure must be higher than compression pressure requiring a high pressure fuel pump. The fuel injectors also require more electrical power due to the high fuel pressure. The ECM supplies a separate high voltage supply circuit and a driver circuit for each fuel injector.

The fuel injector assembly is an inside opening electrical magnetic injector. The injector has six precision machined holes that generate a cone shaped oval spray pattern. The fuel injector has a slim extended tip in order to allow a sufficient cooling jacket in the cylinder head.

The fuel injectors will cause various driveability conditions if the following conditions occur:

- If the injectors will not open
- If the injectors are stuck open
- If the injectors are leaking
- If the injectors have a low coil resistance

Fuel Rail Fuel Pressure Sensor

The fuel rail pressure sensor (4) detects fuel pressure within the fuel rail. The engine control module (ECM) provides a 5 volt reference voltage on the 5 volt reference circuit and ground on the low reference circuit. The ECM receives a varying signal voltage on the signal circuit. The ECM monitors the voltage on the FRP sensor circuits. When the fuel pressure is high, the signal voltage is high. When the fuel pressure is low, the signal voltage is low.

Fuel Pump Relay

The fuel pump relay allows the ECM to energize the fuel pump. The ECM supplies B+ to the fuel pump relay which enables the fuel pump whenever the crankshaft position (CKP) sensor pulses are detected.

Engine Fueling

The engine is fueled by six individual injectors, one for each cylinder, that are controlled by the ECM. The ECM controls each injector by energizing the injector coil for a brief period once every other engine revolution. The length of this brief period, or pulse, is carefully calculated by the ECM to deliver the correct amount of fuel for proper driveability and emissions control. The period of time when the injector is energized is called the pulse width and is measured in milliseconds, thousandths of a second.

While the engine is running, the ECM is constantly monitoring the inputs and recalculating the appropriate pulse width for each injector. The pulse width calculation is based on the injector flow rate, mass of fuel the energized injector will pass per unit of time, the desired air/fuel ratio, and actual air mass in each cylinder and is adjusted for battery voltage, short term, and long term fuel trim. The calculated pulse is timed to occur as each cylinders intake valves are closing to attain largest duration and most vaporization.

Fueling during a crank is slightly different than fueling during an engine run. As the engine begins to turn, a prime pulse may be injected to speed starting. As soon as the ECM can determine where in the firing order the engine is, the ECM begins pulsing the injectors. The pulse width during the crank is based on the coolant temperature and the engine load.

The fueling system has several automatic adjustments in order to compensate for the differences in the fuel system hardware, the driving conditions, the fuel used, and the engine aging. The basis for the fuel control is the pulse width calculation that is described above. Included in this calculation are an adjustment for the battery voltage, the short term fuel trim, and the long term fuel trim. The battery voltage adjustment is necessary since the changes in the voltage across the injector affect the injector flow rate. The short term and the long term fuel trims are fine and coarse adjustments to the pulse width that are designed in order to maximize the driveability and emissions control. These fuel trims are based on the feedback from the oxygen sensors in the exhaust stream and are only used when the fuel control system is in a Closed Loop operation.

Under certain conditions, the fueling system will turn OFF the injectors for a period of time. This is referred to as fuel shut-off. Fuel shut-off is used in order to improve traction, save fuel, improve emissions, and protect the vehicle under certain extreme or abusive conditions.

In case of a major internal problem, the ECM may be able to use a back-up fuel strategy for limp in mode that will run the engine until service can be performed.

Sequential Fuel Injection (SFI)

The ECM controls the fuel injectors based on information that the ECM receives from several information sensors. Each injector is fired individually in the engine firing order, which is called sequential fuel injection. This allows precise fuel metering to each cylinder and improves the driveability under all of the driving conditions.

The ECM has several operating modes for fuel control, depending on the information that has been received from the sensors.

Starting Mode

When the ECM detects reference pulses from the CKP sensor, the ECM will enable the fuel pump. The fuel pump runs and builds up pressure in the fuel system. The ECM then monitors the MAF, IAT, engine coolant temperature (ECT), and the throttle position (TP) sensor signal in order to determine the required injector pulse width for starting.

Clear Flood Mode

If the engine is flooded with fuel during starting and will not start, the Clear Flood Mode can be manually selected. To select Clear Flood Mode, push the accelerator to wide open throttle (WOT). With this signal, the ECM will completely turn OFF the injectors and will maintain this stage as long as the ECM indicates a WOT condition with engine speed below 1,000 RPM.

Run Mode

The Run Mode has 2 conditions: Open Loop operation and Closed Loop operation. When the engine is first started and the engine speed is above 480 RPM, the system goes into Open Loop operation. In Open Loop operation, the ECM ignores the signals from the oxygen sensors and calculates the required injector pulse width based primarily on inputs from the MAF, IAT and ECT sensors.

In Closed Loop, the ECM adjusts the calculated injector pulse width for each bank of injectors based on the signals from each oxygen sensor.

Acceleration Mode

The ECM monitors the changes in the TP and the MAF sensor signals in order to determine when the vehicle is being accelerated. The ECM will then increase the injector pulse width in order to provide more fuel for improved performance.

Deceleration Mode

The ECM monitors changes in TP and MAF sensor signals to determine when the vehicle is being decelerated. The ECM will then decrease injector pulse width or even shut OFF injectors for short periods to reduce exhaust emissions, and for better (engine braking) deceleration.

Battery Voltage Correction Mode

The ECM can compensate in order to maintain acceptable vehicle driveability when the ECM sees a low battery voltage condition. The ECM compensates by performing the following functions:

- Increasing the injector pulse width in order to maintain the proper amount of fuel being delivered
- Increasing the idle speed to increase the generator output

Fuel Shut-Off Mode

The ECM has the ability to completely turn OFF all of the injectors or selectively turn OFF some of the injectors when certain conditions are met. These fuel shut-off modes allow the ECM to protect the engine from damage and also to improve the vehicles driveability.

The ECM will disable all of the six injectors under the following conditions:

- Ignition OFF--Prevents engine run-on
- Ignition ON but no CKP signal--Prevents flooding or backfiring
- A high engine speed--Above the red line
- A high vehicle speed--Above the rated tire speed
- Closed throttle cast down--Reduces the emissions and increases engine braking.

The ECM will selectively disable the injectors under the following conditions:

- The torque management enabled--Transmission shifts or abusive maneuvers.
- The traction control enabled--In conjunction with the front brakes applying

Knock Sensor (KS) System Description

The knock sensor (KS) system detects engine knocking or pinging. The ECM will retard the spark timing based on the signals from the KS system. The KS produce an AC voltage that is sent to the engine Control Module (ECM). The amount of the AC voltage produced is proportional to the amount of knock.

The ECM monitors the voltage of the sensors after each cylinder has fired.

If knock occurs in any of the cylinders, the ignition will be retarded for that particular cylinder. If the knocking then stops, the ignition will be restored to what it was before in steps.

Should knocking continue in the same cylinder in spite of the ignition being retarded, the ECM will retard the ignition an additional steps, and so on, up to a maximum of 12 degrees of retard. The ignition will also be retarded at high ambient temperatures in order to counteract knocking tendencies provoked by high intake air temperatures.

Should either bank 1 or bank 2 sensor fail to work, or should an internal circuit failure occur, the ignition timing will then use a default strategy. The default strategy will retard the ignition the maximum allowed amount to protect the engine from possible damage.

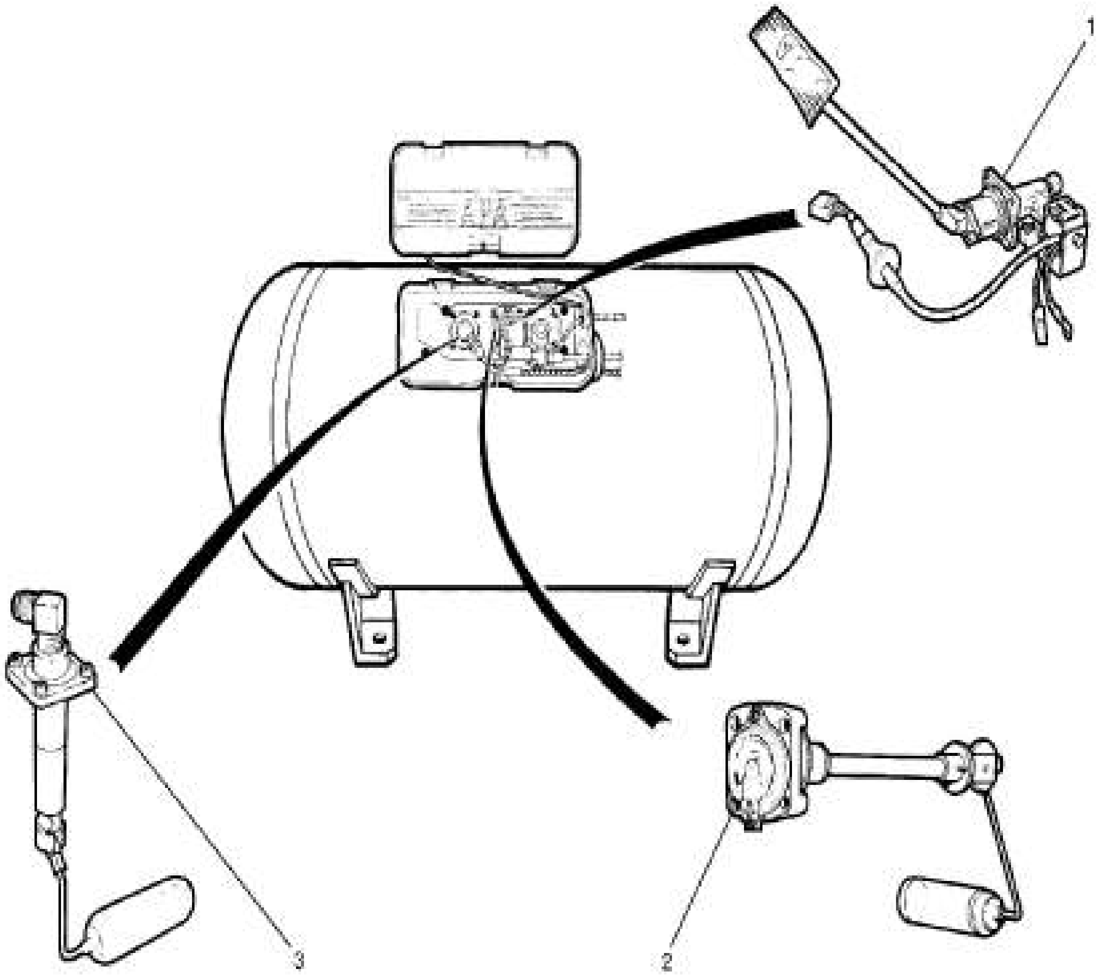
Liquefied Petroleum Gas System Description and Operation

The LPG system works with the petrol system to make a dual fuel vehicle. The LPG system comprises of an LPG tank located in the boot, an LPG filler located in the petrol filler compartment, two LPG lock-off's one is located on the LPG tank and the other underneath the driver, an LPG convertor located behind the left front wheelhouse liner, an LPG control module located behind the right front wheelhouse liner, six LPG injectors located on top of the engine, an LPG switch/gauge located in the floor console in the cigarette lighter compartment, LPG diagnostic connector and fuses located on the left of the radiator.

The fuel selector switch has two positions and a fuel indicator lamp, which changes colour to indicate which fuel mode the vehicle is currently on. Red indicates petrol, amber indicates currently transferring to selected fuel and green is LPG operation. When LPG is selected the engine will start and run on petrol until the required conditions are reached, at which time the system will automatically transfer to LPG operation. When operating on LPG, during certain higher RPM and load conditions, the system will electronically switch to petrol.

LPG Tank

LPG Tank Components



(1) Rear Lock-Off/Service Solenoid Valve Assembly and Excess Flow Valve
(2) Tank Fuel Gauge Assembly
(3) Automatic Fill Limiter (AFL)

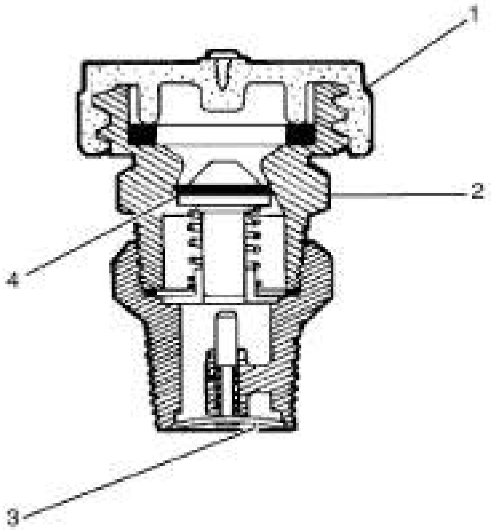
The LPG Tank is made of carbon steel and is manufactured to stringent safety standards. LPG must be stored at approximately 750 kPa at 20°C to remain a liquid. The vapour pressure inside the LPG tank will vary with ambient temperature - as the ambient temperature rises, so does the vapour pressure. The LPG tank is heat treated during manufacture and MUST NOT be heated or welded in any way.

The LPG tank is fitted in the rear compartment, under the rear parcel shelf. The LPG tank incorporates a gas-tight compartment (valve box) which is vented to atmosphere via a vent hose and contains the following components:

- Pressure relief valve.
- Rear lock-off/service solenoid valve assembly and excess flow valve.
- Tank fuel gauge assembly, and Automatic fill limiter (AFL).

These components are either attached into or onto the LPG tank. As the LPG tank is located in the luggage compartment, if any of these components were to leak, or there was an excess pressure discharge, the LPG would be vented to atmosphere via the vent hose and will not vent into the vehicle.

Filler Valve



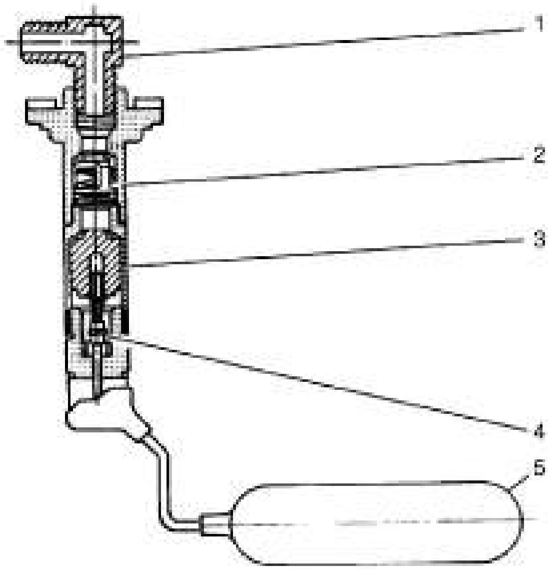
The filler valve is located in the fuel filler pocket, adjacent to the petrol filler.

The valve incorporates two spring-loaded non-return valves (3 & 4) and a sealed cap (1) fitted to the filling connection (2).

The connection is designed to shear off in the event of the vehicle being driven away with the filler hose inadvertently attached. In this situation, the lower valve remains intact, avoiding the LPG discharging.

The filler valve is connected to the LPG tank AFL inlet elbow by a filler line, which is routed through the LPG tank vent hose.

Automatic Fill Limiter



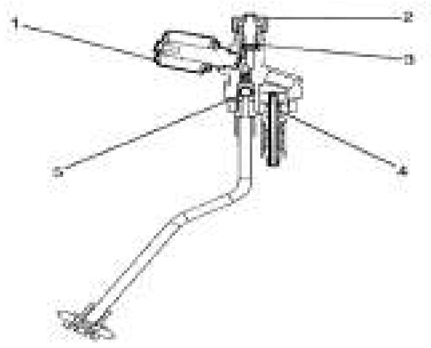
The Automatic Fill Limiter (AFL) is fitted into the LPG tank. The inlet elbow (1) connects the to the LPG filler line.

When the tank is being filled with liquid LPG, the AFL float (5) rises with the liquid within the LPG tank. The float arm is connected to an actuator (4) that operates a shut-off piston (3). When the level reaches approximately 80% full, the piston (3) is in the closed position, effectively shutting off the flow of LPG into the tank.

The remaining 20% of the tank volume is necessary vapour space to allow for the expansion of the liquid that occurs as the temperature of the liquid increases.

The AFL is also fitted with a non-return valve (2) to prevent the gas escaping.

Rear Lock-Off / Service Solenoid Valve Assembly



The rear lock-off/service solenoid valve assembly is fitted to the LPG tank and is four valves in one, it contains the following valves:

- Manual shut off valve.
- Electrically operated solenoid valve.
- Excess flow valve.
- Pressure relief valve.

Manual Shut-Off Valve

The manual shut off valve (3) allows the supply of LPG to be manually shut off for servicing, a leak in the system develops or in the event of a vehicle accident by turning the knob (2).

Solenoid Valve

The solenoid valve (1) is an electrically operated valve, which allows the flow of LPG from the tank into the service line. The solenoid valve is energised for three seconds when the ignition key is first turned on, or constantly while the engine is being cranked or is running.

The solenoid valve (1) will shut off the LPG flow when the ignition is switched off and/or the engine stops running.

Excess Flow Valve

The excess flow valve (4) will close automatically if the flow of liquid LPG is excessive, shutting off the supply of liquid LPG. The valve will automatically reopen when the excess flow condition has ceased.

The excess flow valve is designed to shut off if the flow exceeds a specified amount, as would occur if the service line was severed or opened.

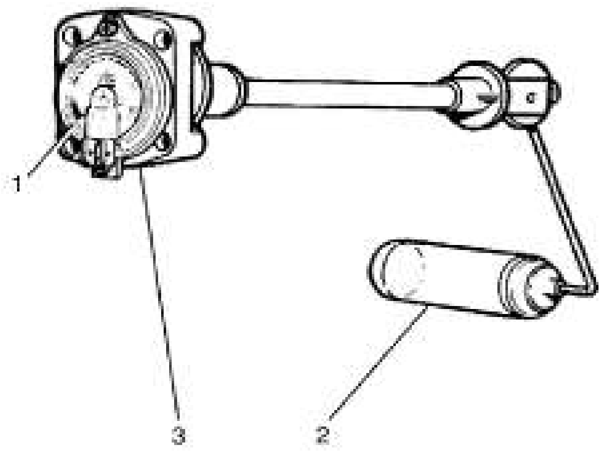
Pressure Relief Valve

If pressure within the LPG tank exceeds approximately 2,550 kPa, the valve (4) opens, overcoming spring tension. The excess pressure will then be vented into the valve box through the orifice (5) and then to atmosphere via the vent hose.

The valve will continue to vent the LPG tank until the pressure drops below 2,550 kPa and the spring closes the valve.

During normal operating conditions the pressure relief valve should not operate.

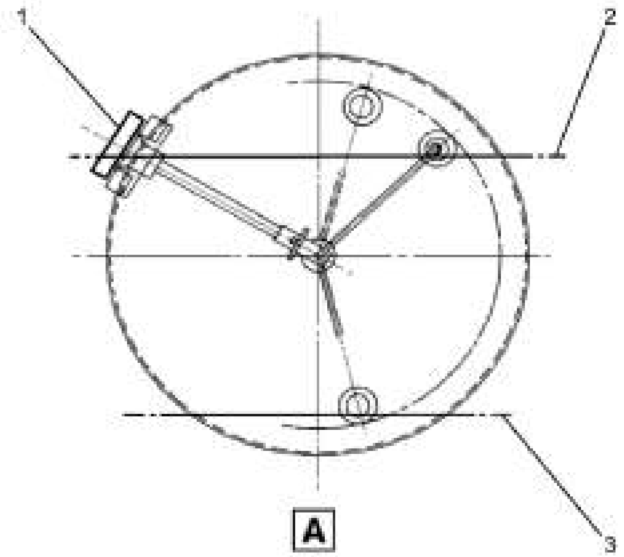
LPG Tank Fuel Gauge Assembly



The tank fuel gauge assembly (1, typical) has a float (2) similar to a petrol gauge sender unit, and a fuel contents gauge (3).

As the liquid level in the LPG tank rises, so too does the float. The float is connected to a magnet within the assembly. Any change in the position of the liquid level is transmitted to the fuel contents gauge via the float and magnet.

The magnetic field produced by the magnet causes the fuel contents gauge mounted on the exterior of the tank to move in relation to the magnet's position.

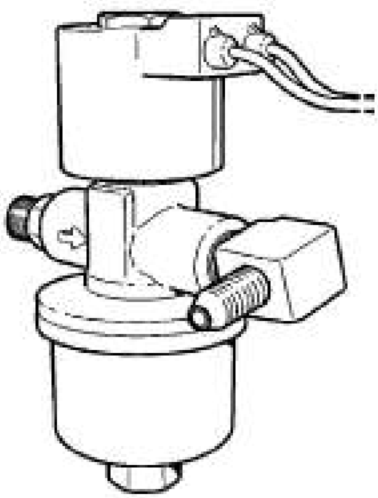


The fuel contents gauge (1) will show full when the liquid level in the tank is at 80% (2). It will show empty when the tank contents falls to approximately 8.5 litres (3).

The fuel gauge sender unit within the fuel contents gauge, incorporates a variable resistor that will vary its resistance from approximately 0 ohms when the tank is empty to approximately 90 ohms when the tank is full.

This change in resistance is used by the LPG control module to determine how many of the fuel level LED's will be activated in the fuel selector switch and fuel level control indicators. When the vehicle is switched to petrol operation, the contents of the petrol tank will be displayed on the instrument cluster.

LPG Front Lock-Off



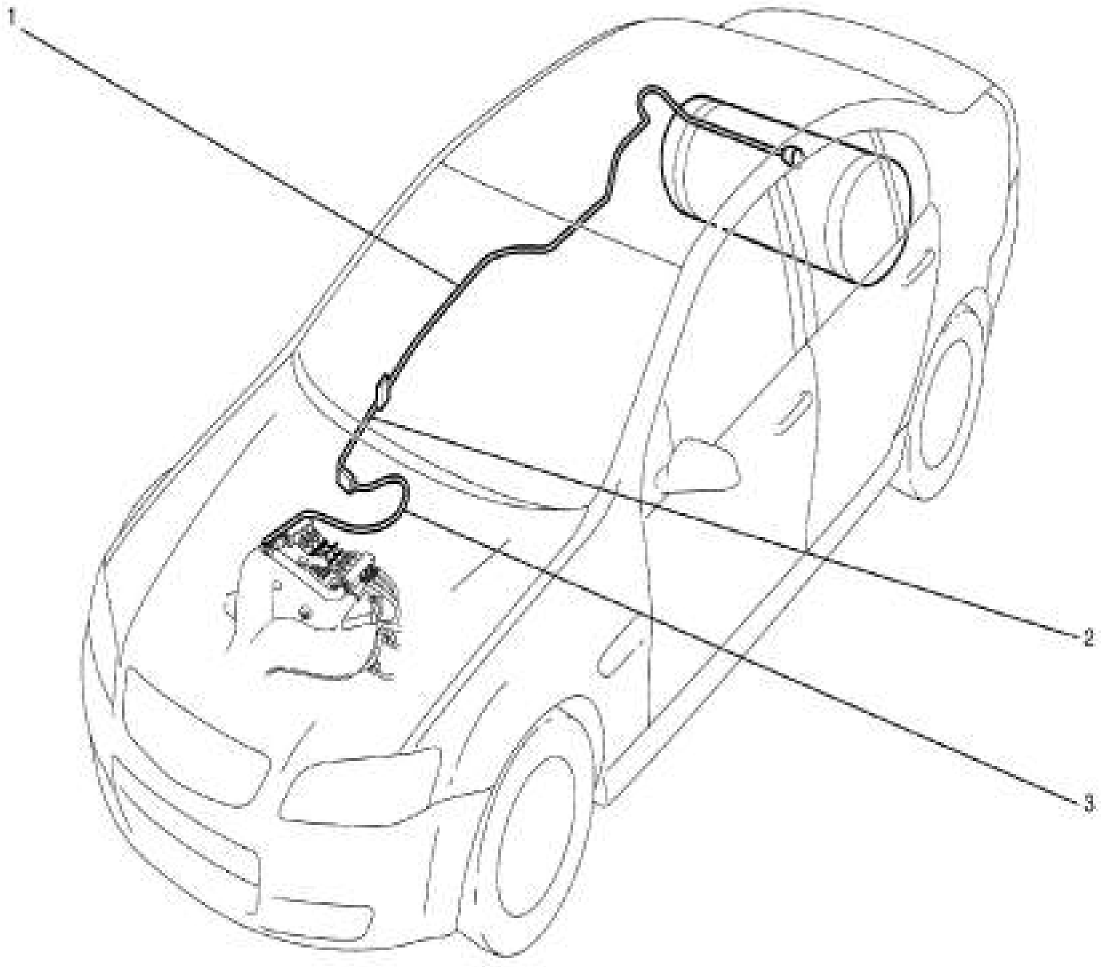
The LPG front lock-off is an electrically operated solenoid valve, which allows or prevents the flow of liquid LPG to the reducer when energised or de-energised by the LPG control module.

The LPG lock-off is energised for three seconds when the ignition is turned on, or constantly while the engine is being cranked or is running.

A filter is incorporated into the design, that is to be serviced every 120,000 km.

When the engine stops running, or the ignition is turned off, the LPG control module de-energises the LPG front lock-off and the supply of LPG is shut off.

Service Line



(1) Rear Service Line

(2) Intermediate Service Line

(3) Front Service Line

The service line carries the liquid LPG from the manual service valve at the LPG storage tank to the LPG lock-off. The service line consists of three major components: the front (3), intermediate (2) and rear (1) service line.

Reducer

Construction

The reducer (also known as a converter) functions are to:

- Control the flow of liquid LPG into the reducer.
- Provide a heat sink to allow vaporisation of the LPG and to prevent icing because of the temperature drop with the volume increase.
- Regulate the output pressure to suit engine requirements.

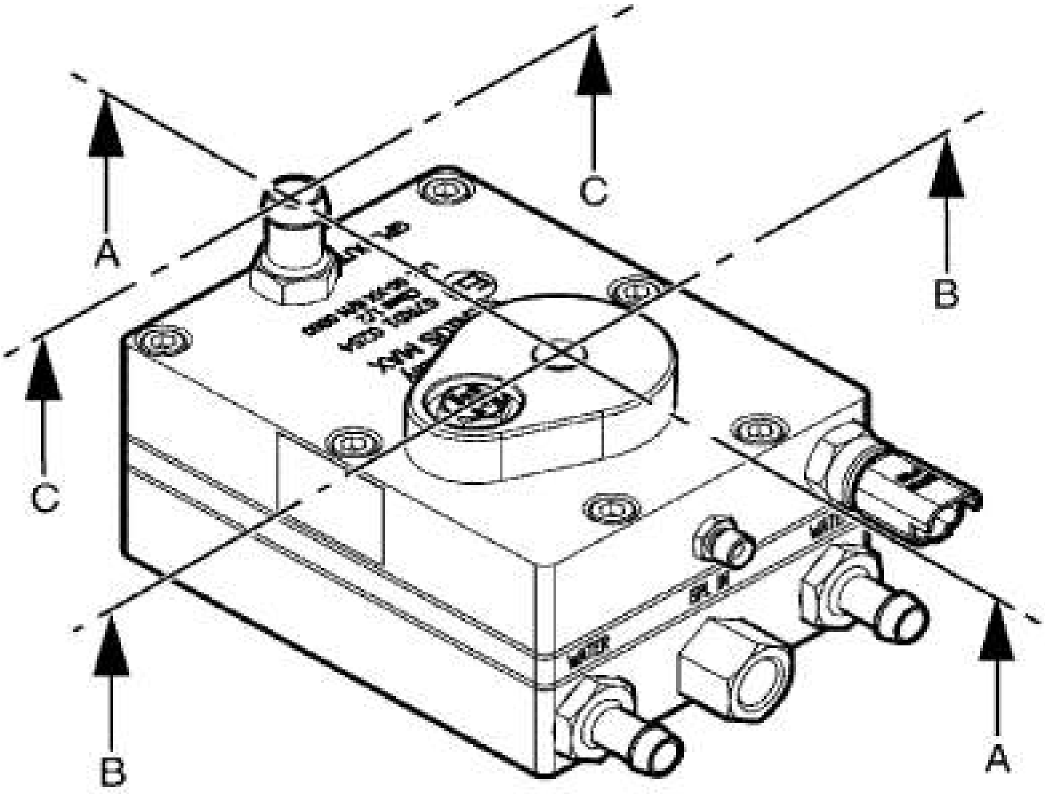


Figure 8A2 -0 21 shows the three sectioned views that follow

Referring to sectioned view "A-A", the Reducer comprises the lower (18) and upper (4) bodies, with an intermediate plate (11), separated by two gaskets (19) and (21).

The upper body (4), contains the pressure regulator spring (1) contained between the upper (2) and lower (6) caps, the upper one of which is adjustable via an externally adjustable screw (3). The diaphragm, located between the upper body and intermediate plate is supported by a small plate (10) and the lower spring cap (6). The upper end of the control shaft (16) is connected to the diaphragm, the two small support plates and Bauer spring (7) by a self-locking nut (5).

Also installed into the upper plate is a fitting (8) for the fitment of a small tube, sensing the engine intake manifold vacuum (or absolute pressure). Also included in the upper plate is a regulating pressure valve (refer to Figure 8A2 - 23 for detail of this valve).

The lower plate contains the primary valve (14) and priming valve pivoting arm (15), connected to the lower end of the control shaft (16). A fitting (13) for the high pressure liquid LPG is provided and the two fittings (12) for the engine coolant (only one is shown in this sectioned view.

Both plates are provided with channels (17) to allow engine coolant to flow around the assembly, with the heat being transferred to the very cold vapour, raising its temperature (and pressure). The Intermediate plate plugged drain (20) in the intermediate plate (11) allows movement of the LPG vapour from the lower (18) to the upper (4) plates.

To summarise, the flow of liquid LPG into the reducer is regulated by the priming valve (14) that is controlled by the vertical movement of the control shaft (16) acting on the priming valve pivot arm (15). The control shaft (16) is connected at the upper end, to the diaphragm separating the upper body (4) and the intermediate plate (11).

(19) Gasket
(20) Intermediate Plate Plugged Drain
(21) Gasket
(22) LPG Vapour Output Fitting

Operation

The conversion of the high pressure liquid LPG coming from the front LPG lock-off to a low pressure, very cold vapour is controlled by the primary valve (14). In turn, the opening of the primary valve is controlled by the vertical movement of the control shaft (16) acting on the primary valve pivot arm (15), that pivots about the pin, anchored to the lower body (18).

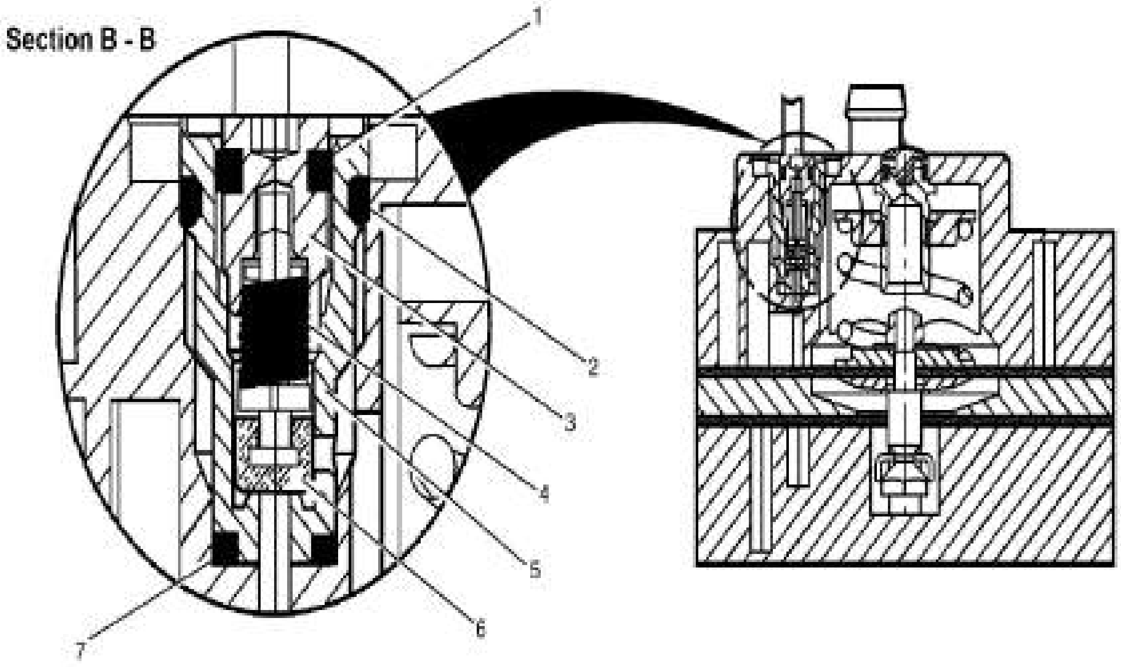
In the process of rapidly reducing the pressure from approximately 1,260 kPa in the tank to atmospheric (101.3 kPa), the liquid LPG changes state to become a vapour and this causes a rapid reduction in temperature. To compensate for this and to assist in vaporisation, engine coolant circulates through the heat exchanger channels (17) in the upper and lower bodies. The reducer seals off LPG flow when the engine is stopped.

The pressure regulating spring (1), acting on the upper side of the diaphragm (6), pushes the diaphragm down. This opens the primary valve (14), allowing LPG to enter the reducer and then to flow through the heat exchanger (17) where the LPG changes state from a liquid to a vapour.

When the engine is cranked or running, a vacuum is created in the engine intake manifold that is transmitted to one end of the reducer by tubing screwed onto the fitting (8). This tube is connected to a ‘T’ piece in the vacuum line and also connected to the P1 MAP sensor. The effect of this vacuum is to work against the regulating spring force, together with the pressure of the LPG acting on the underneath side of the primary diaphragm. This combined action achieves a balance on each side of the diaphragm.

LPG released from the reducer flows through to the vapour filter, before being delivered to each LPG injector manifold by tubing.

Pressure Limit Valve (Section B - B)



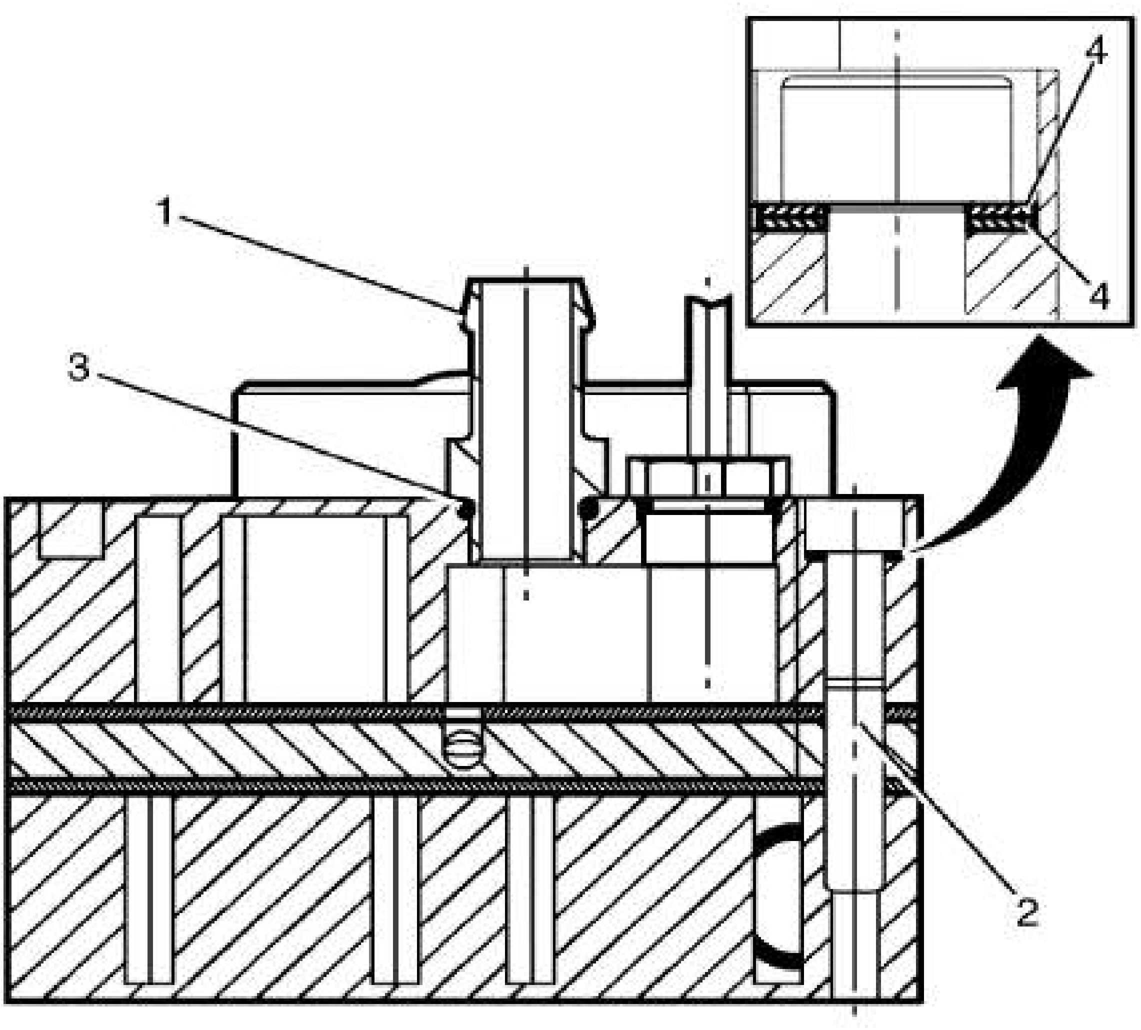
The pressure limiting device consists of the body (5) that is screwed into the reducer upper plate and sealed by O-rings (1 and 2). The adjustment screw (3) that preloads the spring (4) and the piston (6), also sealed by an O-ring (1). At the end of the piston is a seal (7) that seals the sensed LPG pressure.

Should the LPG vapour pressure rise beyond the pre-set value, the piston seal (6) will be lifted off its seat by the LPG pressure, allowing excess vapour to be vented internally into the output stage of the reducer. In this way, no LPG resulting from this pressure control, is released into the atmosphere.

Important: Under no circumstances is the spring force of the pressure limit valve to be tampered with or altered.

Fitment of this valve is purely as a precaution as it is very rarely required to operate. Should it be activated however, it would only be for a very short time and no LPG vapour enters the engine compartment.

Temperature Sensor (Section C -- C)

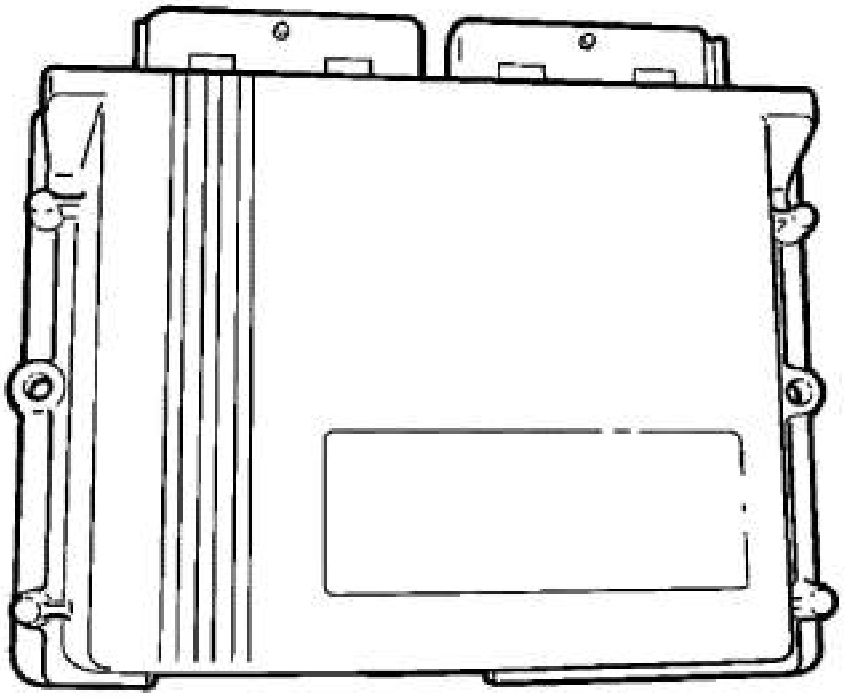


Section C - C shows the location of the NTC resistance, temperature sensor (5) that is located in the outlet stage of the reducer. Until the exiting LPG vapour reaches a prescribed temperature, the LPG ECU will keep the engine running on petrol, regardless of the fuel switch position.

In this way, running on LPG is not possible until the engine coolant reaches a pre-determined temperature.

The outlet fitting (1) and the temperature sensor (5) are sealed by O-rings (3 and 6). The bolts (2) clamping the reducer upper and lower bodies together are sealed by O-Rings (4) under each of the bolt heads.

LPG Control Module



The LPG Electronic Control Unit (ECU), controls the two operating modes: Petrol or LPG.

Petrol Mode

When operating in petrol mode, the LPG ECU signals the smart unit at the LPG tank to stop LPG flow. At the same time, the front LPG Lock-Off solenoid is also de-energised, further preventing LPG flow to the reducer. As the emulator signal is not used in this situation, the vehicle then operates on petrol with full engine management control from the engine ECU. The engine then operates in the same way that a single fuelled petrol engine would do. In this mode, the instrument cluster fuel gauge will show the amount of petrol in the petrol fuel tank.

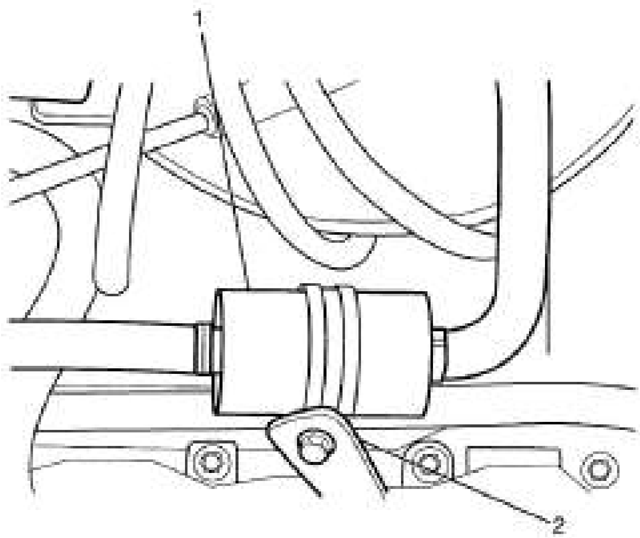
LPG Mode

When operating in the LPG mode, the ECU energises the Smart Unit and the Front Lock-Off solenoid, allowing LPG to flow to the ‘Genius Max’ reducer. The engine switch-over to LPG however, will not occur until engine temperature is high enough to provide adequate vaporisation of the LPG

Once the temperature is up to the pre-determined level, the LPG ECU will activate the emulators and the engine ECM will then control the pulse width of the LPG injectors.

When operating in LPG mode under conditions of prolonged high speed / high load operation, a small amount of petrol is injected into the engine to cool the valves and catalytic reducer.

Vapour Filters

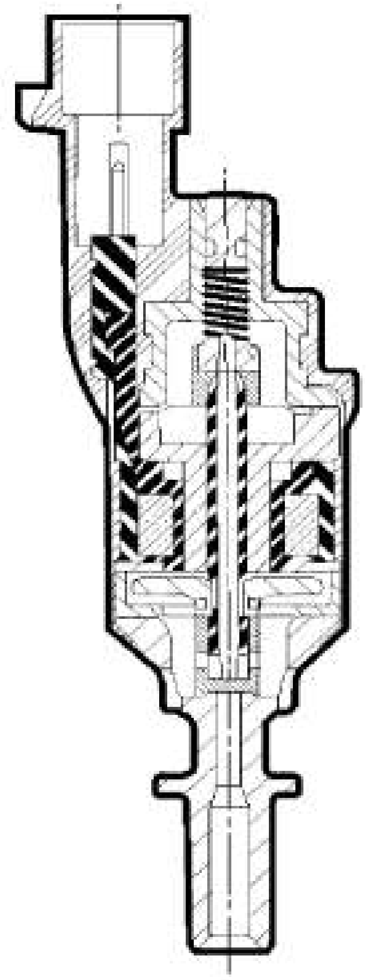


The vapour filter (2) is mounted to a bracket (4) and secured to the mounting bracket by a nut and washer.

Exiting LPG vapour from the reducer passes through the vapour filter and vapour lines (1 & 3) and then to each of the LPG injector manifolds.

Servicing of the vapour filter is by replacement, every 15,000 km.

LPG Fuel Injectors



The BRC LPG injectors are referred to as a ‘bottom feed’ type because the injector is fully immersed in the gas manifold.

When the injector solenoid is energised, the internal valve is lifted from its seat against an internal spring force, by an electro-magnet. This action allows gas to be injected into the engine intake manifold, via a hose.

At the base of the internal valve is a rubber seal, to ensure reliable sealing.

The injector voltage supply is referred to as ‘peak and hold’. This means that battery voltage is applied to the electromagnet to effect a rapid opening and then varied to maintain the valve in an open position.

The injector open time is controlled by the engine ECM as previously described.

The injector coil resistance is 1.8Ω @ 20° C.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Description and Operation | **Document ID: 1974752**

Throttle Actuator Control (TAC) System Description

- The throttle actuator control (TAC) system is used to improve emissions, fuel economy, and driveability. The TAC system removes the mechanical link between the accelerator pedal and the throttle plate. The TAC system removes the need for a cruise Control Module and idle air control motor. The following is a list of TAC system components:
- The accelerator pedal assembly includes the following components:
  - The accelerator pedal
  - The accelerator pedal position (APP) sensor 1
  - The APP sensor 2
- The throttle body assembly includes the following components:
  - The throttle position (TP) sensor 1
  - The TP sensor 2
  - The throttle actuator motor
  - The throttle plate
- The engine Control Module (ECM)

1. The ECM monitors the driver demand for acceleration with 2 APP sensors. The APP sensor 1 signal voltage range is from about 0.98-4.16 volts as the accelerator pedal is moved from the rest pedal position to the full pedal travel position. The APP sensor 2 range is from about 0.49-2.08 volts as the accelerator pedal is moved from the rest pedal position to the full pedal travel position. The ECM processes this information along with other sensor inputs to command the throttle plate to a certain position.
2. The throttle plate is controlled with a direct current motor called a throttle actuator control motor. The ECM can move this motor in the forward or reverse direction by controlling battery voltage and/or ground to 2 internal drivers. The throttle plate is held at a 7 percent rest position using a constant force return spring. This spring holds the throttle plate to the rest position when there is no current flowing to the actuator motor.
3. The ECM monitors the throttle plate angle with 2 TP sensors. The TP sensor 1 signal voltage range is from about 4.86-0.86 volts as the throttle plate is moved from 0 percent to wide open throttle (WOT). The TP sensor 2 voltage range is from about 0.82-4.14 volts as the throttle plate is moved from 0 percent to WOT.
4. The ECM performs diagnostics that monitor the voltage levels of both APP sensors, both TP sensors, and the throttle actuator control motor circuit. It also monitors the spring return rate of both return springs that are housed internal to the throttle body assembly. These diagnostics are performed at different times based on whether the engine is running, not running, or whether the ECM is currently in a throttle body relearn procedure.
5. Every ignition cycle, the ECM performs a quick throttle return spring test to make sure the throttle plate can return to the 7 percent rest position from the 0 percent position. This is to assure that the throttle plate can be brought to the rest position in case of an actuator motor circuit failure. Observe, under cold conditions, the ECM commands the throttle plate to 7 percent with the ignition ON and the engine OFF to release any ice that may have formed on the throttle plate.

Throttle Body Relearn Procedure

The engine Control Module (ECM) stores values that include the lowest possible throttle position (TP) sensor positions-0 percent, the rest positions-7 percent, and the return rate of both springs.

These values will only be erased or overwritten if the ECM is reprogrammed or if a throttle body relearn procedure is performed. Observe, if the battery is disconnected, the ECM will immediately perform a throttle body relearn procedure when the ignition is turned ON.

A throttle body relearn procedure is performed any time the ignition is turned ON, with the engine OFF for longer than 29 seconds when the following conditions have been met:

- The engine speed is less than 40 RPM.
- The vehicle speed is 0 km/h (0 mph).
- The engine coolant temperature (ECT) is between 5-85°C (41-185°F).
- The intake air temperature (IAT) is between than 5-60°C (41-140°F).
- The accelerator pedal position (APP) sensor angle is less than 14.9 percent.
- The ignition 1 voltage is more than 10 volts.

After 29 seconds, the ECM commands the throttle plate from the rest position to full closed, then to around 10 percent open. This procedure takes about 6-8 seconds. If any faults occur in the throttle actuator control (TAC) system, a DTC sets. At the start of this procedure, the scan tool TAC Learn Counter parameter should display 0, then count up to 11 after the procedure is completed. If the counter did not start at 0, or if the counter did not end at 11, a fault has occurred and a DTC should set.

TAC System Default Actions/Reduce Power Modes

1. There are 2 reduce power modes that the engine Control Module (ECM) can default to if an error is detected in the throttle actuator control (TAC) system. If an accelerator pedal position (APP) sensor 1 or APP sensor 2 circuit fault, throttle position (TP) sensor 2 circuit fault, or if a TP sensor 1 circuit fault is detected with some APP angle, the ECM goes into one of the 2 reduce power modes. In this mode, the engine torque is limited so that the vehicle cannot reach speeds of more than 100 km/h (60 mph). The ECM remains in this reduce power mode during the entire ignition cycle even if the fault is corrected.
2. If there is a condition with the throttle actuator control circuits, throttle actuator command vs actual position fault, return spring check fault, or a TP sensor 1 circuit fault, the ECM goes into the other reduce engine power mode. In this mode, the engine speed is limited to 2,500 RPM and the 3-6 fuel injectors are randomly turned OFF. At this time the Reduced Power indicator is commanded ON. The ECM remains in the reduce power mode during the entire ignition cycle even if the fault is corrected. Observe, if a TP sensor 1 or throttle actuator control circuit fault is present at the time the vehicle is at idle, with no accelerator pedal angle, the engine may stall.

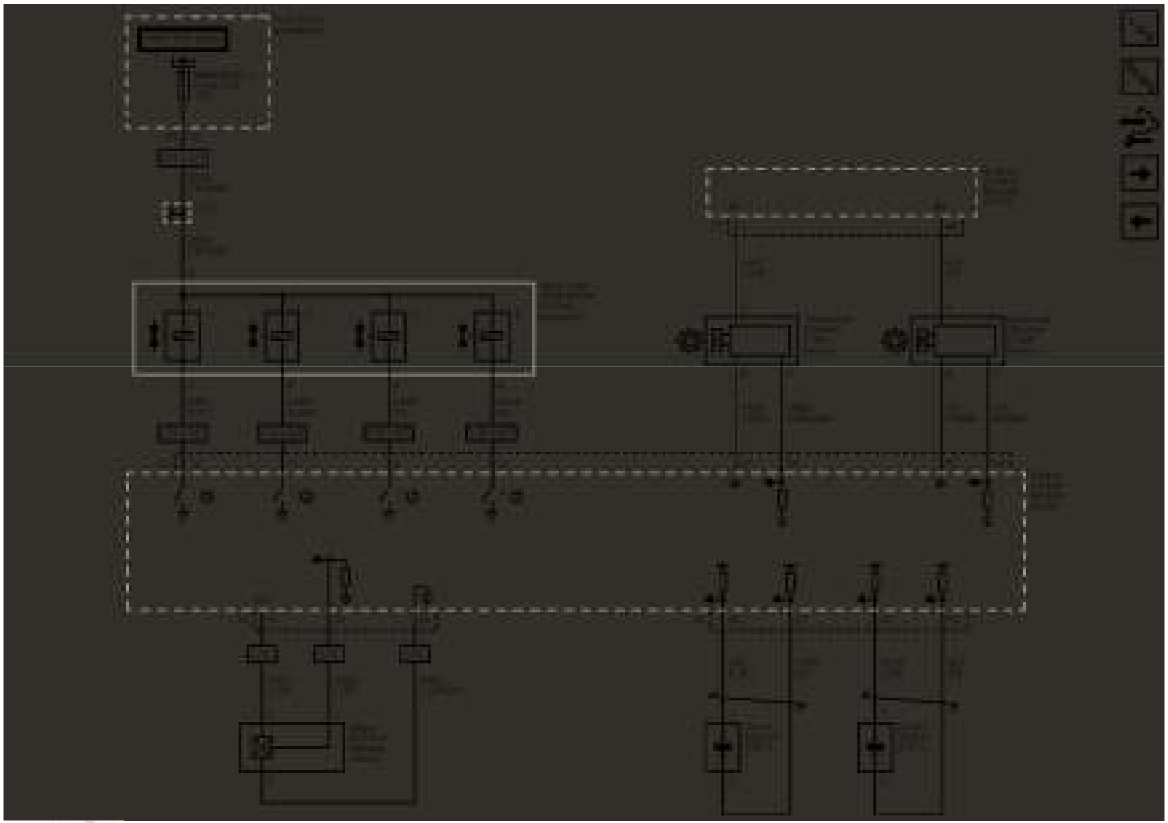
Ignition Controls - Sensors and Active Fuel Management



Diagnostic Starting Point - Engine Controls

Begin the system diagnosis with Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and the codes' statuses

The use of the Diagnostic System Check - Vehicle will identify the correct procedure for diagnosing the system and where the procedure is located.

Scan Tool Data List

The Engine Scan Tool Data List contains all engine related parameters that are available on the scan tool. The list is arranged in alphabetical order. A parameter may appear in any one of the data lists and in some cases may appear more than once or in more than one data list in order to group certain related parameters together.

Use the Engine Scan Tool Data List only after the following conditions are determined:

- The Diagnostic System Check - Vehicle is completed.
- There are no diagnostic trouble codes (DTCs).
- The on-board diagnostics are functioning correctly.

Scan tool values from an engine that is operating correctly may be used for comparison with the engine you are diagnosing. The Engine Scan Tool Data List represents the values that would be seen on a normal operating engine.

Important: Do not use a scan tool that displays faulty data. The scan tool concern should be reported to the manufacturer. Use of a faulty scan tool may result in mis-diagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service information for use in diagnosis. If all values are within the typical range described below, refer to Symptoms - Engine Controls.

Scan Tool Parameter	Data List	Parameter Range/Units	Typical Data Values
Engine Idling/Radiator Hose Hot/Park or Neutral/Closed Loop/Accessories Off			
5V Reference Voltage Circuit 1		Valid Invalid	This parameter displays the voltage sensed on the 5-volt reference 1 circuit at the control module.
5V Reference Voltage Circuit 2		Valid Invalid	This parameter displays the voltage sensed on the 5-volt reference 2 circuit at the control module.
A/C Cutoff Mode (Air Conditioning)		Inactive Pressure Max. Acceleration Active	
A/C Disengagement 1st History		Present Not Present	
A/C Disengagement 1st History		Present Not Present	
A/C Disengagement 2nd History		Present Not Present	

A/C Disengagement 3rd History		Present Not Present	The parameter displays the last 8 air conditioning (A/C) compressor disengages in order from 1 to 8 with 8 being the most recent. There are about 8 possible causes for the A/C compressor to disengage.
A/C Disengagement 4th History		Present Not Present	
A/C Disengagement 5th History		Present Not Present	
A/C Disengagement 6th History		Present Not Present	
A/C Disengagement 7th History		Present Not Present	
A/C Disengagement 8th History		Present Not Present	
A/C Pressure Sensor	--	0 - 3,450 kPa	This parameter displays the pressure from the A/C high side pressure sensor signal circuit to the control module.
A/C Pressure Sensor	--	0 - 5 Volts	The scan tool displays 0-5 Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
Accelerator Pedal Position Sensor 1-2 Correlation	--	Okay	This parameter displays Disagree if the control module detects the signal voltage from APP sensor 1 is not in correct relationship to APP sensor 2. The scan tool displays Agree under the normal operating conditions.
	--	Not Okay	
A/C Request (Air Conditioning)		Not Present	This parameter displays the state of the air conditioning (A/C) request input to the control module from the heating, ventilation, and air conditioning (HVAC) controls. The scan tool will display Not Present indicates the control module is not receiving a request from the HVAC system to ground the A/C clutch relay control circuit.
Actual Torque	--	0 - 100 %	This parameter displays the engine load in percent based on inputs to the control module from various engine sensors. The scan tool will display a low percentage when the engine is at idle with little or no load. The scan tool will display a high percentage when the engine is running at a high RPM under a heavy load
			This parameter displays the commanded state of the generator

Alternator F Terminal	0 - 100 %		by the control module. A High value indicates a high charging command, and a low value indicates a low charging command.
Alternator L Terminal Circuit	--	On/Off	This parameter displays if the control module is allowing the generator to operate. The scan tool displays ON if the generator is allowed to operate. The scan tool displays OFF if the control module is disabling the generator.
Alternator L Terminal Duty Cycle	--		
Amibent Temperature	--	° C	This parameter displays the ambient, outside, air temperature as calculated by the control module.
APP Sensor (Acceleration)	--	0 - 100 %	This parameter displays the position of the Accelerator Pedal as calculated by the Accelerator Pedal Position Sensor.
APP Sensor 1 (Accelerator Pedal Position)	--	%	This parameter displays the voltage signal sent to the control module from accelerator pedal position (APP) sensor 1 of the APP sensor assembly. APP sensor 1 is a range of values indicating a low voltage when the accelerator pedal is not pressed to a high voltage when the accelerator pedal is fully pressed.
APP Sensor 1 (Accelerator Pedal Position)	--	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
APP Sensor 1 (Accelerator Pedal Position)	--	%	This parameter displays the angle of the accelerator pedal position (APP) sensor 1 as calculated by the control module using the signal from the APP sensor 1. APP sensor 1 is a range of values indicating a low percentage when the accelerator pedal is not pressed to a high percentage when the accelerator pedal is fully pressed.
APP Sensor 2 (Accelerator Pedal Position)	--	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
APP Sensor 2			This parameter displays the angle of the accelerator pedal position (APP) sensor 1 as calculated by the control module using the signal from the APP sensor 1. APP sensor 1 is a

(Accelerator Pedal Position)	--	%	range of values indicating a low percentage when the accelerator pedal is not pressed to a high percentage when the accelerator pedal is fully pressed.
Auto Learn Counter		Counts	
Auto Learn Timer		h:m:s	
B1 Average Injection Time (Bank 1)		ms	
B1 Catalyst Temperature	--	° C	This parameter displays the B1 catalytic converter temperature as calculated by the control module.
B1 LTFT Cruise/Acceleration (Bank 1 Long Term Fuel Trim)		%	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the control module. The scan tool will display of more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value of less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B1S1 O2 Sensor (Bank 1 Sensor 1)	--	mV	This parameter displays the voltage from the signal produced by the heated oxygen sensor used to monitor fuel trim for cylinder bank 1. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B1S1 O2 Sensor Heater (Bank 1 Sensor 1)	--	On/Off	This parameter displays the commanded state of the bank 1 sensor 1 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
B1S1 O2 Sensor Heater Circuit Status (Bank 1 Sensor 1)	--	Passed_Failed_Incomplete	This parameter displays the commanded state of the bank 1 sensor 1 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF

			when the heater is commanded OFF.
B1S2 O2 Sensor (Bank 1 Sensor 2)		mV	This parameter displays the voltage from the signal produced by the heated oxygen sensor used to monitor catalyst efficiency for cylinder bank 1. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B1S2 O2 Sensor Heater (Bank 1 Sensor 2)		On/Off	This parameter displays the commanded state of the bank 1 sensor 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
B1S2 O2 Sensor Heater Circuit Status (Bank 1 Sensor 2)		Passed_Failed_Incomplete	This parameter displays the commanded state of the bank 1 sensor 2 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
B2 Average Injection Time (Bank 2)		ms	
B2 Catalyst Temperature (Bank 2)	--	° CA	This parameter displays the B1 catalytic converter temperature as calculated by the control module.
B2 LTFT Cruise/Acceleration (Bank 2 Long Term Fuel Trim)	--	0 - 100 %	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the control module. The scan tool will display of more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value of less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B2 Short Term Fuel Trim (Bank 2)	--	0 - 100 %	
			This parameter displays the voltage from the signal produced by the heated oxygen sensor used to

B2S1 O2 Sensor (Bank 2 Sensor 1)	--	mV	monitor fuel trim for cylinder bank 2. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B2S1 O2 Sensor Heater (Bank 2 Sensor 1)	--	On/Off	This parameter displays the commanded state of the bank 2 sensor 1 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
B2S1 O2 Sensor Heater Circuit Status (Bank 2 Sensor 1)	--	Passed_Failed_Incomplete	This parameter displays the commanded state of the bank 2 sensor 1 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
B2S2 O2 Sensor (Bank 2 Sensor 2)		mV	This parameter displays the voltage from the signal produced by the heated oxygen sensor used to catalyst efficiency for cylinder bank 2. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B2S2 O2 Sensor Heater (Bank 2 Sensor 2)		On/Off	his parameter displays the commanded state of the bank 2 sensor 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
B2S2 O2 Sensor Heater (Bank 2 Sensor 2)		mA	
B2S2 O2 Sensor Heater Circuit Status (Bank 2 Sensor 2)		Passed_Failed_Incomplete	This parameter displays the commanded state of the bank 2 sensor 2 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
			This parameter displays the barometric pressure as calculated by the control module using the signal from the manifold absolute pressure (MAP) sensor measured when the

Barometer Pressure	--	kPa	ignition is turned on with the engine not running. The control module will update the barometric pressure during wide-open throttle (WOT) conditions. The scan tool will display a low value when the barometric pressure is low, and a high value when the barometric pressure is high.
Brake Lamp Switch	--	Active/Inactive	This parameter displays the state of the brake pedal as determined by the control module based on an input from the stop lamp pedal switch. This switch turns on the stop lamps when the brake pedal is depressed. The scan tool will display Active when the brake pedal is depressed.
Calculated Air Flow	--	g/s	
Calculated APP Sensor 1 (Accelerator Pedal Position)	--	0 - 100 %	This parameter displays the angle of the throttle position (TP) sensor 1 in percent. This information is calculated by the control module using the signal from the throttle position sensor 1. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
Calculated APP Sensor 2 (Accelerator Pedal Position)	--	0 - 100 %	This parameter displays the angle of the throttle position (TP) sensor 2 in percent. This information is calculated by the control module using the signal from the throttle position sensor 2. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
Calculated Pedal Position	--	0 - 100 %	This parameter displays the angle of the accelerator pedal as calculated by the control module using the signals from the accelerator pedal position sensors. The APP indicated angle is a range of values indicating a low percentage when the accelerator pedal is not pressed to a high percentage when the accelerator pedal is fully pressed.
			This parameter displays the angle of the throttle position (TP) sensor in

Calculated Throttle Position	--	0 - 100 %	percent. This information is calculated by the control module using the signal from the throttle position sensor. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
Camshaft Active Counter	--	Counts	This parameter displays an incrementing counter when the control module receives a signal form the camshaft position (CMP) sensor.
Camshaft Sensor Engine Speed	--	RPM	This parameter displays the speed of the engine as calculated by the signal from the camshaft position (CMP) sensor.
Catalyst Protection Mode	--	No_Yes	This parameter displays if the control module is commanding catalytic converter protection.
CC Disengagement 1st History	--	On/Off	The parameter displays the last 8 cruise control disengages in order from 1 to 8, with 8 being the most recent. There are about 33 possible causes for the cruise control to disengage.
CC Disengagement 2nd History	--	On/Off	
CC Disengagement 3rd History	--	On/Off	
CC Disengagement 4th History	--	On/Off	
CC Disengagement 5th History	--	On/Off	
CC Disengagement 6th History	--	On/Off	
CC Disengagement 7th History	--	On/Off	
CC Disengagement 8th History	--	On/Off	
Clutch Pedal Start Switch	--	Inactive_Active	This parameter displays the state of the clutch pedal as determined by the control module from the clutch start switch.
Clutch Pedal Switch	--	Inactive_Active	This parameter displays the current state of the clutch pedal as determined by the control module.
			This parameter indicates whether the engine meets the conditions for a cold start-up during the present ignition cycle. The scan tool displays Yes when the conditions for a cold start-up are met during this ignition

Cold Start Up	--	Yes/No	cycle. The scan tool displays No when the conditions for a cold start-up are not met during the present ignition cycle. Conditions for a cold start-up require the coolant temperature and the intake air temperature to be below a predetermined temperature and within a certain range of each other. These conditions must occur after the engine was warmed up to a specific temperature during the previous ignition cycle.
Commanded Air/Fuel Equivalence Ratio	--	0.0:1	This parameter displays the ratio of air to fuel as calculated by the control module based on various sensor inputs. The scan tool will display a lower air fuel ratio when a richer air to fuel mixture is commanded. The scan tool will display a higher air fuel ratio when a leaner air to fuel mixture is commanded. In closed loop operation the air fuel ratio should normally be around 14.2-14.7 to 1.
Commanded B1S1 O2 Sensor Heater (Bank 1 Sensor 1)	--	0 - 100 %	This parameter displays the commanded state of the bank 1 sensor 1 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
Commanded B1S2 O2 Sensor Heater (Bank 1 Sensor 2)	--	0 - 100 %	This parameter displays the commanded state of the bank 1 sensor 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
Commanded B2S1 O2 Sensor Heater (Bank 2 Sensor 1)	--	0 - 100 %	This parameter displays the commanded state of the bank 2 sensor 1 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
Commanded B2S2 O2 Sensor Heater (Bank 2 Sensor 2)	--	0 - 100 %	This parameter displays the commanded state of the bank 2 sensor 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.

Coolant Temperature	--	Degrees	This parameter displays the temperature of the engine coolant based on a voltage input from the engine coolant temperature (ECT) sensor to the control module. The scan tool will display a low value when the coolant temperature is low, and a high value when the coolant temperature is high.
Crank Request	--	Active/Inactive	This parameter displays whether the ignition switch has been cycled to the crank position requesting the control module to activate the starter relay.
Crankshaft Active Count	--	Counts	This parameter displays an incrementing counter when the control module receives a signal from the crankshaft position (CKP) sensor.
Crankshaft Resynchronise	--	Counts	This parameter displays the number of times the control module re-syncs with the crankshaft position (CKP) sensor.
Crankshaft Speed	--	RPM	This parameter displays the engine speed as calculated by the control module using the signal form the crankshaft position (CKP) sensor.
Cruise Control	--	On/Off	This parameter displays the status of the cruise control system as determined by the control module. The scan tool will display On when the cruise control system is in control of vehicle speed. The scan tool will display Off when the cruise control system is not operating.
Cruise Control Active	--	Yes/No	This parameter displays the status of the cruise control system as determined by the control module. The scan tool will display Yes when the cruise control system is in control of vehicle speed. The scan tool will display No when the cruise control system is not operating.
Cruise Control Cancel	--	Active/Inactive	This parameter displays the status of the Cruise Control Cancel.
Cruise Resume/Acceleration Switch	--	Active/Inactive	This parameter displays the status of the Cruise Resume/Acceleration switch.
Cruise Set / Decel Switch	--	Active/Inactive	This parameter displays the status of the Cruise Set/Deceleration switch.

Cycles of Misfire	--	Counts	This parameter displays the number of cylinder firing events that were recorded as misfires as determined by the control module.
Cylinder 1 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 1 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 1 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 2 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 2 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 2 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
			This parameter displays the state of

Cylinder 3 Ignition Circuit Status	--		the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 3 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 3 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 4 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 4 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 4 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 5 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays

			indeterminate until the control circuit has been commanded ON.
Cylinder 5 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 5 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 6 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 6 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 6 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 7 Ignition Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
			This parameter displays the status of the output driver for the injector control circuit. The scan tool will

Cylinder 7 Injector Circuit Status	--	Passed_Failed_Incomplete	display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 7 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Cylinder 8 Injector Circuit Status	--		This parameter displays the state of the fuel injector control circuit. The parameter displays Fault if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays indeterminate until the control circuit has been commanded ON.
Cylinder 8 Injector Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the injector control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 8 Knock Detected	--	Yes/No	This parameter displays the knock retard as commanded by the control module for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
Dec. Fuel Cutoff (Deceleration)	--	Active/Inactive	This parameter displays the status of the operating mode of the control module used to turn off the fuel injectors and the evaporative emission (EVAP) canister purge valve during certain deceleration conditions.
Desired Engine Idle Speed	--	RPM	This parameter displays the desired engine idle speed as commanded by the control module.
Desired Throttle Position	--	0 - 100 %	This parameter displays the angle of the throttle position (TP) in percent. This information is calculated by the control module using the signals from the throttle position sensors. The scan tool will display a low

			percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
Distance Since DTC Cleared	--	Km	This parameter displays the distance accumulated since an emission diagnostic trouble code was cleared. The scan tool will display increasing distance as the vehicle is driven.
ECM Immobilised	--	No_Yes	The scan tool displays Yes or No. The scan tool displays Yes if the body control module (BCM) and the control module lose communications with each other after the BCM sends the correct password. The scan tool displays No if the BCM is communicating the correct password to the ECM.
Engine Control Ignition Relay	--	On/Off	This parameter displays the state of the control circuit control module power relay as commanded by the control module. The scan tool displays ON with the engine running.
Engine Control Ignition Relay Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the EC Ignition Relay control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Engine Control Ignition Relay Feedback	--	V	This parameter displays the voltage available at the EC ignition relay pin of the control module.
Engine Load	--	%	This parameter displays the calculated engine load in percent based on inputs to the control module from various engine sensors.
Engine Oil Life Remaining	--	0 - 100 %	This parameter displays the percent of engine oil life remaining. The controller calculates the engine oil life by monitoring engine load, coolant temperature, and engine speed.
Engine Oil Pressure	--	kPa	This parameter displays the engine oil pressure.
Engine Oil Pressure			The scan tool displays 0-?? Volts. The scan tool displays

Sensor	--	Volts	approximately ?? Volts when the ignition is ON.
Engine Oil Temperature	--	Degree	This parameter displays the temperature of the engine oil.
Engine Run Time	--	hh:mm:ss	This parameter displays the time elapsed since the engine was started. The scan tool will display the time in hours, minutes and seconds. The engine run time will reset to zero as soon as the engine stops running.
Engine Speed	--	RPM	This parameter displays the speed of the crankshaft as calculated by the control module based on inputs from the Crankshaft Position (CKP) Sensor. The scan tool will display the engine speed in revolutions per minute (RPM).
Engine Speed Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the engine speed circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK/Incomplete if the circuit is operating correctly.
EVAP Purge Solenoid (Evaporative Emission)	--	%	This parameter displays the on-time or duty cycle of the EVAP canister purge solenoid commanded by the control module. Zero percent indicates no purge. One hundred percent indicates full purge.
EVAP Purge Solenoid Valve Circuit Status (Evaporative Emission)	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the evaporative emission purge solenoid control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK/Incomplete if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
Fan Relay 1	--	On/Off	This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the circuit has been commanded ON.
			This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan

Fan Relay 1 Circuit Status	--	Passed_Failed_Incomplete	relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the circuit has been commanded ON.
Fan Relay 2 and 3	--	On/Off	This parameter displays the control module commanded state of the fan relay control circuit.
Fan Relay 2 and 3 Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the relay control circuit has been commanded ON.
Fuel Level	--	0 - 100 %	This parameter displays the amount of fuel remaining in tall of the fuel tanks of the vehicle as a percentage. The control module calculates this level using the signals from the sensors used to monitor the fuel level in the fuel tanks. The scan tool will display a low reading when the total fuel level in the vehicle is low or near empty. The scan tool will display a high reading when the fuel level in the tank is high or near full.
Fuel Level Sensor 1 (Right)	--	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
Fuel Level Sensor 2 (left)	--	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
Fuel Pump Relay	--	On/Off	This parameter displays the commanded state of the fuel pump relay control circuit. The fuel pump relay should be ON when the scan tool indicates the fuel pump relay command is ON. The fuel pump relay should be OFF when the scan tool indicates the fuel pump relay command is OFF.
Fuel System Status	--	Closed Loop_Open Loop	The scan tool displays Open Loop or Closed Loop. The scan tool displays Closed Loop if the control module is controlling the fuel delivery according to the heated oxygen sensor (HO2S) voltages. The scan tool displays open loop if the control module is not adjusting for HO2S

			inputs. In open loop the control module bases fuel deliver on throttle position, engine coolant temperature, and mass airflow sensor inputs.
Fuel Pump Relay Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the state of the fuel pump relay control circuit. The parameter displays Fault if the fuel pump relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the circuit has been commanded ON.
Fuel Trim Cell	--	Index	This parameter displays the fuel trim cell as calculated by the control module based on many sensor inputs. The fuel trim cell indicates which cell is currently active.
Fuel Trim Learn	--	Enable/Disable	The scan tool displays Enabled or Disabled. When conditions are appropriate for enabling long term fuel trim corrections, the scan tool displays Enabled. If the scan tool displays Disabled, then long term fuel trim will not respond to changes in short term fuel trim.
Hot Open Loop	--	Inactive_Active	This parameter indicates the status of the fuel delivery system. The scan tool will display Active if the fuel system is running in Open Loop due to a temperature concern. The scan tool will display Inactive if the fuel system is operating normally.
Ignition Accessory Signal	--	On/Off	This parameter displays the state of the ignition input to the control module from the ignition switch. The scan tool will display ON when the ignition switch is in the ignition accessory position. The scan tool will display OFF when the ignition switch is in any other position.
Ignition Voltage	--	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
Injector 1 Disabled Due	--	Yes/No	
Injector 2 Disabled Due	--	Yes/No	
Injector 3 Disabled Due	--	Yes/No	

Injector 4 Disabled Due	--	Yes/No	
Injector 5 Disabled Due	--	Yes/No	
Injector 6 Disabled Due	--	Yes/No	
Injector 7 Disabled Due	--	Yes/No	
Injector 8 Disabled Due	--	Yes/No	
Intake Air Temp	--	Degrees	This parameter displays the temperature of the intake air calculated by the control module based on the input from the intake air temperature (IAT). The scan tool will display a low value for a low intake air temperature, and a high value for a high intake air temperature.
Knock Retard	--	Degrees	The scan tool displays in °. This parameter indicates the amount of timing retard commanded by the control module. The scan tool will display a lower value if no knock is detected, and a higher value as more knock is detected and the control module retards the ignition timing.
MAF Performance Test (Mass Air Flow)	--	Okay_Fail	
Malfunction Indicator (MI)	--	On_Off	This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit. The malfunction indicator lamp should be on when the scan tool indicates the MIL Command is On. The malfunction indicator lamp should be off when the scan tool indicates the MIL Command is Off. The control module will command the MIL On when the ignition is ON with the engine OFF in order to perform a bulb check.
Malfunction Indicator (MI) Circuit Status	--	Passed_Failed_Incomplete	This parameter displays the status of the output driver for the malfunction indicator lamp control circuit. The scan tool will display Passed, Failed or Incomplete. The scan tool will display Pass/Fail if the circuit is operating correctly. The scan tool will display Incomplete if there is an open, short to ground, or

			a short to voltage on the circuit.
Manifold Absolute Pressure	--	kPa	The scan tool displays kPa. This parameter displays the pressure inside of the intake manifold as calculated by the control module based on the input from the MAP sensor. The scan tool will display a high value at cruising speed or wide open throttle (WOT). The scan tool will display a low value at idle speed.
Mass Air Flow Sensor	--	Hz	The scan tool displays in Hz. This parameter indicates the frequency signal sent from the MAF sensor to the control module. the scan tool will display a high value indicates a higher engine speed. The scan tool will display a low value at idle.
MI Requested by DTC (Malfunction Indicator)	--	No_Yes	This parameter indicates the reason the control module illuminated the MIL. The scan tool will display YES when the MIL is requested as a result of an A or B type DTC. The scan tool will display NO if the MIL is illuminated for another reason, such as transmission DTCs.
Misfire Current Cylinder 1	--	(#)	The scan tool will display in counts. This parameter indicates the number of cylinder firing events detected as possible misfires on each cylinder during the last 200 crankshaft revolutions as calculated by the control module. The scan tool will display a low number for a low number of cylinder misfire events. The scan tool will display a high number for a high number of cylinder misfire events.
Misfire Current Cylinder 2	--	(#)	
Misfire Current Cylinder 3	--	(#)	
Misfire Current Cylinder 4	--	(#)	
Misfire Current Cylinder 5	--	(#)	
Misfire Current Cylinder 6	--	(#)	
Misfire Current Cylinder 7	--	(#)	
Misfire Current Cylinder 8	--	(#)	
Misfire History Cylinder 1	--	(#)	The scan tool displays in counts. This parameter displays the total level of cylinder misfires that have been calculated for each cylinder by
Misfire History Cylinder 2	--	(#)	
Misfire History Cylinder 3	--	(#)	
Misfire History Cylinder 4	--	(#)	

Misfire History Cylinder 5	--	(#)	the control module. This parameter will not update or show activity until a misfire DTC has become active. The misfire history counters will update every 200 cylinder firing events.
Misfire History Cylinder 6	--	(#)	
Misfire History Cylinder 7	--	(#)	
Misfire History Cylinder 8	--	(#)	
Number of Warm-ups Since DTC Cleared	--	Counts	This parameter indicates the number of warm-up cycles that have occurred Since DTCs were cleared. The scan tool will display a higher counts as more warm-up cycles have occurred since the DTCs were cleared
Oil Change Symbol	--	On_Off	
Oil Level	--	Normal_Low	This parameter displays the state of the engine oil level switch as determined by the control module. The scan tool will display Normal or Low. OK indicates that the engine oil level is not too low for safe operation of the engine. Low indicates the engine oil level is abnormally low and has closed the engine oil level switch.
Oil Temperature Sensor	--	°C	This parameter displays the engine oil pressure.
Power Enrichment	--	Active/Inactive	Scan tool displays ACTIVE or INACTIVE. ACTIVE displayed indicates that the control module has detected conditions appropriate to operate in Power Enrichment mode. The control module commands Power Enrichment mode when a large increase in throttle position and load is detected. While in Power Enrichment, the control module will increase the amount of fuel delivered by entering Open Loop and increasing the injector pulse width.
Powertrain Immobiliser Status	--		
Reduced Engine Power	--	Active/Inactive	The scan tool displays Active or Inactive. The scan tool displays Active when the control module receives a signal from the throttle actuator control (TAC) module that a TAC system fault is occurring. The scan tool displays inactive when the

			engine is operating normally.
Requested Torque	--	0 - 100 %	This parameter indicates the percentage of available torque requested from the engine to the transmission as calculated by the control module. The scan tool will display a higher value for higher torque, and a lower value for lower torque.
Security Code Accepted	--	Yes_No	
Security Code Lockout	--	Active_Inactive	
Security Code Programmed	--	Yes_No	
Spark Advance	--	Degrees CA	This parameter displays the amount of spark advance the control module is commanding on the ignition control circuits. The control module determines the desired advance.
Start-Up ECT	--	°C	This parameter indicates the engine coolant temperature at start-up, as calculated by the control module based on the input from the engine coolant temperature sensor. The scan tool will display a higher value at higher engine start-up temperatures, and a lower value at lower start-up temperatures.
Start-Up IAT	--	°C	Indicates the intake air temperature (IAT) at the time that the vehicle was started. Used to determine if the last start-up was a cold start. The scan tool range is -39 to +140° C (-38 to +284°F). This parameter indicates the ambient air temperature at start-up.
Starter Relay	--	On/Off	This parameter displays the control modules commanded state of the starter motor relay control circuit.
Starter Relay Circuit Status	--	Incomplete_Pass_Fail	This parameter displays the status of the output driver for the starter relay control circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK/Incomplete if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
			This parameter indicates the status

TAC Forced Engine Shutdown (Throttle Actuator Control)	--	No_Yes	of TAC control by the control module. The scan tool will display YES if the engine has been shut down due to a throttle control fault. The scan tool will display NO if the engine has not been shut down by a throttle control fault.
TAC Motor (Throttle Actuator Control)	--	Enabled_Disabled	This parameter indicates the status of the TAC motor driver. The scan tool will display Enabled if TAC motor operation is allowed. The scan tool will display disabled if the TAC motor is disabled.
TAC Motor Command (Throttle Actuator Control)	--	%	This parameter indicates the required duty cycle to maintain a desired throttle position. The scan tool will display a higher value if more effort is required to move the throttle to the desired position, such as physical resistance. The scan tool will display a lower value if less effort is required to move the throttle to the desired position.
Torque Management Spark Retard	--	°CA	his parameter indicates how much the ignition spark timing is being retarded to control torque by the control module. The scan tool will display a higher value under extreme torque control conditions such as spinning wheels. The scan tool will display a lower value under low torque control conditions such as light driving.
Total Knock Retard		Degrees CA	This parameter indicates how much ignition spark timing is being retarded due to all control systems monitored by the control module. The scan tool will display a high value during extreme conditions such as high temperatures and antilock braking. The scan tool will display a lower value during lighter driving conditions.
Total Misfire		(#)	The scan tool range is 0-255 counts. This parameter indicates the total level of misfire that has been detected on each cylinder. The misfire history counters will not update or show any activity until a misfire or DTC P0300 has become active. The misfire history counter will update every 200 cylinder firing events.

TP Sensor 1 (Throttle Position)	0 - 100 %	This parameter displays the angle of the throttle position (TP) sensor 1 in percent. This information is calculated by the control module using the signal from the throttle position sensor 1. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
TP Sensor 1 (Throttle Position)	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
TTP Sensor 1- 2 Correlation (Throttle Position)	Okay_Not Okay	This parameter displays the results of a control module test that compares signals from the throttle position (TP) sensors 1 and 2 . The scan tool will display Agree when the signal from TP sensor 1 corresponds with the signal from TP sensor 2. The scan tool will display Disagree when the signal from TP sensor 1 conflicts with the signal from TP sensor 2.
TP Sensor 1 Learned Lower Position (Throttle Position)	V	This parameter displays the learned minimum value of TP sensor 1 as recorded by the control module during the last learn procedure.
TP Sensor 2 (Throttle Position)	%	This parameter displays the angle of the throttle position (TP) sensor 2 in percent. This information is calculated by the control module using the signal from the throttle position sensor 2. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
TP Sensor 2 (Throttle Position)	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
TP Sensor 2 Learned Lower Position (Throttle Position)	Volts	The scan tool displays 0-?? Volts. The scan tool displays approximately ?? Volts when the ignition is ON.
		This parameter indicates the current state of the gear select switch on the transmission/transaxle as calculated by the control module

Transmission Gear	P-N_In Gear	based on the TR switch. The scan tool status will switch from High to Low as different combinations are met. On the scan tool in Park, the PRNDL would read P and A will be Low, and B and C will be High.
Transmission Oil Temperature	°C	
Vehicle Speed	Km/h	This parameter indicates the vehicle speed calculated by the control module based on an input from the vehicle speed sensor (VSS). the scan tool will display a high value at higher vehicle speeds, and a low value at lower vehicle speeds.
Vehicle Speed Circuit Status		This parameter displays the status of the Vehicle Speed Circuit. The scan tool will display OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK/Incomplete if the circuit is operating correctly.
Warm-ups without Emission Related DTC's	(w/o unit)	Faults: The scan tool displays in counts. This parameter counts the number of warm-up cycles without an emission fault present. The parameter increments until a fault occurs. If a fault occurs, the counter reverts to 0 until the fault is corrected. Clearing information with a scan tool or a loss of power to the ECM also resets the counter to 0.
Warm-ups without Non-Emission Related DTC'S	(w/o unit)	The scan tool displays in counts. This parameter counts the number of warm-up cycles without a non-emission fault present. The parameter increments until a fault occurs. If a fault occurs, the counter reverts to 0 until the fault is corrected. Clearing information with a scan tool or a loss of power to the ECM also resets the counter to 0.
Wide Open Throttle	No_Yes	This parameter indicates the throttle status commanded by the control module. The scan tool will display YES is the vehicle throttle is commanded to wide open. The scan tool will display NO if the vehicle throttle is commanded to an amount less than 100 percent.

DTC C1209, C1223, C1227, or C1234

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC C1209: Left Rear Wheel Speed Sensor Circuit High

DTC C1223: Left Rear Wheel Speed Sensor Circuit

DTC C1227: Left Rear Wheel Speed Sensor Circuit Range/Performance

DTC C1234: Left Rear Wheel Speed Sensor Circuit Low

Circuit/System Description

The wheel speed sensor receives a 12-volt power supply voltage from the electronic brake control module (EBCM) and provides an output signal to the EBCM. As the wheel spins, the wheel speed sensor sends the EBCM a DC square wave signal. The EBCM uses the frequency of the square wave signal to calculate the wheel speed. If the EBCM identifies an error, it sets a code and communicates via GMLAN to the engine control module (ECM).

Conditions for Running the DTC

Ignition voltage is between 9 and 16 volts.

Conditions for Setting the DTC

- The engine must be ON.
- The vehicle speed is greater than 16 km/h (10 mph).

Action Taken when the DTC Sets

DTCs C1209, C1223, C1227 and C1234 are type C DTCs.

Conditions for Clearing the MIL/DTC

DTCs C1209, C1223, C1227 and C1234 are type C DTCs.

Circuit/System Verification

The ECM sets DTCs C1209, C1223, C1227 and C1234 in conjunction with the EBCM, any EBCM wheel speed sensor DTCs should be diagnosed ahead of performing the test below.

Circuit/System Testing

1. Verify that no other DTCs are set.
   If any other DTCs are set, refer to Diagnostic Trouble Code (DTC) Type Definitions .
2. Ignition ON, using a scan tool view the current DTC's.
   If any of the following DTCs C1209, C1223, C1227 or C1234, are set to current replace ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Engine Control Module Replacement for engine control module replacement, setup and programming.

DTC C1210, C1224, C1228, or C1235

Diagnostic Instructions

DTC P0016

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0016: Crankshaft Position (CKP) Camshaft Position (CMP) Correlation

Circuit / System Description

The engine control module (ECM) uses the crankshaft position (CKP) sensor and the camshaft position (CMP) sensor pulses to monitor the correlation between the crankshaft and the camshaft position. The crankshaft reluctor wheel consists of a 60-tooth pattern with 2 teeth missing for the reference gap. Each tooth is evenly spaced 6 degrees apart, except for the reference gap. The camshaft reluctor wheel has 4 teeth, 2 narrow, and 2 wide. The 4 trailing edges of each tooth are evenly spaced at 90 degrees apart around the circumference of the camshaft sprocket. With the engine running, and the CMP actuator in the parked position, the ECM expects the camshaft signal pulses to occur 36 crankshaft degrees before top dead center (BTDC) for cylinder number 1, and every 90 degrees thereafter.

Conditions for Running the DTC

- DTC P0335, P0336, P0340, P0341, P0641, or P0651 is not set.
- The engine is running.
- The engine speed is less than 2,000 RPM.
- DTC P0016 runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the CMP sensor pulses occur more than 11 crank degrees before, or 11 crank degrees after, nominal position for 24 out of 30 engine cycles.

Action Taken When the DTC Sets

DTC P0016 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0016 is a Type B DTC.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Start the engine.
2. Allow the engine to reach normal operating temperature.
3. Allow the engine to idle.
4. Observe the DTC information with a scan tool.

   If the scan tool indicates P0016 has failed this ignition cycle, continue with the Circuit/System Testing.
5. If the vehicle passes the Circuit/System Verification Test, then operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records Data List.

Circuit/System Testing

Important: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Inspect the engine front cover area, or review the service history of the vehicle for any recent repairs involving the timing chain, timing chain tensioner, camshaft, crankshaft, camshaft actuator, or sprockets.

If recent repairs were made, refer to Camshaft Timing Chain and Sprocket Replacement , and inspect the timing chain, timing chain tensioner, and both sprockets for proper timing alignment or indexing.

2. Remove the engine front cover, refer to Engine Front Cover Replacement and inspect the timing chain, timing chain tensioner, and sprockets for wear or damage. Refer to Camshaft Timing Chain and Sprocket Cleaning and Inspection.

   If any components are worn or damage, replace as necessary.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Camshaft Timing Chain and Sprocket Replacement

DTC P0030, P0036, P0053, P0054, P0135, or P0141

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Typical Scan Tool Data

HO2S Sensor 1 Voltage

Circuit	Short to Ground	Open	Short to Voltage

Parameter Normal Range: 200-800 mV			
HO2S Heater Low Control	0 A	0 A	0 A
HO2S Heater Voltage Supply	0 A	0 A	1-2 A

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside the HO2S minimizes the time required for the sensors to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running, ground is provided to the heater by the HO2S heater low control circuit through a low side driver within the engine control module (ECM). The ECM uses pulse width modulation (PWM) to control the HO2S heater operation to maintain a specific HO2S operating temperature range.

Conditions for Running the DTC

P0030 or P0036

- The Ignition 1 Signal parameter is between 11-18 volts.
- The engine speed is more than 400 RPM.
- DTC P0030 or P0036 runs continuously when the above conditions are met for 1 second.

P0053 or P0054

- DTCs P0112, P0113, P0117, P0118 are not set.
- The engine is started.
- The ignition voltage is less than 18 volts.
- The ignition is OFF for more than 10 hours.
- The Engine Coolant Temperature (ECT) Sensor parameter is between -30 to +45°C (-22 to +113°F) at engine start-up.
- The Engine Coolant Temperature (ECT) Sensor parameter minus the Intake Air Temperature (IAT) Sensor parameter is less than 8°C (14°F) at engine start-up.
- DTC P0053 or P0054 run once per drive cycle when the above conditions are met.

P0135

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0125, P0128, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 50°C (122°F).
- The Ignition 1 Signal parameter is between 10-18 volts.
- The MAF Sensor parameter is between 3-40 g/s.
- The Engine Run Time parameter is more than 300 seconds.

- The Engine Speed parameter is between 500-3,000 RPM.
- DTC P0135 runs the heater current test once per drive cycle when the above conditions are met for 120 seconds.

P0141

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0125, P0128, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 50°C (122°F).
- The Ignition 1 Signal parameter is between 10-18 volts.
- The MAF Sensor parameter is between 3-40 g/s.
- The Engine Run Time parameter is more than 300 seconds.
- The Engine Speed parameter is between 500-3,000 RPM.
- DTC P0141 runs the heater current test twice per drive cycle when the above conditions are met for 120 seconds.

Conditions for Setting the DTC

P0030 or P0036

- The ECM detects that the affected HO2S heater low control circuit is not within a specified range.
- DTCs P0030 or P0036 set within 3 seconds when the above condition is met.

P0053

- The ECM detects that the affected HO2S heater low control circuit is not within a specified resistance range at engine start-up.
- DTCs P0053 sets within 1 second when the above condition is met.

P0054

- The ECM detects that the affected HO2S heater low control circuit is not within a specified resistance range at engine start-up.
- DTC P0054 sets within 1 second when the above condition is met.

P0135

- The ECM detects that the HO2S 1 heater current parameter is more than 3.125 amps or less than 0.25 amp.
- DTC P0135 sets within 120 seconds during the heater current test when the above condition is met.

P0141

- The ECM detects that the HO2S 2 heater current parameter is more than 2.875 amps or less than 0.25 amp.
- DTC P0141 sets within 120 seconds during the heater current test when the above condition is met.

Action Taken When the DTC Sets

DTCs P0030, P0036, P0053, P0054, P0135, and P0141 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0030, P0036, P0053, P0054, P0135, and P0141 are Type B DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Allow the engine to reach operating temperature. With the engine running, observe the HO2S Heater parameter with a scan tool. The value should vary from below 2A to above 1A.
2. With the engine running at operating temperature, observe the HO2S Heater parameter with a scan tool and manipulate the related wiring and connectors.

   If manipulation does affect the parameter then repair the harness or connector.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not

reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that a test lamp illuminates between the appropriate HO2S heater voltage supply circuit terminal D and ground.

   If the test lamp does not illuminate, test the HO2S heater voltage supply circuit for a short to ground or an open/high resistance. If the circuit tests normal and the HO2S heater voltage supply circuit fuse is open, test all components connected to the fuse and replace as necessary.
3. Ignition ON, verify that a test lamp does not illuminate between the appropriate HO2S heater voltage supply circuit terminal D and the appropriate HO2S heater low control circuit terminal listed below:
   - B1S1 terminal C
   - B1S2 terminal C

   If the lamp illuminates, test the HO2S heater low control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Engine running, leave the test lamp connected from the previous step. The lamp should flash or be ON steady.

   If the test lamp is not ON steady or flashing, test the HO2S heater low control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.

   Important:
   - The output driver should detect a short to voltage and turn OFF. If a resistance fault is present the driver will remain ON and the scan tool will display more than 0.0 amp. Less than 10 ohms may set a DTC.
   - Performing this test may set additional DTCs.

5. Ignition OFF, install a 30A fused jumper wire between the appropriate HO2S heater voltage supply circuit terminal D and the appropriate HO2S heater low control circuit terminal listed below:
   - B1S1 terminal C
   - B1S2 terminal C
6. Engine running, verify the appropriate scan tool HO2S Heater parameter is less than 0.1 amp.

   If more than the specified range, test the HO2S heater voltage supply and HO2S heater low control circuits for more than 1 ohm. If the circuits test normal, replace the ECM.
7. If the ECM and all circuits test normal, replace the appropriate HO2S.

HO2S Heater

Circuit	Short to Ground	Open	Short to Voltage

Parameter Normal Range: 200-800 mV			
HO2S Heater Low Control	0 A	0 A	0 A
HO2S Heater Voltage Supply	0 A	0 A	1-2 A

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside the HO2S minimizes the time required for the sensors to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running, ground is provided to the heater by the HO2S heater low control circuit through a low side driver within the engine control module (ECM). The ECM uses pulse width modulation (PWM) to control the HO2S heater operation to maintain a specific HO2S operating temperature range.

Conditions for Running the DTC

P0050 or P0056

- The ignition 1 signal parameter is between 11-18 volts.
- The engine speed is more than 400 RPM.
- DTCs 0050 or P0056 run once per drive cycle when the above conditions are met.

P0059 or P0060

- DTCs P0112, P0113, P0117, P0118 are not set.
- The engine is started.
- The ignition voltage is less than 18 volts.
- The ignition is OFF form more than 10 hours.
- The Engine Coolant Temperature (ECT) Sensor parameter is between -30 and +45°C (-22 and +113°F) at engine start-up.
- The Engine Coolant Temperature (ECT) Sensor parameter minus the Intake Air Temperature (IAT) Sensor parameter is less than 8°C (14°F) at engine start-up.
- DTCs P0059 or P0060 run once per drive cycle when the above conditions are met.

P0155

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0125, P0128, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 50°C (122°F).
- The Ignition 1 Signal parameter is between 10-18 volts.
- The MAF Sensor parameter is between 3-40 g/s.
- The Engine Run Time parameter is more than 300 seconds.

- The Engine Speed parameter is between 500-3,000 RPM.
- DTC P0155 runs the heater current test once per drive cycle when the above conditions are met for 120 seconds.

P0161

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0125, P0128, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 50°C (122°F).
- The Ignition 1 Signal parameter is between 10-18 volts.
- The MAF Sensor parameter is between 3-40 g/s.
- The Engine Run Time parameter is more than 300 seconds.
- The Engine Speed parameter is between 500-3,000 RPM.
- DTC P0161 runs the heater current test twice per drive cycle when the above conditions are met for 120 seconds.

Conditions for Setting the DTC

P0050 or P0056

- The ECM detects that the affected HO2S heater low control circuit is not within a specified range at engine start-up.
- DTCs P0050, and P0056 set within 1 second when the above condition is met.

P0059

- The ECM detects that the affected HO2S heater low control circuit is not within a specified resistance range at engine start-up.
- DTCs P0059 sets within 1 second when the above condition is met.

P0060

- The ECM detects that the affected HO2S heater low control circuit is not within a specified resistance range at engine start-up.
- DTCs P0060 sets within 1 second when the above condition is met.

P0155

- The ECM detects that the HO2S 1 heater current parameter is more than 3.125 amps or less than 0.25 amp.
- DTC P0155 sets within 120 seconds during the heater current test when the above condition is met.

P0161

- The ECM detects that the HO2S 2 heater current parameter is more than 2.875 amps or less than 0.25 amp.
- DTC P0161 sets within 120 seconds during the heater current test when the above condition is met.

Action Taken When the DTC Sets

DTCs P0050, P0056, P0059, P0060, P0155, and P0161 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0050, P0056, P0059, P0060, P0155, and P0161 are Type B DTCs.

Circuit/System Verification

1. Allow the engine to reach operating temperature. With the engine running, observe the HO2S Heater parameter with a scan tool. The value should vary from below 2A to above 1A.
2. With the engine running at operating temperature, observe the HO2S Heater parameter with a scan tool and manipulate the related wiring and connectors.

   If manipulation does affect the parameter then repair the harness or connector.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not

reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that a test lamp illuminates between the appropriate HO2S heater voltage supply circuit terminal D and ground.

   If the test lamp does not illuminate, test the HO2S heater voltage supply circuit for a short to ground or an open/high resistance. If the circuit tests normal and the HO2S heater voltage supply circuit fuse is open, test all components connected to the fuse and replace as necessary.
3. Ignition ON, verify that a test lamp does not illuminate between the appropriate HO2S heater voltage supply control circuit terminal D and the appropriate HO2S heater low control circuit terminal listed below:
   - B2S1 terminal C
   - B2S2 terminal C

   If the lamp illuminates, test the HO2S heater low control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Engine running, leave the test lamp connected from the previous step. The lamp should flash or be ON steady.

   If the test lamp is not ON steady or flashing, test the HO2S heater low control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.

   Important:
   - The output driver should detect a short to voltage and turn OFF. If a resistance fault is present the driver will remain ON and the scan tool will display more than 0.0 amp. Less than 10 ohms may set a DTC.
   - Performing this test may set additional DTCs.
5. Ignition OFF, install a 30A fused jumper wire between the appropriate HO2S heater voltage supply circuit terminal D and the appropriate HO2S heater low control circuit terminal listed below:
   - B2S1 terminal C
   - B2S2 terminal C
6. Engine running, verify the appropriate scan tool HO2S Heater parameter is less than 0.1 amp.

   If more than the specified range, test the HO2S heater voltage supply and HO2S heater low control circuits for more than 1 ohm. If the circuits test normal, replace the ECM.
7. If the ECM and all circuits test normal, replace the appropriate HO2S.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0068: Throttle Body Airflow Performance

DTC P0121: Throttle Position (TP) Sensor 1 Performance

Circuit / System Description

The engine control module (ECM) uses the following information to calculate an expected airflow rate:

- The throttle position (TP)
- The barometric pressure (BARO)
- The manifold absolute pressure (MAP)
- The intake air temperature (IAT)
- The engine RPM

Conditions for Running the DTC

P0068

- DTCs P0641, P0651, P1516, P2101, P2119, P2176 are not set.
- The engine is running.
- DTC P0068 run continuously when the above conditions are met.

P0121

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0128, P0315, P0335, P0336 are not set.
- The engine speed is more than 450 RPM.
- The IAT Sensor parameter is between -7 to +125°C (+19 to +257°F).
- The ECT Sensor parameter is between 70-125°C (158-257°F).
- DTC P0121 run continuously when the above conditions are met.

Conditions for Setting the DTC

P0068

The ECM detects that the throttle position and the indicated engine load do not correspond with the expected load and throttle position for less than 1 second.

P0121

The predicted air flow and the predicted MAP combined are outside a calibrated range for more than 3 seconds.

Action Taken When the DTC Sets

P0068

- DTC P0068 is a Type A DTC.
- The control module commands the throttle actuator control (TAC) system to operate in the Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions the control module commands the engine OFF.

P0121

DTC P0121 is a Type B DTC.

Conditions for Clearing the MIL/DTC

- DTC P0068 is a Type A DTC.
- DTC P0121 is a Type B DTC.

Circuit / System Testing

1. Inspect for the following conditions:
    - Vacuum hoses for splits, kinks, and proper connections as shown on Vehicle Emission Control Information label
    - Inspect thoroughly for any type of leak or restriction
    - Air leaks at throttle body mounting area and intake manifold sealing surfaces
    - Throttle body for dirt, debris, and coking--Refer to Throttle Body Cleaning.
2. Allow the engine to reach operating temperature. Observe the MAP Sensor Voltage parameter with a scan tool. Voltage should be more than 0.8 volt and less than 4 volts.

    If more than 4 volts or less than 0.8 volt, refer to DTC P0106.
3. Idle the engine. Observe the MAP Sensor kPa parameter with a scan tool. Increase the engine speed slowly and then back to idle. The MAP sensor kPa should change smoothly and gradually as engine speed is increased and returned to idle.

    If the MAP sensor kPa does not change, refer to DTC P0106.
4. Take a snapshot of the engine data list while performing the actions listed below. The mass air flow (MAF) sensor g/s should change smoothly and gradually as the engine speed is increased and is returned to idle.
    - Idle the engine.
    - Increase the engine speed slowly to 3,000 RPM, then back to idle.
    - Exit from the snapshot and review the data.
    - Observe the Mass Air Flow (MAF) Sensor parameter frame by frame with a scan tool. The MAF sensor g/s should change smoothly and gradually as the engine speed is increased and is returned to idle.

        If the MAF sensor g/s does not change smoothly and gradually as the engine speed is increased and is returned to idle, refer to DTC P0101 or P1101.
5. Inspect the throttle body for the following conditions:
    - Loose or damaged throttle blade
    - Broken throttle shaft
    - Any throttle body damage

    If any of these conditions exist, replace the throttle body assembly.

Circuit Description

The intake flow rationality diagnostic provides the within-range rationality check for the mass air flow (MAF), manifold absolute pressure (MAP), and the throttle position (TP) sensors. This is an explicit model-based diagnostic containing 4 separate models for the intake system.

- The throttle model describes the flow through the throttle body and is used to estimate the MAF through the throttle body as a function of barometric pressure (BARO), TP, intake air temperature (IAT), and estimated MAP. The information from this model is displayed on the scan tool as the MAF Performance Test parameter.

- The first intake manifold model describes the intake manifold and is used to estimate MAP as a function of the MAF into the manifold from the throttle body and the MAF out of the manifold caused by engine pumping. The flow into the manifold from the throttle uses the MAF estimate calculated from the above throttle model. The information from this model is displayed on the scan tool as the MAP Performance Test 1 parameter.
- The second intake manifold model is identical to the first intake manifold model except that the MAF sensor measurement is used instead of the throttle model estimate for the throttle air input. The information from this model is displayed on the scan tool as the MAP Performance Test 2 parameter.
- The fourth model is created from the combination and additional calculations of the throttle model and the first intake manifold model. The information from this model is displayed on the scan tool as the TP Performance Test parameter.

The estimates of MAF and MAP obtained from this system of models and calculations are then compared to the actual measured values from the MAF, MAP, and the TP sensors and to each other to determine the appropriate DTC to fail. The following table illustrates the possible failure combinations and the resulting DTC or DTCs.

Scan Tool Diagnostic Test Results

Conditions for Running the DTCs

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0128, P0335, P0336 are not set.
- The engine speed is between 450-8,000 RPM.
- The IAT Sensor parameter is between -7 to +125°C (+19 to +257°F).
- The ECT Sensor parameter is between 70-125°C (158-257°F).
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

The engine control module (ECM) detects that the actual measured airflow from the MAF, MAP, and TP sensors is not within range of the calculated airflow that is derived from the system of models for more than 0.5 second.

Action Taken When the DTC Sets

DTCs P0101 and P1101 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0101 and P1101 are Type B DTCs.

Diagnostic Aids

- A steady or intermittent high resistance of 15 ohms or greater on the ignition 1 voltage circuit will cause the MAF sensor signal to be increased by as much as 60 g/s. To pinpoint this condition perform a voltage drop test on the circuit.
- Depending on the current ambient temperature, and the vehicle operating conditions, a MAF sensor signal circuit that is shorted to the IAT signal circuit will increase or decrease the MAF sensor signal that is interpreted by the ECM. Additionally it may cause a rapid fluctuation in the IAT Sensor parameter.

Circuit/System Verification

1. Verify that DTC P0641 or P0651 is not set.

   If any of the DTCs are set, refer to DTC P0641 or P0651.
2. Verify that restrictions do not exist in the exhaust system. Refer to Restricted Exhaust.
3. Engine running at idle, observe the scan tool MAF Sensor parameter. The reading should be between 1,700-3,200 Hz depending on the ECT.
4. A wide open throttle (WOT) acceleration from a stop should cause the MAF Sensor parameter on the scan tool to increase rapidly. This increase should be from 4-8 g/s at idle to greater than 150 g/s at the time of the 1-2 shift.
5. Use the scan tool and compare the MAF Sensor parameter to a known good vehicle under various operating conditions.
6. Verify the proper operation of the MAP sensor. A skewed MAP sensor will cause the barometric pressure (BARO) value to be inaccurate. Refer to DTC P0106.
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Verify the integrity of the entire air induction system by inspecting for the following conditions:
   - Any damaged components
   - Loose or improper installation
   - An air flow restriction
   - Any vacuum leak
   - Water intrusion
   - In cold climates, inspect for any snow or ice buildup
   - The MAF sensor element for contamination
2. Ignition OFF, disconnect the harness connector at the MAF/IAT sensor.
3. Ignition OFF and scan tool disconnected for 90 seconds, test for less than 5 ohms between the ground circuit terminal C and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal B and

ground.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.

5. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Ignition OFF, connect the red lead of the J 38522 to the signal circuit terminal A at the MAF/IAT sensor harness connector. Connect the battery voltage supply to B+. Connect the black lead to ground.
7. Set the J 38522 Signal switch to 5 volts, the Frequency switch to 5K, and the Duty Cycle switch to Normal.
8. Engine idling, observe the scan tool MAF Sensor parameter. The scan tool MAF Sensor parameter should be between 4,950-5,025 Hz.

   If the MAF Sensor parameter is not within the specified range, replace the ECM.
9. If the circuits test normal, test or replace the MAF sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Mass Airflow Sensor/Intake Air Temperature Sensor Replacement
- Control Module References for ECM replacement, setup, and programming

MAF Sensor Signal	0 Hz	0 Hz	0 Hz
Ground	--	0 Hz	--

Circuit/System Description

The mass air flow (MAF) sensor is integrated with the intake air temperature (IAT) sensor. The MAF sensor is an air flow meter that measures the amount of air entering the engine. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. A small quantity of air entering the engine indicates a deceleration or idle condition. A large quantity of air entering the engine indicates an acceleration or high load condition. The MAF/IAT sensor has the following circuits:

- An ignition 1 voltage circuit
- A ground circuit

- A MAF sensor signal circuit
- An IAT sensor signal circuit
- A low reference circuit

The ECM applies 5 volts to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a frequency based on the inlet air flow through the sensor bore. The frequency varies within a range of near 1,700 Hertz at idle to near 9,500 Hertz at maximum engine load.

Conditions for Running the DTC

- The engine is running for more than one second.
- The ignition 1 signal is more than 8 volts.
- The above conditions are met for more than one second.
- These DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0102

The ECM detects that the MAF Sensor parameter is less than 1,500 Hz for greater than 5 seconds.

P0103

The ECM detects that the MAF Sensor parameter is more than 14,500 Hz for greater than 5 seconds.

Action Taken When the DTC Sets

DTCs P0102 and P0103 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0102 and P0103 are Type B DTCs.

Diagnostic Aids

- Verify the integrity of the air induction system by inspecting for the following conditions:
  - A restricted or collapsed air intake duct
  - A misaligned air intake duct
  - A dirty or deteriorating air filter element
  - Any objects blocking the air inlet screen of the MAF/IAT sensor
  - Any water intrusion in the induction system
  - Any contamination or debris on the sensing elements of the MAF sensor
  - Damaged components
  - Loose or improper installation

  - Any air flow restriction
  - Any vacuum leak
- A wide open throttle (WOT) acceleration from a stop should cause the MAF sensor parameter on the scan tool to increase rapidly. This increase should be from 3-8 g/s at idle to 100 g/s or more at the time of the 1-2 shift.
- Verify that any electrical aftermarket devices are properly connected and grounded. Refer to Checking Aftermarket Accessories.

Special Tools

J 38522 Variable Signal Generator

Circuit/System Verification

- Engine running, observe the scan tool MAF Sensor parameter. The reading should be between 1,700-3,800 Hz, depending on the engine coolant temperature (ECT).
- A wide open throttle (WOT) acceleration from a stop should cause the MAF sensor parameter on the scan tool to increase rapidly. This increase should be from 3-8 g/s at idle to greater than 180 g/s at the time of the 1-2 shift.
- Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: All electrical components and accessories must be turned OFF and allowed to power down.

1. Ignition OFF, disconnect the MAF/IAT harness connector at the MAF/IAT sensor.
2. Ignition OFF and scan tool disconnected for 90 seconds, test for less than 5 ohms between the ground circuit terminal C and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal B and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
4. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit terminal A for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Ignition OFF, connect the red lead of the J 38522 to the signal circuit terminal A at the MAF/IAT sensor harness connector. Connect the battery voltage supply to B+. Connect the black lead to ground.
6. Set the J 38522 signal to 5 volts, the Frequency to 5K, and the Duty Cycle to Normal.
7. Engine idling, observe the scan tool MAF Sensor parameter. The scan tool MAF Sensor parameter should be between 4,950-5,025 Hz.

   If the MAF Sensor parameter is not within the specified range, replace the ECM.
8. If all other circuits test normal, replace the MAF sensor.

Conditions for Running the DTC

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0128, P0335, P0336 are not set.
- The engine is running.
- The IAT Sensor parameter is between -7 and +125°C (+19 and 257°F).
- The ECT Sensor parameter is between 70-125°C (158-257°F).
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The engine control module (ECM) detects that the MAP sensor pressure is not within range of the calculated pressure that is derived from the system of models for more than 0.5 second.

Action Taken When the DTC Sets

DTC P0106 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0106 is a Type B DTC.

Diagnostic Aids

Important: Verify that the engine is in good mechanical condition before continuing with this diagnostic.

- A skewed or stuck engine coolant temperature (ECT) or IAT sensor will cause the calculated models to be inaccurate and may cause this DTC to run when it should not. Refer to Temperature Versus Resistance.
- The BARO that is used by the ECM to calculate the air flow models is initially based on the MAP sensor at ignition ON. When the engine is running, the ECM will continually update the BARO value near wide open throttle using the MAP sensor and a calculation. A skewed MAP sensor will cause the BARO value to be inaccurate. Use the scan tool and compare the BARO parameter at ignition ON to the Altitude vs. Barometric Pressure Table. Refer to Altitude Versus Barometric Pressure.
- A skewed MAP sensor will also cause the first and second intake manifold models to disagree with the actual MAP sensor measurements. Use the scan tool and compare the MAP Sensor parameter to a known good vehicle, under various operating conditions.
- Inspect for the following conditions:
    - Incorrect CAM timing--Refer to Camshaft Timing Chain and Sprocket Replacement for the correct timing.
    - Worn piston rings--Refer to Engine Compression Test.

Circuit/System Verification

1. If DTC P0641 or P0651 are set, refer to DTC P0641 or P0651.
2. Verify that restrictions do not exist in the exhaust system. Refer to Restricted Exhaust.
3. Verify that the engine is in good mechanical condition. Refer to Symptoms - Engine Mechanical for the 4.8L, 5.3L, 6.0L and 6.2L engine.
4. Ignition OFF for 90 seconds, determine the current vehicle testing altitude. Ignition ON, observe the scan tool BARO Sensor parameter. Compare the parameter to the Altitude Versus Barometric Pressure table. The BARO sensor pressure parameter should be within the specified range indicated in the table.
5. A skewed MAP sensor will also cause the first and second intake manifold models to disagree with the actual MAP sensor measurements. Use the scan tool and compare the MAP Sensor parameter to a known good vehicle under various operating conditions. The readings should be within 3 kPa of the known good vehicle.
6. Ignition ON, observe the scan tool MAP sensor parameter. Start the engine. The MAP Sensor parameter should change.

   If the vehicle passes the Circuit System Verification Test, operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records list.

Circuit/System Testing

Important: All electrical components and accessories must be turned OFF and allowed to power down.

1. Verify the integrity of the air induction system by inspecting for the following conditions:
   - Any damaged components
   - Loose or improper installation
   - Improperly routed vacuum hoses
   - Any vacuum leak
   - Any type of restriction
   - MAP sensor seal that is missing or damaged
2. Verify that restrictions do not exist in the MAP sensor vacuum source.
3. Ignition OFF, disconnect the harness connector at the MAP sensor.
4. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal 2 and ground.

   If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
5. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 1 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Verify the scan tool MAP Sensor parameter is less than 12 kPa.

   If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the ECM.
7. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 1. Verify the scan tool MAP Sensor parameter is greater than 103 kPa.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
8. If all circuits test normal, test or replace the MAP sensor.

Component Testing

Important: You must perform the Circuit/System Testing in order to verify the integrity of the MAP sensor circuits before proceeding with the Component Testing.

Skewed Sensor Test

1. Using the following steps and referencing the table below will determine if the MAP sensor is skewed.
2. Ignition ON, engine OFF, observe the MAP sensor scan tool parameter.
3. Use the observed MAP Sensor Scan Tool parameter that is closest to a value that is indicated in the first column.
4. Using the MityVac to apply 5 in Hg of vacuum to the MAP sensor, the parameter in the first column should decrease by 17 kPa. The acceptable range is indicated in the second column.
5. Using the MityVac to apply 10 in Hg of vacuum to the MAP sensor, the parameter in the first column should decrease by 34 kPa. The acceptable range is indicated in the third column.

Ignition ON, Engine OFF, MAP Sensor Parameter	MAP Sensor Parameter With 5 Inches of Vacuum Applied	MAP Sensor Parameter With 10 Inches of Vacuum Applied
100 kPa	79-87 kPa	62-70 kPa
95 kPa	74-82 kPa	57-65 kPa

90 kPa	69-77 kPa	52-60 kPa
80 kPa	59-67 kPa	42-50 kPa
70 kPa	49-57 kPa	32-40 kPa
60 kPa	39-47 kPa	22-30 kPa

Erratic Signal Test

1. Ignition OFF, remove the MAP sensor.
2. Install a 3A fused jumper wire between the 5-volt reference circuit terminal 1 and the corresponding terminal of the MAP sensor.
3. Install a jumper wire between the low reference terminal 2 of the MAP sensor and ground.
4. Install a jumper wire at terminal B of the MAP sensor.
5. Connect a DMM between the jumper wire from the terminal 3 of the MAP sensor and ground.
6. Ignition ON, with the MityVac, slowly apply vacuum to the sensor while observing the voltage on the DMM. The voltage should vary between 4.9-0.2 volts without any spikes or dropouts.

   If the voltage is erratic, replace the MAP sensor.

MAP Sensor Signal	12-103 kPa	10 kPa	10 kPa	104 kPa
Low Reference	--	--	80-103 kPa	--

Circuit Description

The manifold absolute pressure (MAP) sensor measures the pressure inside the intake manifold. Pressure in the intake manifold is affected by engine speed, throttle opening, air temperature, and barometric pressure (BARO). A diaphragm within the MAP sensor is displaced by the pressure changes that occur from the varying load and operating conditions of the engine. The sensor translates this action into electrical resistance. The MAP sensor wiring includes 3 circuits. The engine control module (ECM) supplies a regulated 5 volts to the sensor on a 5-volt reference circuit. The ECM supplies a ground on a low reference circuit. The MAP sensor provides a signal voltage to the ECM, relative to the pressure changes, on the MAP sensor signal circuit. The ECM converts the signal voltage input to a pressure value.

Under normal operation the highest pressure that can exist in the intake manifold is equal to BARO. This occurs when the vehicle is operated at wide-open throttle (WOT) or when the ignition is ON while the engine is OFF. Under these conditions, the ECM uses the MAP sensor to determine the current BARO. The lowest manifold pressures occur when the vehicle is idling or decelerating. MAP can range from 10 kPa, when pressures are low, to as much as 104 kPa when pressures are high, depending on the BARO. The ECM monitors the MAP sensor signal for pressure outside of the normal range.

Conditions for Running the DTC

P0107

- DTCs P0641, P0651, P1516, P2101, P2125, P2135, P2138, P2176 are not set.
- The engine speed is greater than 400 RPM.
- The throttle angle is greater than 0 percent when the engine speed is less than 800 RPM.

  OR
- The throttle angle is greater than 13 percent when the engine speed is greater than 800 RPM.
- This DTC runs continuously when the above conditions are met.

P0108

- DTCs P0101, P0102, P0103, P0120, P0122, P0123, P0220, P0222, P0223, P1516, P2101, P2125, P2135, P2138, P2176 are not set.
- The engine has been running for a period of time that is determined by the start-up engine coolant temperature (ECT). The time ranges from 8 seconds at less than -30°C (-22°F) to 3 seconds at greater than 30°C (86°F).
- The throttle angle is less than 1 percent when the engine speed is less than 1,200 RPM.

  OR
- The throttle angle is less than 20 percent when the engine speed is greater than 1,200 RPM.
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0107

The ECM detects that the MAP sensor voltage is less than 0.2 volt for more than 5 seconds.

P0108

The ECM detects that the MAP sensor voltage is more than 4.5 volts for greater than 5 seconds.

Action Taken When the DTC Sets

DTCs P0107 and P0108 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0107 and P0108 are Type B DTCs.

Diagnostic Aids

Verify the integrity of the MAP sensor system by inspecting for the following conditions:

- Intake manifold vacuum leaks
- Any damage to the MAP sensor housing
- Any damage to the MAP sensor seal
- A loose or improperly installed MAP sensor
- A restriction in the vacuum source of the MAP sensor

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

- Use the scan tool and compare the MAP Sensor parameter to a known good vehicle, under various operating conditions.
- Use the scan tool and compare the MAP Sensor parameter at ignition ON, with the engine OFF, to the Altitude vs Barometric Pressure table. Refer to Altitude Versus Barometric Pressure.

Circuit/System Testing

Important: All electrical components and accessories must be turned OFF and allowed to power down.

1. Ignition OFF, disconnect the harness connector at the MAP sensor.
2. Ignition OFF, test for less than 5 ohms between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 1 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Verify the scan tool MAP Sensor parameter is less than 12 kPa.

   If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the ECM.
5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 1. Verify the scan tool MAP Sensor parameter is greater than 103 kPa.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal, test or replace the MAP sensor.

Component Testing

Important: You must perform the Circuit/System Testing in order to verify the integrity of the MAP sensor circuits before proceeding with the Component Testing.

1. Turn ON the ignition, with the engine OFF, and remove the MAP sensor.
2. Install a 3A fused jumper wire between the 5-volt reference circuit terminal 1 and the corresponding terminal of the MAP sensor.
3. Install a jumper wire between the low reference circuit terminal 2 of the MAP sensor and ground.
4. Install a jumper wire at the MAP sensor signal circuit terminal 3.
5. Connect a DMM between the jumper wire from the MAP sensor signal circuit and ground.
6. Install the MityVac to the MAP sensor vacuum port. Slowly apply vacuum to the sensor while observing the voltage on the DMM. The voltage should vary between 0-5.2 volts without any spikes or dropouts.

   If the voltage is not within the specified range or is erratic, replace the MAP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Manifold Absolute Pressure Sensor Replacement
- Control Module References for ECM replacement, setup, and programming

DTC P0112 or P0113

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0112: Intake Air Temperature (IAT) Sensor Circuit Low Voltage

DTC P0113: Intake Air Temperature (IAT) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
IAT Sensor Signal	P0112	P0113	P0113	P0113	--
Low Reference	--	P0113	P0113	P0113	--

Typical Scan Tool Data

IAT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running *Parameter Normal Range:* Varies with ambient temperature			
IAT Sensor Signal	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	--	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The intake air temperature (IAT) sensor is a variable resistor. The IAT sensor has a signal circuit and a low reference circuit. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit, and a ground for the IAT low reference circuit.

Conditions for Running the DTC

P0112

- DTCs P0116, P0117, P0118, P0128, P0502, P0503 are not set.
- The engine is running for greater than 10 seconds.
- The engine coolant temperature (ECT) is less than 150°C (302°F).
- This DTC runs continuously when the above conditions are met.

P0113

- DTCs P0101, P0102, P0103, P0116, P0117, P0118, P0128, P0502, P0503 are not set.
- The engine is running for greater than 10 seconds.
- The ECT is more than -40°C (-40°F).
- The MAF Sensor parameter is greater than 511 g/s.
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0112

The ECM detects that the IAT sensor parameter is warmer than 150°C (302°F) for greater than 6.3 seconds.

P0113

The ECM detects that the IAT sensor parameter is colder than -60°C (-76°F) for greater than 6.3 seconds.

Action Taken When the DTC Sets

DTCs P0112 and P0113 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0112 and P0113 are Type B DTCs.

Diagnostic Aids

- With the ignition ON, the engine OFF, if the engine is cold, a properly functioning IAT sensor will gradually increase the scan tool IAT Sensor parameter. This is due to the heat that is generated by the mass air flow (MAF) sensor heating elements.
- Depending on the ambient temperature, an IAT sensor signal circuit or low reference circuit that is shorted to the MAF sensor signal circuit can cause a DTC P0113 to set. This condition causes a rapid fluctuation in the IAT Sensor parameter.
- An IAT sensor signal circuit that is shorted to the MAF sensor ignition circuit can cause a DTC P0113 to set.

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, observe the scan tool IAT Sensor parameter. The reading should be between -38 to +149°C (-38 to +300°F) depending on the current ambient temperature and the vehicle operating conditions.
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the IAT sensor.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal E and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, verify the scan tool IAT parameter is colder than -39°C (-38°F).

   If greater than the specified range, test the signal circuit terminal D for a short to ground. If the circuit tests normal, replace the ECM.
4. Install a 3A fused jumper wire between the signal circuit terminal D and ground. Verify the scan tool IAT parameter is greater than 149°C (300°F).

   If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the IAT sensor.

Component Testing

Measure and record the resistance of the IAT sensor at various ambient temperatures, and then compare those measurements to the Temperature vs Resistance table. Refer to Temperature Versus Resistance.

DTC Descriptor

DTC P0116: Engine Coolant Temperature (ECT) Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
ECT Sensor Signal	P0117	P0118	P0118	P0118	P0116, P0128
Low Reference	--	P0118	P0118	P0118	P0128

Typical Scan Tool Data

ECT Sensor Temperature

Circuit	Normal Range	Short to Ground	Open	Short to Voltage
ECT Sensor Signal	-39 to +120°C (-38 to +248°F)	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	--	--	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT sensor signal circuit, and supplies a ground to the low reference circuit. The ECM uses this high side coolant rationality diagnostic to determine if the input from the ECT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the ignition is OFF. If the calibrated ignition OFF timer is met at start-up, the ECM will compare the temperature difference between the ECT and the intake air temperature (IAT), to determine if the temperatures are within an acceptable operating range of each other.

Conditions for Running the DTC

- DTCs P0112, P0113, P0117, P0118, P0502, P0503, P0601, P0603, P062F, P2610 are not set.
- The vehicle has had a minimum ignition OFF time of 10 hours.
- The ignition is ON.
- The start-up IAT is more than -7°C (+19°F).
- The Fuel Level Sensor parameter is more than 5 percent.
- This DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

- The ECM detects a temperature difference at power-up that indicates that the ECT sensor is 30°C (54°F) more than the IAT sensor.

  OR
- The ECM detects a temperature difference at power-up that indicates that the ECT sensor is 10°C (18°F) more than the IAT sensor, and the time spent cranking the engine is more than 10 seconds, when the fuel level is more than 5 percent.

  OR
- With the power-up IAT more than -7°C (+19°F), the ECM detects a temperature difference at power-up that indicates that the ECT sensor is 20°C (36°F) more than the IAT sensor. Then the vehicle must be driven for more than 6 minutes and 40 seconds at more than 40 km/h (25 mph). If the IAT sensor then decreases more than 4°C (7°F), an engine block heater was detected and the test is aborted. If the IAT sensor does not decrease, an engine block heater was not detected and DTC P0116 will set.

Action Taken When the DTC Sets

DTC P0116 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0116 is a Type B DTC.

Diagnostic Aids

- The use of non-thermostatically controlled aftermarket block heater will cause this DTC to set.
- Inspect the ECT sensor terminals for corrosion and for engine coolant leaking through the sensor. Engine coolant that is leaking through the sensor will create a high resistance short to ground. This condition results in less voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a warmer ECT.
- An IAT sensor that is skewed colder at various ambient temperatures due to greater resistance than is normal will increase the range between these two sensors. Measure and record the resistance of the IAT sensor at various ambient temperatures, then compare those measurements to the Temperature vs Resistance table. Refer to Temperature Versus Resistance.
- A slight to moderate resistance in the IAT sensor signal circuit or low reference circuit will increase the range between these two sensors. This condition results in a greater voltage on the IAT sensor signal circuit, which is interpreted by the ECM as a colder IAT.

Circuit/System Verification

1. Ignition OFF, inspect the cooling system surge tank for the proper coolant level. Refer to Cooling System Leak Testing and Cooling System Draining and Filling.
2. Inspect the thermostatically-controlled coolant heater, if equipped, for damage or modifications. Test for proper operation of the coolant heater. Refer to Coolant Heater Inoperative.
3. Ignition OFF for 8 hours or greater.
4. Ignition ON, observe the scan tool IAT and ECT sensor parameters. The ECT, IAT, and ambient temperature should be within 6°C (11°F) of each other.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal A and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, verify the scan tool ECT parameter is colder than -39°C (-38°F).

   If greater than the specified range, test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.
4. Install a 3A fused jumper wire between the signal circuit terminal B and the low reference

circuit terminal A. Verify the scan tool ECT parameter is greater than 149°C (300°F).

   If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.

5. If all circuits test normal, test or replace the ECT sensor.
6. Inspect for the proper operation of the OEM block heater cord by verifying that the thermostat has turned OFF the heater at temperatures warmer than -10° (+14°F).

Component Testing

Measure and record the resistance of the ECT sensor at various ambient temperatures, then compare those measurements to the Temperature vs Resistance table. Refer to Temperature Versus Resistance.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Coolant Temperature Sensor Replacement

Typical Scan Tool Data

ECT Sensor Temperature

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine operating in Closed Loop *Parameter Normal Range:* Varies with coolant temperature			
ECT Sensor Signal	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	--	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and supplies a ground to the low reference circuit.

Conditions for Running the DTC

P0117

- The engine is running for more than 10 seconds.
  OR
- The ignition is ON when the intake air temperature (IAT) is less than 50°C (122°F).
- This DTC runs continuously when the above conditions are met.

P0118

- The engine is running for more than 10 seconds.
  OR
- The ignition is ON when the IAT is more than 0°C (32°F).
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0117

The ECM detects that the ECT is more than 150°C (302°F) for more than 5 seconds.

P0118

The ECM detects that the ECT is less than -60°C (-76°F) for more than 5 seconds.

Action Taken When the DTC Sets

DTCs P0117 and P0118 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0117 and P0118 are Type B DTCs.

Circuit/System Verification

> **Warning:** Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

1. Turn OFF the ignition.
2. Inspect the cooling system surge tank for the proper engine coolant level. Refer to Cooling System Leak Testing and Cooling System Draining and Filling.
3. Turn ON the ignition, with the engine OFF.
4. Use the scan tool to verify the proper operation of the engine cooling system fans.
5. Turn OFF the ignition.
6. Verify the proper heat range, and the operation of the thermostat. Refer to Thermostat Diagnosis.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal A and ground.
   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, verify the scan tool ECT parameter is colder than -39°C (-38°F).
   If greater than the specified range, test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.
4. Install a 3A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool ECT parameter is greater than 149°C (300°F).
   If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the ECT sensor.

Component Testing

Measure and record the resistance of the ECT sensor at various ambient temperatures, then compare those measurements to the Temperature vs Resistance table. Refer to Temperature Versus Resistance.

TP Sensor 2 Low Reference	--	5 V	--

Circuit/System Description

The throttle actuator control (TAC) system uses two throttle position (TP) sensors to monitor the throttle position. The TP sensors 1 and 2 are located within the throttle body assembly. Each sensor has the following circuits:

- A 5-volt reference circuit
- A low reference circuit
- A signal circuit

Two processors are also used to monitor the TAC system data. Both processors are located within the engine control module (ECM). Each signal circuit provides both processors with a signal voltage proportional to throttle plate movement. Both processors monitor each other's data to verify that the indicated TP calculation is correct.

Conditions for Running the DTC

P0120, P0122, P0123, P0220, P0222, and P0223

- DTC P0601, P0602, P0603, P0604, P0606, P0607, P0641, P0651 are not set.
- The system voltage is more than 5.23 volts.
- The ignition is in the Unlock/Accessory or Run position.
- DTC P0120, P0122, P0123, P0220, P0222, P0223 run continuously when the above conditions are met.

P2135

- The system voltage is more than 5.23 volts.
- The ignition is in the Unlock/Accessory or Run position.
- DTC P0120, P0220, P0641, P0651 are not set.
- DTC P2135 runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0120

TP sensor 1 voltage is less than 0.325 volt or more than 4.75 volts for more than 1 second.

P0122

The ECM detects that the TP sensor 1 voltage is less than 0.325 volt for more than 1 second.

P0123

The ECM detects that the TP sensor 1 voltage is more than 4.75 volts for more than 1 second.

P0220

The TP sensor 2 voltage is less than 0.25 volt or more than 4.59 volts for more than 1 second.

P0222

The ECM detects that the TP sensor 2 voltage is less than 0.25 volt for more than 1 second.

P0223

The ECM detects that the TP sensor 2 voltage is more than 4.59 volts for more than 1 second.

P2135

The difference between the TP sensor 1 and TP sensor 2 exceeds a predetermined value for more than 2 seconds.

Action Taken When the DTC Sets

- DTC P0120, P0122, P0123, P0220, P0222, P0223, and P2135 are Type A DTCs.
- The control module commands the TAC system to operate in the Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions the control module commands the engine OFF.

Conditions for Clearing the MIL/DTC

DTCs P0120, P0122, P0123, P0220, P0222, P0223, and P2135 are Type A DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool TP sensor 1 voltage parameter. The reading should be between 4.75-0.33 volts and change with accelerator pedal input.
2. Ignition ON, observe the scan tool TP sensor 2 voltage parameter. The reading should be between 0.25-4.59 volts and change with accelerator pedal input.
3. Ignition ON, observe the scan tool TP sensor 1 and 2 parameter. The scan tool should indicate agree.
4. Clear the DTCs with the scan tool. Operate the vehicle within the Conditions for Running the DTC, or within the conditions that you observed from the Freeze Frame/Failure Records.
5. Verify that DTC P0120 or P0220 are not the only throttle position DTCs set.

   If DTC P0120 or P0220 are the only DTCs set, replace the control module.
6. Verify that DTCs P0641 or P0651 are not set.

   If DTC P0641 or P0651 is set, refer to DTC P0641 or P0651.
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the throttle body. Allow up to 2 minutes for the ECM to completely power down.
2. Ignition OFF, test for less than 5 ohms between the low reference circuit terminal C and ground.

   If greater than 5 ohms, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between 5-volt reference circuit terminal E and ground.

If less than 4.8 volts, test 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

If greater than 5.2 volts, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.

4. Verify the scan tool TP sensor 1 voltage is less than 0.1 volt.

   If greater than 0.1 volt, test the signal circuit terminal D for a short to voltage. If the circuit tests normal, replace the ECM.
5. Verify the scan tool TP sensor 2 voltage is greater than 4.8 volts.

   If less than 4.8 volts, test the signal circuit terminal F for a short to ground. If the circuit tests normal, replace the ECM.
6. Install a 3A fused jumper wire between the signal circuit terminal D and the 5-volt reference circuit terminal E of the TP sensor 1. Verify the TP sensor 1 voltage is greater than 4.8 volts.

   If less than 4.8 volts, test the TP sensor 1 signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
7. Install a test lamp between the signal circuit terminal F of the TP sensor 2 and ground. The test lamp should not illuminate.

   If the test lamp illuminates, test the TP sensor 2 signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
8. Install a 3A fused jumper wire between the signal circuit terminal F and the low reference circuit terminal C of the TP sensor 2. Verify that the TP sensor 2 voltage is less than 0.1 volt.

   If greater than 1.0 volt, test the TP sensor 2 signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
9. Ignition OFF, disconnect the harness connector at the ECM.
10. Test for less than 5 ohms on all TP sensor circuits between the following terminals:
    - ECM X2 signal circuit terminal 65 to TP terminal D
    - ECM X2 signal circuit terminal 63 to TP terminal F
    - ECM X2 5-volt reference circuit terminal 3 to terminal E

    If greater than 5 ohms, repair the affected circuit for open/high resistance.
11. Test for infinite resistance between TP sensor 1 signal circuit terminal D and TP sensor signal circuit terminal F.

    If less than infinite resistance, repair the short between TP sensor 1 signal circuit and TP sensor 2 signal circuit.
12. If all circuits test normal, replace the throttle body.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Throttle Body Assembly Replacement
- Control Module References for ECM replacement, setup, and programming

DTC P0128

Diagnostic Instructions

Low Reference	--	P0118	P0118	P0118	P0128

Typical Scan Tool Data

ECT Sensor Temperature

Circuit	Normal Range	Short to Ground	Open	Short to Voltage
ECT Sensor Signal	-39 to +120°C (-38 to +248°F)	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	--	--	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and supplies a ground to the low reference circuit.

The purpose of both of these rationality diagnostics are to use the ECT sensor to determine if the engine coolant will heat up at the correct rate and also meet the calibrated target temperatures under various operating conditions.

The ECM uses the start-up ECT and the start-up intake air temperature (IAT) to begin the diagnostic calculation. The air flow into the engine is accumulated and vehicle speed, distance and engine run time are also factored to determine if the ECT does increase normally, and reach the calibrated target temperatures.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0171, P0172, P0174, P0175, P0502, P0503 are not set.
- The start-up IAT is more than -7°C (+19°F).
- The start-up ECT is less than 70°C (158°F), when the IAT is above 10°C (50°F).
- The start-up ECT is less than 50°C (122°F), when the IAT is below 10°C (50°F).
- The engine run time is between 90 seconds and 22 minutes.
- The vehicle has traveled more than 2.4 kilometers (1.5 miles) at more than 8 km/h (5 mph).
- The accumulated airflow is between 20-75 g/s, with the minimum average airflow more than 10 g/s.
- The fuel ethanol percentage is less than 85 percent.
- This DTC runs once per ignition cycle within the enabling conditions.

Conditions for Setting the DTC

The ECM detects that the minimum ECT of 75°C (167°F) has not been met, when the IAT is more than 10°C (50°F).

OR

The ECM detects that the minimum ECT of 55°C (131°F) has not been met, when the IAT is less than 10°C (50°F).

Action Taken when the DTC Sets

DTC P0128 is Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0128 is Type B DTC.

Diagnostic Aids

- DTC P0128 occurring with insufficient vehicle interior heating is an indication of improper thermostat operation.
- Inspect the ECT sensor terminals and the ECT harness connector for corrosion. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.
- This diagnostic runs in a specific range. Measure and record the resistance of the ECT sensor at various ambient temperatures between -7 to +80°C (+19 to +176°F), then compare those measurements to the Temperature Versus Resistance.
- A slight to moderate resistance in the ECT sensor signal circuit or low reference circuit will affect this diagnostic. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition OFF, inspect the cooling system surge tank for proper coolant level. Refer to Cooling System Leak Testing and Cooling System Draining and Filling.
2. Ignition OFF for 8 hours or greater.
3. Ignition ON, observe the scan tool IAT Sensor and ECT Sensor parameters. The ECT, IAT, and ambient temperatures should be within 6°C (11°F) of each other.
4. Use the scan tool to verify the proper operation of the engine cooling system fans.

   Note: A critical analysis of the operation of the thermostat is necessary, to properly diagnose these DTCs.

5. Verify the proper heat range, and the operation of the thermostat. Refer to Thermostat Diagnosis.
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal A and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, verify the scan tool ECT Sensor parameter is less than -39°C (-38°F).

   If warmer than the specified range, test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.
4. Install a 3A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool ECT Sensor parameter is greater than 149°C (300°F).

   If colder than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the ECT sensor.

Component Testing

Measure and record the resistance of the ECT sensor at different ambient temperatures, and then compare those measurements to the Temperature Versus Resistance Table. Refer to Temperature Versus Resistance.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Coolant Temperature Sensor Replacement
- Engine Coolant Thermostat Replacement
- Engine Control Module Replacement for ECM replacement, setup and programming.

Typical Scan Tool Data

HO2S Sensor 1 Voltage

Circuit	Short to Ground	Open	Short to Voltage
Parameter Normal Range: 200-800 mV			
HO2S High Signal	0 mV	Approximately 470 mV	Approximately 1,100 mV

HO2S Low Signal	455 mV	Approximately 450 mV	Approximately 445 mV

Circuit / System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. Heating elements inside the HO2S minimize the time required for the sensors to reach operating temperature. The engine control module (ECM) supplies the HO2S with a reference, or bias, voltage of about 450 mV. When the engine is first started, the ECM operates in Open Loop, ignoring the HO2S voltage signal. Once the HO2S reaches operating temperature and Closed Loop is achieved, the HO2S generates a voltage within a range of 0-1,000 mV that fluctuates above and below bias voltage. High HO2S voltage indicates a rich exhaust stream. Low HO2S voltage indicates a lean exhaust stream.

Conditions for Running the DTC

P0131

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Throttle Position (TP) Indicated Angle parameter is between 3-70 percent.
- DTC P0131 runs continuously when the above conditions are met for 2 seconds.

P0132

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Throttle Position (TP) Sensor parameter is between 0-70 percent.
- DTC P0132 runs continuously when the above conditions are met for 2 seconds.

P0137

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.

- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The TP Sensor parameter is between 3-70 percent.
- DTC P0137 runs the lean test continuously when the above conditions are met for 2 seconds.

P0138

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The TP Sensor parameter is between 3-70 percent.
- DTC P0138 runs the rich test continuously when the above conditions are met for 2 seconds.

Conditions for Setting the DTC

P0131

- The ECM detects that the HO2S 1 Voltage parameter is less than 50 mV.
- DTC P0131 sets within 100 seconds during the lean test when the above condition is met.

P0132

- The ECM detects that the HO2S 1 parameter is more than 1,050 mV.
- DTC P0132 sets within 15 seconds during the rich test when the above condition is met.

P0137

- The ECM detects that the HO2S 1 voltage parameter is less than 50 mV.
- DTC P0137 sets within 100 seconds during the lean test when the above condition is met.

P0138

- The ECM detects that the HO2S 1 voltage parameter is more than 1,050 mV.
- DTC P0138 sets within 100 seconds during the rich test when the above condition is met.

Action Taken When the DTC Sets

DTCs P0131, P0132, P0137, and P0138 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0131, P0132, P0137, and P0138 are Type B DTCs.

Circuit/System Verification

1. If any HO2S heater DTCs are set, perform those diagnostics first.
2. Allow the engine to reach operating temperature.
3. Engine running, observe the affected HO2S parameter with a scan tool.
    - The pre-catalyst oxygen sensors value should vary from below 200 mV to above 800 mV and respond to fueling changes.
    - The post-catalyst oxygen sensors value should change more than 200 mV when the throttle is quickly cycled 3 times from closed to wide open and back to closed after running the engine at 1,500 RPM for 30 seconds.
4. The affected HO2S may be damaged due to contamination. Prior to replacing the affected HO2S, inspect for the following sources of contamination:

    Notice: Refer to Silicon Contamination of Heated Oxygen Sensors Caution in the Preface section.

    - A silicon contaminated HO2S
    - Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.

- Engine oil consumption--Refer to Oil Consumption Diagnosis.
- Engine coolant consumption--Refer to Loss of Coolant.

5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: All modules must be powered down or misdiagnosis may result.

1. Ignition OFF, disconnect the scan tool and wait 60 seconds to ensure all modules are powered down.
2. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
3. Ignition OFF, measure for less than 5 ohms between the appropriate HO2S low signal circuit terminal A and ground.

   If more than the specified range, test the appropriate HO2S low signal circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify the appropriate scan tool HO2S parameter is approximately 450 mV.

   If more than the specified value, test the appropriate HO2S high signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.

   If less than the specified value, test the appropriate HO2S high signal circuit for a short to ground. If the circuit tests normal, replace the ECM.
5. Ignition ON, install a 3A fused jumper wire at the HO2S high signal circuit terminal B. Toggle the jumper wire between the HO2S low signal circuit terminal A and battery voltage. Verify the appropriate scan tool HO2S parameter toggles between 0 mV and approximately 1,000 mV.

   If the appropriate scan tool HO2S parameter does not toggle correctly, test the HO2S high signal circuit for an open/high resistance. If the circuits test normal, replace the ECM.
6. If all circuits test normal, replace the appropriate HO2S.

Repair Instructions

Notice: Refer to Heated Oxygen Sensor Resistance Learn Reset Caution in the Preface section.

Important: For DTC P0131 and P0132, in order to ensure that the performance of the catalyst has not been affected by the fault that set this DTC, operate the vehicle within the conditions for running and setting DTC P0420 and verify that P0420 runs and passes. Refer to DTC P0420 or P0430.

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Once the HO2S reaches operating temperature and Closed Loop is achieved, the HO2S generates a voltage within a range of 0-1,000 mV that fluctuates above and below bias voltage. High HO2S voltage indicates a rich exhaust stream. Low HO2S voltage indicates a lean exhaust stream.

Conditions for Running the DTC

P0133

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Engine Coolant Temperature (ECT) Sensor parameter is more than 60°C (140°F).
- The Intake Air Temperature (IAT) Sensor parameter is more than -40°C (-40°F)
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Engine Run Time parameter is more than 160 seconds.
- The Engine Speed parameter is between 1,200-3,000 RPM.
- The Barometric (BARO) Pressure parameter is more than 70 kPa.
- The Mass Airflow (MAF) Sensor parameter is between 20-55 g/s.
- The Loop Status parameter is Closed.
- The Throttle Position (TP) Indicated Angle parameter is more than 5 percent.
- DTC P0133 runs once per drive cycle when the above conditions are met for 1 second.

P0134

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The engine run time is more than 300 seconds.

- DTC P0134 runs continuously when the above conditions are met.

P0140

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Run Time parameter is more than 300 seconds.
- The Loop Status parameter is closed.
- DTC P0140 runs once per drive cycle when the above conditions are met.

P1133

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 60°C (140°F).
- The Engine Speed parameter is between 1,200-3,000 RPM.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Run Time parameter is more than 160 seconds.
- The Loop Status parameter is Closed.
- The TP Indicated Angle parameter is more than 5 percent.
- The Fuel Level Sensor parameter is more than 10 percent.
- The BARO Pressure parameter is more than 70 kPa.
- The MAF Sensor parameter is between 20-55 g/s.
- DTC P1133 runs once per drive cycle when the above conditions are met for 1 second.

P2270

- DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0443, P0458, P0459, P2232 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Speed parameter is between 500-5,000 RPM.
- The MAF Sensor parameter is between 3-50 g/s.
- The Vehicle Speed parameter is between 24-132 km/h (15-82 mph).
- The Fuel Level Sensor parameter is more than 10 percent.
- The Loop Status parameter is closed.
- DTC P2270 runs once per drive cycle when the above conditions are met.

P2271

- DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0443, P0458, P0459, P2232 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Speed parameter is between 500-5,000 RPM.
- The MAF Sensor parameter is between 3-50 g/s.
- The Vehicle Speed parameter is between 24-132 km/h (15-82 mph).
- The Fuel Level Sensor parameter is more than 10 percent.
- The Loop Status parameter is closed.
- DTC P2271 runs once per drive cycle when the above conditions are met for 1 second.

Conditions for Setting the DTC

P0133

- The ECM detects that the HO2S 1 rich-to-lean or lean-to-rich average response time is more than a calibrated value.
- DTC P0133 sets within 100 seconds when the above condition is met.

P0134

- The ECM detects that the HO2S 1 parameter is between 350-550 mV for 100 seconds.
- The Throttle Position (TP) Indicated Angle parameter changes more than 5 percent, 1 time.
- DTC P0134 sets within 100 seconds when the above conditions are met.

P0140

- The ECM detects that the HO2S 1 parameter is between 410-490 mV.
- The TP Indicated Angle parameter changes more than 5 percent 6 times.
- DTC P0140 sets within 100 seconds when the above conditions are met.

P1133

- The ECM detects that the HO2S 1 rich-to-lean counts, or the lean-to-rich counts are less than a calibrated value.
- DTC P1133 sets within 100 seconds when the above condition is met.

P2270

- The ECM detects that the HO2S 2 voltage oscillations are slower than a calibrated value.
- DTC P2270 sets within 4 seconds when the above condition is met continuously, or within 50 seconds when the above condition is met cumulatively.

P2271

- The ECM detects that the HO2S 2 voltage oscillations are faster than a calibrated value.
- DTC P2271 sets within 4 seconds when the above condition is met continuously, or within 50 seconds when the above condition is met cumulatively.

Action Taken When the DTC Sets

DTCs P0133, P0134, P0140, P1133, P2270, and P2271 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0133, P0134, P0140, P1133, P2270, and P2271 are Type B DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. If any HO2S heater DTCs are set, perform those diagnostics first.
2. Allow the engine to reach operating temperature.
3. Engine running, observe the affected HO2S parameter with a scan tool.
    - The pre-catalyst oxygen sensors value should vary from below 200 mV to above 800 mV and respond to fueling changes.
    - The post-catalyst oxygen sensors value should change more than 200 mV when the throttle is quickly cycled 3 times from closed to wide open and back to closed after

running the engine at 1,500 RPM for 30 seconds.

4. The affected HO2S may be damaged due to contamination. Prior to replacing the affected HO2S, inspect for the following sources of contamination:

   Notice: Refer to Silicon Contamination of Heated Oxygen Sensors Caution in the Preface section.

   - A silicon contaminated HO2S
   - Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Engine oil consumption--Refer to Oil Consumption Diagnosis.
   - Engine coolant consumption--Refer to Loss of Coolant.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: All modules must be powered down or misdiagnosis may result.

1. Ignition OFF, disconnect the scan tool and wait 60 seconds to ensure all modules are powered down.
2. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
3. Ignition OFF, measure for less than 5 ohms between the appropriate HO2S low signal circuit terminal A and ground.

   If more than the specified range, test the appropriate HO2S low signal circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify the appropriate scan tool HO2S parameter is approximately 450 mV.

   If more than the specified value, test the appropriate HO2S high signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.

   If less than the specified value, test the appropriate HO2S high signal circuit for a short to ground. If the circuit tests normal, replace the ECM.
5. Ignition ON, install a 3A fused jumper wire at the HO2S high signal circuit terminal B. Toggle the jumper wire between the HO2S low signal circuit terminal A and battery voltage. Verify the appropriate scan tool HO2S parameter toggles between 0 mV and approximately 1,000 mV.

   If the appropriate scan tool HO2S parameter does not toggle correctly, test the HO2S high signal circuit for an open/high resistance. If the circuits test normal, replace the ECM.
6. If all circuits test normal, replace the appropriate HO2S.

Repair Instructions

Notice: Refer to Heated Oxygen Sensor Resistance Learn Reset Caution in the Preface section.

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Typical Scan Tool Data

HO2S Sensor 1 Voltage

Circuit	Short to Ground	Open	Short to Voltage
Parameter Normal Range: 200-800 mV			
HO2S High Signal	0 mV	Approximately 470 mV	Approximately 1,100 mV

HO2S Low Signal	455 mV	Approximately 450 mV	Approximately 445 mV

Circuit / System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. Heating elements inside the HO2S minimize the time required for the sensors to reach operating temperature. The engine control module (ECM) supplies the HO2S with a reference, or bias, voltage of about 450 mV. When the engine is first started, the ECM operates in Open Loop, ignoring the HO2S voltage signal. Once the HO2S reaches operating temperature and Closed Loop is achieved, the HO2S generates a voltage within a range of 0-1,000 mV that fluctuates above and below bias voltage. High HO2S voltage indicates a rich exhaust stream. Low HO2S voltage indicates a lean exhaust stream.

Conditions for Running the DTC

P0151

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Throttle Position (TP) Indicated Angle parameter is between 3-70 percent.
- DTC P0151 runs continuously when the above conditions are met for 2 seconds.

P0152

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Throttle Position (TP) Sensor parameter is between 0-70 percent.
- DTC P0152 runs continuously when the above conditions are met for 2 seconds.

P0157

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.

- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The TP Sensor parameter is between 3-70 percent.
- DTC P0157 runs the lean test continuously when the above conditions are met for 2 seconds.

P0158

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Loop Status parameter is Closed.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The TP Sensor parameter is between 3-70 percent.
- DTC P0158 runs the rich test continuously when the above conditions are met for 2 seconds.

Conditions for Setting the DTC

P0151

- The ECM detects that the HO2S 1 Voltage parameter is less than 50 mV.
- DTC P0151 sets within 100 seconds during the lean test when the above condition is met.

P0152

- The ECM detects that the HO2S 1 parameter is more than 1,050 mV.
- DTC P0152 sets within 15 seconds during the rich test when the above condition is met.

P0157

- The ECM detects that the HO2S 1 voltage parameter is less than 50 mV.
- DTC P0157 sets within 100 seconds during the lean test when the above condition is met.

P0158

- The ECM detects that the HO2S 1 voltage parameter is more than 1,050 mV.
- DTC P0158 sets within 100 seconds during the rich test when the above condition is met.

Action Taken When the DTC Sets

DTCs P0151, P0153, P0157, P0158 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0151, P0153, P0157, P0158 are Type B DTCs.

Typical Scan Tool Data

HO2S Sensor 1 Voltage

Circuit	Short to Ground	Open	Short to Voltage
Parameter Normal Range: 200-800 mV			
HO2S High Signal	0 mV	Approximately 470 mV	Approximately 1,100 mV
HO2S Low Signal	455 mV	Approximately 450 mV	Approximately 445 mV

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. Heating elements inside the HO2S minimize the time required for the sensors to reach operating temperature. The engine control module (ECM) supplies the HO2S with a reference, or bias, voltage of about 450 mV. When the engine is first started, the ECM operates in Open Loop, ignoring the HO2S voltage signal. Once the HO2S reaches operating temperature and Closed Loop is achieved, the HO2S generates a voltage within a range of 0-1,000 mV that fluctuates above and below bias voltage. High HO2S voltage indicates a rich exhaust stream. Low HO2S voltage indicates a lean exhaust stream.

Conditions for Running the DTC

P0153

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Engine Coolant Temperature (ECT) Sensor parameter is more than 60°C (140°F).
- The Intake Air Temperature (IAT) Sensor parameter is more than -40°C (-40°F).
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Fuel Level Sensor parameter is more than 10 percent.
- The Engine Run Time parameter is more than 160 seconds.
- The Engine Speed parameter is between 1,200-3,000 RPM.
- The Barometric (BARO) Pressure parameter is more than 70 kPa.
- The Mass Airflow (MAF) Sensor parameter is between 20-55 g/s.
- The Loop Status parameter is Closed.
- The Throttle Position (TP) Indicated Angle parameter is more than 5 percent.
- DTC P0153 runs once per drive cycle when the above conditions are met for 1 second.

P0154

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The engine run time is more than 300 seconds.

- DTC P0154 runs continuously when the above conditions are met.

P0160

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Run Time parameter is more than 300 seconds.
- The Loop Status parameter is closed.
- DTC P0160 runs once per drive cycle when the above conditions are met.

P1153

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ECT Sensor parameter is more than 60°C (140°F).
- The IAT Sensor parameter is more than -40°C (-40°F).
- The Engine Speed parameter is between 1,200-3,000 RPM.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Run Time parameter is more than 160 seconds.
- The Loop Status parameter is Closed.
- The TP Indicated Angle parameter is more than 5 percent.
- The Fuel Level Sensor parameter is more than 10 percent.
- The BARO Pressure parameter is more than 70 kPa.
- The MAF Sensor parameter is between 20-55 g/s.
- DTC P1153 runs once per drive cycle when the above conditions are met for 1 second.

P2272

- DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0443, P0458, P0459, P2232 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Speed parameter is between 500-5,000 RPM.
- The MAF Sensor parameter is between 3-50 g/s.
- The Vehicle Speed parameter is between 24-132 km/h (15-82 mph).
- The Fuel Level Sensor parameter is more than 10 percent.
- The Loop Status parameter is closed.
- DTC P2272 runs once per drive cycle when the above conditions are met.

P2273

- DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0443, P0458, P0459, P2232 are not set.
- The Ignition 1 Signal parameter is between 10-18 volts.
- The Engine Speed parameter is between 500-5,000 RPM.
- The MAF Sensor parameter is between 3-50 g/s.
- The Vehicle Speed parameter is between 24-132 km/h (15-82 mph).
- The Fuel Level Sensor parameter is more than 10 percent.
- The Loop Status parameter is closed.
- DTC P2273 runs once per drive cycle when the above conditions are met for 1 second.

Conditions for Setting the DTC

P0153

- The ECM detects that the HO2S 1 rich-to-lean or lean-to-rich average response time is more than a calibrated value.
- DTC P0133 sets within 100 seconds when the above condition is met.

P0154

- The ECM detects that the HO2S 1 parameter is between 350-550 mV for 100 seconds.
- The Throttle Position (TP) Indicated Angle parameter changes more than 5 percent, 1 time.
- DTC P0154 sets within 100 seconds when the above conditions are met.

P0160

- The ECM detects that the HO2S 1 parameter is between 410-490 mV.
- The TP Indicated Angle parameter changes more than 5 percent 1 time.
- DTC P0160 sets within 100 seconds when the above conditions are met.

P1153

- The ECM detects that the HO2S 1 rich-to-lean counts, or the lean-to-rich counts are less than a calibrated value.
- DTC P1153 sets within 100 seconds when the above condition is met.

P2272

- The ECM detects that the affected HO2S is below 730 mV.
- DTC P2272 sets within 1 second when the above condition is met.

P2273

- The ECM detects that the affected HO2S is above 225 mV.

- DTC P2273 sets within 1 second when the above condition is met.

Action Taken When the DTC Sets

DTCs P0153, P0154, P0160, P1153, P2272, and P2273 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0153, P0154, P0160, P1153, P2272, and P2273 are Type B DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. If any HO2S heater DTCs are set, perform those diagnostics first.
2. Allow the engine to reach operating temperature.
3. Engine running, observe the affected HO2S parameter with a scan tool.
   - The pre-catalyst oxygen sensors value should vary from below 200 mV to above 800 mV and respond to fueling changes.
   - The post-catalyst oxygen sensors value should change more than 200 mV when the throttle is quickly cycled 3 times from closed to wide open and back to closed after running the engine at 1,500 RPM for 30 seconds.
4. The affected HO2S may be damaged due to contamination. Prior to replacing the affected

HO2S, inspect for the following sources of contamination:

Notice: Refer to Silicon Contamination of Heated Oxygen Sensors Caution in the Preface section.

- A silicon contaminated HO2S
- Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
- Engine oil consumption--Refer to Oil Consumption Diagnosis.
- Engine coolant consumption--Refer to Loss of Coolant.

5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: All modules must be powered down or misdiagnosis may result.

1. Ignition OFF, disconnect the scan tool and wait 60 seconds to ensure all modules are powered down.
2. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
3. Ignition OFF, measure for less than 5 ohms between the appropriate HO2S low signal circuit terminal A and ground.

   If more than the specified range, test the appropriate HO2S low signal circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify the appropriate scan tool HO2S parameter is approximately 450 mV.

   If more than the specified value, test the appropriate HO2S high signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.

   If less than the specified value, test the appropriate HO2S high signal circuit for a short to ground. If the circuit tests normal, replace the ECM.
5. Ignition ON, install a 3A fused jumper wire at the HO2S high signal circuit terminal B. Toggle the jumper wire between the HO2S low signal circuit terminal A and battery voltage. Verify the appropriate scan tool HO2S parameter toggles between 0 mV and approximately 1,000 mV.

   If the appropriate scan tool HO2S parameter does not toggle correctly, test the HO2S high signal circuit for an open/high resistance. If the circuits test normal, replace the ECM.
6. If all circuits test normal, replace the appropriate HO2S.

Repair Instructions

Notice: Refer to Heated Oxygen Sensor Resistance Learn Reset Caution in the Preface section.

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Heated Oxygen Sensor Replacement - Bank 2 Sensor 1
- Heated Oxygen Sensor Replacement - Bank 2 Sensor 2

DTC P0171, P0172, P0174, or P0175

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0171: Fuel Trim System Lean Bank 1

DTC P0172: Fuel Trim System Rich Bank 1

DTC P0174: Fuel Trim System Lean Bank 2

DTC P0175: Fuel Trim System Rich Bank 2

Circuit/System Description

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open Loop and Closed Loop (CL). During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During CL, the ECM adds HO2S inputs and level of purge to calculate the short and long term fuel trim (FT) adjustments. If the HO2S indicates a lean condition, the fuel trim values will be above 0 percent. If the HO2S indicates a rich condition, the FT values will be below 0 percent. The short term FT values change rapidly in response to the HO2S voltage signals. The long term FT makes coarse adjustments in order to maintain an optimum air/fuel ratio. A block of cells contain information arranged in combinations of engine RPM and engine load for a full range of vehicle operating conditions. The long term FT diagnostic is based on an average of cells currently being used. The ECM selects the cells based on the engine speed and load. The FT diagnostic will conduct a test to determine if a rich failure actually exists or if excessive vapor from the evaporative emission (EVAP) canister is causing a rich condition.

If the ECM detects an excessively lean condition, DTC P0171 or P0174 sets. If the ECM detects an excessively rich condition, DTC P0172 or P0175 sets.

Conditions for Running the DTC

- DTCs P0030, P0036, P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0117, P0118, P0120, P0121, P0128, P0130, P0131, P0132, P0133, P0134, P0135, P0136, P0137, P0138, P0140, P0141, P0201-P0208, P0220, P0300, P0301-P0304, P0442, P0443, P0446, P0449, P0452, P0453, P0455, P0496, P1106, P1107, P1114, P1115, P1133, P1516, P2101, P2119, P2120, P2125, P2135, P2138, P2176 are not set.
- The engine is in Closed Loop status.
- The engine coolant temperature (ECT) is between -40 and +150°C (-40 and +302°F).

- The intake air temperature (IAT) is between -20 and +150°C (-4 and +302°F).
- The manifold absolute pressure (MAP) is between 10-255 kPa (1.45-37 psi).
- The vehicle speed is less than 134 km/h (83 mph).
- The engine speed is between 375-7,000 RPM.
- The mass air flow (MAF) is between 1-510 g/s.
- The barometric pressure (BARO) is more than 70 kPa (10.2 psi).
- The fuel level is more than 10 percent.
- This diagnostic runs continuously when the above conditions have been met.

Conditions for Setting the DTC

- The average long term FT weighted average value is more or less than a calibrated value.
- The above condition is present for approximately 3 minutes after the Conditions for Running the DTC have been met.

Action Taken When the DTC Sets

The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the ECM stores this information in the Failure Records. If the diagnostic reports a failure on the second ignition cycle the ECM records the operating conditions at the time of the failure. The ECM writes the operating conditions to the Freeze Frame and updates the Failure Records. The ECM illuminates the malfunction indicator lamp (MIL) when one of the following occur:

- The ECM detects the same fuel trim failure during 2 consecutive trips.
- The ECM detects any fuel trim failure during any subsequent trip if the conditions at the time of failure meet the following criteria:
  - The engine load is within 20 percent of the previous test that failed.
  - The engine speed is within 375 RPM of the previous test that failed.
  - The engine coolant temperature is in the same range of the previous test that failed.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) at the beginning of the fourth ignition cycle, after 3 ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC and related Freeze Frame data clears after 40 warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Clear the MIL and the DTC with a scan tool.

Reference Information

Electrical Information Reference

- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

- Disregard any transmission symptoms, antilock brake system (ABS) indicators, and traction control system (TCS) indicators until any fuel trim faults are repaired. A fuel trim fault may cause default actions such as harsh shifts and illumination of the ABS/TCS indicators.
- E85 compatible engine only--Over estimation of the ethanol content will result in a rich shift of fuel trim values, and under-estimation will result in a lean shift of fuel trim values. A fuel trim DTC may set if the learned alcohol content, Fuel Alcohol Content parameter on the scan tool, is different than the measured alcohol content in the vehicle such that fuel trim values exceed failure threshold values.
- Verify that other DTCs are not set.

  If any DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
- Allow the engine to reach operating temperature. With the engine running, observe the HO2S parameter with a scan tool. The HO2S value should vary from approximately 40 mV to approximately 900 mV, and respond to fueling changes.

  If the value does not vary from approximately 40 mV to approximately 900 mV, refer to DTC P0131, P0132, P0137, or P0138 , DTC P0133, P0134, P0140, P1133, P2270, or P2271 , DTC P0153, P0154, P0160, P1153, P2272, or P2273 , or DTC P0153, P0154, P0160, P1153, P2272, or P2273.

Important: EVAP purge enablement may cause the FT to be momentarily outside the normal range.

- The normal Short Term FT parameter should be between +10 percent and -10 percent, with near 0 percent the optimum, with the engine running at operating temperature.
- The Long Term FT parameter should be between +10 percent and -10 percent, with near 0 percent the optimum, with the engine running at operating temperature.
- Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

P0171 or P0174

Allow the engine to reach operating temperature. With the engine running, observe the affected Long Term FT parameter with a scan tool. The reading should be between 0-19 percent.

If not within the specified range, inspect for the following:

- With the ignition ON and the engine OFF, observe the manifold absolute pressure (MAP) sensor parameter. The MAP sensor pressure should be within the range specified for your altitude. Refer to Altitude Versus Barometric Pressure.

  Refer to DTC P0106 if the MAP sensor does not indicate the correct barometric pressure.
- With the engine idling, observe the mass air flow (MAF) sensor parameter. The MAF sensor parameter should be within 2-6 g/s at idle.

  Refer to DTC P0101 or P1101 or DTC P0102 or P0103 if the MAF sensor parameter is not within 2-6 g/s at idle.
- Vacuum hoses for splits, kinks, and improper connections
- Insufficient fuel in the tank
- Low fuel pressure--Refer to Fuel System Diagnosis.
- Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
- Malfunctioning fuel injectors--Refer to Fuel Injector Diagnosis.
- Missing, loose, or leaking exhaust components from the HO2S forward--Refer to Symptoms - Engine Exhaust.
- Vacuum leaks at the intake manifold, the throttle body, and the injector O-rings
- The air induction system and the air intake ducts for leaks or for a missing air filter element
- A cracked EVAP canister
- Evaporative pipes obstructed or leaking--Refer to Fuel Hose/Pipes Routing Diagram.
- The crankcase ventilation system for leaks
- The HO2S for improper installation and for electrical wires or connectors that may have contacted the exhaust system
- The HO2S signal circuit open, shorted to ground, or shorted to the low reference circuit
- Malfunctioning engine components--Refer to Symptoms - Engine Mechanical.

P0172 or P0175

Allow the engine to reach operating temperature. With the engine running, observe the affected Long Term FT parameter with a scan tool. The reading should be between -19 and 0 percent.

If not within the specified range, inspect for the following:

- With the engine idling and the transmission in the Park or Neutral position, observe the manifold absolute pressure (MAP) sensor parameter. The MAP sensor parameter should be between 19-42 kPa.

  Refer to DTC P0106 if the MAP sensor parameter is not between 19-42 kPa.
- With the engine idling, observe the mass air flow (MAF) sensor parameter. The MAF sensor parameter should be within 2-6 g/s at idle.

  Refer to DTC P0101 or P1101 or DTC P0102 or P0103 if the MAF sensor parameter is not within 2-6 g/s at idle.
- Vacuum hoses for splits, kinks, and improper connections
- The air intake duct for being collapsed or restricted
- The air filter for being dirty or restricted
- Objects blocking the throttle body
- Excessive fuel in the crankcase due to leaking fuel injectors

- The evaporative emissions control system for improper operation--Refer to Fuel Hose/Pipes Routing Diagram.
- Excessive fuel pressure--Refer to Fuel System Diagnosis.
- Malfunctioning fuel injectors--Refer to Fuel Injector Diagnosis.
- Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
- The HO2S for improper installation and for electrical wires or connectors that may have contacted the exhaust system
- The HO2S signal circuit shorted to voltage

Repair Instructions

- Air Cleaner Assembly Replacement
- Air Cleaner Element Replacement
- Evaporative Emission Canister Replacement
- Evaporative Emission Canister Purge Solenoid Valve Replacement
- Evaporative Emission Canister Vent Solenoid Valve Replacement
- Evaporative Emission Hoses/Pipes Replacement - Engine
- Fuel Hose/Pipes Replacement - Chassis
- Fuel Injector Replacement
- Fuel System Cleaning
- Fuel Tank Draining
- Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 and Heated Oxygen Sensor Replacement - Bank 2 Sensor 1
- Manifold Absolute Pressure Sensor Replacement
- Mass Airflow Sensor/Intake Air Temperature Sensor Replacement
- Throttle Body Assembly Replacement

Repair Verification

Important:

- After repairs, use the scan tool Fuel Trim Reset function in order to reset the Long Term Fuel Trim.
- To verify the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTC P0420 or P0430. Refer to DTC P0420 or P0430.

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Turn ON the ignition, with the engine OFF.

   Important: DO NOT clear codes with the engine running. The codes may reset in the same ignition cycle.

4. Clear the DTCs.
5. Turn OFF the ignition for 60 seconds.

6. Start the engine.
7. Duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets, or another DTC is present, refer to the Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

DTC P0196, P0197, or P0198

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0196: Engine Oil Temperature Sensor Circuit Range/Performance

DTC P0197: Engine Oil Temperature Sensor Circuit Low Input

DTC P0198: Engine Oil Temperature Sensor Circuit High Input

Circuit / System Description

The engine oil temperature (EOT) sensor is a variable resistor that measures the temperature of the engine oil. The engine control module (ECM) supplies a 5 voltage to the EOT signal circuit and supplies a ground for the reference circuit.

Conditions for Running the DTC

P0112, P0196 or P0198

- The engine has been running for more than 10 seconds.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0196

The ECM detects that the engine EOT sensor is not within 100°C of predetermined values.

P0197

The ECM detects that the EOT sensor is less than -35°C of longer than 3 seconds.

P0198

The ECM detects that the EOT sensor is greater than 170°C for longer than 3 seconds.

Action Taken when the DTC Sets

DTCs P0196, P0197 and P0198 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0196, P0197 and P0198 are type B DTCs.

Scan Tool Reference

Control Module References

Circuit/System Verification

Inspect condition of oil system. Refer to Oil Pressure Diagnosis and Testing.

Circuit/System Testing

P0196, P0197 or P0198

1. Ignition ON, engine OFF.
2. Disconnect the EOT sensor.
3. Measure for proper voltage range of 4.9-5.2 Volts.

   If the voltage is less than 4.9 volts, test the EOT sensor circuit for a short to ground or an open/high resistance.

   If the voltage is greater than 5.2 volts, test the EOT circuit for a short to voltage.

   If the EOT circuit tests normal and the voltage is not within the proper range then replace the ECM.
4. Connect a 3 amp fusiable link between the signal circuit of the EOT and the low reference circuit.

   Observe the sensor parameters while connecting and disconnecting the link between the EOT sensor signal and the low reference circuit.

   the EOT should switch between the upper and lower limits.

if the EOT signal does not switch between the upper and lower limits then replace the ECM..

if the EOT signal does switch between the upper and lower limits then replace the EOT.

Component Testing

Measure and record the resistance of the EOT sensor at various temperatures and then compare those measurements to the Temperature Versus Resistance Table. Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Circuit/System Description

The control module enables the appropriate fuel injector pulse for each cylinder. Ignition voltage is supplied to the fuel injectors. The control module controls each fuel injector by grounding the control circuit via a solid state device called a driver. The control module monitors the status of each driver. If the control module detects an incorrect voltage for the commanded state of the driver, a fuel injector control circuit DTC sets.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is more than 11 volts.
- DTC P0201-P0208 runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The control module detects an incorrect voltage on the fuel injector control circuit.
- The above condition is met for 1 second.

Action Taken When the DTC Sets

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0207, and P0208 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0207, and P0208 are Type B DTCs.

Diagnostic Aids

Performing the Fuel Injector Diagnosis may help isolate an intermittent condition. Refer to Fuel Injector Diagnosis.

J 34730-405 Injector Test Lamp

Circuit/System Testing

1. Ignition OFF, disconnect the affected fuel injector harness connector at the fuel injector.
2. Ignition ON, verify that a test lamp illuminates between the ignition 1 voltage circuit terminal A and ground.

   If the test lamp does not illuminate, test the ignition 1 voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition 1 voltage circuit fuse is open, test or replace the fuel injector.
3. Connect the J 34730-405 between the control circuit terminal B and the ignition 1 voltage circuit terminal A.
4. Command the fuel injector ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the engine control module (ECM).

   If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, test or replace the fuel injector.

Component Testing

Important: The engine coolant temperature (ECT) sensor must be between 10-32°C (50-90°F) for an accurate measurement.

Measure for 11-14 ohms of resistance between the terminals of the fuel injector.

If the resistance is not within the specified range, replace the fuel injector.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Fuel Injector Replacement
- Control Module References for ECM replacement, setup, and programming

DTC P0230

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0230: Fuel Pump Relay Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Voltage - Relay Switch Side	[1]	[2]	--	--
Fuel Pump Supply Voltage	[1]	[2]	[3]	--
Fuel Pump Relay Control	P0230	P0230	P0230	--
Fuel Pump Relay Ground	--	P0230	--	--
Fuel Pump Ground	--	[2]	--	--

[1] Open fuel pump fuse, cranks no start

[2] Cranks no start

[3] Fuel pump operates continuously, then discharged battery

Circuit/System Description

The control module enables the fuel pump relay when the ignition switch is turned ON. The control module will disable the fuel pump relay within 2 seconds unless the control module detects ignition reference pulses. The control module continues to enable the fuel pump relay as long as ignition reference pulses are detected. The control module disables the fuel pump relay within 2 seconds if ignition reference pulses cease to be detected and the ignition remains ON.

The control module monitors the voltage on the fuel pump relay control circuit. If the control module detects an incorrect voltage on the fuel pump relay control circuit, a fuel pump relay control DTC sets.

Conditions for Running the DTC

- The ignition voltage is between 11-18 volts.
- DTC P0230 runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The control module detects that the commanded state of the driver and the actual state of the control circuit do not match.
- The above condition is met for a minimum of 2.5 seconds.

Action Taken When the DTC Sets

DTC P0230 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0230 is a Type B DTC.

Special Tools

J 43244 Relay Puller Pliers

Circuit / System Verification

Important: An open or a short to voltage in the control circuit will cause both the Ckt. Open Test Status and the Ckt. Short Volts Test Status parameters to display Fault.

- Ignition ON, command the fuel pump relay ON and OFF with a scan tool while observing the following control circuit status parameters:
  - Fuel Pump Relay Ckt. Short Gnd Test Status
  - Fuel Pump Relay Ckt. Open Test Status
  - Fuel Pump Relay Ckt. Short Volts Test Status
- Each parameter should toggle between OK and Not Run or Not Run and OK.

Circuit / System Testing

1. Ignition OFF, disconnect the fuel pump relay.
2. Ignition ON, verify that a test lamp illuminates between the ground circuit terminal and B+.

   If the test lamp does not illuminate, test the ground circuit for a short to voltage or an open/high resistance.
3. Verify that a test lamp does not illuminate between the ground circuit terminal and the control circuit terminal.

   If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the fuel pump relay ON with a scan tool. Verify the scan tool fuel pump relay Ckt. Short Grnd Test Status parameter is OK.

   If not the specified value, test the fuel pump relay control circuit for a short to ground. If the circuit tests normal, replace the ECM.
6. Install a 3A fused jumper wire between the fuel pump relay control circuit terminal and the ground circuit terminal. Command the fuel pump ON with a scan tool. Verify the scan tool fuel pump relay Ckt. Short Grnd Test Status parameter is Fault.

   If not the specified value, test the fuel pump relay control circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the fuel pump relay.

DTC P0300-P0308

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0300: Engine Misfire Detected

DTC P0301: Cylinder 1 Misfire Detected

DTC P0302: Cylinder 2 Misfire Detected

DTC P0303: Cylinder 3 Misfire Detected

DTC P0304: Cylinder 4 Misfire Detected

DTC P0305: Cylinder 5 Misfire Detected

DTC P0306: Cylinder 6 Misfire Detected

DTC P0307: Cylinder 7 Misfire Detected

DTC P0308: Cylinder 8 Misfire Detected

Circuit/System Description

The engine control module (ECM) uses information from the crankshaft position (CKP) sensor in order to determine when an engine misfire is occurring, and uses information from the camshaft position (CMP) sensor in order to determine which cylinder is misfiring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. If the ECM detects a misfire rate sufficient to cause emission levels to exceed mandated standards, DTC P0300 sets. Under certain driving conditions, a misfire rate can be high enough to cause the catalytic converter to overheat, possibly damaging the converter. The malfunction indicator lamp (MIL) will flash ON and OFF when catalytic converter overheating conditions are present and DTC P0300 is set. DTCs P0301-P0308 corresponds to cylinders 1-8. If the ECM is able to determine that a specific cylinder is misfiring, the DTC for that cylinder will also set.

Conditions for Running the DTC

- DTC P0010, P0011, P0101, P0102, P0103, P0106, P0108, P0116, P0117, P0118, P0128, P0220, P0335, P0336, P0502, P1258, P3401, P3425, P3441, and P3449 are not set.
- The engine speed is between 650-6,200 RPM.
- The ignition voltage is between 11-18 volts.

- The engine coolant temperature (ECT) is between -7 and +130°C (+19 and +266°F).
- The fuel level is more than 10 percent.
- The antilock brake system (ABS) and the traction control system (TCS) are not active.
- The power management is not active.
- The transmission is not changing gears.
- The ECM is not in fuel shut-off, or decel fuel cut-off mode.
- Excessive drive wheel slip is not detected.
- The power take-off is disabled.
- The cylinder deactivation is not in progress.
- A manual transmission with a throttle position less than 95 percent.
- DTCs P0300-P0308 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM is detecting a crankshaft rotation speed variation indicating a misfire sufficient to cause emission levels to exceed mandated standards.

Action Taken When the DTC Sets

- DTCs P0300-P0308 are Type B DTCs.
- When the MIL is flashing the fuel injector may be disabled for the misfiring cylinder to protect the catalytic converter.
- Depending on the conditions that set the DTC, the engine may go into Open Loop.

Conditions for Clearing the MIL/DTC

- DTCs P0300-P0308 are Type B DTCs.
- The DTC must run and pass under the same operating conditions that were present when the DTC failed.

Diagnostic Aids

- Ensure that each fuel injector is connected to the proper fuel injector harness connector.
- A misfire may only occur when the engine is operating under a load or when the engine is cold.
- A high resistance condition on any ignition control (IC) circuit can cause an engine misfire P0300-P0308 DTC to set without setting an IC circuit P0351-P0358 DTC.
- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.
- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect the following for possible sources of vibration:
  - A tire or wheel that is out of round or balance
  - Variable thickness brake rotors
  - An unbalanced drive shaft

- Certain rough road conditions
- A damaged accessory drive component or belt
- A damaged reluctor wheel
- The Crankshaft Position System Variation Learn procedure may need to be performed.

Special Tools

J 26792 HEI Spark Tester

Circuit / System Verification

1. Verify that no other DTCs are set.
   If a DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Engine idling, verify there is no abnormal engine noise.
   If there is an abnormal engine noise, refer to Symptoms - Engine Mechanical.
3. Observe the Misfire Current Counters with a scan tool. The Misfire Current Counters should not be incrementing. A random misfire, across one or more cylinders that are not steadily incrementing may be normal for this engine.
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

Important: You must perform the Circuit/System Verification first.

1. Verify that the following conditions do not exist:
   - The fuel injector wire harness electrical connectors are connected to the wrong fuel injectors. Refer to Engine Controls Schematics.
   - Engine vacuum leaks
   - Fuel pressure that is too low or too high--Refer to Fuel System Diagnosis.
   - Contaminated fuel--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Restricted exhaust system--Refer to Restricted Exhaust.
   - The cylinder deactivation system, for misfire on either cylinders 1, 4, 6, or 7--Refer to Cylinder Deactivation (Active Fuel Management) System Diagnosis.
2. Measure the resistance of the spark plug wire, and verify the condition of the spark plug wire. Refer to Ignition System Specifications and Spark Plug Wire Inspection.

   If the resistance value is not within the specified range, or does not pass the inspection, replace the spark plug wire.
3. Reinstall the spark plug wire to the ignition module/coil assembly.
4. Install the J 26792 to the spark plug wire boot.

   Important: An erratic or weak spark is considered a no spark condition.

5. Attempt to start the engine and observe the J 26792 . The spark plug tester should spark.

   If there is no spark, refer to Electronic Ignition (EI) System Diagnosis.
6. Ignition OFF, remove the spark plug from the misfiring cylinder. Verify that the following conditions do not exist with the spark plug:
   - Gas, coolant, or oil fouled
   - Cracked, worn, or incorrectly gapped--Refer to Spark Plug Inspection.

     If there is a condition with the spark plug, replace the spark plug.
7. Exchange the suspected spark plug with another cylinder that is operating correctly.
8. Operate the engine under the conditions in which the misfire occurred, this may include putting the engine under a load or allowing the engine to return to a cold condition. Observe the Misfire Current Counters with a scan tool. The misfire should not follow the spark plug exchange.

   If the misfire follows with the spark plug, replace the spark plug.
9. If all conditions test normal, test or inspect for the following:
   - A lean or rich fuel injector--Refer to Fuel Injector Diagnosis.
   - An engine mechanical condition--Refer to Symptoms - Engine Mechanical.

Repair Instructions

- Spark Plug Replacement
- Ignition Coil Replacement
- Engine Control Module Replacement
- Engine Control Module Programming and Setup

Repair Verification

If the customer concern was a flashing MIL, perform the following procedure:

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.
6. To verify that the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTCs P0420 and P0430. Refer to DTC P0420 or P0430.

DTC P0315

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0315: Crankshaft Position (CKP) System Variation Not Learned

Circuit/System Description

The crankshaft position (CKP) system variation learn feature is used to calculate reference period errors caused by slight build tolerance variations in the CKP sensor, crankshaft, and CKP sensor position. The calculated error allows the engine control module (ECM) to accurately compensate for reference period variations. This enhances the ability of the ECM to detect misfire events over a wide range of engine speeds and load conditions. The ECM stores the Crankshaft Position System Variation values after a learn procedure has been performed. If the actual crankshaft position variation is not stored within the CKP compensating value look up table, then DTC P0300 may set. If the CKP system variation values are not stored in the ECM memory, or a proper ECM power down does not occur after completing the CKP Learn Procedure, then DTC P0315 sets.

Conditions for Running the DTC

The diagnostic runs continuously.

Conditions for Setting the DTC

The ECM detects that the CKP system variation values are not stored in memory.

Action Taken When the DTC Sets

DTC P0315 is a Type A code.

Conditions for Clearing the MIL/DTC

DTC P0315 is a Type A code.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

Important: The CKP System Variation Learn Procedure may have to be repeated up to 5 times before the procedure is learned.

1. Perform the CKP System Variation Learn Procedure. Refer to Crankshaft Position System Variation Learn.
2. If the CKP System Variation Learn Procedure cannot be performed successfully, inspect for the following conditions:
   - Any worn crankshaft main bearings
   - A damaged or misaligned reluctor wheel
   - Excessive crankshaft runout
   - A damaged crankshaft--Refer to Crankshaft and Bearing Cleaning and Inspection.
   - Interference in the signal circuit of the CKP sensor
   - The ignition switch is left in the ON position, until the battery is discharged
   - An ECM power disconnect, with the ignition ON, that may have erased the CKP system variation values and set DTC P0315
   - Any debris between the CKP sensor and the reluctor wheel

   If the ECM is still unable to complete the learn procedure, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Control Module Programming and Setup
- Engine Control Module Replacement

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0324: Knock Sensor (KS) Module Performance

DTC P0325: Knock Sensor (KS) Circuit Bank 1

DTC P0326: Knock Sensor (KS) Performance

DTC P0327: Knock Sensor (KS) Circuit Low Voltage Bank 1

DTC P0328: Knock Sensor (KS) Circuit High Voltage Bank 1

DTC P0330: Knock Sensor (KS) Circuit Bank 2

DTC P0332: Knock Sensor (KS) Circuit Low Voltage Bank 2

DTC P0333: Knock Sensor (KS) Circuit High Voltage Bank 2

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Knock Sensor Signal	P0327, P0328, P0332, P0333	P0325, P0330	P0327, P0332	P0326

Circuit/System Description

The knock sensor (KS) system enables the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The ECM monitors 2 separate KS, one on each side of the engine block. Each KS produces an AC voltage that varies, depending on the vibration levels detected during engine operation. The ECM receives the KS signal through 2 isolated signal circuits for each KS. The ECM adjusts the spark timing based on the amplitude and frequency of each KS signal. The ECM learns a minimum noise levels for each sensor at idle speed and uses calibrated noise level value for the rest of the RPM range. The ECM should monitor a normal KS signal within the noise channel.

Conditions for Running the DTC

P0324

This DTC runs continuously when the engine speed is greater than or equal to 1,500 RPM and the engine load is greater than a calibrated amount.

P0326

This DTC runs continuously when:

- The engine speed is greater than or equal to 500 RPM.
- The MAP is greater than 55 kPa.
- DTCs P0120, P0121, P0122, or P0123 are not set.

P0325, P0327, P0328, P0330, P0332, and P0333

The DTCs run continuously when:

- The engine coolant temperature (ECT) is greater than -40°C (-40°F).
- The engine run time is greater than 1 second.
- PTO is not active.

Conditions for Setting the DTC

P0324

The ECM has detected an internal circuitry fault.

P0325 and P0330

The KS signal circuits are open or shorted together for 5 seconds.

P0326

- The KS signal indicates an engine knock is present.
- The ECM has commanded the spark retard to a value, which is more than the calibrated value, for a specific engine load and speed.
- The above conditions exist for more than 5 seconds.

P0327, P0328, P0332, and P0333

The KS signal circuits are shorted to voltage or ground.

Action Taken When the DTC Sets

- DTCs P0324, P0325, P0326, P0327, P0328, P0330, P0332, and P0333 are Type B codes.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTC

DTCs P0324, P0325, P0326, P0327, P0328, P0330, P0332, and P0333 are Type B codes.

Diagnostic Aids

- Inspect the KS for physical damage. A KS that is dropped or damaged may cause a DTC to set.
- Inspect the KS for proper installation. A KS that is loose or over-torqued may cause a DTC to set.
- The KS mounting surface should be free of burs, casting flash, and foreign material.

Circuit/System Testing

P0324

Important: If DTC P0325, P0326, P0327, P0328, P0330, P0332, or P0333 are also set, diagnose those DTCs first.

DTC P0324 indicates an internal control module circuitry failure. Replace the ECM.

P0325, P0327, P0328, P0330, P0332, P0333

1. Ignition ON, engine OFF.
2. Disconnect the appropriate KS harness connector.
3. Measure for 2-3 volts between each of the following circuits and ground on the ECM side of the harness connector:
   - The KS signal circuit, terminal A
   - The KS signal circuit, terminal B

     If less than the specified range, test the circuits for a short to ground or an open/high resistance. If the circuits test normal, replace the ECM.

     If greater than the specified range, test the circuits for a short to voltage. If the circuits test normal, replace the ECM.
4. If all circuits test normal, replace the KS.

P0326

Important: If DTC P0325, P0327, P0328, P0330, P0333, P0335, or P0336 are also set, diagnose those DTCs first.

- Inspect for a loose or broken engine mount, engine mounted accessory, or accessory mounting bracket.
- Inspect for excessive engine mechanical noise. Refer to Symptoms - Engine Mechanical.

Component Testing

1. Connect a DMM to both KS signal circuits, terminals A and B, at the KS.
2. Set the DMM to the 400 mV AC hertz scale and wait for the DMM display to stabilize at 0 Hz.

   Important: DO NOT tap on plastic engine components.

3. Tap on the engine block with a non-metallic object near the KS while observing the signal indicated on the DMM.
4. The DMM should display a fluctuating frequency while tapping on the engine block.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Control Module Programming and Setup
- Engine Control Module Replacement
- Knock Sensor Replacement

DTC P0335

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0335: Crankshaft Position (CKP) Sensor Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference Circuit	P0651	P0335	P0651, P2135	--
CKP Sensor Signal Circuit	P0335	P0335	P0335	P0336
Low Reference Circuit	--	P0335	P0335	--

Circuit/System Description

The crankshaft position (CKP) sensor circuits consist of an engine control module (ECM) supplied 5-volt reference circuit, low reference circuit and an output signal circuit. The CKP sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes between the peaks and valleys of a 58-tooth reluctor wheel on the crankshaft. Each tooth on the reluctor wheel is spaced at 60-tooth spacing, with 2 missing teeth for the reference gap. The CKP sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The frequency of the CKP sensor output depends on the velocity of the crankshaft. The CKP sensor sends a digital signal, which represents an image of the crankshaft reluctor wheel, to the ECM as each tooth on the wheel rotates past the CKP sensor. The ECM uses each CKP signal pulse to determine crankshaft speed and decodes the crankshaft reluctor wheel reference gap to identify crankshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The ECM also uses CKP sensor output information to determine the crankshaft relative position to the camshaft, to detect cylinder misfire, and to control the CMP actuator if equipped.

Conditions for Running the DTC

- DTC P0340, P0341, P0641, or P0651 is not set.
- The engine is cranking or running.

- DTC P0335 runs continuously when the above conditions are met.

Conditions for Setting the DTC

Note: The ECM detects engine movement by sensing the airflow through the MAF sensor, when airflow is greater than 3 grams per second, or by sensing camshaft position (CMP) sensor pulses.

- The ECM detects that the starter is commanded on and the engine has been cranking for more than 4 seconds without a CKP sensor pulse.
- The ECM detects that the engine is running, but has not received a CKP sensor pulse for 2 of 10 engine cycles.

Action Taken When the DTC Sets

- DTC P0335 is a Type A DTC.
- The CMP actuator if equipped is commanded to the parked position.
- The ignition system defaults to a limp home mode. The CMP sensor is used to determine engine position.

Conditions for Clearing the DTC

DTC P0335 is a Type A DTC.

Diagnostic Aids

- With this DTC set, the engine may crank for an extended period of time during start-up.
- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

J 35616-A/BT-8637 Connector Test Adapter Kit

Circuit/System Verification

1. Ignition OFF, inspect the engine wiring harness carrying the CKP sensor circuits for the following conditions:
   - Close routing of aftermarket electrical equipment.
   - Close to solenoids, motors, and relays.

     If any of these are determined to be a possible source of electrical interference, correct any wire harness routing or component placement conditions.
2. Start the engine. Using the live plot function on the scan tool, select the CMP sensor parameter. Change the minimum spec to 400, and the maximum spec to 4,000 RPM. Select the CKP sensor parameter. Change the minimum spec to 600, and the maximum spec to 3,300 RPM.
3. Observe the scan tool.
4. Quickly accelerate and release the accelerator pedal several times. Do not accelerate past 3,200 RPM. The graphed lines on the live plot display should track together across the screen.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF, disconnect the harness connector at the crankshaft position (CKP) sensor.
2. Test for less than 1 ohm between the CKP low reference circuit, terminal B, and ground.

   If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the CKP 5-volt reference circuit, terminal C and ground.

   If less than the specified range, test the 5-volt reference circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage.

If the circuit tests normal, replace the ECM.

4. Ignition ON, test for 4.8-5.2 volts between the CKP signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Ignition OFF, connect a fused jumper wire to the CKP signal circuit terminal A.
6. Ignition ON, momentarily touch the other end of the fused jumper wire to the battery negative post. The CKP Active counter, should increment.

   If the CKP Active counter increments, test or replace the CKP sensor.

   If the CKP Active counter does not increment, replace the ECM.

Component Testing

Note: You must perform the Circuit/System Testing before proceeding with Component Testing.

1. Inspect the CKP sensor for correct installation. Remove the CKP sensor from the engine and inspect the sensor O-ring for damage.

   If the sensor is loose, incorrectly installed, or damaged, replace the CKP sensor.
2. Connect the CKP sensor harness connector to the CKP sensor.
3. Ignition ON, engine OFF. Observe the CKP Active counter parameter on the scan tool.
4. Pass a flat steel object across the tip of the sensor repeatedly. The CKP Active counter parameter should increment with each pass of the steel object.

   If the parameter does not increment, replace the CKP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Crankshaft Position Sensor Replacement
- Engine Control Module Programming and Setup
- Engine Control Module Replacement

DTC P0336

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0336: Crankshaft Position (CKP) Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference Circuit	P0651	P0335	P0651, P2135	--
CKP Sensor Signal Circuit	P0335	P0335	P0335	P0336
Low Reference Circuit	--	P0335	P0335	--

Circuit/System Description

The crankshaft position (CKP) sensor circuits consist of an engine control module (ECM) supplied 5-volt reference circuit, low reference circuit and an output signal circuit. The CKP sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes between the peaks and valleys of a 58-tooth reluctor wheel on the crankshaft. Each tooth on the reluctor wheel is spaced at 60-tooth spacing, with 2 missing teeth for the reference gap. The CKP sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The frequency of the CKP sensor output depends on the velocity of the crankshaft. The CKP sensor sends a digital signal, which represents an image of the crankshaft reluctor wheel, to the ECM as each tooth on the wheel rotates past the CKP sensor. The ECM uses each CKP signal pulse to determine crankshaft speed and decodes the crankshaft reluctor wheel reference gap to identify crankshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The ECM also uses CKP sensor output information to determine the crankshaft relative position to the camshaft, to detect cylinder misfire, and to control the CMP actuator if equipped.

Conditions for Running the DTC

- DTC P0340, P0341, P0641, or P0651 is not set.
- The engine is cranking or running.

- DTC P0336 runs continuously when the above conditions are met.

Conditions for Setting the DTC

Note: The ECM detects engine movement by sensing the airflow through the MAF sensor, when airflow is greater than 3 grams per second, or by sensing camshaft position (CMP) sensor pulses.

- The ECM detects that the engine is running, but receives less than 53 or more than 63 CKP sensor pulses, during each engine revolution, for 8 of 10 engine revolutions.
- The ECM detects that the engine is running, but more than 25 crankshaft resyncs have occurred within 20 seconds.
- The ECM detects that the engine has been running, but the crankshaft does not sync for 0.4 second.

Action Taken When the DTC Sets

- DTC P0336 is a Type A DTC.
- The CMP actuator if equipped is commanded to the parked position.
- The ignition system defaults to a limp home mode. The CMP sensor is used to determine engine position.

Conditions for Clearing the DTC

DTC P0336 is a Type A DTC.

Diagnostic Aids

- With this DTC set, the engine may crank for an extended period of time during start-up.
- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Circuit/System Verification

1. Ignition OFF, inspect the engine wiring harness carrying the CKP sensor circuits for the following conditions:
    - Close routing of aftermarket electrical equipment.
    - Close to solenoids, motors, and relays.

      If any of these are determined to be a possible source of electrical interference, correct any wire harness routing or component placement conditions.
2. Start the engine. Using the live plot function on the scan tool, select the CMP sensor parameter. Change the minimum spec to 400, and the maximum spec to 4,000 RPM. Select the CKP sensor parameter. Change the minimum spec to 600, and the maximum spec to 3,300 RPM.
3. Observe the scan tool.
4. Quickly accelerate and release the accelerator pedal several times. Do not accelerate past 3,200 RPM. The graphed lines on the live plot display should track together across the screen.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF, inspect the CKP sensor for looseness and correct installation.

   If the CKP sensor is loose, inspect the sensor and the O-ring for damage, replace as necessary.
2. Inspect the engine for the following conditions:
    - Engine oil for debris and contamination
    - Crankshaft reluctor wheel for damage
    - The timing chain, tensioner, and sprockets for wear or damage

If debris is found in the engine oil, inspect the internal engine components to determine the cause. Repair or replace any worn or damaged components.

Component Testing

Note: You must perform the Circuit/System Testing before proceeding with Component Testing.

1. Inspect the CKP sensor for correct installation. Remove the CKP sensor from the engine and inspect the sensor O-ring for damage.

   If the sensor is loose, incorrectly installed, or damaged, replace the CKP sensor.
2. Connect the CKP sensor harness connector to the CKP sensor.
3. Ignition ON, engine OFF. Observe the CKP Active counter parameter on the scan tool.
4. Pass a flat steel object across the tip of the sensor repeatedly. The CKP Active counter parameter should increment with each pass of the steel object.

   If the parameter does not increment, replace the CKP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Crankshaft Position Sensor Replacement
- Engine Control Module Programming and Setup
- Engine Control Module Replacement

DTC P0340

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0340: Camshaft Position (CMP) Sensor Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference Circuit	P0107, P0452, P0522, P0532, P0641	P0340	P0641	--
CMP Sensor Signal Circuit	P0340	P0340	P0340	P0341
Low Reference Circuit	--	P0340	P0340	--

Circuit/System Description

The 4X camshaft position (CMP) sensor circuits consist of an engine control module (ECM) supplied 5-volt reference circuit, low reference circuit, and an output signal circuit. The CMP sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes between the peaks and valleys of a 4-tooth reluctor wheel attached to the camshaft. As each reluctor wheel tooth rotates past the CMP sensor, the resulting change in the magnetic field is used by the sensor electronics to produce a digital output pulse. The sensor returns a digital ON/OFF DC voltage pulse of varying frequency, with 2 narrow, and 2 wide output pulses per camshaft revolution that represent an image of the camshaft reluctor wheel. The frequency of the CMP sensor output depends on the velocity of the camshaft. The ECM decodes the narrow and wide tooth pattern to identify camshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The ECM also uses CMP sensor output information to determine the camshaft relative position to the crankshaft, to control the CMP actuator if equipped, and for limp-home operation.

Conditions for Running the DTC

- DTC P0335, P0336, P0641, or P0651 is not set.
- The engine is cranking or running.
- DTC P0340 runs continuously when the above conditions are met.

Conditions for Setting the DTC

Important: The ECM detects engine movement by sensing the airflow through the MAF sensor, when airflow is greater than 3 grams per second, or by sensing crankshaft position (CKP) sensor pulses.

- The ECM detects that the starter is commanded on and the engine has been cranking for more than 4 seconds without a CMP sensor pulse.
- The ECM detects that the engine has started, but did not receive a CMP sensor pulse during the first engine revolution.
- The ECM detects that the engine is running, but does not receive a CMP sensor pulse for 800 of 1000 engine cycles.

Action Taken When the DTC Sets

- DTC P0340 is a Type B DTC.
- The CMP actuator if equipped is commanded to the parked position.
- The ignition system defaults to a failed CMP sensor limp home mode.

Conditions for Clearing the DTC

DTC P0340 is a Type B DTC.

Diagnostic Aids

- With a DTC set, the engine may crank for an extended period of time during start-up.
- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Circuit/System Verification

1. Ignition OFF, inspect the engine wiring harness carrying the CMP sensor circuits for the following conditions:
   - Close routing of aftermarket electrical equipment.
   - Close to solenoids, motors, and relays.

   If any of these are determined to be a possible source of electrical interference, correct any wire harness routing or component placement conditions.
2. Start the engine. Using the live plot function on the scan tool, select the CMP sensor parameter. Change the minimum spec to 400, and the maximum spec to 4,000 RPM. Select the CKP sensor parameter. Change the minimum spec to 600, and the maximum spec to 3,300 RPM.
3. Observe the scan tool.
4. Quickly accelerate and release the accelerator pedal several times. Do not accelerate past 3,200 RPM. The graphed lines on the live plot display should track together across the screen.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the camshaft position (CMP) sensor.
2. Test for less than 1 ohm on the CMP low reference circuit, terminal B, and ground.

   If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the CMP 5-volt reference circuit terminal A and ground.

   If less than the specified range, test the 5-volt reference circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Ignition ON, test for 4.8-5.2 volts between the CMP signal circuit terminal C and ground.

   If less than the specified range, test the signal circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.

5. Ignition OFF, connect a fused jumper wire to the CMP signal circuit terminal C.
6. Ignition ON, momentarily touch the other the other end of the fused jumper wire to the battery negative post. The scan tool should show the CMP Active counter incrementing.

   If the CMP Active counter increments, test or replace the CMP sensor.

   If the CMP Active counter does not increment, replace the ECM.

Component Testing

Important: You must perform the Circuit/System Testing before proceeding with Component Testing.

1. Inspect the CMP sensor for correct installation. Remove the CMP sensor from the engine and inspect the sensor O-ring for damage.

   If the sensor is loose, incorrectly installed, or damaged, replace the CMP sensor.
2. Connect the CMP sensor harness connector to the CMP sensor.
3. Ignition ON, engine OFF. Observe the CMP Active counter parameter on the scan tool.
4. Pass a flat steel object across the tip of the sensor repeatedly. The CMP Active counter parameter should increment with each pass of the steel object.

   If the parameter does not increment, replace the CMP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Circuit/System Description

The 4X camshaft position (CMP) sensor circuits consist of an engine control module (ECM) supplied 5-volt reference circuit, low reference circuit, and an output signal circuit. The CMP sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes between the peaks and valleys of a 4-tooth reluctor wheel attached to the camshaft. As each reluctor wheel tooth rotates past the CMP sensor, the resulting change in the magnetic field is used by the sensor electronics to produce a digital output pulse. The sensor returns a digital ON/OFF DC voltage pulse of varying frequency, with two narrow, and two wide output pulses per camshaft revolution that represent an image of the camshaft reluctor wheel. The frequency of the CMP sensor output depends on the velocity of the camshaft. The ECM decodes the narrow and wide tooth pattern to identify camshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The ECM also uses CMP sensor output information to determine the camshaft relative position to the crankshaft, to control the CMP actuator if equipped, and for limp-home operation.

Conditions for Running the DTC

- DTC P0335, P0336, P0641, or P0651 is not set.
- The engine is cranking or running.
- DTC P0341 runs continuously when the above conditions are met.

Conditions for Setting the DTC

Important: The ECM detects engine movement by sensing the airflow through the MAF sensor, when airflow is greater than 3 grams per second, or by sensing crankshaft position (CKP) sensor pulses.

- The ECM detects that the engine was started, but has received less than 2 or more than 8 CMP sensor pulses during the first engine resolution.
- The ECM detects that the engine has started and is running, but receives less than 398 or more than 402 CMP pulses per 100 engine cycles in 800 of 1000 engine cycles.

Action Taken When the DTC Sets

- DTC P0341 is a Type B DTC.
- The CMP actuator if equipped is commanded to the parked position.
- The ignition system defaults to a failed CMP sensor limp home mode.

Conditions for Clearing the DTC

DTC P0341 is a Type B DTC.

Diagnostic Aids

- With this DTC set, the engine may crank for an extended period of time during start-up.
- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Circuit/System Verification

1. Ignition OFF, inspect the engine wiring harness carrying the CMP sensor circuits for the following conditions:
   - Close routing of aftermarket electrical equipment
   - Close to solenoids, motors, and relays.

   If any of these are determined to be a possible source of electrical interference, correct any wire harness routing or component placement conditions.
2. Start the engine. Using the live plot function on the scan tool, select the CMP sensor parameter. Change the minimum spec to 400, and the maximum spec to 4,000 RPM. Select the CKP sensor parameter. Change the minimum spec to 600, and the maximum spec to 3,300 RPM.
3. Observe the scan tool.
4. Quickly accelerate and release the accelerator pedal several times. Do not accelerate past 3,200 RPM. The graphed lines on the live plot display should track together across the screen.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, inspect the CMP sensor for looseness and correct installation.

   If the CMP sensor is loose, inspect the sensor and the O-ring for damage, and replace as necessary.
2. Inspect the engine for the following conditions:
   - Engine oil for debris
   - Camshaft reluctor wheel for damage
   - The timing chain, timing chain tensioner, and sprockets for wear or damage

   If debris is found in the engine oil, inspect the internal engine components to determine the cause. Repair or replace any worn or damaged components.

Component Testing

Important: You must perform the Circuit/System Testing before proceeding with Component Testing.

1. Inspect the CMP sensor for correct installation. Remove the CMP sensor from the engine and inspect the sensor O-ring for damage.

   If the sensor is loose, incorrectly installed, or damaged, replace the CMP sensor.
2. Connect the CMP sensor harness connector to the CMP sensor.
3. Ignition ON, engine OFF, observe the CMP Active Counter parameter on the scan tool.
4. Pass a flat steel object across the tip of the sensor repeatedly. The CMP Active Counter parameter should increment with each pass of the steel object.

   If the parameter does not increment, replace the CMP sensor.

Control Circuit				

Circuit/System Description

The ignition system on this engine uses an individual coil/module for each cylinder. The engine control module (ECM) controls the spark event for each cylinder through the eight individual ignition control (IC) circuits. When the ECM commands the IC circuit ON, electrical current will flow through the primary winding of the ignition coil, creating a magnetic field. When a spark event is requested, the ECM will command the IC circuit OFF, interrupting current flow through the primary winding. The magnetic field created by the primary winding will collapse across the secondary coil windings, producing a high voltage across the spark plug electrodes. The ECM uses information from the crankshaft position (CKP) sensor, and the camshaft position (CMP) sensor for sequencing and timing of the spark events. Each ignition coil/module assembly has the following circuits:

- Ignition voltage
- Ground
- Ignition control (IC)
- Low reference

If the ECM detects that the IC circuit has an incorrect voltage level, DTC P0351-P0358 will set.

Conditions for Running the DTC

- The ignition is ON.
- DTC P0351-P0358 runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects one of the following failures on the IC circuit:

- An open
- A short to ground
- A short to voltage

Action Taken When the DTC Sets

DTCs P0351-P0358 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0351-P0358 are Type B DTCs.

Diagnostic Aids

- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

- A high resistance condition on any IC circuit can cause an engine misfire without setting DTC P0351-P0358.

Description and Operation

Electronic Ignition (EI) System Description

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. With the engine running, monitor the following ignition control (IC) circuit status parameters with a scan tool:
   - Cylinder 1-8 IC Ckt. Short Gnd Test Status
   - Cylinder 1-8 IC Ckt. Open Test Status
   - Cylinder 1-8 IC Ckt. Short to Volts Test Status

     Each parameter should display OK.
2. With the engine running, observe the Misfire Current counters with a scan tool.

   The counters should not be incrementing.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. With the engine running, monitor the Cylinder 1-8 IC Circuit Status parameters with a scan tool.

   If a short to GND or Open status test displays FAULT, test for an open/high resistance or short to ground on the affected IC circuit terminal C.

If a short to volts status test displays FAULT, test for a short to voltage on the affected IC circuit terminal C.

Important: A high resistance on any IC circuit can cause a misfire condition before DTCs P0351-P0358 set.

2. Exchange the affected ignition coil/module with the ignition coil/module of a cylinder that is not affected.
3. Start and run the engine. With a scan tool, monitor the IC circuit parameters and the Misfire Current counters.

   If the circuit status fault identified or the misfire transfers with the ignition coil/module, replace the ignition coil/module assembly.

   If the circuit status fault identified or the misfire does not transfer with the ignition coil/module, replace the ECM.

Repair Instructions

- Ignition Coil Replacement
- Engine Control Module Replacement
- Engine Control Module Programming and Setup

Repair Verification

Important: An IC circuit fault condition will result in an engine misfire, and under certain driving conditions could possibly overheat the 3-way catalytic converter.

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Start and run the engine. With a scan tool, monitor the IC circuit status parameters. All IC circuit status parameters should display OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic.
4. To verify that the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTC P0420 or P0430. Refer to DTC P0420 or P0430.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2152493

DTC P0420 or P0430

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0420: Catalyst System Low Efficiency Bank 1

DTC P0430: Catalyst System Low Efficiency Bank 2

Circuit / System Description

Important: A new converter with less than 100 miles on it may set DTC P0420 or P0430 due to out-gassing of the internal matting. Operating the vehicle at highway speeds for approximately 1 hour may correct the condition.

A 3-way catalytic converter (TWC) controls emissions by converting hydrocarbons (HC) and carbon monoxide (CO) into carbon dioxide (CO2), and oxides of nitrogen (NOx) into nitrogen. The TWC also stores oxygen. When the listed idle conditions follow the listed driving conditions the Catalyst System Efficiency test will run. The engine control module (ECM) monitors this oxygen storage capacity by comparing the pre and post-catalyst oxygen sensor signals while adding and subtracting fuel during specific idle conditions. The ECM compares the pre and post-catalyst oxygen sensor signals to determine if the oxygen storage capacity of the catalyst is degraded.

Conditions for Running the DTC

1. Driving Conditions
    - DTCs P0030, P0031, P0036, P0037, P0038, P0068, P0106, P0107, P0108, P0112, P0113, P0117, P0118, P0120, P0121, P0122, P0123, P0125, P0128, P0130, P0131, P0132, P0133, P0134, P0135, P0136, P0137, P0138, P0140, P0141, P0171, P0172, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0300, P0315, P0326, P0327, P0336, P0340, P0341, P0442, P0446, P0452, P0453, P0455, P0496, P0500 (manual transmission only), P0502, P0506, P0507, P0601, P0602, P0606, P0641, P0722, P0723, P1133, P1134, P1516, P1621, P2135, P2138, P2176 are not set.
    - The engine has been running for more than 2 minutes.
    - The vehicle has been driven at more than 1,000 RPM for more than 10 seconds.
    - The vehicle is in Closed Loop.
    - The vehicle has Fuel Trim Learn enabled.
    - The Engine Coolant Temperature (ECT) parameter is between 45-128°C (113-262°F).
    - The Barometric Pressure (BARO) parameter is more than 70 kPa.
    - The Catalytic Converter Calculated Temperature parameter is greater than or equal to

375°C (707°F).
    - The Intake Air Temperature (IAT) parameter is between -20 and +85°C (-4 and +185°F).
    - The battery voltage is more than 11 volts.
2. Idle Conditions
    - The vehicle speed is less than 3.2 km/h (2 mph).
    - For automatic transmissions, the transmission is in Reverse, Drive, or Low.
    - The Throttle Position (TP) parameter is 2 percent or less.
    - The short term fuel trim (FT) is between -10 and +10 percent.
    - This diagnostic attempts one test during each valid idle period when the above conditions have been met. This diagnostic attempts up to 6 tests during each drive cycle.

Conditions for Setting the DTC

- The ECM has determined the catalyst efficiency has degraded below a calibrated threshold.
- This diagnostic may conclude in one test attempt. However, this diagnostic may require as many as 18 test attempts, which would require at least 3 drive cycles. Each test attempt may conclude within approximately 1 minute.

Action Taken When the DTC Sets

DTCs P0420 and P0430 are Type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0420 and P0430 are Type A DTCs.

Circuit/System Verification

Notice: Refer to Three-Way Catalytic Converter Damage Caution in the Preface section.

Notice: Refer to Heated Oxygen Sensor Resistance Learn Reset Caution in the Preface section.

Important: A new converter with less than 100 miles on it may set DTC P0420 or P0430 due to out-gassing of the internal matting. Operating the vehicle at highway speeds for approximately 1 hour may correct the condition.

1. If any other DTCs are set perform those diagnostics first.

2. Inspect for the following conditions, which may cause a catalytic converter to degrade:
   - An engine misfire
   - High engine oil or high coolant consumption
   - Retarded spark timing
   - A weak or poor spark
   - A lean fuel mixture
   - A rich fuel mixture
   - A damaged oxygen sensor or wiring harness
   - The catalyst test may abort if the vehicle falls outside the conditions for running the DTC.
   - A catalyst may be temporarily degraded if a fuel with high sulfur content has been used. Drive the vehicle at highway speeds for 10 minutes and retest the converter.
3. Operate the vehicle within the Conditions for Running the DTC.

   If the DTC fails this key cycle, continue with this procedure.
4. Inspect the catalytic converter for the following conditions:
   - Dents
   - A severe discoloration caused by excessive temperatures
   - Road damage
   - An internal rattle caused by damaged catalyst substrate
   - Restrictions

   If a condition is found, replace the catalytic converter.
5. Inspect the exhaust system for the following conditions:
   - Leaks
   - Physical damage
   - Loose or missing hardware
   - Properly torqued HO2S
   - Restrictions

   If a condition is found, repair the exhaust system.
6. Inspect the post catalyst HO2S for the following conditions:
   - A grounded wiring harness
   - Damage

   If a condition is found, replace the post catalyst HO2S.

   If no physical condition is detected, replace the catalytic converter.

Repair Instructions

Important: A new converter with less than 100 miles on it may set DTC P0420 or P0430 due to out-gassing of the internal matting. Operating the vehicle at highway speeds for approximately 1 hour may correct the condition.

- Exhaust Manifold Replacement - Left Side
- Exhaust Manifold Replacement - Right Side
- Heated Oxygen Sensor Replacement - Bank 1 Sensor 2
- Heated Oxygen Sensor Replacement - Bank 2 Sensor 2

- Exhaust Leakage
- Restricted Exhaust

Repair Verification

1. Clear the DTCs.
2. Allow the engine coolant temperature to reach 70°C (156°F).
   - Place the gear selector in Park, Neutral for manual.
   - Set the parking brake.
3. Press and hold the service brake.
4. Run the engine for 6 minutes at 2500 RPM.
5. Allow engine speed to return to idle speed, then place gear selector into Drive, or apply clutch pedal for manual.
6. After 2 minutes verify that DTC P0420 or P0430 have passed or failed this ignition cycle.

   If not passed or failed this ignition cycle, the test aborted resulting in an inconclusive test result. The above test may need to be repeated up to 5 more times during this drive cycle. The first test should be run after the initial warm up period of 6 minutes. Between subsequent tests maintain 2,500 RPM for 2 minutes.
7. If 6 tests have been attempted and the DTC has not run or passed during this key cycle, turn the key to OFF for 30 seconds, then run the procedure a second time.
8. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

DTC P0443

DTC Descriptor

DTC P0443: Evaporative Emission Control System Purge Control Valve Circuit Malfunction

Diagnostic Fault Information

Important: Always perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit	Short to Ground	High Resistance	Open	Short to Voltage
Ignition 1 Voltage - Purge Supply	P0443	P0443	P0443	--
EVAP Purge Solenoid Control	P0443	P0443	P0443	P0443

Circuit/System Description

An ignition voltage is supplied directly to the evaporative emission (EVAP) canister purge solenoid valve. The EVAP canister purge solenoid valve is pulse width modulated (PWM). The scan tool displays the amount of ON time as a percentage. The control module monitors the status of the driver. The engine control module (ECM) controls the EVAP canister purge solenoid valve ON time by grounding the control circuit via an internal switch called a driver. If the ECM detects an incorrect voltage for the commanded state of the driver this DTC sets.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9-18 volts.
- DTC P0443 runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 6 seconds.

Action Taken when the DTC Sets

DTC P0443 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0443 is a Type B DTC.

Scan Tool Reference

Control Module References

Circuit/System Verification

Ignition ON , engine OFF, you should hear a clicking sound when the EVAP canister purge solenoid valve is commanded to 50 percent with a scan tool. The clicking sound should stop when the EVAP canister purge solenoid valve is commanded to 0 percent. The rate at which the valve cycles should increase when the command state is increased and decrease when the command state is decreased.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the EVAP canister purge solenoid valve.
2. Ignition ON, verify that a test lamp illuminates between the voltage supply circuit terminal A and ground.

   If the test lamp does not illuminate, test the voltage supply circuit for a short to ground or an open/high resistance. If the circuit tests normal and the voltage supply circuit fuse is open, test or replace the EVAP canister purge solenoid.
3. Connect a test lamp between the voltage supply circuit terminal A and the control circuit terminal B.
4. Command the EVAP canister purge solenoid valve to 50 percent with a scan tool. The test lamp should respond to the command.

   If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.

   If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. If all circuits test normal, replace the canister purge solenoid valve.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Evaporative Emission Canister Purge Solenoid Valve Replacement
- Control Module References

DTC P0506 or P0507

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptors

DTC P0506: Idle Speed Low

DTC P0507: Idle Speed High

Circuit/System Description

The throttle actuator control (TAC) motor is controlled by the engine control module (ECM). The DC motor located in the throttle body drives the throttle blade. In order to decrease idle speed, along with spark and fuel delivery changes the ECM commands the throttle closed reducing air flow into the engine and the idle speed decreases. In order to increase idle speed, the ECM commands the throttle plate open allowing more air to pass the throttle plate.

Conditions for Running the DTC

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0117, P0118, P0120, P0122, P0123, P0171, P0172, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0221, P0222, P0223, P0230, P0300, P0336, P0442, P0446, P0449, P0452, P0453, P0455, P0462, P0463, P0496, P1516, P2101, P2135, P2176 are not set.
- The engine is operating for at least 60 seconds.
- The engine is idling for greater than 10 seconds.
- The engine coolant temperature (ECT) is more than -60°C (-140°F).
- The intake air temperature (IAT) is more than -20°C (-4°F).
- The barometric pressure (BARO) is more than 70 kPa.
- The system voltage is between 9-18 volts.
- The vehicle speed is less than 1.6 km/h (1 mph).
- DTC P0506 and P0507 run continuously when the above conditions are met.

Conditions for Setting the DTC

P0506

The actual idle speed is approximately 100 RPM lower than the desired idle speed.

P0507

The actual idle speed is approximately 200 RPM greater than the desired idle speed.

Action Taken When the DTC Sets

DTCs P0506 and P0507 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0506 and P0507 are Type B DTCs.

Diagnostic Aids

- A stalling condition can cause DTC P0506 to set.
- An intermittent vehicle speed sensor (VSS) signal can cause DTC P0507 to set.
- An intermittent clutch pedal position sensor signal, if equipped, can cause DTC P0506 to set.

Circuit/System Verification

Important: The engine must first be running for greater than 60 seconds, then idle at a steady state for an additional 10 seconds before comparing the actual and desired engine idle speed parameters.

1. Use a scan tool to compare the desired engine idle speed to the actual engine idle speed.
   Actual engine idle speed should be no greater than 100 RPM below desired.
   Actual engine idle speed should be no greater than 200 RPM above desired.
2. If any other DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Inspect for any condition that can reduce idle speed by increasing engine load.
   - Incorrect torque converter clutch (TCC) operation
   - Accessories that require additional torque to operate
   - Excessive deposits in the throttle body
   - Restricted exhaust
   - Mechanical conditions that limit engine speed
   - Repair any conditions, if necessary.
2. Inspect for the following conditions:
   - Vacuum leaks
   - A faulty positive crankcase ventilation (PCV) valve

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptors

DTC P0601: Control Module Read Only Memory (ROM)

DTC P0602: Control Module Not Programmed

DTC P0603: Control Module Long Term Memory Reset

DTC P0604: Control Module Random Access Memory (RAM)

DTC P0606: Control Module Internal Performance

DTC P0607: Control Module Performance

DTC P060D: Control Module Accelerator Pedal Position (APP) System Performance

DTC P062F: Control Module Long Term Memory Performance

DTC P2610: Control Module Ignition Off Timer Performance

Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM) and the throttle actuator control (TAC) system. This diagnostic also addresses if the ECM is not programmed.

The ECM monitors its ability to read and write to the memory. It also monitors a timing function. The ECM and the TAC processors are used to monitor the TAC system data. Both processors monitor the other processors data to verify that the indicated APP calculation is correct. The ECM performs an intrusive test in order to confirm that the APP signals are not shorted together. The ECM accomplishes this by pulling the APP sensor 2 low momentarily and looking for sensor 1 to also be pulled low.

Conditions for Running the DTC

P0601

- The ignition switch is in Run or Crank.
- DTC P0601 runs continuously when the above condition is met.

P0602

- The ignition switch is in Run or Crank.
- DTC P0602 runs once per ignition cycle.

P0603

- The ignition switch is in Run or Crank.
- DTC P0603 runs once per ignition cycle.

P0604

- The ignition switch is in Run or Crank.
- DTC P0604 runs continuously when the above condition is met.

P0606

- The ignition switch is in the Unlock/Accessory, Run, or Crank positions.
- The system voltage is more than 5.23 volts.
- DTC P0606 runs continuously when the above conditions are met.

P0607

- The ignition switch is in Unlock, Accessory, Run or Crank.
- The system voltage is more than 5.23 volts.
- DTCs P0601, P0602, P0603, P0604, P0606, P062F, P0641, P0651, P2610 are not set
- DTC P0607 runs continuously when the above conditions are met.

P060D

- DTC P0606 is not set.
- The ignition switch is in the Unlock, Accessory, Run, or Crank position.
- The system voltage is more than 5.23 volts.
- DTC P060D runs continuously when the above conditions are met.

P062F

- The ignition is ON.
- DTC P062F runs once per ignition cycle.

P2610

- The ECM is powered down.
- The intake air temperature is between -40 to +125°C (-40 to +257°F).
- DTC P2610 runs once per ignition cycle.

Conditions for Setting the DTC

The ECM detects an internal failure or incomplete programming for more than 10 seconds.

Actions Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, P060D, and P062F are Type A DTCs.
- DTC P0607 is a Type C DTC.
- DTC P2610 is a Type B DTC.

Conditions for Clearing the MIL/DTC

- DTCs P0601, P0602, P0603, P0604, P0606, P060D, and P062F are Type A DTCs.
- DTC P0607 is a Type C DTC.
- DTC P2610 is a Type B DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Testing

1. Observe the DTCs with the scan tool.

   If DTC P0602 is set, attempt to program the ECM before replacing the ECM. Refer to Service Programming System (SPS).

   If DTC P0602 resets, replace the ECM.

   Important: An intermittent or momentary, less than 1 second, loss of system voltage during throttle tip-in may set DTC P060D.

2. Test the voltage and ground inputs to the ECM for the following:
   - A short
   - An open
   - High resistance

   If all circuits test normal, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

The Crankshaft Position (CKP) Sensor 5-Volt Reference 2 Circuit	P0651	P0335	P0651	--
Throttle Position (TP) Sensor 1 and 2 5-Volt Reference 2 Circuit	P0651	P0122, P0222	P0651	--

Circuit/System Description

The engine control module (ECM) has 2 internal 5-volt reference buses called 5 volt reference 1 and 5 volt reference 2. Each reference bus provides 5 volt reference circuits for more than one sensor. Therefore a fault condition on one 5 volt reference circuit will affect the other 5 volt reference circuits connected to that reference bus. The ECM monitors the voltage on the 5 volt reference buses.

The 5 volt reference 1 bus provides 5 volts to the following sensors:

- The manifold absolute pressure (MAP) sensor.
- The fuel tank pressure (FTP) sensor
- The air conditioning (A/C) refrigerant pressure sensor.
- The accelerator pedal position (APP) sensor 2.
- The engine oil pressure (EOP) sensor.
- The camshaft position (CMP) sensor.

The 5 volt reference 2 bus provides 5 volts to the following sensors:

- The APP sensor 1.
- The throttle position (TP) sensor 1 and 2.
- The crankshaft position (CKP) sensor.

Conditions for Running the DTC

- DTCs P0601, P0602, P0603, P0604, P0605, P0606, P0607, P060D, P062F and P2610 are not set.
- The ignition is in Unlock, Accessory, Run, or Crank.
- The ignition voltage is more than 5.23 volts.
- DTCs P0641 and P0651 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects a voltage out of tolerance condition on the 5-volt reference 1 or 2 bus for more than 0.5 second.

Action Taken when the DTC Sets

DTCs P0641 and P0651 are Type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0641 and P0651 are Type A DTCs.

Diagnostic Aids

- The 5-volt reference 1 bus provides 5 volts to the following sensors:
  - The manifold absolute pressure (MAP) sensor
  - The fuel tank pressure (FTP) sensor

  - The accelerator pedal position (APP) sensor 2
  - The air injector reaction (AIR) pressure sensor, if equipped
  - The engine oil pressure (EOP) switch
  - The air conditioning (A/C) refrigerant pressure sensor
  - The camshaft position (CMP) sensor
- The 5-volt reference 2 bus provides 5 volts to the following sensors:
  - The APP sensor 1
  - The throttle position (TP) sensor 1 and 2
  - The crankshaft position (CKP) sensor
- It may be possible to locate the fault by disconnecting one component at a time from the affected 5-volt reference circuit while viewing the 5-Volt Reference circuit status parameter on the scan tool. The scan tool parameter will change from Fault to OK when the source of the fault is disconnected. If all 5-volt reference components have been disconnected and a fault is still indicated, the fault may exist in the wiring harness.

Control Module References

Circuit/System Verification

1. Observe the scan tool 5-volt reference 1 circuit status and the 5-volt reference 2 circuit status parameters. Verify the parameters display OK.
2. Ignition ON, observe the DTC information with a scan tool. DTC P0641 and P0651 should not set on this ignition cycle.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: A short to voltage on the signal circuit of certain components may cause this DTC to set.

1. Ignition ON, disconnect the harness connector of all appropriate sensors for the applicable DTC. Refer to Diagnostic Aids for the appropriate sensors.
2. Ignition ON, measure for 4.8-5.2 volts between one of the 5-volt reference circuits and ground.

   If less than the specified range, test for a short to ground on all 5-volt reference circuits. If all circuits test normal, replace the ECM.

   If greater than the specified range, test for a short to voltage on all the 5-volt reference circuits. If all circuits test normal, replace the ECM.
3. Connect each component associated with the 5-volt reference circuit, one at a time, while monitoring the voltage. Verify the voltage remains between 4.8-5.2 volts.

   If not within the specified range when a component is connected, test the signal circuit for a short to voltage. If the circuit tests normal, replace the appropriate component.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Accelerator Pedal Position Sensor Replacement
- Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement
- Camshaft Position Sensor Replacement
- Crankshaft Position Sensor Replacement
- Engine Oil Pressure Sensor and/or Switch Replacement
- Fuel Tank Pressure Sensor Replacement

DTC P0650

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0650: Malfunction Indicator (MI) Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open	Short to Voltage	Signal Performance
MIL Voltage Supply	P0650	P0650	--	--
MIL Control	P0650/MIL ON	P0650	P0650	--

Circuit/System Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC).

The MIL informs the driver that an emission system fault has occurred and that the engine control system requires service. The engine control module (ECM) monitors the MIL control circuit for conditions that are incorrect for the commanded states of the MIL.

Conditions for Running the DTC

- The ignition is in the Run or Crank position.
- The ignition voltage is between 9-18 volts.
- DTC P0650 runs continuously when the ignition is ON.

Conditions for Setting the DTC

The ECM detects that the commanded state of the MIL driver and the actual state of the control circuit do not match for more than 5 seconds.

Action Taken when the DTC Sets

DTC P0650 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0650 is a Type B DTC.

EC Ignition Powertrain Relay Circuit Status	OK/Incomplete	Short to GRD/Open	Short to GRD/Open	Short to B+
EC Ignition Powertrain Relay Command	ON	ON	ON	ON
EC Ignition Powertrain Relay Feedback Signal	12-12.9 V	0.0 V	0.0 V	12-12.9 V

Circuit/System Description

The powertrain relay is a normally open relay. The relay armature is held in the open position by spring tension. Battery positive voltage is supplied directly to the relay coil and the armature contact at all times. The engine control module (ECM) supplies the ground path to the relay coil control circuit via an internal integrated circuit called an output driver module (ODM). The ODM output control is configured to operate as a low side driver for the powertrain relay. The ODM for the powertrain relay also incorporates a fault detection circuit, which is continuously monitored by the ECM. When the ECM commands the powertrain relay ON, ignition 1 voltage is supplied to the ECM, and to several additional circuits.

Conditions for Running the DTC

P0685

- The ignition is ON.
- The battery voltage is between 9-16 volts.

P0689

- The ignition is ON.
- The powertrain relay is commanded ON.
- DTC P0685 is not set.

P0690

- This DTC will run with the ignition ON or OFF.
- This DTC will run when the powertrain relay is commanded ON or OFF.
- DTC P0685 is not set.

Conditions for Setting the DTC

P0685

- The commanded state of the ODM and the actual state of the control circuit do not match.
- The condition is present for more than 5 seconds.

P0689

- The ECM detects less than 5 volts on the ignition 1 voltage circuit to the ECM.
- The condition is present for more than 5 seconds.

P0690

- The ECM detects more than 16 volts on the ignition 1 voltage circuit to the ECM when the relay is commanded ON.
- The ECM detects more than 2 volts on the ignition 1 voltage circuit to the ECM when the relay is commanded OFF.
- The condition is present for more than 2 seconds.

Action Taken When the DTC Sets

DTCs P0685, P0689, and P0690 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0685, P0689, and P0690 are Type B DTCs.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Special Tools

- J 35616 GM-Approved Terminal Test Kit
- J 43244 Relay Puller Pliers

Circuit/System Verification

1. Engine running, command the powertrain relay ON and OFF, with a scan tool, while observing the following powertrain relay coil control circuit status parameters.

- Powertrain relay coil control Ckt. Short Gnd Test Status
- Powertrain relay coil control Ckt. Open Test Status
- Powertrain relay coil control Ckt. Short Volts Test Status
- Each parameter should toggle between OK and Not Run or Not Run and OK

2. Ignition ON, engine OFF, with a test lamp, probe both test points of all the fuses that are powered by the powertrain relay. The test lamp should illuminate ON for at least one test point of each fuse.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification first.

1. Ignition OFF, disconnect the powertrain relay.
2. Ignition ON, verify that a test lamp illuminates between the powertrain relay coil B+ terminal 85 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the battery positive cable to the underhood fuse block.
3. Ignition OFF, verify that a test lamp does not illuminate between the powertrain relay coil B+ terminal 85 circuit and the control circuit terminal 86.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the powertrain relay ON, with a scan tool. Verify with a scan tool that the powertrain relay Ckt. Short Volts Test Status parameter is OK.

   If not the specified value, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Test the coil side of the powertrain relay terminal 85 and 86 for 200-240 ohms.

   If not within the specified value, replace the relay.
7. Ignition OFF, disconnect the ECM X1 connector.
8. Test the powertrain relay control circuit X1-59 for an open/high resistance.

   If the circuit tests normal, replace the ECM.
9. Verify that a test lamp does not illuminate between the relay ignition 1 terminal 30 voltage circuit and ground.

   If the test lamp illuminates, test the relay ignition 1 voltage circuit terminal 87 for a short to voltage. If the circuit tests normal, replace the ECM.
10. Verify that a test lamp illuminates between the relay switch B+ terminal 87 and ground.

    If the test lamp does not illuminate, test the relay switch B+ terminal 87 circuit for a short to ground, or an open/high resistance. If the circuits test normal, and the fuse for the ignition 1 voltage circuit is open, test the ignition 1 voltage circuit to the ECM for a short to ground. If the circuit tests normal, replace the ECM.
11. Connect a 20 A fused jumper wire between the relay switch B+ terminal 87 and the relay ignition 1 voltage circuit terminal 30.
12. Ignition ON, engine OFF, monitor the EC Ignition Relay Feedback parameter with a scan tool. The parameter should display B+.

    If the parameter does not display B+, test the ignition 1 voltage circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
13. If all circuits test normal, replace the relay.

Repair Instructions

- Engine Control Module Programming and Setup
- Engine Control Module Replacement
- Relay Replacement

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. Ignition ON, command the powertrain relay ON and OFF with a scan tool, while observing the powertrain relay circuit status parameters, The circuit status parameters should change from OK to Not Run or Not Run to OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

DTC P0700

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0700: Transmission Control Module (TCM) Requested MIL Illumination

Circuit/System Description

The transmission control module (TCM) uses the (GMLAN) to signal the engine control module (ECM) that the TCM is requesting malfunction indicator lamp (MIL) illumination. This happens when the TCM has determined that a failure affecting emissions has occurred in transmission control system. When the ECM receives the a message from the TCM, DTC P0700 will set.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The TCM is requesting MIL illumination.

Action Taken When the DTC Sets

DTC P0700 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0700 is a Type A DTC.

Diagnostic Aids

DTC P0700 can not be cleared from the ECM until the related TCM codes have been cleared.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Diagnostic Trouble Code (DTC) List - Vehicle to correct any transmission DTCs

DTC P1174 or P1175

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P1174: Fuel Trim Cylinder Balance Bank 1

DTC P1175: Fuel Trim Cylinder Balance Bank 2

Circuit/System Description

The Fuel Trim Cylinder Balance diagnostic detects a rich or lean cylinder to cylinder air/fuel ratio imbalance in each bank. The diagnostic monitors the pre-catalyst heated oxygen sensor (HO2S) signal's frequency and amplitude characteristics by calculating an accumulated voltage over a predetermined sample period. An imbalance is indicated when multiple samples of the accumulated voltage are consistently higher than the desired value.

Conditions for Running the DTC

- DTCs P0030, P0036, P0050, P0053, P0059, P0101, P0102, P0103, P0106, P0107, P0108, P0117, P0118, P0128, P0131, P0132, P0133, P0134, P0135, P0151, P0152, P0153, P0154, P0155, P0201-P0206, P0300, P0301-P0306, P0411, P0412, P0418, P0442, P0443, P0446, P0449, P0452, P0453, P0454, P0455, P0496, P1133, P1153, P1516, P2101, P2119, P2120, P2125, P2135, P2138, P2176, P2431, P2432, P2433, P2440, P2A00, P2A03 are not set.
- The device control is not active.
- The intrusive diagnostics are not active.
- The engine overspeed protection is not active.
- The power take-off (PTO) is not active.
- The traction control is not active.
- The fuel control is in air-fuel Closed Loop.
- The system voltage is more than 10 volts, or less than 18 volts.
- The engine run time is greater than 100 seconds.
- The engine coolant temperature (ECT) is greater than -20°C (-4°F).
- The engine speed is greater than 425 RPM, but less than 6,000 RPM.
- The mass air flow is greater than 25 g/s, but less than 510 g/s.

Conditions for Setting the DTC

Multiple samples of the pre-catalyst HO2S accumulated voltage are consistently greater than the desired value.

Action Taken When the DTC Sets

DTCs P1174 and P1175 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P1174 and P1175 are Type B DTCs.

Diagnostic Aids

- The fuel trim cylinder balance diagnostic is very sensitive to heated oxygen sensor (HO2S) design. A non-OE sensor or an incorrect part number may set a false DTC.
- Monitoring the misfire current counters, or misfire graph, may help to isolate the cylinder that is causing the condition.

Circuit/System Testing

1. Read and record the Freeze Frame/Failure Records data taking note of the speed and load at which the DTC set.
2. Diagnose any other DTCs that are set. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

3. With the engine idling and the transmission in the Park or Neutral position, observe the manifold absolute pressure (MAP) sensor parameter. The MAP sensor parameter should be between 19-42 kPa.

   If the MAP sensor parameter is not between 19-42 kPa, refer to DTC P0106 or DTC P0107 or P0108.
4. Inspect the air induction system for modified, damaged, leaking, or restricted components.
5. Inspect the crankcase ventilation system for improper operation.
6. Inspect the vacuum hoses for splits, kinks, and improper connections.
7. Inspect for vacuum leaks at the intake manifold, the throttle body, and the injector O-rings.
8. Test for a restricted, damaged, leaking, or modified exhaust system from the catalytic converter forward. Refer to Symptoms - Engine Exhaust.
9. Test the fuel injectors for improper operation. Refer to Fuel Injector Diagnosis.
10. Test for fuel contamination. Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
11. Test for excessive fuel in the crankcase due to leaking injectors.
12. Test the ignition system for improper operation. Refer to Electronic Ignition (EI) System Diagnosis.
13. Test the engine for any mechanical conditions such as sticking valves, lifters, etc., which could alter the flow into the combustion chamber. Refer to Symptoms - Engine Mechanical.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure. Verify the repair under the same speed and load as noted in the Freeze Frame/Failure Records data recorded during testing.

DTC P1380 or P1381

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptors

DTC P1380: Misfire Detected - Rough Road Data Not Available

DTC P1381: Misfire Detected - No Communication with Brake Control Module

System Description

The engine control module (ECM) detects engine misfire by detecting variations in crankshaft deceleration between firing strokes. For accurate detection of engine misfire, the ECM must distinguish between crankshaft deceleration caused by actual misfire and deceleration caused by rough road conditions. The antilock brake system (ABS) can detect if the vehicle is on a rough road based on wheel acceleration/deceleration data supplied by the wheel speed sensors. If the ABS detects rough road above predetermined threshold, this information is sent to the ECM. The ECM uses the rough road information when calculating engine misfire. If the ABS is malfunctioning and cannot detect rough roads, the misfire diagnostic will continue to run; however, if an engine misfire DTC sets, this DTC also sets indicating that rough road data was not available, or there was no communication with the brake control module during the misfire calculation due to an ABS malfunction.

Conditions for Running the DTC

- The vehicle speed is greater than 8 km/h (5 mph).
- The engine speed is less than 7,000 RPM.
- The engine load is less than 60 percent.
- Engine misfire is detected and DTC P0300 sets with the MIL illuminated.
- DTCs P1380 and P1381 run continuously when the above conditions are met.

Conditions for Setting the DTC

P1380

- The ABS controller sends a message to the ECM indicating that a failure has occurred in the ABS module.
- Engine misfire is detected and DTC P0300 set.

P1381

- An ABS malfunction exists for more than 10 seconds, preventing the ECM from receiving rough road detection data.
- Engine misfire is detected and DTC P0300 set.

Action Taken When the DTC Sets

DTCs P1380 and P1381 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P1380 and P1381 are Type C DTCs.

DTC P1400

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptor

DTC P1400: Cold Start Emission Reduction Control System

Circuit/System Description

The catalytic converter must be warmed to efficiently reduce the emissions. The cold start strategy is to reduce the amount of time it takes to warm the catalytic converter. During a cold start, the engine idle speed is elevated and spark timing is retarded to allow the catalyst to warm quickly. This diagnostic monitors the following to build an exhaust energy model:

- Engine speed
- Spark advance
- Throttle position
- Engine airflow
- Engine coolant temperature
- Engine runtime
- Park/neutral position
- Vehicle speed

The actual model is then compared to the expected exhaust energy model.

Conditions for Running the DTC

- The engine is running, and a cold start has been detected.
- Vehicle speed is less than 2 km/h (1 mph).
- The engine is at idle with no input from the accelerator pedal.
- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0335, P0336, P0351, P0352, P0353, P0501, P0502, P0506, P0507, P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, P0641, P0651, P1101, P1516, P1682, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, P2176, P2610 are not set.

This DTC runs for 15 seconds within the first 2 minutes of start-up. This diagnostic runs once per trip when a cold start has been determined.

Conditions for Setting the DTC

The actual exhaust energy model does not match the expected exhaust energy model.

Action Taken When the DTC Sets

DTC P1400 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P1400 is a Type A DTC.

Description and Operation

Engine Control Module Description

Diagnostic Aids

Any loading of the engine that lowers engine RPM, such as with partial application of the clutch, A/C cycling etc., during the first 120 seconds of engine runtime may set this DTC.

Circuit/System Verification

1. Allow the engine to cool.
2. Start and idle the engine for at least 2 minutes.
3. DTC P1400 should run and pass.

Circuit/System Testing

- Inspect the air intake system for the following:
  - Damage, restriction, or modification
  - Dirty or deteriorating air filter element
  - Crankcase ventilation system for correct operation--Refer to Crankcase Ventilation System Inspection/Diagnosis .
  - Water intrusion

  - Vacuum leak and other un-metered air downstream of the mass air flow (MAF) sensor
  - Intake manifold leak
- Inspect the exhaust system for the following:
  - Water intrusion
  - Exhaust leak
  - Damaged, restricted, modified or enhanced exhaust system--Refer to Symptoms - Engine Exhaust .
- Inspect the engine mechanical for items that could alter the air flow into the combustion chamber. Refer to Symptoms - Engine Mechanical .

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P1516, P2101, P2119, or P2176

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P1516: Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance

DTC P2101: Throttle Actuator Position Performance

DTC P2119: Throttle Closed Position Performance

DTC P2176: Minimum Throttle Position Not Learned

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Motor Control 1	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176
Motor Control 2	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176

Circuit/System Description

The engine control module (ECM) is the control center for the throttle actuator control (TAC) system. The ECM determines the drivers intent and then calculates the appropriate throttle response. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the TAC motor. The TAC system uses the following circuits:

- Motor control 1
- Motor control 2

Two processors are also used to monitor the TAC system data. Both processors are located within the ECM. Both processors monitor each other's data to verify that the indicated throttle position is correct.

Conditions for Running the DTC

P1516 and P2101

- The ignition is ON.
- The ignition voltage is more than 8 volts.
- The system is not in the Battery Save mode.
- The engine is running.
- DTC P0068 is not set.
- DTCs P1516 and P2101 run continuously when the above conditions are met.

P2119

- The ignition is ON.
- The vehicle speed is 0 km/h (0 mph).
- The ignition 1 voltage is more than 10 volts.
- DTC P2119 runs once per ignition cycle when the above conditions are met for more than 1 second.

P2176

- The ignition is ON.
- DTCs P0120, P0122, P0123, P0220, P0222, P0223 are not set.
- DTC P2176 runs once per key cycle.

Conditions for Setting the DTC

P1516

The indicated throttle position does not match the predicted throttle position for more than 0.5 second.

P2101

The indicated throttle position does not match the predicted throttle position for more than 0.3 second.

P2119

The ECM determines that the throttle valve did not return to the rest position within 720 milliseconds.

P2176

The difference between the predicted and the actual throttle position is more than a calibrated amount for more than 1.5 seconds.

Action Taken When the DTC Sets

P1516, P2101, and P2176

- DTCs P1516, P2101, and P2176 are Type A DTCs.
- The control module illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Freeze Frame/Failure Records.
- The control module commands the TAC system to operate in the Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions, the control module commands the engine OFF.

P2119

- DTC P2119 is a Type C DTC.
- The control module stores the DTC information into memory when the diagnostic runs and fails.
- The MIL will not illuminate.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Failure Records.
- The driver information center, if equipped, may display a message.

Conditions for Clearing the MIL/DTC

- DTCs P1516, P2101, and P2176 are Type A DTCs.
- DTC P2119 is a Type C DTC.
- The control module turns OFF the MIL after 3 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Clear the MIL and the DTC with a scan tool.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, engine OFF, use a scan tool to observe the throttle position (TP) sensor 1 indicated position. Throttle position should increase as pedal is applied, and decrease as pedal is released. When no accelerator pedal activity is detected, the throttle position will return to the spring loaded default position.

   Important: A low voltage condition may set this DTC.

2. Review the Freeze Frame/Failure Records and ensure sufficient ignition voltage was present when the DTC was set.
   If voltage was low, verify with the owner that the battery was not discharged. If the battery has not been discharged, refer to Power Mode Mismatch.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Caution: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

1. Inspect the throttle body for the following conditions:
   - A throttle blade that is NOT in the rest position
   - A throttle blade that is binding open or closed
   - A throttle blade that is free to move open or closed WITHOUT spring pressure

   If a condition is found, replace the throttle body assembly.

   Important: Disconnecting the throttle body harness connector causes additional DTCs to set.

2. Ignition OFF, disconnect the harness connector at the throttle body.
3. Ignition ON, verify that a test lamp does not illuminate between motor control 1 circuit terminal B and ground.
   If test lamp illuminates, test the motor control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify that a test lamp does not illuminate between motor control 2 circuit terminal A and ground.
   If the test lamp illuminates, test the motor control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Ignition ON, verify that a test lamp does not illuminate between motor control 1 circuit terminal B and B+.
   If the test lamp illuminates, test the motor control circuit for a short to ground. If the

circuit tests normal, replace the ECM.

6. Ignition ON, verify that a test lamp does not illuminate between motor control 2 circuit terminal A and B+.

   If the test lamp illuminates, test the motor control circuit for a short to ground. If the circuit tests normal, replace the ECM.

7. Ignition OFF, allow sufficient time for the ECM to completely power down. Connect a DMM between the motor control 1 circuit terminal B and ground.

   Important: When measuring peak voltage, ensure that the DMM is on the proper voltage scale and that the response time is set to 1 ms.

8. Measure for B+ on the motor control 1 circuit terminal B as the ignition is turned ON.

   If the peak voltage is not within 1 volt of B+, test the circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

9. Ignition OFF, allow sufficient time for the ECM to completely power down.
10. Measure for B+ on the motor control 2 circuit terminal A as the ignition is turned ON.

    If the peak voltage is not within 1 volt of B+, test the circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

11. If all circuits test normal, replace the throttle body.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Throttle Body Assembly Replacement
- Control Module References for ECM replacement, setup, and programming

DTC P1682

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1682: Ignition 1 Switch Circuit 2

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition 1 Voltage, Powertrain Relay	P0689	P0689, P1682	P0690	--
Ignition 1 Voltage, Run/Crank Relay	--	P1682	--	--

Typical Scan Tool Data

Ignition Scan Tool Data

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON, engine OFF, and run/crank and powertrain relay are commanded ON			
Ignition 1 Voltage, Run/Crank	0 Volts	0 Volts	12 Volts
EC Ignition (Powertrain) Relay Feedback Signal	0 Volts	0 Volts	12 Volts

Circuit/System Description

There are 2 ignition 1 voltage circuits supplied to the engine control module (ECM). The first ignition circuit is provided by the powertrain relay, through a fuse. This ignition 1 voltage circuit supplies power to all the internal ECM circuits associated with the throttle actuator control (TAC) operation. The second ignition 1 voltage circuit is supplied by the run/crank relay through a fuse, and is used to power the remaining internal ECM circuits. If the ECM detects a voltage difference between the 2 ignition 1 voltage circuits, DTC P1682 will set.

Conditions for Running the DTC

- The ignition is ON.

- System voltage is more than 7 volts.
- The powertrain relay is commanded ON.
- DTC P1682 runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the voltage level difference is greater than 3 volts between the 2 ignition 1 voltage circuits for less than 1 second.

Action Taken When the DTC Sets

DTC P1682 is a Type A DTC.

Conditions for Clearing the DTC

DTC P1682 is a Type A DTC.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

Circuit/System Verification

Important: On the scan tool, the powertrain relay is referred to as the EC ignition relay.

1. If DTCs P0685, P0689, or P0690 are set, diagnose those DTCs first.
2. Ignition ON, engine OFF, observe both the Ignition 1 Voltage signal and the EC Ignition Relay Feedback signal parameters on the scan tool. Both parameter values should display no more than 3 volts difference between the 2 parameters.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF, disconnect the powertrain relay.
2. Ignition ON, verify that a test lamp does not illuminate between the powertrain relay controlled output circuit terminal and ground.

   If the test lamp illuminates, test the powertrain relay controlled output circuit for a short to voltage.
3. Ignition OFF, verify that a test lamp illuminates between the powertrain relay coil voltage supply circuit terminal and ground.

   If the test lamp does not illuminate, test the powertrain relay coil voltage supply circuit for a short to ground or an open/high resistance.
4. Verify that a test lamp illuminates between the powertrain relay switch voltage supply circuit terminal and ground.

   If the test lamp does not illuminate, test the powertrain relay switch voltage supply circuit for an open/high resistance.
5. Disconnect the ECM.
6. Ignition ON, verify that a test lamp illuminates between ECM connector terminal X1-19 and ground.

   If the test lamp does not illuminate, test the ignition 1 relay controlled output circuit for a short to ground or open/high resistance.

   If the circuit tests normal and its fuse is open, replace the ECM.
7. Ignition OFF, connect the harness connector at the ECM.
8. Ignition ON, connect a jumper wire between the powertrain relay voltage supply circuit terminal and the powertrain relay controlled output circuit terminal. Verify the EC Ignition Relay Feedback parameter indicates battery positive voltage.

   If not the specified value, test the powertrain relay controlled output circuit for a short to ground or an open/high resistance. If the circuit tests normal and its fuse is open, replace the ECM.
9. If all circuits test normal, replace the powertrain relay.

APP Sensor 2 low Reference	0.33-2.50 V	--	4.92 V	--

Circuit/System Description

The throttle actuator control (TAC) system uses two accelerator pedal position (APP) sensors to monitor the accelerator pedal position. The APP sensors 1 and 2 are located within the pedal assembly. Each sensor has the following circuits:

- A 5-volt reference circuit
- A low reference circuit
- A signal circuit

Two processors are also used to monitor the TAC system data. Both processors are located within the engine control module (ECM). Each signal circuit provides both processors with a signal voltage proportional to pedal movement. Both processors monitor each other's data to verify that the indicated APP calculation is correct.

Conditions for Running the DTC

P2120, P2122, P2123, P2125, P2127, P2128

- The system voltage is more than 5.23 volts.
- The ignition is in the Unlock/Accessory or Run position.
- DTC P0641 and P0651 are not set.
- DTC P2120, P2122, P2123, P2125, P2127, P2128 run continuously when the above conditions are met.

P2138

- The system voltage is more than 5.23 volts.
- The ignition is in the Unlock/Accessory or Run position.
- DTC P0641, P0651, P2120, P2125 are not set.
- DTC P2138 runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2120

The APP sensor 1 voltage is less than 0.325 volt, or more than 4.75 volts for more than 0.4 second.

P2122

The ECM detects that the APP sensor 1 voltage is less than 0.325 volt for more than 0.4 second.

P2123

The ECM detects that the APP sensor 1 voltage is more than 4.75 volts for more than 0.4 second.

P2125

The APP sensor 2 voltage is less than 0.325 volt, or more than 4.75 volts for more than 0.4 second.

P2127

The ECM detects that the APP sensor 2 voltage is less than 0.325 volt for more than 0.4 second.

P2128

The ECM detects that the APP sensor 2 voltage is more than 4.75 volts for more than 0.4 second.

P2138

The voltage difference between APP sensor 1 and APP sensor 2 exceeds a predetermined value for more than 2 seconds.

Action Taken When the DTC Sets

- DTCs P2120, P2122, P2123, P2125, P2127, P2128, and P2138 are Type A DTCs.
- The control module commands the TAC system to operate in the Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions the control module commands the engine OFF.

Conditions for Clearing the MIL/DTC

DTCs P2120, P2122, P2123, P2125, P2127, P2128, and P2138 are Type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool APP sensor 1 voltage parameter. The reading should be between 0.32-4.75 volts, and change with accelerator pedal input.
2. Ignition ON, observe the scan tool APP sensor 2 voltage parameter. The reading should be between 0.32-4.75 volts, and change with accelerator pedal input.
3. Ignition ON, observe the scan tool APP sensor 1 and 2 parameter. The scan tool should indicate agree.
4. Clear the DTCs with the scan tool. Operate the vehicle within the Conditions for Running the DTC, or within the conditions that you observed from the Freeze Frame/Failure Records.

   If DTC P2120 or P2125 are the only DTCs set, replace the control module.

   If DTC P0641 or P0651 are set, refer to DTC P0641 or P0651.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the accelerator pedal. Allow sufficient time for the ECM to power down.
2. Test for less than 5 ohms between each low reference circuit terminals 4 and 5 and ground.

   If greater than 5 ohms, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between each 5-volt reference circuit terminals 2 and 1 and ground.

   If less than 4.8 volts, test the affected 5-volt reference circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

   If greater than 5.2 volts, test the affected 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify the scan tool APP sensor 1 and 2 voltages are less than 0.1 volt.

   If greater than 0.1 volt, test the APP sensor 1 and 2 signal circuits terminals 3 and 6 for a short to voltage. If the circuit tests normal, replace the ECM.

5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2 of the APP sensor 1. Verify the scan tool parameter AP sensor 1 voltage is greater than 4.8 volts.

   If less than 4.8 volts, test the APP sensor 1 signal circuit for an open, or short to ground. If the circuit tests normal, replace the ECM.

6. Install a 3A fused jumper wire between the signal circuit terminal 6 and the 5-volt reference circuit terminal 1 of the APP sensor 2. Verify that the scan tool parameter APP sensor 2 voltage is greater than 4.8 volts.

   If less than 4.8 volts, test the APP sensor 2 signal circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the ECM.

7. Ignition OFF, disconnect the harness connector at the ECM.
8. Test for less than 5 ohms of resistance on all APP sensor circuits between the following terminals:
   - ECM X1 signal circuit terminal 29 to APP terminal 3
   - ECM X1 signal circuit terminal 32 to APP terminal 6
   - ECM X1 5-volt reference circuit terminal 36 to terminal 1
   - ECM X1 5-volt reference circuit terminal 56 to terminal 2

   If greater than 5 ohms, repair the affected circuit.

9. Test for infinite resistance between APP sensor 1 signal circuit terminal 3 and APP sensor 2 signal circuit terminal 6.

   If less than infinite resistance, repair the short between APP sensor 1 signal circuit and APP sensor 2 signal circuits.

   If all circuits test normal, replace the accelerator pedal.

Component Test

Important: Perform the Circuit/System Testing before proceeding with the Component Test.

Dynamic Test

1. Install a 3A fused jumper wire between the 5-volt reference terminal of the applicable APP sensor and 5 volts. Install a jumper wire between the low reference terminal and a ground.
2. Sweep the sensor through the entire range while monitoring the voltage between the signal terminal and the low reference terminal with a DMM. The voltage should vary between 0.30-4.98 volts without any spikes or dropouts.

   If the voltage is not within the specified range or is erratic, replace the accelerator pedal assembly.

DTC Descriptor

DTC P250A: Engine Oil Level Sensor Circuit

Circuit/System Description

The engine oil level (EOP) sensor changes voltage based on the engine oil pressure. The EOP sensor is a 3-wire sensor comprising of the signal circuit, the low reference circuit and the 5 volt reference circuit. The engine control module (ECM) supplies 5 volts to the EOP sensor via the 5 volt reference circuit and provides ground via the EOP low reference circuit. The ECM monitors the signal circuit of the EOP sensor to determine the engine oil pressure sensor voltage is within the normal operating range of approximately 1-4 volts. When the engine oil pressure is high, the EOP sensor voltage is high and the ECM senses a high signal voltage. When the engine oil pressure is low, the EOP sensor voltage is low and the ECM senses a low signal voltage. The ECM sends the EOP information to the instrument panel cluster (IPC) via GMLAN serial data message.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

- The ECM detects that the EOP sensor signal circuit is greater than 4.4 volts.
- The above condition is present for greater than 10 seconds.

Action Taken when the DTC Sets

DTC P250A is a type C store Only DTC.

Conditions for Clearing the MIL/DTC

DTC P250A is a type C store Only DTC.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the engine oil pressure (EOP) sensor.
2. Ignition OFF, test for less than 1 ohm of resistance between the low reference circuit and a known ground.

   If greater than 1 ohm, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the 5 volt reference circuit and a known ground.

   If less than 4.8 volts, test the 5 volt reference circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the ECM.

   If greater than 5.2 volts, test the 5 volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Connect an approved test lamp between the 5-volt reference circuit and the signal circuit at the wiring harness connector.

   If the test lamp does not illuminate test the signal circuit for a open/high resistance. If the circuit tests normal replace the ECM.
5. If all circuits test normal, test or replace the EOP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Oil Pressure Sensor and/or Switch Replacement.
- Engine Control Module Replacement for engine control module replacement, setup and programming.

DTC P2544

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptor

DTC P2544: Transmission Torque Request Circuit

Circuit / System Description

To improve shift feel, the transmission control module (TCM) may request that the engine control module (ECM) reduce engine torque during shift events. When such a request is received, the ECM responds by retarding the base ignition timing and notifying the TCM that the request has succeeded. If the ECM is unable to comply with the request, the ECM sends the TCM a message that the request has failed.

The torque reduction request is sent to the ECM through a communication network called the controller area network (CAN). Two circuits are used to communicate CAN data between the ECM and TCM. A fault in the CAN will not cause DTC P2544 to set by itself. If a CAN fault occurs, other DTCs will set before DTC P2544.

When the TCM receives a torque reduction failure message from the ECM, then DTC P2544 will set. DTC P2544 is a type B DTC.

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- No other CAN errors are present.

Conditions for Setting the DTC

The ECM notifies the TCM that a torque reduction request has failed for 2 seconds.

Action Taken When the DTC Sets

- DTC P2544 is a Type B DTC.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.

- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2544 in TCM history.

Conditions for Clearing the DTC

- DTC P2544 is a Type B DTC.
- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test

DTC Descriptor

DTC P3400: Cylinder Deactivation System Performance

Circuit / System Description

The Cylinder Deactivation System Performance diagnostic is a test of the internal mechanical condition of the engine, during operation in V4 mode. The engine control module (ECM) determines the internal mechanical condition of the engine through the actual measured values of the mass airflow (MAF) sensor, the intake manifold absolute pressure (MAP) sensor, and the throttle position (TP) sensor. The actual measured values of the 3 sensors are then compared to the calculated values for V4 mode, stored in the ECM. If the measured values are incorrect for V4 mode, the ECM will set DTC P3400, and will return to V8 mode operation.

Conditions for Running the DTC

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0119, P0335, and P0336 are not set.
- The engine speed is between 450-6,400 RPM.
- The IAT Sensor parameter is between -7 and +125°C (+19 and +257°F).
- The ECT Sensor parameter is between 70- 125°C (158-257°F).
- Time in V8 mode is more than 2 seconds.
- Time in V4 mode is more than 2 seconds.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

- The ECM detects that the actual measured values from the MAF sensor, MAP sensor, and TP sensor, is not within the range of the calculated values for V4 mode.
- The above condition is met for more than 100 milliseconds.

Action Taken When the DTC Sets

- DTC P3400 is a Type B DTC.

- The engine will return to V8 mode.

Conditions for Clearing the DTC

DTC P3400 is a Type B DTC.

Diagnostic Aids

- This DTC will not set during engine idling conditions. The vehicle will need to be driven for the DTC to set.
- This test procedure requires that the vehicle battery has passed a load test and its completely charged. Refer to Battery Inspection/Test.
- The valve lifter oil manifold (VLOM) solenoids are assigned to the following engine cylinders:
  - Solenoid #1--Cylinder #1
  - Solenoid #2--Cylinder #4
  - Solenoid #3--Cylinder #6
  - Solenoid #4--Cylinder #7

Circuit/System Verification

1. Start and idle the engine.
2. Allow the engine to reach normal engine operating temperature. The engine should idle smoothly, without any misfires. If the engine misfires, refer to DTC P0300-P0308.
3. Monitor the cylinder deactivation system data parameters with a scan tool.
4. Road test the vehicle under light throttle and load conditions that will allow the engine to command V4 mode. If all enabling conditions are met for cylinder deactivation, and if no internal engine hydraulic/mechanical fault conditions are present, the ECM will continue with V4 mode operation.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Electrical System Testing

1. If DTCs P3401, P3425, P3441, or P3449 are set, refer to DTC P3401, P3425, P3441, or P3449.
2. Ignition ON, the engine OFF, command each VLOM solenoid ON and OFF using the scan tool output control function. While standing next to the engine compartment, you should be able to hear the solenoid energize and de-energize with each scan tool output control command.

   If you cannot hear each solenoids energize and de-energize, then refer to Cylinder Deactivation (Active Fuel Management) System Diagnosis.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Circuit/System Description

Each of the 4 valve lifter oil manifold (VLOM) solenoid windings, are connected in parallel to a fused ignition circuit, supplied by the powertrain relay, in the underhood fuse block. The control circuit for each solenoid is connected to an individual low side driver, internal to the engine control module (ECM). Each low side driver has its own fault detection circuit, which monitors the solenoid control circuit for an incorrect voltage level. If an incorrect voltage level, such as an open/high resistance, or short to ground is detected, the low side driver will turn OFF, and the fault detection circuit will communicate the condition to the central processor internal to the ECM. These DTCs will set when the ECM detects an incorrect voltage level on the ignition circuit, the solenoids, or a solenoid control circuit, after the ignition switch is turned ON. If a VLOM solenoid control circuit DTC is set, the ECM will command V8 mode, turn ON the malfunction indicator light (MIL), and turn OFF the fuel injector for that cylinder, resulting in an engine misfire.

Conditions for Running the DTC

- The engine speed is greater than 400 RPM.
- The ignition voltage is between 9-18 volts.
- DTC P3401, P3425, P3441, and P3449 runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The ECM detects that the commanded state of the low side driver and the actual voltage level of the control circuit do not match.
- The condition is present for 20 out of 25 sample counts.

Action Taken When the DTC Sets

- DTC P3401, P3425, P3441, and P3449 are Type B DTCs.
- The engine will return to V8 mode.
- The fuel injector will turn OFF for the cylinder that has a cylinder deactivation DTC set, resulting in an engine misfire.

Conditions for Clearing the DTC

DTC P3401, P3425, P3441, and P3449 are Type B DTCs.

Diagnostic Aids

The VLOM solenoids are assigned to the following engine cylinders:

- Solenoid #1 = Cylinder #1
- Solenoid #2 = Cylinder #4
- Solenoid #3 = Cylinder #6
- Solenoid #4 = Cylinder #7

Important: This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

1. Remove and inspect the fuse for the valve lifter oil manifold assembly.
   If the fuse is open, then a short to ground condition exists in the circuit.
2. Ignition ON, engine OFF, measure and record the ignition voltage at the fuse for the valve lifter oil manifold (VOLM) assembly.
3. Connect a DMM in series with a 15A fused jumper wire and a non-fused jumper wire across the exposed fuse terminals in the underhood fuse block.
4. Select the 10A range and zero out the DMM display.
5. Command each VLOM solenoid ON with a scan tool.
6. Record the amperage reading display on the DMM for each solenoid.
   If zero current is detected, then an open circuit condition exists in the circuit.
7. Calculate the resistance for each solenoid circuit. The total resistance for each solenoid circuit should be within 11-22 ohms.
   If the total circuit resistance exceeds 22 ohms, an open/high resistance condition exists in the circuit.

Special Tools

EN-46999 Displacement On Demand Tester

Circuit/System Verification

1. Engine running, command the affected cylinder deactivation solenoid ON and OFF, with a scan tool, while observing the following cylinder deactivation control circuit status parameters.
   - Cylinder 1, 4, 6, or 7 solenoid control Ckt. Short Gnd Test Status
   - Cylinder 1, 4, 6, or 7 solenoid control Ckt. Open Test Status
   - Cylinder 1, 4, 6, or 7 solenoid control Ckt. Short Volts Test Status
   - Each parameter should toggle between OK and Not Run or Not Run and OK
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification first.

1. Disconnect the valve lifter oil manifold (VOLM) harness connector.
2. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal E and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test or replace the VLOM assembly.
3. Verify that a test lamp does not illuminate between the ignition circuit terminal E and the affected control circuit terminal.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the affected cylinder deactivation solenoid ON with a scan tool. Verify with a scan tool that the affected cylinder deactivation solenoid Ckt. Short Volts Test Status parameter is OK.

   If not the specified value, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Install a 3A fused jumper wire between the affected control circuit terminal and the ignition circuit terminal E. Command the affected cylinder deactivation solenoid ON with a scan tool. Verify with a scan tool that the affected cylinder deactivation solenoid Ckt. Short Volts Test Status parameter is displaying Fault.

If not the specified value, test the control circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

7. If all the circuits test normal, test or replace the VOLM assembly.

Component Testing

Important: Perform the Circuit/System Testing first.

Static Test

1. Ignition OFF, disconnect the VLOM harness connector at the VLOM assembly.
2. Connect the cable that is labeled resistance from the displacement on demand (DoD) tester to the VLOM connector.
3. Connect the power leads from the DoD tester to B+ and ground. Test for 11-18 ohms on each VLOM solenoid.

   If the resistance is not within the specified range for each solenoid, replace the VLOM assembly.
4. Test for infinite resistance between each VLOM circuit terminal and the VLOM housing.

   If less than infinite resistance, replace the VLOM assembly.

Dynamic Test

1. Ignition OFF, disconnect the VLOM harness connector at the VLOM assembly.
2. Connect the cable that is labeled power from the displacement on demand DoD tester to the VLOM connector.
3. Connect the power leads from the DoD tester to B+ and ground.
4. Command each VLOM solenoid ON and OFF using the DoD tester. You should be able to hear each solenoid turn ON and OFF.

   If the function does not perform as specified, replace the VLOM assembly.

Repair Instructions

- Engine Control Module Programming and Setup
- Engine Control Module Replacement

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. Engine running, command each cylinder deactivation solenoid ON and OFF with a scan tool, while observing the cylinder deactivation circuit status parameters. The circuit status parameters should change from OK to NOT Run or Not Run to OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

Alcohol/Contaminants-in-Fuel Diagnosis (with Special Tool)

Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust or deterioration.

Ethanol concentrations of greater than 10 percent can cause driveability conditions and fuel system deterioration. Fuel with more than 10 percent ethanol could result in driveability conditions such as hesitation, lack of power, stalling , or no start. Excessive concentrations of ethanol used in vehicles not designed for it may cause fuel system corrosion, deterioration of rubber components, and fuel filter restriction.

Test Procedure

1. Test the fuel composition using J 44175 Fuel Composition Tester and J44175-3 Instruction Manual.
2. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample. Refer to the examples in the Fuel Composition Test Examples table.
3. If the fuel sample contains more than 15 percent ethanol, add fresh, regular gasoline to the vehicle's fuel tank.
4. Test the fuel composition.
5. If testing shows the ethanol percentage is still more than 15 percent, replace the fuel in the vehicle.

Fuel Composition Test Examples

--	Frequency (Hz)	Subtract 50	Ethanol Percent
Example A	50 Hz	-50	0
Example B	65 Hz	-50	15
Example C	129 Hz	-50	79

Alcohol/Contaminants-in-Fuel Diagnosis (without Special Tool)

Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust, or deterioration.

Alcohol concentrations of 10 percent or greater in fuel can be detrimental to fuel system components. Alcohol contamination may cause fuel system corrosion, deterioration of rubber components, and subsequent fuel filter restriction. Some types of alcohol are more detrimental to fuel system components than others. Ethanol is commonly used in gasoline, but in concentrations of no more than 10 percent. Some fuels, such as E85, contain a very high percentage of ethanol. Fuel with more than 10 percent ethanol may cause driveability conditions such as hesitation, lack of power, stalling, or no start.

Alcohol in Fuel Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear. If alcohol contamination is suspected then use the following procedure to test the fuel quality.

1. Using a 100 ml (3.4 oz) specified cylinder with 1 ml (0.03 oz) graduation marks, fill the cylinder with fuel to the 90 ml (3.04 oz) mark.
2. Add 10 ml (0.34 oz) of water in order to bring the total fluid volume to 100 ml (3.4 oz) and install a stopper.
3. Shake the cylinder vigorously for 10-15 seconds.
4. Carefully loosen the stopper in order to release the pressure.
5. Re-install the stopper and shake the cylinder vigorously again for 10-15 seconds.
6. Put the cylinder on a level surface for approximately 5 minutes in order to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer, which would now contain both alcohol and water, will be more than 10 ml (0.34 oz). For example, if the volume of the lower layer is increased to 15 ml (0.51 oz), this indicates at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel.

Particulate Contaminants in Fuel Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear. If the sample appears cloudy, or contaminated with water, as indicated by a water layer at the bottom of the sample, use the following procedure to diagnose the fuel.

1. Using an approved fuel container, draw approximately 0.5 liter (0.13 gal) of fuel.

2. Place the cylinder on a level surface for approximately 5 minutes in order to allow settling of the particulate contamination.

Particulate contamination will show up in various shapes and colors. Sand will typically be identified by a white or light brown crystals. Rubber will appear as black and irregular particles. If particles are found clean the entire fuel system thoroughly.

Electronic Ignition (EI) System Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

This ignition system uses individual ignition module/coil assemblies for each cylinder. The engine control module (ECM) controls the spark events by transmitting the timing pulses on the ignition control (IC) circuits to the individual ignition module/coil assemblies in firing order sequence. Each ignition module/coil has the following circuits:

- Ignition voltage
- Ground
- Ignition Control (IC)
- Low reference

Diagnostic Aids

- Depending on location in the spliced ignition voltage circuit, a slight resistance can cause a misfire or a crank/no start condition. A voltage drop test on the circuit will pinpoint this condition.
- A slight to moderate resistance on any IC circuit can cause a misfire before DTC P0351-P0358 sets.
- Extended engine cranking time may foul the spark plugs with excessive fuel.
- When disconnecting electrical connectors or removing fuses and relays from a fuse block, always inspect both mating electrical terminals for corrosion and terminal tightness.
- Use the J 35616 for any test that requires probing the underhood fuse block terminals, component wire harness terminals, or the ECM wire harness terminals.

Circuit/System Verification

1. Verify that the engine is in good mechanical condition before continuing with this diagnostic.
2. Verify the following conditions:
    - The ignition coils/modules are correctly wired and connected
    - The proper firing order
    - The proper spark plug type
    - The proper spark plug gap and torque
    - The proper ohm values for the spark plug wires
    - Refer to Ignition System Specifications and Spark Plug Inspection.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the affected ignition coil/modules.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the ground circuit terminal A and ground.

    If greater than the specified range, test the ground circuit for an open/high resistance.
3. Test for less than 5 ohms between the low reference circuit terminal B and ground.

    If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

    Important: If the ignition fuse is open, it will be necessary to test the spliced ignition circuits and the components for a short to ground.

4. Ignition ON, verify that a test lamp illuminates between the ignition voltage circuit terminal D and ground.

    If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. Exchange the affected ignition coil/module with the ignition coil/module of a good cylinder.
6. Start the engine and observe the scan tool Misfire Current Cylinder parameters.

    If the misfire transfers with the suspect ignition coil/module, replace as needed.

7. If the circuits test normal, test or replace the spark plugs.

Component Testing

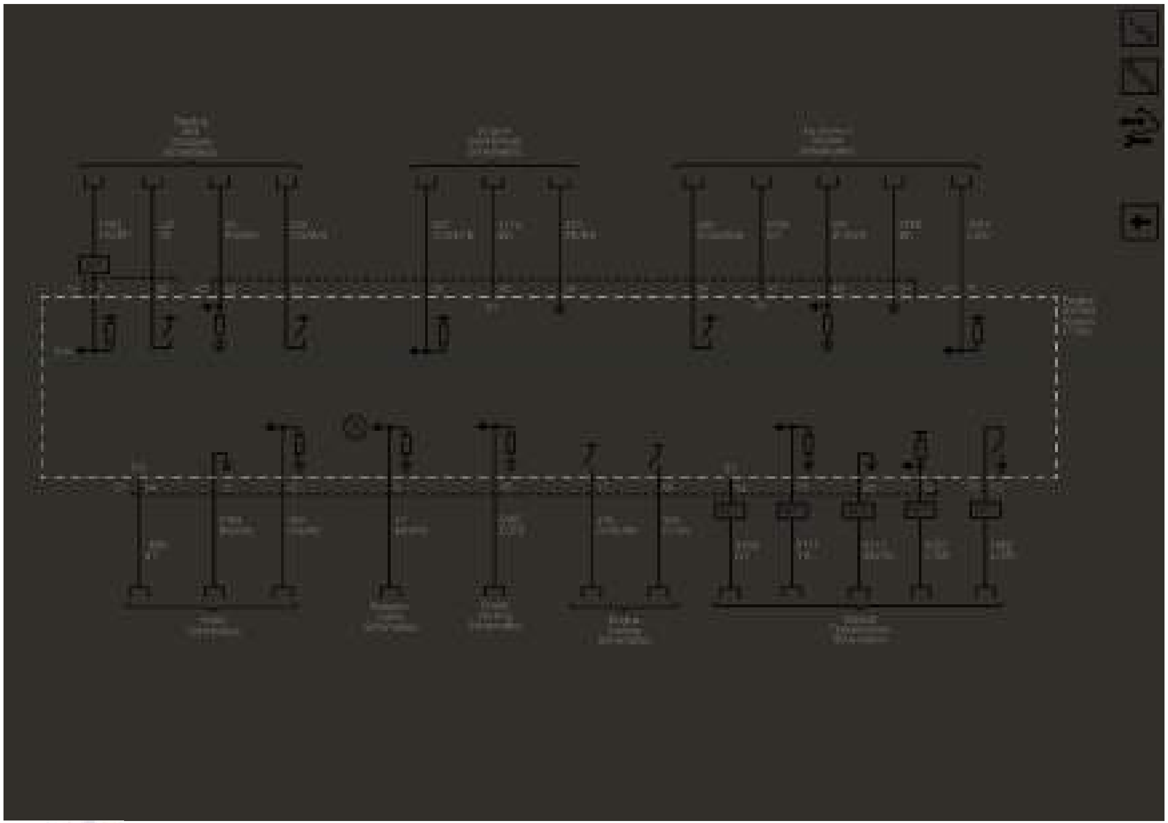
Use the J 26792 to verify the output of each ignition module/coil.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Control Module Programming and Setup
- Engine Control Module Replacement
- Ignition Coil Replacement
- Spark Plug Replacement

Controlled / Monitored Subsystem References



Cylinder Deactivation (Active Fuel Management) System Diagnosis (L98, LS2, LS3)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit Description

To provide maximum fuel economy under light load driving conditions, the engine control module (ECM) will command the valve lifter oil manifold (VLOM) solenoids ON, to deactivate engine cylinders 1 and 7 on the left bank, and cylinders 4 and 6 on the right bank. The VLOM consists of 4 electrically operated normally closed solenoids, which directs pressurized engine oil to 8 deactivating valve lifters. All 4 VLOM solenoids are connected in parallel to a fused ignition circuit supplied by the powertrain relay. The control circuit for each solenoid is connected to an individual low side driver internal to the ECM. When enabling conditions for V4 mode are met, the ECM will command each low side driver to turn ON, in engine firing order sequence.

Diagnostic Aids

The VLOM solenoids are assigned to the following engine cylinders:

- Solenoid #1--Cylinder #1
- Solenoid #2--Cylinder #4
- Solenoid #3--Cylinder #6
- Solenoid #4--Cylinder #7

Description and Operation

Cylinder Deactivation (Active Fuel Management) System Description

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. If any DTCs are set, then repair those DTC first. Refer to Diagnostic System Check - Vehicle.
2. Start and idle the engine.
3. Allow the engine to reach normal engine operating temperature. The engine should idle smoothly without any misfires. If the engine misfires, refer to DTC P0300-P0308.
4. Monitor the cylinder deactivation system data parameters with a scan tool.
5. Road test the vehicle under light throttle and load conditions that will allow the ECM to command V4 mode. If all enabling conditions are met for cylinder deactivation, and if no internal engine hydraulic/mechanical fault conditions are present, the ECM will continue operation in V4 mode.

   If the vehicle passes the Circuit/System Verification test, then review the active fuel management driving information in the Features and Controls section of the owners manual with the vehicle operator, or instruct the vehicle operator in the proper driving techniques to obtain V4 mode.

   If the vehicle does not pass the Circuit/System Verification test, then review the cylinder deactivation inhibit reasons listed on the scan tool.

Circuit/System Testing

Electrical System Testing

Ignition ON and the engine OFF, command each VLOM solenoid ON and OFF using the scan tool. Standing next to the engine compartment, you should be able to hear the solenoid energize and de-energize with each command.

If you cannot hear each solenoid energize and de-energize, then refer to DTC P3401, P3425, P3441, or P3449.

Mechanical System Testing

1. Connect a vacuum gage to the EVAP vacuum tube fitting on the electronic throttle body. DO NOT use a compound pressure and vacuum gage. The vacuum gage on a hand held vacuum pump will work fine for this test.
2. Start the engine. Allow the engine to reach normal operation temperature.
3. With a scan tool, command each VLOM solenoid ON, one at a time. Each time a solenoid is command ON, you should observe a fluctuating drop of intake manifold vacuum, and a misfire on the cylinder that was deactivated.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Engine Cranks But Does Not Run

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

This Engine Cranks but Does Not Run diagnostic is an organized approach to identify a condition which causes the engine to crank but does not continue to run. This diagnostic directs the service technician to the appropriate system diagnosis. This diagnostic assumes the vehicle system voltage levels are adequate for starter motor operation. Refer to Battery Inspection/Test and Engine Cranks Slowly. The fuel level supply must be adequate, and the fuel quality must be able to sustain the combustion process.

Diagnostic Aids

- When disconnecting electrical connectors or removing fuses and relays from a fuse block, always inspect both mating electrical terminals for corrosion and terminal tightness.
- Use the J 35616 Connector Test Adapter Kit for any test that requires probing the underhood fuse block terminals, component wire harness terminals, or the ECM wire harness terminals.

Circuit / System Verification

Attempt to start the engine. The engine should start and run.

If the vehicle passes the Circuit/System Verification test, refer to Testing for Intermittent Conditions and Poor Connections.

Circuit / System Testing

1. Crank the engine for up to 30 seconds.
2. Observe the vehicle DTC information with a scan tool.
   If any of the following DTCs are set, diagnose these DTCs first: DTC P0117, P0118, P0122, P0123, P0201-P0208, P0222, P0223, P0335, P0336, P0351-P0358, P0562, P0563, P0601-P0604, P0606, P0607, P062F, P0633, P0685, P0690, P1631, P1682, or P2610. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.
3. With the ignition ON and the engine OFF, test the fuses that are supplied ignition 1 voltage by the powertrain relay. The test lamp should illuminate ON for each test point of the fuses.
   If the test lamp does not illuminate ON for at least one test point of each fuse, refer to DTC P0685, P0689, or P0690.
4. Crank the engine for 15 seconds. Observe the engine speed parameter with a scan tool.
   If engine RPM is not indicated, refer to DTC P0335.
5. Install a spark plug tester onto one ignition module/coil assembly on each bank of the engine.
6. Observe both spark plug testers.

   Note: An erratic or weak spark is considered a no spark condition.

7. Crank the engine for 15 seconds. The ignition coil secondary voltage should be observed across the gap of both spark plug testers.
   If the ignition coil secondary voltage is not observed, is inconsistent, or weak on either spark plug tester, refer to Electronic Ignition (EI) System Diagnosis.
8. With the ignition ON and the engine OFF, command the fuel pump ON and OFF with the scan tool. The fuel pump should energize when commanded ON, and de-energize when commanded OFF.
   If the fuel pump does not turn ON and OFF, refer to Fuel System Diagnosis.
9. Turn OFF the ignition.
10. Install the J 34730-1A Fuel Pressure Gage. With the ignition ON and the engine OFF, command the fuel pump ON several times with the scan tool. Refer to Fuel System Diagnosis for the fuel pressure specification.
11. Inspect for the following conditions:

- Compare the actual engine coolant temperature to the ECT parameter.
- Filter and air intake system for restrictions and obstructions
- Test the fuel for contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
- Inspect the spark plugs--Refer to Spark Plug Inspection.
- Test the exhaust system for restrictions--Refer to Restricted Exhaust.
- Engine mechanical conditions, such as worn timing chain, sprocket gears, low compression, etc.--Refer to Symptoms - Engine Mechanical.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Evaporative Emission System Diagnosis

Operating Instructions for the Evaporative Emission System Tester (EEST)

Vehicle Setup

Important: A large difference between the vehicle temperature and shop temperature will seriously affect the accuracy of the tests. Always allow enough time, at least 15 minutes, for the vehicle temperature to adjust to the shop temperature. Refer to Temperature Variation Instructions for more information about vehicle versus shop temperatures.

1. Engine OFF, open the hood. Position a large fan to blow air under the vehicle onto the fuel tank area.
2. Connect the red battery clip from the tester to the positive battery terminal.

Important: The vehicle battery must be fully charged for optimum tester performance.

3. Connect the black battery clip from the tester to chassis ground.

Flowmeter Test - Leak Detection

1. Open the Nitrogen tank valve and turn the NITROGEN/SMOKE valve on the front control panel to NITROGEN.
2. Connect the hose to the correct test orifice on the bottom front of the tester. For orifice size, refer to the GM Service manual for the vehicle being tested. The vehicle specific information can be found in service procedures for DTCs that relate to evaporative emission (EVAP) system leaks.
3. Press and release the remote switch to activate the tester.
4. Position the sliding red flag on the flowmeter to align with the floating indicator. When the red flag is set, press and release the remote switch to deactivate the tester.
5. Remove the hose from the test orifice and install the hose onto the vehicle. For proper connection location, and the special tool numbers for any adapters that may be required, refer to the service manual for the vehicle being tested. The vehicle specific information can be found in service procedures for DTCs that relate to EVAP system leaks.
6. Seal the EVAP system per instructions in the service manual. Most systems can be sealed using a scan tool output control for the EVAP canister vent solenoid valve. Other systems require that the system be plugged. Refer to the service manual for vehicle being tested for specific instructions.

Important:

- Larger volume fuel tanks, and/or those with lower fuel levels, may require several minutes to fill with nitrogen.
- Static buildup may cause the float indicator to stick. It may be necessary to tap on the flowmeter to free up the float.

7. Press and release the remote switch to activate the nitrogen flow and fill the system.
8. Compare the stable floating indicator position to the red flag.

- ABOVE the red flag, the result is UNACCEPTABLE, FAIL--Go to Smoke Procedure
- BELOW the red flag, the result is ACCEPTABLE, PASS--Test complete

9. Press and release the remote switch to deactivate the tester.

Smoke Procedure - Locate the Leak

Important: It is not recommended to use the tester in an outside repair bay area because wind and sunlight may affect temperature and your ability to see the smoke.

1. Turn OFF any fans that may cause air movement around or near the vehicle.

Important: Completely unwind the nitrogen/smoke hose from the bracket to optimize the tester's performance.

2. Connect the nitrogen/smoke hose to the vehicle as directed in the service manual. Some vehicles require that the nitrogen/smoke hose be connected at the front of the EVAP system at the EVAP service port. An adapter may be necessary. Other vehicles require the connection be made at the rear of the system using an adapter at the fuel fill cap. Consult the service manual for vehicle specific instructions regarding connection location and adapters.
3. Open the nitrogen tank valve and turn the NITROGEN/SMOKE valve on the control panel to SMOKE.

Important: The remote switch operates in a push ON, push OFF fashion.

4. Press and release the remote switch to activate the tester and inject smoke into the EVAP system.
5. Verify smoke has filled the EVAP system by opening the system opposite the end where smoke is injected. When injecting smoke at the service port, remove the fuel fill cap, or temporarily leave the EVAP canister vent valve open, until smoke is observed. Then close the system and continue testing. If using a special tool fuel fill cap adapter at the filler neck, use the J 41413-VLV EVAP Service Port Vent Fitting tool at the service port until smoke is observed, then remove the J 41413-VLV tool and continue with the test.

Important: Inject smoke in less than 2-minute cycles for optimum tester performance.

6. Press and release the remote switch to deactivate the tester.

Important: For optimum visual smoke performance, deactivate the smoke flow and allow the system pressure to drop. Allowing the smoke to exit small holes at a low flow rate greatly enhances visibility.

7. Introduce smoke into the system for an additional 60 seconds. Continue introducing smoke at 15-second intervals, as necessary.
8. Using the a high-intensity white light , inspect the entire EVAP system path, and look for the source of the leak indicated by the exiting smoke. Introduce smoke at 15-second intervals, as needed, until leak source is identified.

Temperature Variation Instructions

The Concern

Ideal circumstances for conducting the EVAP Flowmeter Test require equal temperatures between the nitrogen gas and the vehicle EVAP system. Significant differences in temperature between them can result in a flow or pressure change during testing, causing misleading results. Typically, the Evaporative Emissions System Tester is stored indoors, approximately 21°C (70°F). Vehicles brought in for diagnosis may have an EVAP system at significantly different temperatures -40 to +43°C (-40 to +110°F).

For Example

Important: With no temperature difference between the nitrogen gas and EVAP system, the resulting vehicle EVAP system pressure will remain stable at 13 inches H2O once pressurized, providing no leaks are present.

When the EVAP Flowmeter Tests are performed with significant differences in temperature between the nitrogen gas and the vehicle EVAP system, the following results can occur:

- An increase in flow during the flowmeter test can be caused by a vehicle’s warm EVAP system cooling down.
- A decrease in flow during the flowmeter test can be caused by a vehicle’s cool EVAP system warming up.

The Solution

When working on a vehicle with significant temperature differences between the vehicle EVAP system and the nitrogen gas, allow the vehicle EVAP system temperature to stabilize as close as possible to the temperature of the nitrogen gas before conducting the Flowmeter Test.

Fuel Injector Diagnosis (W/J39021 or W/Tech 2)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

Circuit/System Description

The control module enables the appropriate fuel injector pulse for each cylinder. The ignition voltage is supplied directly to the fuel injectors. The control module controls each fuel injector by grounding the control circuit via a solid state device called a driver. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. A fuel injector control circuit DTC may not set, but a misfire may be apparent. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

When performing the fuel injector balance test, the scan tool is first used to energize the fuel pump relay. The fuel injector tester or the scan tool is then used to pulse each injector for a precise amount of time, allowing a measured amount of the fuel to be injected. This causes a drop in the system fuel pressure that can be recorded and used to compare each injector.

Diagnostic Aids

- Monitoring the misfire current counters, or misfire graph, may help to isolate the fuel injector that is causing the condition.
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition.
- Perform the fuel injector coil test within the conditions of the customer's concern. A fuel injector condition may only be apparent at a certain temperature, or under certain conditions.

Component Testing

Fuel Injector Coil Test

Verify the resistance of each fuel injector with one of the following methods:

- If the engine coolant temperature (ECT) sensor is between 10-32°C (50-90°F), the resistance of each fuel injector should be 11-14 ohms.

  If the injectors measure OK, perform the Fuel Injector Balance Test - Fuel Pressure Test.

  If not within the specified range, replace the fuel injector.
- If the ECT sensor is not between 10-32°C (50-90°F), measure and record the resistance of each fuel injector with a DMM. Subtract the lowest resistance value from the highest resistance value. The difference between the lowest value and the highest value should be equal to or less than 3 ohms.

  If the difference is equal to or less than 3 ohms, refer to Fuel Injector Balance Test - Fuel Pressure Test for further diagnosis of the fuel injectors.

  If the difference is more than 3 ohms, add all of the fuel injector resistance values to obtain a total resistance value. Divide the total resistance value by the number of fuel injectors to obtain an average resistance value. Subtract the lowest individual fuel injector resistance value from the average resistance value. Compute the difference between the highest individual fuel injector resistance value and the average resistance value. Replace the fuel injector that displays the greatest difference above or below the average.

Important:

- DO NOT perform this test if the engine coolant temperature (ECT) is above 94°C (201°F). Irregular fuel pressure readings may result due to hot soak fuel boiling.
- Verify that adequate fuel is in the fuel tank before proceeding with this diagnostic.
- Before proceeding with this test review the User Manual CH 48027-5 for Safety Information

and Instructions.

Fuel Injector Balance Test-Fuel Pressure Test

1. Install a CH-48027 . Refer to Fuel Pressure Gage Installation and Removal.
2. Turn ON the ignition, with the engine OFF.

   Important:
   - The fuel pump relay may need to be commanded ON a few times in order to obtain the highest possible fuel pressure.
   - DO NOT start the engine.

3. Command the fuel pump relay ON with a scan tool.
4. Observe the fuel pressure gage with the fuel pump commanded ON. The fuel pressure should be 345-414 kPa (50-60 psi).

   If the fuel pressure is not 345-414 kPa (50-60 psi), refer to Fuel System Diagnosis.
5. Monitor the CH-48027 for one minute. The fuel pressure should not decrease more than 34 kPa (5 psi).

   If the fuel pressure decreases more than 34 kPa (5 psi), refer to Fuel System Diagnosis.
6. Perform the Fuel Injector Balance Test with Special Tool or the Fuel Injector Balance Test with Tech 2.

Fuel Injector Balance Test with Special Tool

1. Set the amperage supply selector switch on the fuel injector tester to the Balance Test 0.5-2.5 amp position.
2. Connect the J 39021 to a fuel injector with a J 44602 .
3. Command the fuel pump relay ON and then OFF three times with a scan tool. On the last command, as the fuel pressure begins to slowly degrade and stabilize, select a fuel pressure within 34 kPa (5 psi) of the maximum pump pressure. Record this fuel pressure. This is the starting pressure at which you will pulse each injector.
4. Command the fuel pump relay ON one more time and energize the fuel injector by depressing the Push to Start Test button on the J 39021 at the previously selected pressure.
5. After the injector stops pulsing, select Min from the Display Mode and record the Min pressure.

   Important: New test results will not be recorded if the Min/Max results are not cleared after each injector is tested.

6. Clear the Min/Max results.
7. Select Normal from the Display Mode.
8. Repeat steps 2 and 4 through 7 for each fuel injector.
9. Perform the Pressure Drop Calculation.

Fuel Injector Balance Test with Tech 2

1. Command the fuel pump relay ON and then OFF three times with a scan tool. On the last command, as the fuel pressure begins to slowly degrade and stabilize, select a fuel pressure within 34 kPa (5 psi) of the maximum pump pressure. Record this fuel pressure. This is the starting pressure at which you will pulse each injector.
2. With a scan tool, select the Fuel Injector Balance Test function within the Special Functions menu.

3. Select an injector to be tested.
4. Press Enter to prime the fuel system.
5. Energize the fuel injector by depressing the Pulse Injector button on the scan tool at the previously selected pressure.
6. After the injector stops pulsing, select Min from the Display Mode on the CH-48027 and record the Min pressure.

   Important: New test results will not be recorded if the Min/Max results are not cleared after each injector is tested.

7. Clear the Min/Max results on the CH-48027 .
8. Select Normal from the Display Mode on the CH-48027 .
9. Press Enter on the scan tool to bring you back to the Select Injector screen.
10. Repeat steps 3 through 9 for each fuel injector.
11. Perform the Pressure Drop Calculation.

Pressure Drop Calculation

1. Subtract the minimum pressure from the starting pressure for one fuel injector. The result is the pressure drop value.
2. Obtain a pressure drop value for each fuel injector.
3. Add all of the individual pressure drop values except for the injector suspected of being faulty. This is the total pressure drop.
4. Divide the total pressure drop by the number of fuel injectors that were added together. This is the average pressure drop. The difference between any individual pressure drop and the average pressure drop should not be more than 20 kPa (3 psi).
   - If the difference between any individual pressure drop and the average pressure drop is more than 20 kPa (3 psi), replace the fuel injector, E-85 only. All other engine, refer to Fuel Injector Cleaning.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Fuel Injector Replacement

Fuel Injector Diagnosis (W/CH47976)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

Circuit/System Description

The control module enables the appropriate fuel injector pulse for each cylinder. The ignition voltage is supplied directly to the fuel injectors. The control module controls each fuel injector by grounding the control circuit via a solid state device called a driver. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. A fuel injector control circuit DTC may not set, but a misfire may be apparent. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

The CH-47976 , is used to test the fuel pump, fuel system leak down, and the fuel injectors. Following the User Guide, CH 47976-11, and the on screen prompts or selections, will indicate the steps required to perform each of the available tests. The tester will perform all of the tests automatically and display results of the test. The results can also be down loaded for storage and printing.

Component Testing

Fuel Injector Coil Test

Verify the resistance of each fuel injector with one of the following methods:

- If the engine coolant temperature (ECT) sensor is between 10-32°C (50-90°F), the resistance of each fuel injector should be 11-14 ohms.

  If the injectors measure OK, perform the Active Fuel Injector Tester (AFIT) Test Procedure.

  If not within the specified range, replace the fuel injector.
- If the ECT sensor is not between 10-32°C (50-90°F), measure and record the resistance of each fuel injector with a DMM. Subtract the lowest resistance value from the highest resistance value. The difference between the lowest value and the highest value should be equal to or less than 3 ohms.

  If the difference is equal to or less than 3 ohms, refer to AFIT Test Procedure.

  If the difference is more than 3 ohms, add all of the fuel injector resistance values to obtain a total resistance value. Divide the total resistance value by the number of fuel injectors to obtain an average resistance value. Subtract the lowest individual fuel injector resistance value from the average resistance value. Compute the difference between the highest individual fuel injector resistance value and the average resistance value. Replace the fuel injector that displays the greatest difference above or below the average.

Important:

- DO NOT perform this test if the engine coolant temperature (ECT) is above 94°C (201°F). Irregular fuel pressure readings may result due to hot soak fuel boiling.
- Verify that adequate fuel is in the fuel tank before proceeding with this diagnostic.

AFIT Test Procedure

1. Turn OFF all accessories.
2. Turn OFF the ignition.
3. Install the AFIT. Refer to the AFIT User Guide.
4. Turn ON the AFIT and select the vehicle.
5. Turn ON the ignition and perform the Injector Test.

   If the AFIT aborts testing due to fuel pressure or fuel leak down, refer to Fuel System Diagnosis.
6. View the test results.

   If any injector exceeds the recommended tolerance, replace the injector(s), E-85 only. All other engine, refer to Fuel Injector Cleaning.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Fuel Injector Replacement

Document ID: 1992892

Fuel System Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

The engine control module (ECM) enables the fuel pump relay when the ignition switch is turned ON. The ECM will disable the fuel pump relay within 3 seconds unless the ECM detects ignition reference pulses. The ECM continues to enable the fuel pump relay as long as ignition reference pulses are detected. The engine control module (ECM) disables the fuel pump relay within 3 seconds if ignition reference pulses cease to be detected and the ignition remains ON.

The fuel system is a returnless on-demand design. The fuel pressure regulator is a part of the primary fuel tank module, eliminating the need for a return pipe from the engine. A returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

An electric turbine style fuel pump attaches to the primary fuel tank module inside the fuel tank. The fuel pump supplies high pressure fuel through the fuel filter, past the fuel pressure regulator, and through the fuel feed line to the fuel injection system. The fuel pressure regulator has a T-joint that diverts the needed fuel to the fuel rail with the unused fuel dropping back into the reservoir of the primary fuel tank module. The primary fuel tank module contains a reverse flow check valve. The check valve and the fuel pressure regulator maintain fuel pressure in the fuel feed line and the fuel rail in order to prevent long cranking times.

The primary fuel tank module also contains a primary jet pump and a secondary jet pump. Fuel pump flow loss, caused by vapour expulsion in the pump inlet chamber, is diverted to the primary jet pump and the secondary jet pump through a restrictive orifice located on the pump cover. The primary jet pump fills the reservoir of the primary fuel tank module. The secondary jet pump creates a venturi action which causes the fuel to be drawn from the secondary side of the fuel tank, through the fuel transfer pipe, to the primary side of the fuel tank.

Diagnostic Aids

- A vehicle that runs out of fuel above empty may indicate a condition with the siphon jet pump, or transfer lines between the fuel tanks. Inspect for blockage, foreign objects or restrictions in all related hardware
- A vehicle that runs out of fuel above empty may be caused by an inaccurate fuel level sender. Inspect the float arm for binding, or obstructions.

Scan Tool Reference

Control Module References.

Special Tools Required

Commercially available Fuel Pressure gauge.

Circuit / System Verification

Note:

- Inspect the fuel system for damage or external leaks before proceeding
- Verify that adequate fuel is in the fuel tank before proceeding
- The fuel pump relay may need to be commanded ON a few times in order to obtain the highest possible fuel pressure
- DO NOT start the engine.

1. Ignition ON, command the fuel pump relay ON with a scan tool. You should hear the fuel pump turn ON and OFF for 3-5 seconds.

   If the fuel pump does not operate, refer to Fuel Pump Electrical Circuit Diagnosis.
2. Ignition OFF, all accessories OFF, install the fuel pressure gauge. Refer to Fuel Pressure Gage Installation and Removal.
3. Ignition ON, command the fuel pump relay ON with a scan tool. Verify the fuel pressure is between 380-410 kPa (55-60 psi) and remains steady for 5 minutes.
4. Operate the vehicle within the conditions of the customers concern while monitoring fuel related parameters with a scan tool.

   If the scan tool parameters do not indicate a lean condition, refer to Symptoms - Engine Controls.

Circuit / System Testing

1. Ignition ON, command the fuel pump relay ON with a scan tool and observe the fuel pressure while the fuel pump is operating. Verify the fuel pressure is between 380-410 kPa (55-60 psi).

   If the fuel pressure is more than the specified range, replace the fuel pump.

   If the fuel pressure is less than the specified range, remove the fuel tank and test/inspect for the following:

   - Restricted fuel feed line
   - Restricted or plugged fuel filter
   - Restricted or plugged strainer
   - Stuck or binding fuel level float
   - Restricted siphon jet pump

- Restricted transfer lines between fuel tanks
- Faulty fuel pressure regulator
- Poor connections at the harness connectors and ground circuits of the fuel pump

If you find a condition, repair as necessary

If all components test normal, replace the fuel pump.

Note: The fuel pressure may vary slightly when the fuel pump stops operating. After the fuel pump stops operating, the fuel pressure should stabilize and remain constant.

2. Verify that the fuel pressure does not decrease more than 34 kPa (5 psi) in 1 minute.

   If the fuel pressure decreases more than the specified value, perform the following procedure:

   2.1. Ignition OFF, relieve the fuel pressure. Refer to Fuel Pressure Relief

   2.2. Install the *J 37287* Fuel Line Shut-Off Adapters between the fuel feed pipe and the fuel rail.

   2.3. Open the valve on the *J 37287* Fuel Line Shut-Off Adapters .

   2.4. Bleed the air from the fuel pressure gage.

   2.5. Close the valve on the *J 37287* Fuel Line Shut-Off Adapters .

   2.6. Verify that the fuel pressure does not decrease more than 34 kPa (5 psi) in 1 minute.

   If the fuel pressure remains constant, replace the fuel pump.

   If the fuel pressure drops, locate and replace the leaking fuel injector.
3. Relieve the fuel pressure to 69 kPa (10 psi). Verify that the fuel pressure does not decrease more than 14 kPa (2 psi) in 5 minutes.

   If the fuel pressure decreases more than the specified value, replace the fuel pump.
4. Remove the *J 37287* Fuel Line Shut-Off Adapters and the *AU-338* Fuel Pressure Gage . Refer to Fuel Pressure Gage Installation and Removal.
5. Operate the vehicle within the conditions of the customer concern while monitoring fuel related parameters with a scan tool.

   If the scan tool parameters indicate a lean condition, test/inspect for the following:

   - Restricted fuel feed line
   - Restricted fuel filter
   - Restricted siphon jet pump
   - Restricted transfer lines between fuel tanks
   - Faulty fuel pressure regulator
   - Poor connections at the harness connectors and ground circuits of the fuel pump

   If all components test normal and the scan tool parameters indicate a lean condition, replace the fuel pump.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Primary Fuel Tank Module Replacement
- Fuel Injector and Fuel Rail Replacement

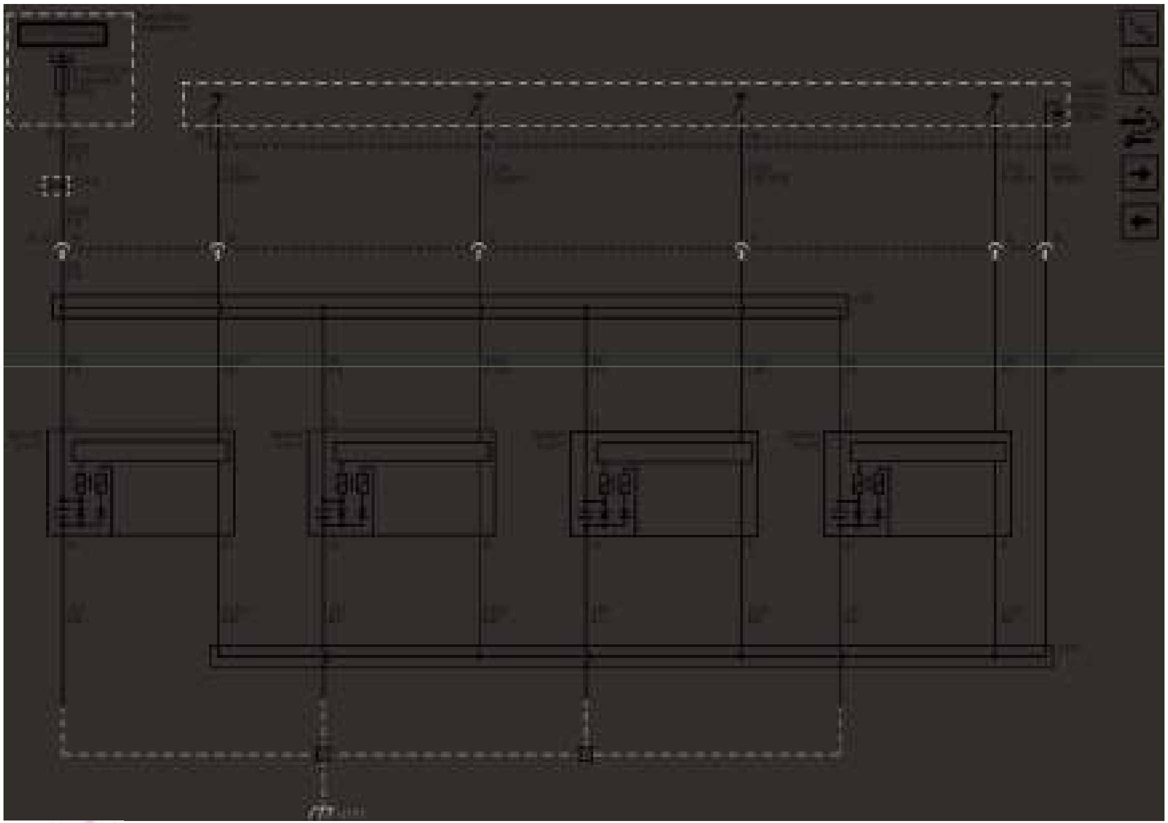
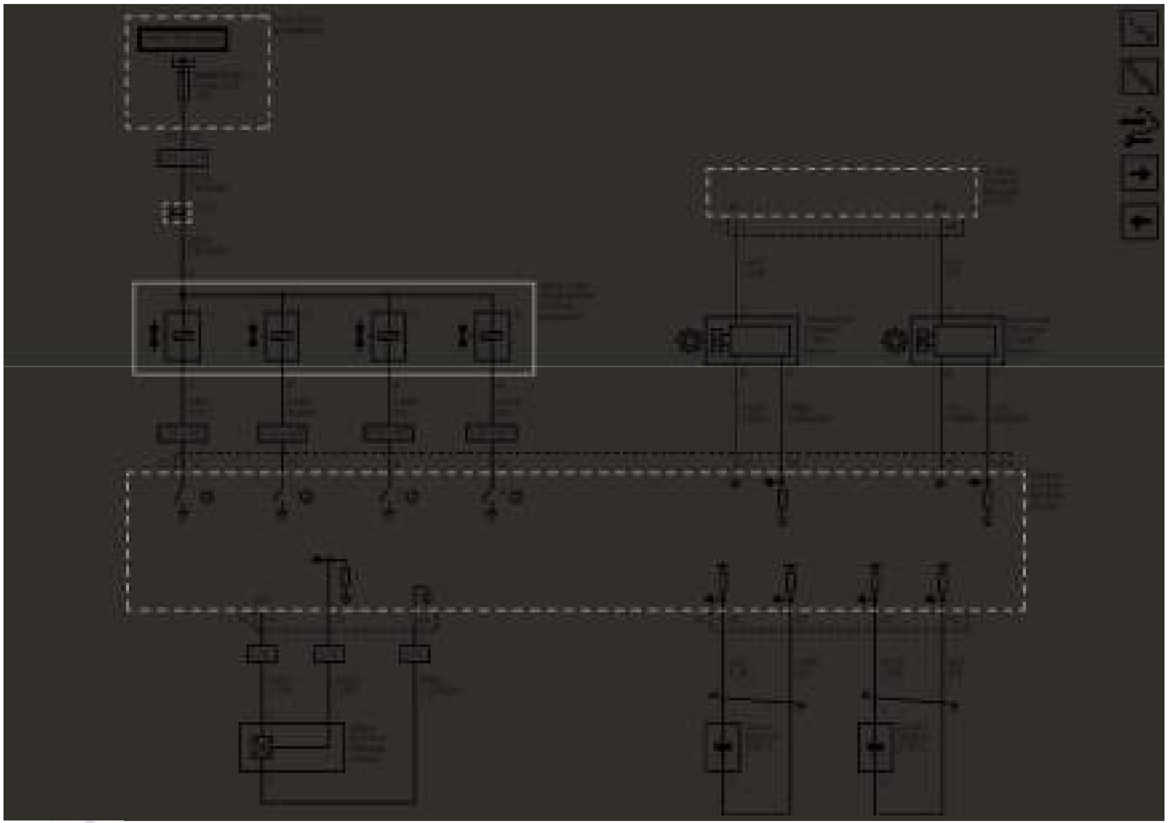
Ignition Controls - Ignition System Coils 2, 4, 6, and 8



Ignition Controls - Sensors and Active Fuel Management



Inspection / Maintenance (I / M) Complete System Set Procedure

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Description

The purpose of the Inspection/Maintenance (I/M) Complete System Set Procedure is to satisfy the enable criteria necessary to execute all of the I/M readiness diagnostics and complete the drive cycles for those particular diagnostics. When all I/M monitored diagnostic tests are completed, the I/M System Status indicators are set to YES. Perform the I/M Complete System Set Procedure if any I/M System Status indicators are set to NO.

I / M Data List

To determine if the I/M readiness diagnostic tests can be run this ignition cycle, use a scan tool to observe the I/M monitor enabled parameters in the I/M Data List.

Conditions for Meeting a Cold Start

- The ignition voltage between 11-18 volts.
- The barometric pressure (BARO) is more than 75 kPa.
- The start-up engine coolant temperature (ECT) is between 4-30°C (39-86°F).
- The start-up intake air temperature (IAT) is between 4-30°C (39-86°F).
- The difference between the IAT and the ECT is less than or equal to 6°C (10.8°F).
- The ambient air temperature is between 4-30°C (39-86°F).
- The fuel level is between 15-85 percent.

Circuit / System Verification

Review the I/M Status indicators with a scan tool. All I/M System Status indicators should report YES.

Inspection / Maintenance (I / M) System Set Procedure

> **Important:** Whenever the ignition is turned ON, ignition positive voltage is supplied to the heated oxygen sensor (HO2S) heaters. After verifying the enable criteria, turn OFF the ignition for approximately 5 minutes to allow the sensors to cool before continuing with the test. Once the engine is started, do NOT turn the engine OFF for the remaining portion of the set procedure.

1. Ensure that the vehicle meets the conditions for a cold start listed above.
2. The evaporative emission (EVAP) I/M System Status indicator should display YES.

   If the EVAP I/M System Status indicator displays NO, perform the EVAP Service Bay Test, if applicable. If the EVAP Service Bay Test is NOT available, it may take up to 6 drive cycles, with up to 17 hours between drive cycles, for the EVAP I/M System Status indicator to transition to YES.
3. The O2S Heater I/M System Status indicator should display YES.

   If the O2S Heater I/M System Status indicator displays NO, ensure that the ignition has been turned OFF for at least 10 hours.
4. Turn OFF all accessories; HVAC system, other electrical loads, including aftermarket/add-on equipment, etc.
5. Set the vehicle parking brake and ensure the vehicle is in Park for automatic transmission or Neutral for manual transmission.
6. Turn OFF all accessories; HVAC system, other electrical loads, including aftermarket/add-on equipment, etc.
7. Start and idle the engine for at least 2 minutes and until 65°C (149°F) is achieved.
8. Run the engine for 6.5 minutes within the following conditions:
   - MAF parameter between 4-30 g/s
   - Engine speed steady between 1,000-3,000 RPM
9. Return the engine to idle for 1 minute.
10. Apply and hold the brake pedal, and shift to Drive for automatic transmission, or apply the clutch pedal for manual transmission and operate the vehicle within the following conditions for 2 minutes:
    - Depress the accelerator pedal until throttle position (TP) sensor angle is more than 2 percent.
    - Mass air flow (MAF) signal between 15-30 g/s
    - RPM steady between 1,200-2,000 RPM

    Important: DO NOT touch the accelerator pedal during the idle period. A change in TP sensor angle or an increase in engine speed may invalidate this portion of the test.
11. Release the accelerator pedal and shift the vehicle to Park for automatic transmission, or Neutral and release the clutch pedal for manual transmission, and allow the engine to idle for 2 minutes.
12. Quickly depress the accelerator pedal until TP sensor angle is more than 8 percent and return to idle, repeat 3 times.
13. Allow engine to idle for at least 2 minutes.

    Caution: Refer to Road Test Warning in the Preface section.
14. Release the parking brake and drive vehicle at 24 km/h (15 mph) or slower for 2 minutes.
15. Continue to drive the vehicle for at least 5.5 miles between 45-112 km/h (28-70 mph) with the vehicle reaching at least 80 km/h (50 mph).
16. Release the accelerator pedal for at least 2 seconds. This will allow the vehicle to enter decel fuel cut-off.
17. Depress the accelerator pedal until the TP sensor angle is increased 3-20 percent and maintain a safe speed for 1 minute.
18. Safely stop the vehicle, with the engine in Drive for automatic transmission or in Neutral with the clutch pedal depressed and parking brake applied for manual transmission, idle for 2 minutes.
19. Shift to Park for automatic and apply the parking brake, or neutral and release clutch pedal for manual.

Important: Do NOT disturb the vehicle or turn ON the ignition until told to do so. Disturbing the vehicle may invalidate this portion of the test.

20. Turn OFF the ignition and exit the vehicle. Do NOT disturb the vehicle for 60 minutes.
21. Observe the Inspection/Maintenance (I/M) System Status with a scan tool. All of the I/M System Status indicators should display YES.

    If the EVAP I/M System Status indicator displays NO, turn OFF the ignition for 17 hours, ensure that the vehicle meets the conditions for a cold start, and repeat steps 12-18 six more times, or until the EVAP I/M System Status indicator transitions to YES. If the indicator continues to display NO, refer to the Inspection/Maintenance (I/M) System DTC Table to identify the DTCs that did not run. Follow the Conditions for Running the DTC in order to set the EVAP I/M System Status indicator

    If any of the I/M System Status indicators display NO, refer to the Inspection/Maintenance (I/M) System DTC Table for the indicator which did not display YES. The I/M System DTC Table identifies the DTCs associated with each I/M System Status Indicator. Follow the Conditions for Running the DTC in order to set the associated status indicator.

Inspection/Maintenance (I/M) System Check

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Description

Several states require that a vehicle pass on-board diagnostic (OBD) system tests and the inspection/maintenance (I/M) emission inspection in order to renew license plates. This is accomplished by viewing the I/M System Status display on a scan tool. Using a scan tool, the technician can observe the I/M System Status in order to verify that the vehicle meets the criteria that comply with the local area requirements.

Conditions for Updating the I/M System Status

Each system monitor requires at least one, and sometimes several diagnostic tests. The result of each test is reported by a DTC. A system monitor is complete when either all of the DTCs composing the monitor have Run and Passed, or when any one of the DTCs comprising the monitor has illuminated the malfunction indicator lamp (MIL). Once the system monitor is complete, the I/M System Status display will indicate YES in the Completed column.

For example, when the HO2S Heater Status indicates YES, either all of the oxygen sensor heater tests have passed or one of the tests has illuminated the MIL. If the vehicle has 4 heated oxygen sensors, either all 4 heater circuit tests have passed or one of the heater circuit tests has illuminated the MIL. The I/M System Status will indicate NO under the Completed column when any of the required tests for that system have not run. The following is a list of conditions that would set the I/M System Status indicator to NO:

- The vehicle is new from the factory and has not yet been driven through the necessary drive conditions to complete the tests.
- The battery has been disconnected or discharged below operating voltage.
- The control module power or ground has been interrupted.
- The control module has been reprogrammed.
- The control module DTCs have been cleared.

Monitored Emission Control Systems

The OBD II System monitors all emission control systems that are on-board. The OBD II regulations require monitoring of the following:

- The air conditioning system
- The catalytic converter efficiency

- Comprehensive component monitoring--Emission related inputs and outputs
- The evaporative emission (EVAP) system
- The fuel delivery system
- Heated catalyst monitoring
- Misfire monitoring
- The oxygen sensor system (O2S or HO2S)
- The oxygen sensor heater system (HO2S heater)

For the specific DTCs required for each system, refer to Inspection/Maintenance (I/M) System DTC Table. Systems such as fuel delivery, misfire, and comprehensive components may not be listed in a system status list. These tests run continuously and do not require an I/M System Status indicator.

Circuit/System Verification

Review the I/M System Status indicators. All I/M System Status indicators should report YES.

Circuit/System Testing

> **Important:** Many DTC related repairs will instruct the technician to clear the DTC information. Clearing the DTC will reset the I/M System Status indicators to NO. Performing the I/M Complete System Set Procedure will set each of the I/M System Status indicators to YES.

1. Observe the Engine DTC information with a scan tool.

   If a DTC is set that would prevent the I/M System Status tests from completing, diagnose that DTC before continuing. Refer to Inspection/Maintenance (I/M) System DTC Table.
2. Review applicable service bulletins for software updates that would prevent the I/M System Status tests from completing.

   If a control module re-program or other repair is required, perform the Inspection/Maintenance (I/M) Complete System Set Procedure.
3. Observe the I/M System Status indicators.

   If any I/M System Status indicators report NO, perform the Inspection/Maintenance (I/M) Complete System Set Procedure.

Inspection/Maintenance (I/M) System DTC Table

System	DTCs Required to Set System Status to YES
If an I/M System Status indicator did NOT update to YES during the Inspection/Maintenance (I/M) Complete System Set Procedure , review each indicator and reference this table to determine each DTC associated with the I/M System Status Indicator. Each DTC listed below has specific conditions that must be met for the diagnostic to run. Included within the conditions are additional DTCs which, if set, may inhibit the DTCs listed below from running. Reviewing and operating the vehicle within the Conditions for Running for each DTC listed below will allow the I/M System Status Indicators to transition to YES.	
Catalyst	DTC P0420 or P0430
Oxygen Sensor	• DTC P0131, P0132, P0137, or P0138 • DTC P0133, P0134, P0140, P1133, P2270, or P2271 • DTC P0151, P0152, P0157, or P0158 • DTC P0153, P0154, P0160, P1153, P2272, or P2273
Oxygen Sensor Heater	• DTC P0030, P0036, P0053, P0054, P0135, or P0141 • DTC P0050, P0056, P0059, P0060, P0155, or P0161

Malfunction Indicator Lamp (MIL) Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Description

Ignition voltage is supplied to the malfunction indicator lamp (MIL). The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit.

Reference Information

Schematic Reference

- Instrument Cluster Schematics

Control Module References for scan tool information

Circuit / System Verification

Ignition ON, the MIL should turn ON and OFF when commanded with a scan tool.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the instrument panel cluster (IPC).
2. Ignition ON, verify that a test lamp illuminates between the ignition circuit and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the IPC.

3. Connect a test lamp between the control circuit and the ignition circuit.
4. Command the MIL ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.

   If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.

5. If all circuits test normal, replace the IPC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Instrument Cluster Replacement
- Control Module References for ECM replacement, setup, and programming

Poor Fuel Fill Quality

Problem	Causes
DEFINITION: Difficulty when refueling the vehicle.	
Difficult to fill	• The check valve is stuck closed. • The fill limiter vent valve is stuck closed. • The evaporative emission (EVAP) canister is restricted. • Restricted EVAP pipes. • High Reid vapor pressure. • High fuel temperature. • The fuel filler hose/pipe is pinched, kinked or blocked. • The fuel feed hose, or crossover hose, is pinched, kinked or blocked. • The ignition switch is ON.
Over fill	• The pressure relief valve in the fill limiter vent valve is stuck open. • The pressure relief valve in the fill limiter vent is valve leaking. • The fill limiter vent valve is stuck open. • The fill limiter vent valve is leaking.
Pre-mature shut-off of the fuel dispensing nozzle	• The check valve is stuck closed. • The fill limiter vent valve is stuck closed. • The EVAP canister is restricted. • Restricted EVAP pipes. • High Reid vapor pressure. • High fuel temperature. • The fuel filler hose/pipe is pinched, kinked or blocked. • The fuel feed hose, or crossover hose, is pinched, kinked or blocked. • The ignition switch is ON.
Fuel spit back	• The check valve is stuck open. • The check valve is stuck closed. • The check valve is leaking. • High Reid vapor pressure. • High fuel temperature.
Liquid fuel in the EVAP canister	

	• The fill limiter vent valve is stuck open. • The fill limiter vent valve is leaking.
Liquid fuel leak	• The pressure relief valve in the fill limiter vent valve is stuck open. • The pressure relief valve in the fill limiter vent valve is leaking. • The fuel filler hose is loose or torn. • The fuel feed hose, or crossover hose, is loose or torn. • The fill limiter vent valve is stuck open.
Fuel odor	• The pressure relief valve in the fill limiter vent valve is stuck open. • The pressure relief valve in the fill limiter vent valve is leaking. • The EVAP canister is saturated.

Powertrain Relay Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Typical Scan Tool Data

EC Ignition Relay

Display Parameters	Normal Range	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Ignition ON, engine OFF, powertrain relay commanded ON.				
EC Ignition Powertrain Relay Circuit Status	OK/Incomplete	Short to GRD/Open	Short to GRD/Open	Short to B+
EC Ignition Powertrain Relay Command	ON	ON	ON	ON
EC Ignition Powertrain Relay Feedback Signal	12-12.9 V	0.0 V	0.0 V	12-12.9 V

Circuit/System Description

The powertrain relay is a normally open relay. The relay armature is held in the open position by spring tension. Battery positive voltage is supplied directly to the relay coil and the armature contact at all times. The engine control module (ECM) supplies the ground path to the relay coil control circuit via an internal integrated circuit called an output driver module (ODM). The ODM output control is configured to operate as a low side driver for the powertrain relay. The ODM for the powertrain relay also incorporates a fault detection circuit, which is continuously monitored by the ECM. When the ECM commands the powertrain relay ON, ignition 1 voltage is supplied to the ECM, and to several additional circuits.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.

- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Special Tools

- J 35616 GM-Approved Terminal Test Kit
- J 43244 Relay Puller Pliers

Circuit/System Verification

1. Engine running, command the powertrain relay ON and OFF, with a scan tool, while observing the following powertrain relay coil control circuit status parameters.
   - Powertrain relay coil control Ckt. Short Gnd Test Status
   - Powertrain relay coil control Ckt. Open Test Status
   - Powertrain relay coil control Ckt. Short Volts Test Status
   - Each parameter should toggle between OK and Not Run or Not Run and OK
2. Ignition ON, engine OFF, with a test lamp, probe both test points of all the fuses that are powered by the powertrain relay. The test lamp should illuminate ON for at least one test point of each fuse.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Important: You must perform the Circuit/System Verification first.

1. Ignition OFF, disconnect the powertrain relay.
2. Ignition ON, verify that a test lamp illuminates between the powertrain relay coil B+, and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the battery positive cable to the underhood fuse block.
3. Ignition OFF, verify that a test lamp does not illuminate between the powertrain relay coil B+ circuit and the control circuit.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the powertrain relay ON, with a scan tool. Verify with a scan tool that the

powertrain relay Ckt. Short Volts Test Status parameter is OK.

If not the specified value, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.

6. Test the coil side of the powertrain relay for 65-110 ohms.

   If not within the specified value, replace the relay.

7. Ignition OFF, disconnect the ECM C1 connector.
8. Test the powertrain relay control circuit for an open/high resistance.

   If the circuit tests normal, replace the ECM.

9. Verify that a test lamp does not illuminate between the relay ignition 1 voltage circuit and ground.

   If the test lamp illuminates, test the relay ignition 1 voltage circuit for a short to voltage. If the circuit tests normal, replace the ECM.

10. Verify that a test lamp illuminates between the relay switch B+ and ground.

    If the test lamp does not illuminate, test the relay switch B+ circuit for a short to ground, or an open/high resistance. If the circuits test normal, and the fuse for the ignition 1 voltage circuit is open, test the ignition 1 voltage circuit to the ECM for a short to ground. If the circuit tests normal, replace the ECM.

11. Connect a 20 A fused jumper wire between the relay switch B+ and the relay ignition 1 voltage circuit.
12. Ignition ON, engine OFF, monitor the EC Ignition Relay Feedback parameter with a scan tool. The parameter should display B+.

    If the parameter does not display B+, test the ignition 1 voltage circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

13. If all circuits test normal, replace the relay.

Repair Instructions

- Engine Control Module Programming and Setup
- Engine Control Module Replacement
- Relay Replacement

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. Ignition ON, command the powertrain relay ON and OFF with a scan tool, while observing the powertrain relay circuit status parameters, The circuit status parameters should change from OK to Not Run or Not Run to OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

Service Bay Test

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Description

The purpose of the evaporative emission (EVAP) Service Bay Test is to aid in resetting the EVAP inspection/maintenance (I/M) system status. For this vehicle that is equipped with the engine off natural vacuum (EONV) diagnostic, the Service Bay Test uses the scan tool to initiate the engine control module (ECM) regular sequence of EVAP system DTC tests, but with different enable criteria. By using the Service Bay Test the I/M indicator can be set without the need for multiple cold soaks.

The scan tool displays for the Service Bay Test are based on the events that occur within the following three categories:

- The engine running portion of the tests--The vehicle must remain at rest, in Park, or in Neutral, during this portion of the test. This test inspects for large leaks, a leaking purge valve and/or vent system restrictions. The scan tool will display test progress or the reason for an abort or failure.
- Drive cycle--The scan tool will display time and distance needed to warm the fuel.
- Ignition OFF--During this portion of the test, the engine controller will remain active for up to 45 minutes when the ignition is turned OFF to allow control of the EVAP vent valve and run the EONV test. The engine controller inspects for small leaks during this period by monitoring fuel tank pressure or vacuum. If the system is sealed, there will be a pressure or vacuum change. Pressure or vacuum changes that are less than the calibrated values indicate a leak.

When the EVAP diagnostics are initiated by the Service Bay Test, the scan tool will indicate if the enable conditions listed below are not met, or will display a specific reason if the test aborts. When complete, the display will indicate that the tests passed or failed.

Conditions for Running the Test

The following conditions must be met in order to enable the Service Bay Test:

- The battery voltage is between 11-18 volts.
- The engine coolant temperature (ECT) is less than 70°C (158°F) at start-up.
- The EVAP I/M system status indicator is set to NO.
- The fuel level is 15-85 percent capacity and cannot be refueled during the tests.
- There are no DTCs displayed.
- The vehicle must be driven for the time and distance specified on the scan tool.

- The ambient air temperature is between 0-40°C (32-104°F).
- The ignition must remain OFF during the engine OFF portion of the test, and the vehicle must remain at rest.

Test Procedure

Note: If the Service Bay Test aborts or fails, a DTC will NOT be set.

1. Install a scan tool.
2. Select the Service Bay Test with the scan tool.

   Warning: Refer to Road Test Warning in the Preface section.

3. Follow the instructions on the scan tool.

   If the test aborts, correct the condition for running the test, then retest.

   If the test fails, repair the vehicle for the condition indicated by the failure message on the scan tool.
4. Verify that the EVAP I/M system status is set to YES.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Diagnostic Information and Procedures |

Document ID: 2152481

Symptoms - Engine Controls

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

Symptoms Description

Symptoms cover conditions that are not covered DTCs. Certain conditions can cause multiple symptoms. These conditions are listed together under Symptoms Testing. Conditions that may only cause certain symptoms are listed separately under Additional Symptoms Test. Perform the Symptoms Testing before using the Additional Symptoms Tests. Poor Fuel Fill Quality test may be performed separately from the Symptoms Testing and Additional Symptoms Tests procedures.

Symptoms Definition

Backfire: Fuel ignites in the intake manifold or in the exhaust system, making a loud popping noise.

Cuts Out, Misses: A steady pulsation or jerking that follows engine speed, which is usually more pronounced as the engine load increases. This condition is not normally felt above 1500 RPM or 48 km/h (30 mph). The exhaust has a steady spitting sound at idle or at low speed.

Detonation/Spark Knock: A mild to severe ping which usually occurs worse while under acceleration. The engine makes sharp metallic knocks that change with throttle opening.

Dieseling, Run-On: The engine continues to run after the key is turned OFF, but runs very rough.

Hard Start: Engine cranks OK, but does not start for a long time. The vehicle does eventually run, or may start but immediately stalls.

Hesitation, Sag, Stumble: Momentary lack of response as the accelerator is pushed down. This condition can occur at any vehicle speed. This condition is usually more pronounced when first trying to make the vehicle move, as from a stop. This condition may cause the engine to stall in severe conditions.

Lack of Power, Sluggishness, or Sponginess: The engine delivers less than expected power. Little or no increase in speed when the accelerator pedal is pushed down part way.

Poor Fuel Economy: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, the fuel economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Poor Fuel Fill Quality: Difficulty when refueling the vehicle.

Rough, Unstable, or Incorrect Idle and Stalling: The engine runs unevenly at idle. If severe, the engine or the vehicle may shake. Engine idle may vary in speed. Either condition may be severe enough to stall the engine.

Surges/Chuggles: Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal position.

Symptoms Verification

Before using the Symptom tables, perform the following inspections:

- Ensure that the engine control module (ECM) and malfunction indicator lamp (MIL) are operating correctly.
- Ensure that there are no DTCs that are stored.
- Ensure that the scan tool data is within a normal operating range.
- Verify the customer concern.
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help reveal the cause of an intermittent condition.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movements of a component. Refer to the following for a list of issues that may cause an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Incomplete connector mating
- Poor terminal contact
- High circuit or component resistance--High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harness that is too short or tight.
- Wire insulation that is chaffed or cut.
- High or low ambient temperature
- High or low engine coolant temperatures
- High underhood temperatures
- Heat build up in component or circuit due to circuit resistance, poor terminal contact, or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surfaces
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of aftermarket, add on accessories

Visual/Physical Check

- Ensure that the control module grounds are clean, tight, and correctly located. Refer to

Wiring Repairs.

- Ensure that the vacuum hoses are not split, kinked, and properly connected, as shown on the Vehicle Emission Control Information label.
- Ensure that the air filter is clean and free from restrictions.
- Ensure that there is no water intrusion in connectors terminals and components.
- Inspect the air intake ducts for the following conditions:
  - Collapsed
  - Damaged areas
  - Looseness
  - Incorrect installation
  - Leaking
- Inspect for air leaks at the throttle body mounting area, the mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Inspect the wiring harness for the following conditions:
  - Poor connections
  - Pinches
  - Cuts
- Inspect for loose, damaged, unseated, or missing sensors/components.
- Inspect the terminals for corrosion and correct contact.

Symptoms Testing

Backfire, Cuts Out / Misses, Detonation / Spark Knock, Dieseling / Run-On, Hard Start, Hesitation / Sag / Stumble, Lack of Power / Sluggishness / Sponginess, Poor Fuel Economy, Rough, Unstable, or Incorrect Idle and Stalling, or Surges / Chuggles

1. Test for the following conditions:
   - The fuel system for the following:
     - Each fuel injector is connected to the proper fuel injector harness connector.
     - Correct fuel pressure--Refer to Fuel System Diagnosis
     - Fuel injectors that are leaking or improper operation--Refer to Fuel Injector Diagnosis.
     - Contaminated or a poor fuel quality condition--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - The ignition system for the following:
     - Spark plugs for incorrect heat range or an abnormal condition--Refer to Spark Plug Inspection.
     - For diagnosis of coolant or oil fouled spark plugs, refer to Loss of Coolant or Symptoms - Engine Mechanical.
     - Wet down the secondary ignition system with water from a spray bottle. Wetting down the secondary ignition system may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as the water is applied.
     - Weak spark using the J 26792 Spark Tester--Refer to Electronic Ignition (EI) System Diagnosis.

- The operation of the transmission torque converter clutch (TCC)--The scan tool should indicate an engine speed drop when the TCC is commanded ON.
- The operation of the A/C compressor
- Items that can cause an engine to run rich or lean.
- Inspect the heated oxygen sensors (HO2S). The HO2S should respond quickly to different throttle positions.

Notice: Refer to Heated Oxygen and Oxygen Sensor Caution in the Preface section.

- Water intrusion in the HO2S connector
- The cylinder deactivation system. Refer to Cylinder Deactivation (Active Fuel Management) System Diagnosis.

Important: The embossed arrows on the MAF sensor indicate the direction of the intake air flow. The arrows must point toward the engine.

- Inspect the MAF sensor installation. A MAF sensor that is incorrectly installed may cause a hard start. Install the MAF in the proper direction. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement.
- Inspect the MAF sensor connections.
- Engine oil contaminated by fuel
- The engine for the following mechanical failures--Refer to Symptoms - Engine Mechanical :
  - Excessive oil in the combustion chamber or leaking valve seals
  - Incorrect cylinder compression
  - Sticking or leaking valves
  - Worn camshaft lobes
  - Incorrect valve timing
  - Worn rocker arms
  - Broken valve springs
  - Excessive carbon buildup in the combustion chambers--Clean the chambers with top engine cleaner. Follow the instructions on the can.
  - Incorrect engine parts
- Vacuum hoses for splits or kinks--Verify that the routing and connections are as shown on the Vehicle Emission Control Information label.
- Knock sensor (KS) system for excessive spark retard activity--Refer to DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333.
- The exhaust system components for the following:
  - Physical damage or possible internal failure
  - The three-way catalytic converters for a restriction
  - For more information, refer to Symptoms - Engine Exhaust.
- Electromagnetic interference (EMI) on the reference circuit can cause a misfire condition. You can usually detect EMI with a scan tool by monitoring the engine speed parameter. A sudden increase in the engine speed parameter with little change in actual engine speed indicates that EMI is present. Inspect the high voltage components near the ignition

control circuit if a condition exists.

- The crankcase ventilation valve for proper operation--Refer to Crankcase Ventilation System Inspection/Diagnosis.
- Evaporative emission (EVAP) canister purge solenoid that is stuck open
- The engine cooling system for the following conditions:
  - The thermostat is the correct heat range. Refer to Thermostat Diagnosis.
  - Proper engine coolant level--Refer to Cooling System Draining and Filling.

2. If the above conditions do not address the symptom, refer to the additional symptoms tests.

Additional Symptoms Tests

Detonation/Spark Knock: Test the engine for an overheating condition. Refer to Symptoms - Engine Cooling.

Poor Fuel Economy: Inspect for foreign material accumulation in the throttle bore, and for carbon deposits on the throttle plate and shaft. Also inspect for throttle body tampering.

Rough, Unstable, or Incorrect Idle and Stalling: Inspect the engine mounts.

Surges/Chuggles: Test the heated oxygen sensors (HO2S). The HO2S should respond quickly to a change in throttle position. If the HO2S do not respond to different throttle positions, inspect for contamination from fuel, silicon, or the incorrect use of RTV sealant. The sensors may have a white powdery coating and result in a high, but false, signal voltage, which gives a rich exhaust indication. The ECM reduces the amount of fuel delivered to the engine, causing a driveability condition.

Hard Start

- Test the engine coolant temperature (ECT) sensor. Compare the ECT sensor value to the intake air temperature (IAT) sensor value on a cold engine. The ECT and IAT sensor values should be within ± 3°C (5°F). If the ECT sensor is out of range with the IAT sensor, test the resistance of the ECT sensor. Refer to Temperature Versus Resistance for resistance specifications. Replace the ECT sensor if the resistance is not within specification. Refer to Engine Coolant Temperature Sensor Replacement. If the sensor is within the specification, test the ECT circuits for a high resistance.
- Test the idle air control (IAC) system.
- Test the fuel pump relay operation. The fuel pump should turn ON for 2 seconds when the ignition is turned ON. Refer to Fuel System Diagnosis.

Hesitation, Sag, Stumble

- Test the manifold absolute pressure (MAP) sensor. Refer to DTC P0106.
- Test the generator. Refer to Symptoms - Engine Electrical. Repair the charging system if the generator output voltage is less than 9 volts or more than 16 volts.

Poor Fuel Economy

- Heavy loads being carried or towed.
- Acceleration rate too much or too often.

- Inspect for foreign material accumulation in the throttle bore, and for carbon deposits on the throttle plate and shaft. Also inspect for throttle body tampering.

Poor Fuel Fill Quality

Test for the following conditions that is applicable to the current symptom.

Difficult to Fill

- Restricted vent lines
- The evaporative emission (EVAP) vent valve is stuck closed
- High fuel temperature
- A condition with the internal components of the fuel tank assembly.

  For more information, refer to:
- Evaporative Emissions Hose Routing Diagram
- Fuel System Description
- Evaporative Emission Control System Description

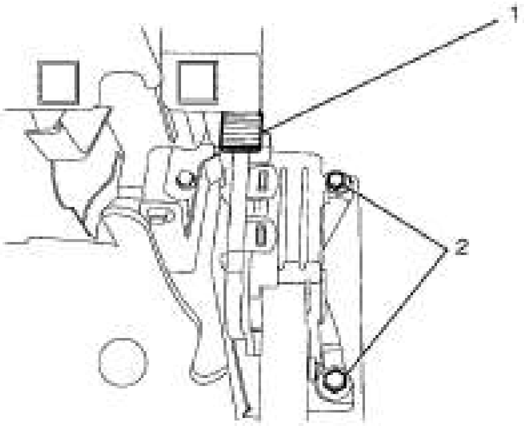
Fuel Odor

- Saturated EVAP canister--Refer to Evaporative Emission Control System Description.
- A condition with the internal components of the fuel tank assembly--Refer to Fuel System Description.

Accelerator Pedal Position Sensor Replacement

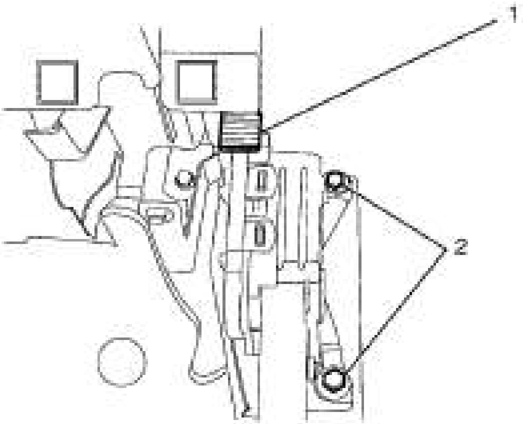
Removal Procedure

Notice: Handle the electronic throttle control components carefully. Use cleanliness in order to prevent damage. Do not drop the electronic throttle control components. Do not roughly handle the electronic throttle control components. Do not immerse the electronic throttle control components in cleaning solvents of any type.



1. Remove the left instrument panel (I/P) on the lower closeout insulator panel. Refer to Knee Bolster Replacement.
2. Disconnect the electrical connector (1) to the accelerator pedal sensor module.
3. Remove the accelerator pedal to steering column support bracket retaining bolts (2).
4. Remove the accelerator pedal.

Installation Procedure



1. Install the accelerator pedal to the steering column support bracket.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the accelerator pedal to steering column support bracket retaining bolts (2).

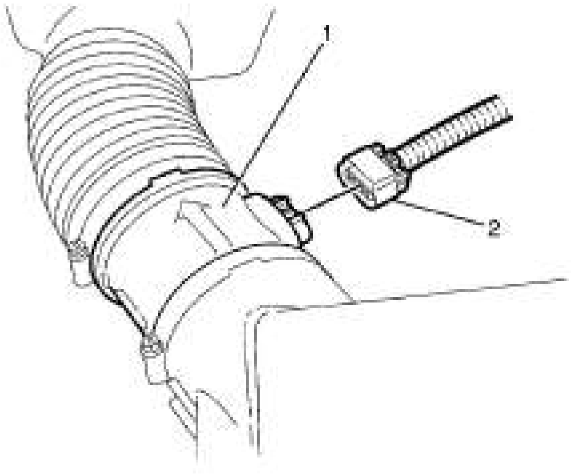
   Tighten
   Tighten the accelerator pedal mounting bolts to 20 N·m (15 lb ft).

3. Connect the accelerator pedal sensor module electrical connector (1).
4. Inspect for correct carpet fit under the accelerator pedal.
5. If re-programming is required. Refer to Control Module References.
6. Install the left I/P on the lower closeout insulator panel. Refer to Knee Bolster Replacement.

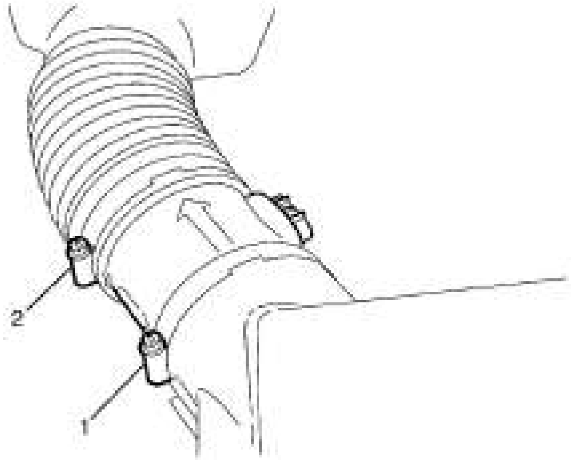
Air Cleaner Assembly Replacement

Removal Procedure

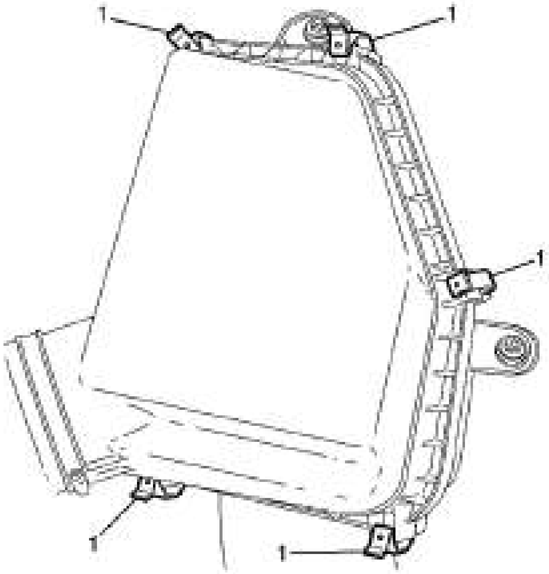
1. Remove the engine cover. Refer to Engine Cover Replacement .



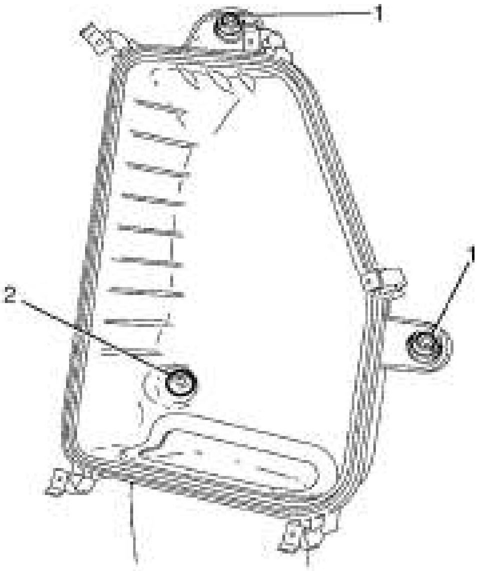
2. Disconnect the wiring harness connector (2) to the intake air temperature (IAT)/mass air flow (MAF) sensor (1).



3. Loosen the IAT/MAF to upper air cleaner body retaining clamp (1).
4. Loosen the IAT/MAF to air intake duct retaining clamp (2).

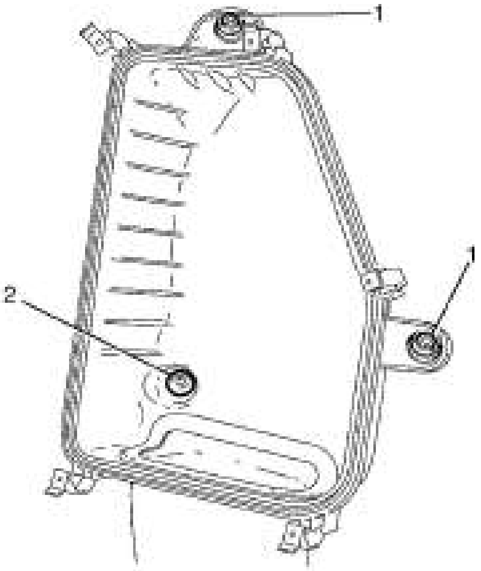


5. Remove five retaining clips (1) securing the upper air cleaner body.
6. Remove upper air cleaner body and air cleaner filter assembly.
7. Remove the air cleaner element. Refer to Air Cleaner Element Replacement .



8. Remove the lower air cleaner body to front inner wheelhouse retaining nuts (1).
9. Disengage the lower air cleaner body to front inner wheelhouse retainer (2).
10. Remove the lower air cleaner body from the vehicle.

Installation Procedure



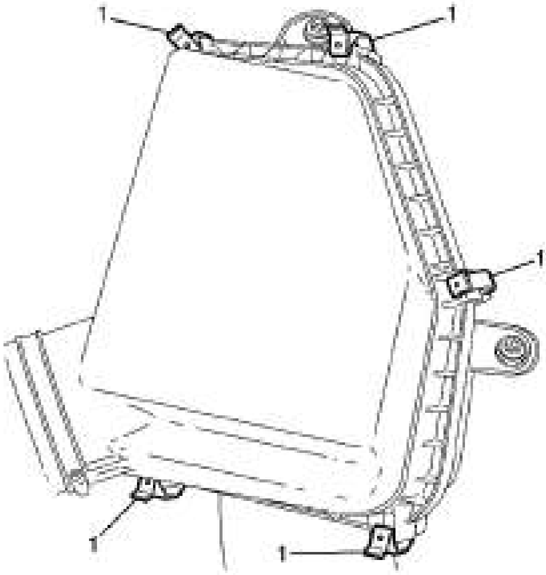
1. Install the lower air cleaner body to the front inner wheelhouse
2. Engage the lower air cleaner body to the front inner wheelhouse retainer (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the lower air cleaner body to front inner wheelhouse retaining nuts (1).

   Tighten
   Tighten the nuts to 10 N·m (89 lb in).

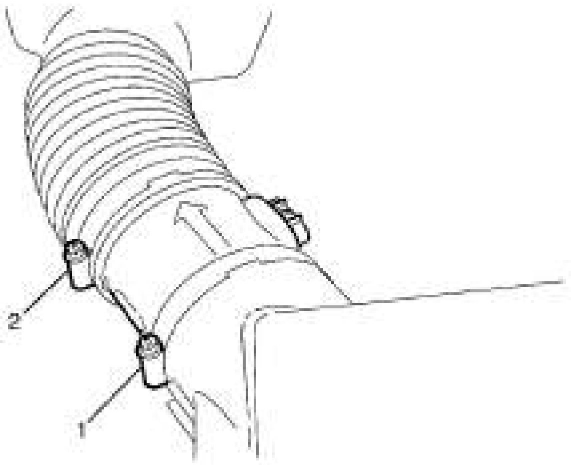
4. Install the air cleaner element to the lower air cleaner body. Refer to Air Cleaner Element Replacement .



5. Assemble the air cleaner element into the upper air cleaner body and place the upper body

onto the lower air cleaner body.

6. Install the five retaining clips (1) securing the upper air cleaner body to the lower air cleaner body.

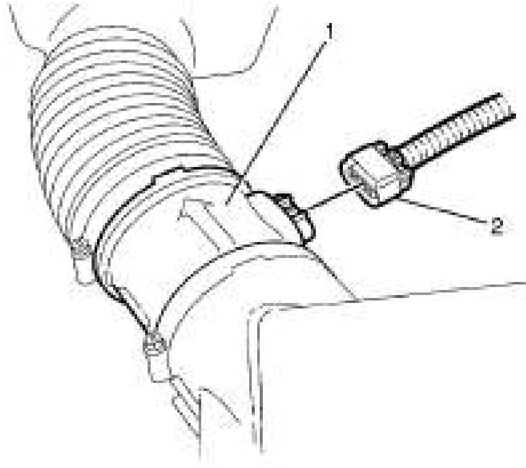


7. Install the IAT/ MAF sensor to the upper air cleaner body.
8. Install the IAT/MAF sensor to the air intake duct.
9. Tighten the IAT/MAF sensor to upper air cleaner body retaining clamp (1).

   Tighten
   Tighten the clamp to 2 N·m (18 lb in).

10. Tighten the IAT/MAF sensor to air intake duct retaining clamp (2).

    Tighten
    Tighten the clamp to 2 N·m (18 lb in).

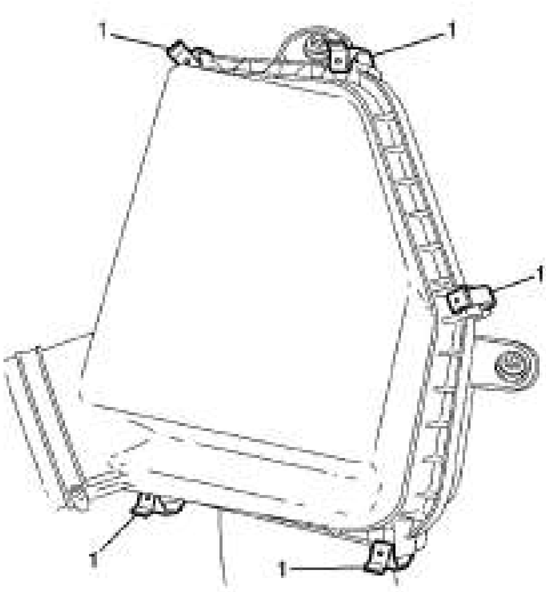


11. Connect wiring harness connector (2) to the IAT/ MAF sensor (1).
12. Install the engine cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1976121**

Air Cleaner Element Replacement

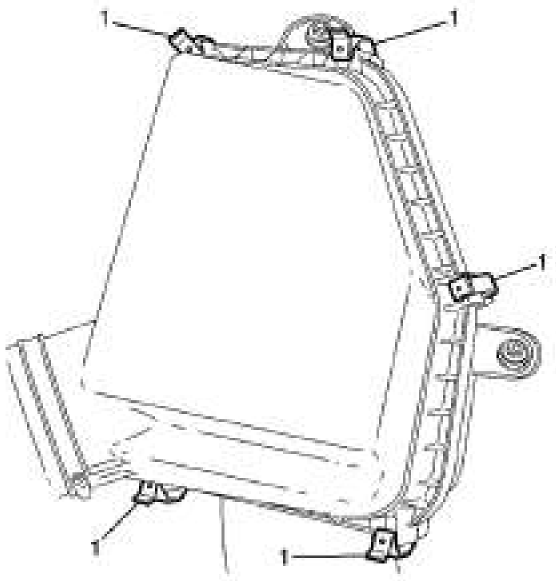
Removal Procedure



1. Remove five retaining clips (1) securing the upper air cleaner body.
2. Remove upper air cleaner body and air cleaner filter assembly.
3. Remove the air cleaner element from the air cleaner assembly.

   Discard the air cleaner element.

Installation Procedure

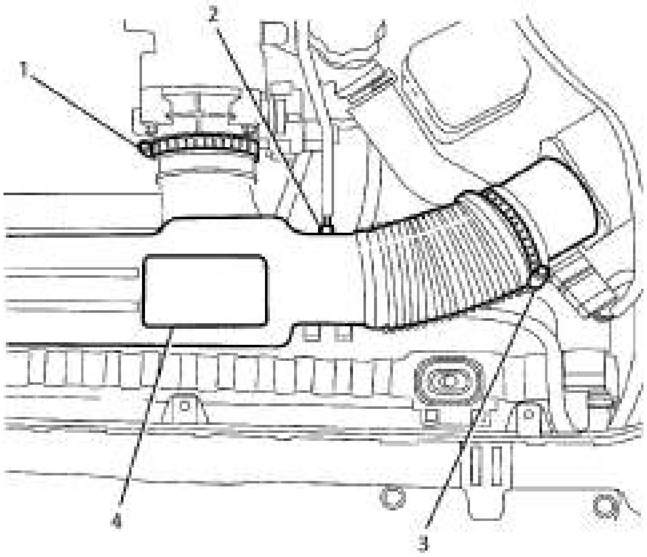


1. Install a NEW air cleaner element to the lower air cleaner body.
2. Reassemble the air cleaner element into the upper air cleaner body and place the upper air cleaner body onto the lower air cleaner body.
3. Reinstall the five retaining clips (1) securing the upper air cleaner body to the lower air cleaner body.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1990355**

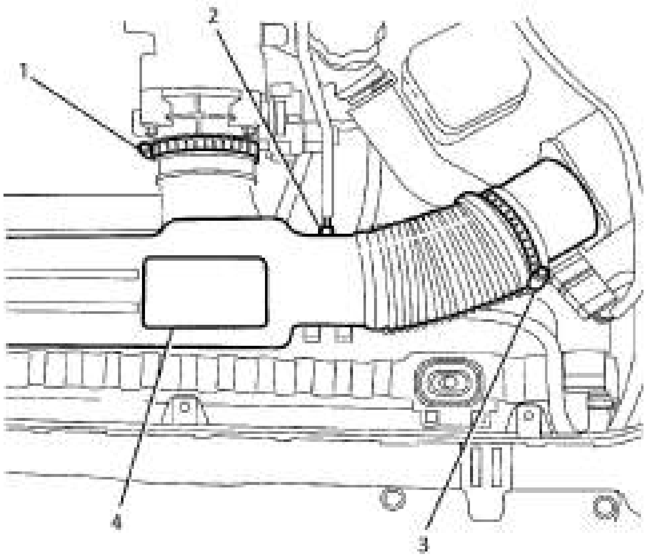
Air Cleaner Inlet Duct Replacement

Removal Procedure



1. Remove the positive crankcase ventilation (PCV) hose (2) from the air cleaner duct resonator (4).
2. Remove the air cleaner duct to throttle body retaining clamp (1).
3. Remove the air cleaner duct to intake air temperature (IAT)/mass air flow (MAF) sensor retaining clamp (3)
4. Remove the air cleaner duct (4).

Installation Procedure



1. Install the air cleaner intake duct (4) to the engine.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the air cleaner duct to throttle body retaining clamp (1).

   Tighten
   Tighten the clamp to 4 N·m (35 lb in).

3. Install the air cleaner duct to IAT/MAF retaining clamp (3)

   Tighten
   Tighten the clamp to 4 N·m (35 lb in).

4. Install the PCV hose (2) to the intake duct resonator.

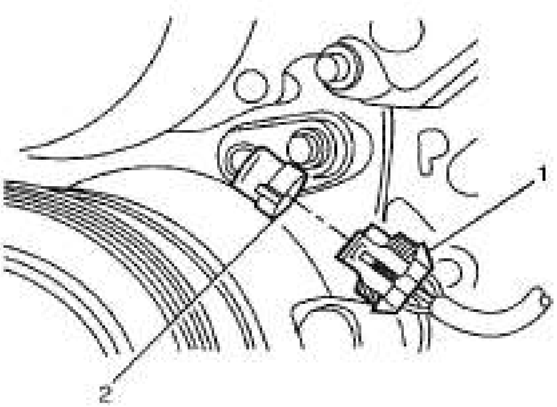
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2039081**

Camshaft Position Sensor Replacement

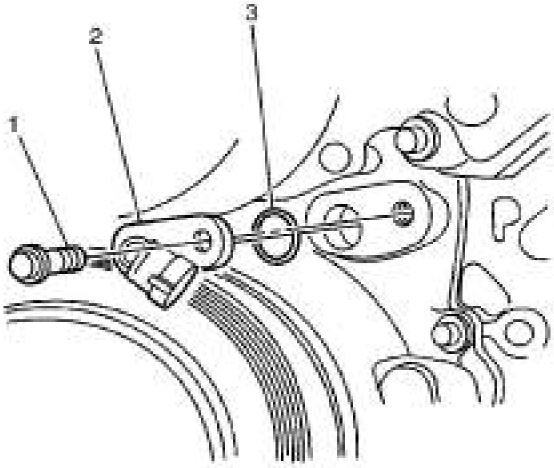
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine cover. Refer to Engine Cover Replacement .



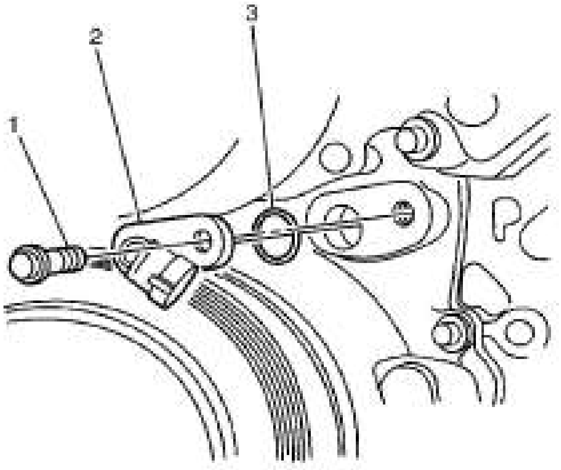
3. Disconnect the camshaft position (CMP) sensor electrical connector (1).



4. Remove the CMP sensor to engine front cover retaining bolt (1).
5. Remove the CMP sensor (2) from the engine front cover.
6. Remove the CMP sensor O-ring (3) from the CMP sensor and discard.

   Discard the O-ring.

Installation Procedure



Important: Install a NEW "O" ring to the camshaft sensor

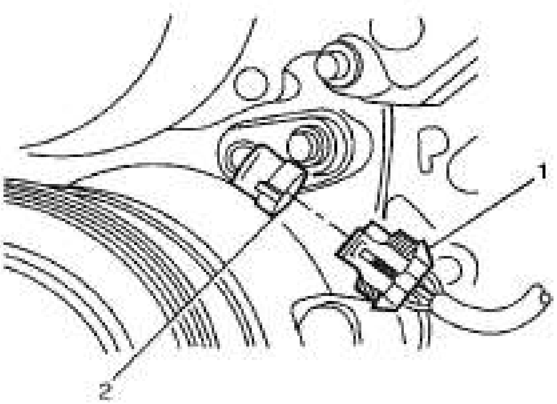
Important: Before installing the camshaft sensor, apply a small amount of clean motor oil to the O-ring (3).

1. Install a NEW O-ring (3) to the CMP sensor.
2. Install the CMP sensor (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the CMP sensor to engine front cover retaining bolt (1).

   Tighten
   Tighten the bolt 25 N·m (18 lb ft).



4. Connect the CMP sensor electrical connector (1) to wiring harness.
5. Install the engine cover. Refer to Engine Cover Replacement .
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. If re-programming is required. Refer to Control Module References .

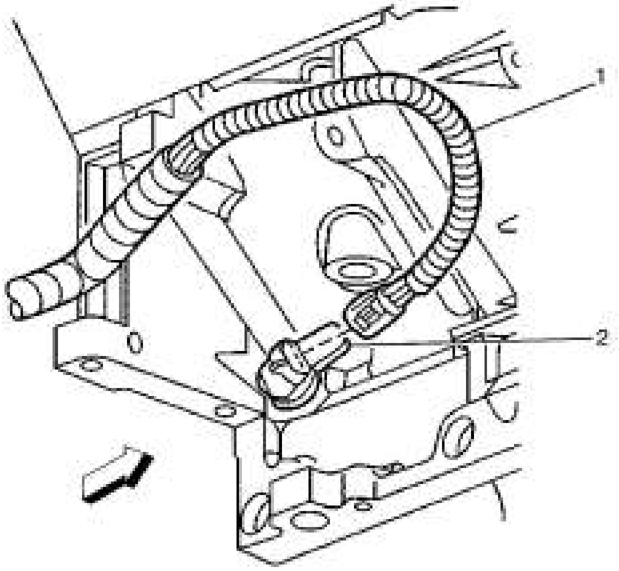
Crankshaft Position Sensor Replacement

Removal Procedure

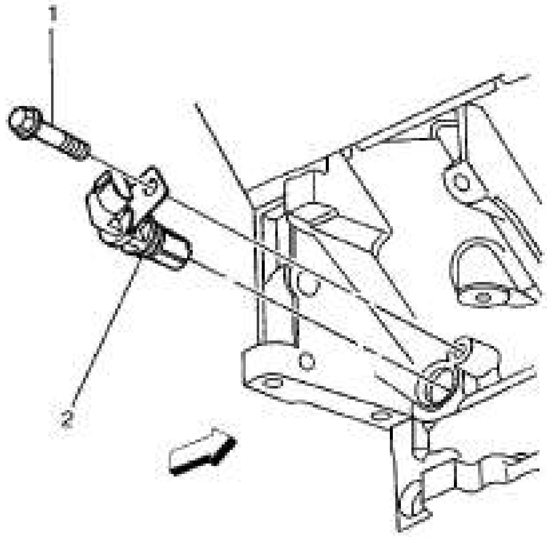
Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the starter. Refer to Starter Motor Replacement .

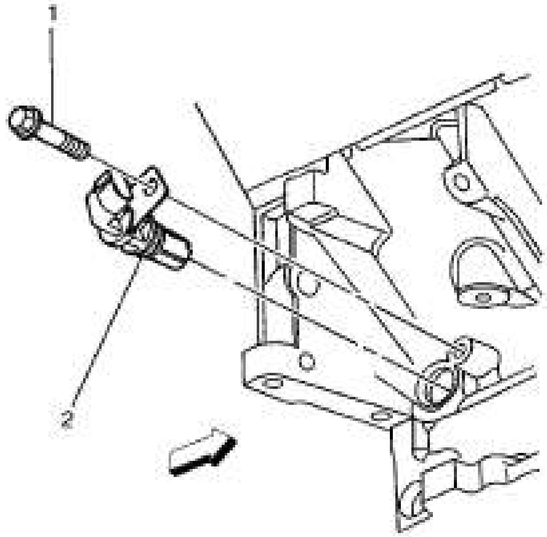


4. Disconnect the crankshaft position (CKP) sensor electrical connector (2) from the wiring harness (1).



5. Remove the CKP sensor to engine block retaining bolt (1).
6. Remove the CKP sensor (2) from the engine block.

Installation Procedure

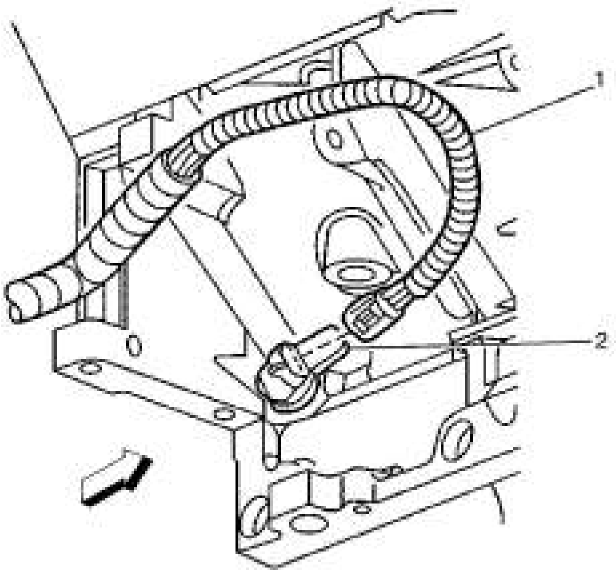


1. Install the CKP sensor (2) to the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the CKP sensor to engine block retaining bolt (1).

Tighten
Tighten the bolt to 25 N·m (18 lb ft).



3. Connect the CKP sensor electrical connector (2) to the wiring harness (1).
4. Install the starter. Refer to Starter Motor Replacement .
5. Lower the vehicle.
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. If re-programming is required. Refer to Control Module References .

Crankshaft Position System Variation Learn

1. Install a scan tool.
2. Monitor the engine control module (ECM) for DTCs with a scan tool. If other DTCs are set, except DTC P0315, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC that set.
3. Select the crankshaft position (CKP) variation learn procedure with a scan tool.
4. The scan tool instructs you to perform the following:
   - 4.1. Accelerate to wide open throttle (WOT).
   - 4.2. Release throttle when fuel cut-off occurs.
   - 4.3. Observe fuel cut-off for applicable engine.
   - 4.4. Engine should not accelerate beyond calibrated RPM value.
   - 4.5. Release throttle immediately if value is exceeded.
   - 4.6. Block drive wheels.
   - 4.7. Set parking brake.
   - 4.8. DO NOT apply brake pedal.
   - 4.9. Cycle ignition from OFF to ON.
   - 4.10. Apply and hold brake pedal.
   - 4.11. Start and idle engine.
   - 4.12. Turn A/C OFF.
   - 4.13. Vehicle must remain in Park or Neutral.
   - 4.14. The scan tool monitors certain component signals to determine if all the conditions are met to continue with the procedure. The scan tool only displays the condition that inhibits the procedure. The scan tool monitors the following components:
     - CKP sensors activity--If there is a CKP sensor condition, refer to the applicable DTC that set.
     - Camshaft position (CMP) sensor activity--If there is a CMP sensor condition, refer to the applicable DTC that set.
     - Engine coolant temperature (ECT)--If the ECT is not warm enough, idle the engine until the engine coolant temperature reaches the correct temperature.
5. Enable the CKP System Variation Learn Procedure with a scan tool.

   Important: While the learn procedure is in progress, release the throttle immediately when the engine starts to decelerate. The engine control is returned to the operator and the engine responds to throttle position after the learn procedure is complete.

6. Accelerate to WOT.
7. Release when the fuel cut-off occurs.
8. Test in progress.
9. The scan tool displays Learn Status: Learned this ignition. If the scan tool indicates that DTC P0315 ran and passed, the CKP Variation Learn Procedure is complete. If the scan tool indicates DTC P0315 failed or did not run, refer to DTC P0315. If any other DTCs set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC that set.
10. Turn OFF the ignition for 30 seconds after the learn procedure is completed successfully.
11. The CKP Variation Learn Procedure is also required when the following service procedures have been performed, regardless of whether DTC P0315 is set:

- A CKP sensor replacement
- An engine replacement
- A ECM replacement
- A harmonic balancer replacement
- A crankshaft replacement
- Any engine repairs which disturb the CKP sensor relationship

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1993901**

Engine Control Module Replacement

Engine control module (ECM) service should normally consist of either ECM replacement or electrically erasable programmable read only memory (EEPROM) programming. If the diagnostic procedures require ECM replacement, inspect the ECM first to see if the correct part is being used.

Important: In order to prevent internal ECM damage, the ignition must be OFF when you disconnect or reconnect the power to the ECM. For example, disconnect the power when you work with the following components:

- A battery cable
- The ECM pigtail
- The ECM fuse
- Jumper cables

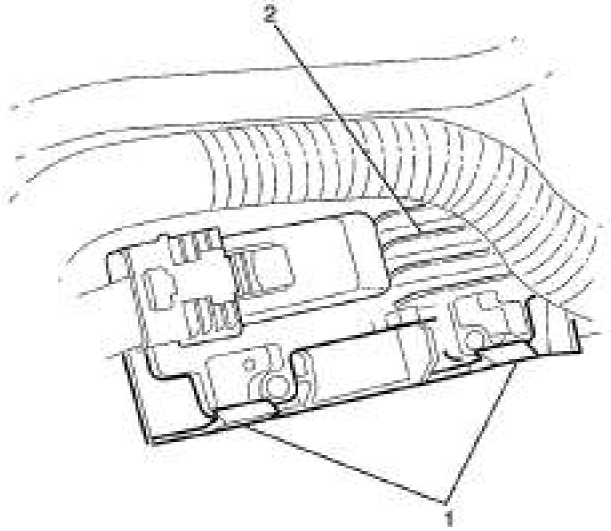
Important: When you diagnose or replace the ECM, remove any debris from the ECM connector surfaces before servicing the ECM module connector gaskets. Make sure that the gaskets are installed correctly. The gaskets prevent contamination intrusion into the ECM.

Important:: The replacement ECM MUST be programmed.

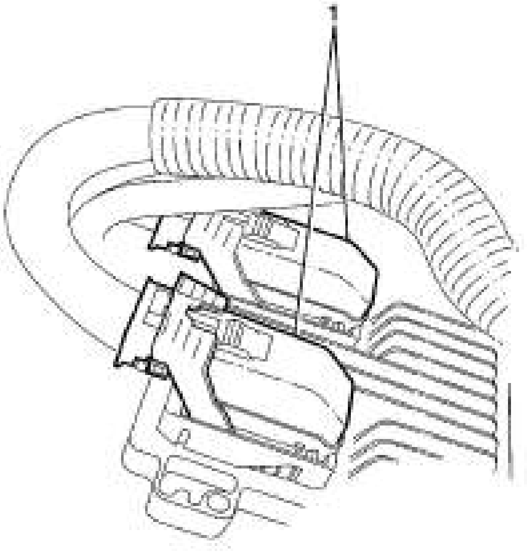
Removal Procedure

Important: It is necessary to record the remaining engine oil life. If the replacement module is not programmed with the remaining engine oil life, the engine oil life will default to 100%. If the replacement module is not programmed with the remaining engine oil life, the engine oil will need to be changed at 5000 km (3,000 mi) from the last engine oil change.

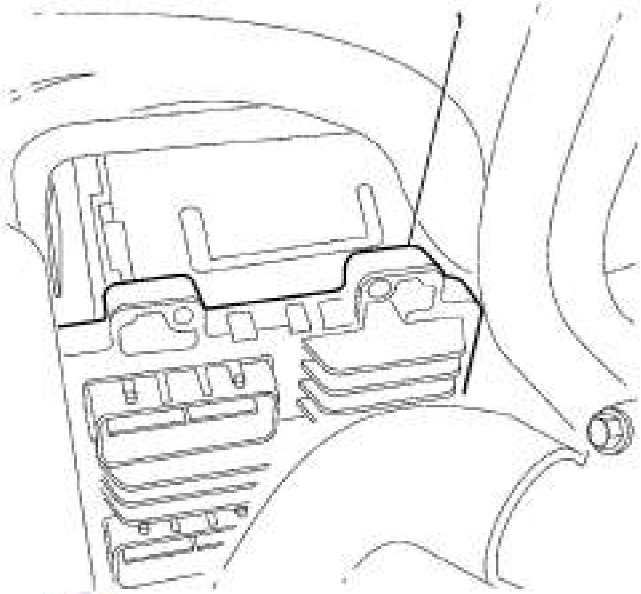
1. Using a scan tool, retrieve the percentage of remaining engine oil. Record the remaining engine oil life.
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .



3. Release the ECM retaining clips (1) and detach the ECM (2).



4. Move the connector lock levers to the unlock position and disconnect the ECM electrical connectors (1).

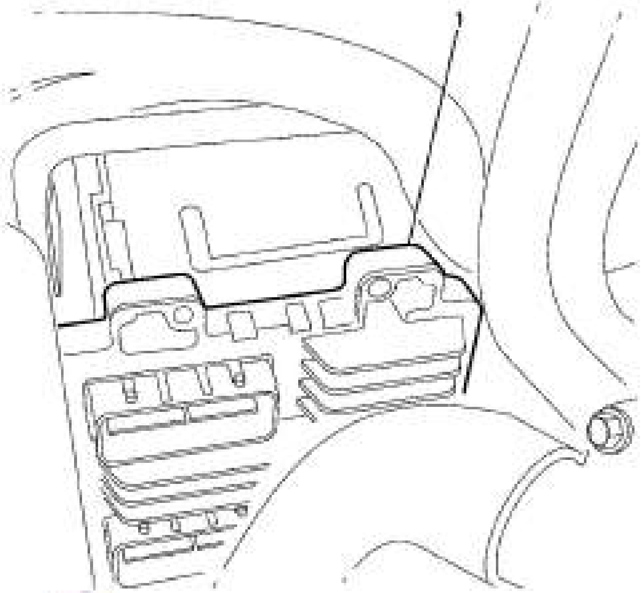


5. Remove the ECM from the vehicle.

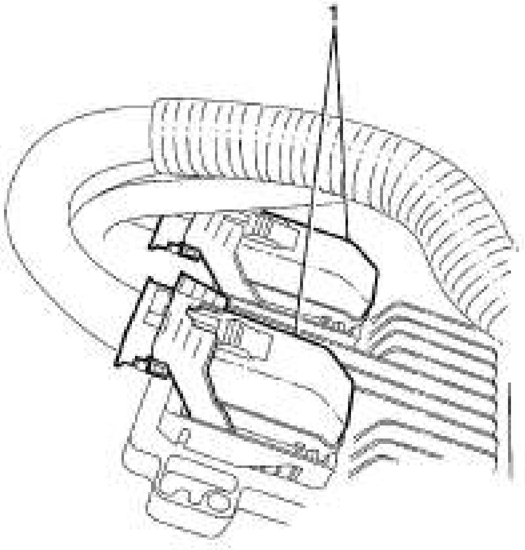
Installation Procedure

Notice: Do not touch the connector pins or soldered components on the circuit board in order to prevent possible electrostatic discharge (ESD) damage to the PCM.

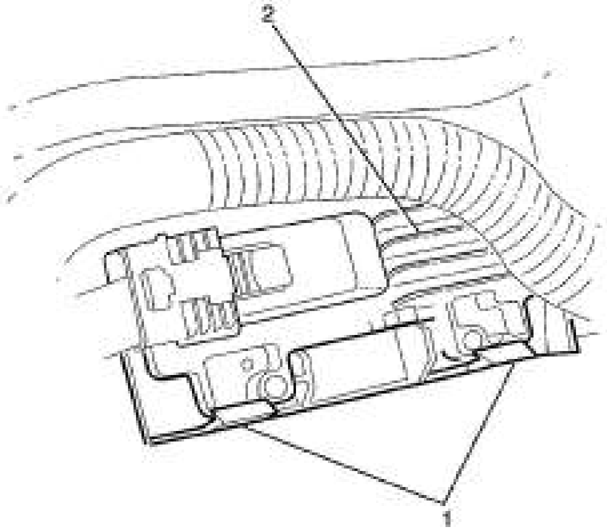
Notice: In order to prevent internal damage to the PCM, the ignition must be OFF when disconnecting or reconnecting the PCM connector.



1. Install the ECM to the vehicle.



2. Connect the ECM electrical connectors (1).



3. Engage the ECM retaining clips (1) to secure the ECM (2).
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
5. If a new ECM is being installed, program the ECM. Refer to Service Programming System (SPS) .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1976101**

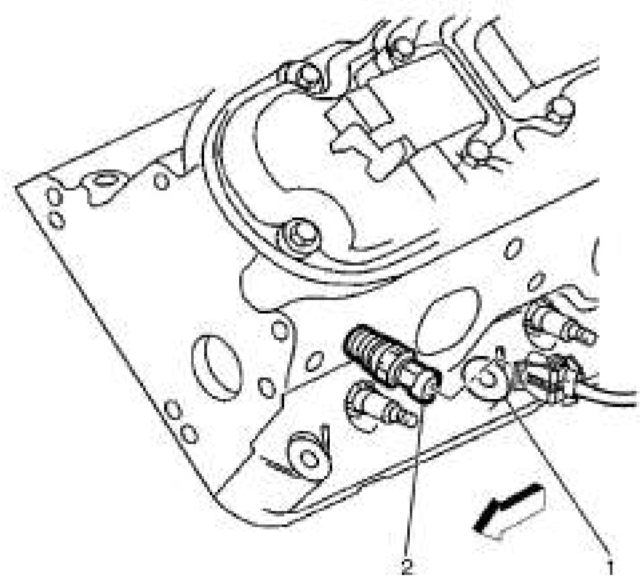
Engine Coolant Temperature Sensor Replacement

Removal Procedure

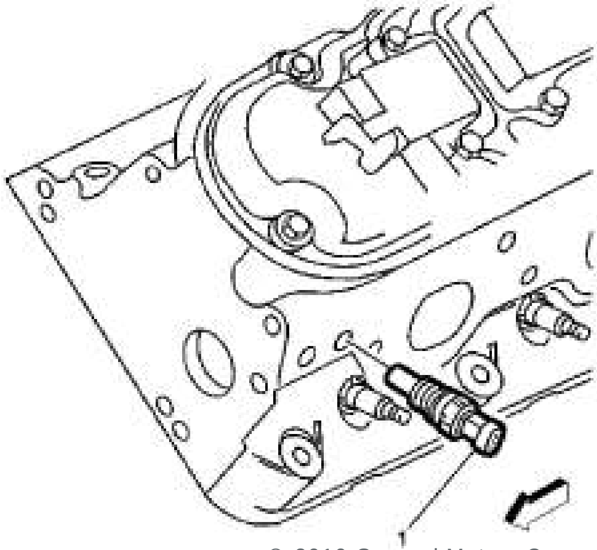
1. Turn OFF the ignition.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Drain the engine coolant below the level of the engine coolant temperature (ECT) sensor. Refer to Cooling System Draining and Filling.
4. Lower the vehicle.



5. Disconnect the ETC wiring harness connector (1) from the ECT sensor.



Notice: Use care when handling the coolant sensor. Damage to the coolant sensor will affect the operation of the fuel control system.

6. Remove the ECT sensor (2) from the cylinder head.

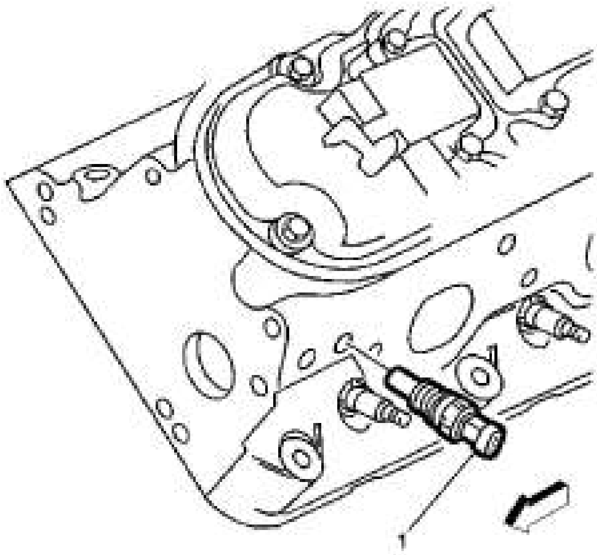
Installation Procedure

Notice: Replacement components must be the correct part number for the application. Components requiring the use of the thread locking compound, lubricants, corrosion inhibitors, or sealants are identified in the service procedure. Some replacement components may come with these coatings already applied. Do not use these coatings on components unless specified. These coatings can affect the final torque, which may affect the operation of the component. Use the correct torque specification when installing components in order to avoid damage.

Notice: Use care when handling the coolant sensor. Damage to the coolant sensor will affect the operation of the fuel control system.

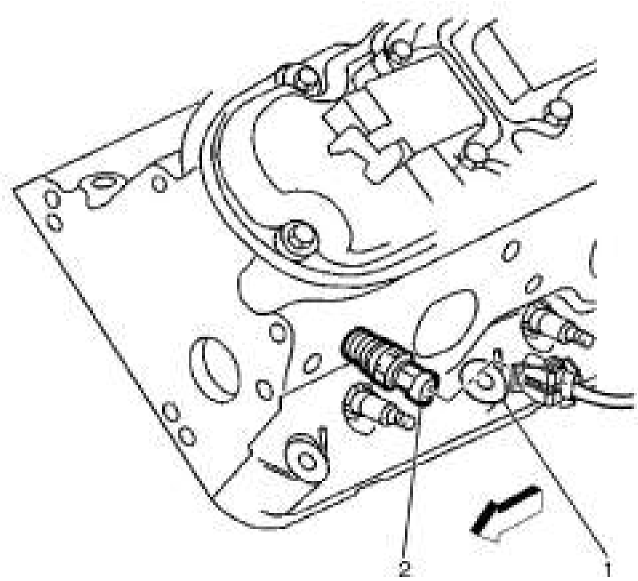
1. Coat the ECT sensor threads with sealer or the equivalent.

Notice: Refer to Fastener Notice in the Preface section.



2. Install the ECT sensor (2) to the cylinder head.

Tighten
Tighten the ECT sensor to 20 N·m (15 lb ft).

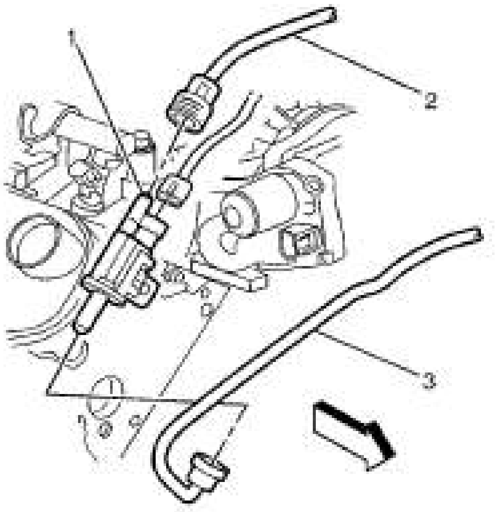


3. Connect the ETC wiring harness connector (1) ECT sensor.
4. Refill the engine coolant. Refer to Cooling System Draining and Filling.

Evaporative Emission Canister Purge Solenoid Valve Replacement

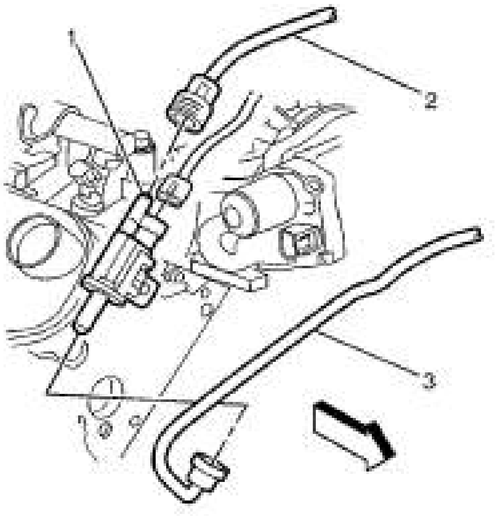
Removal Procedure

1. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief .



2. Disconnect the EVAP engine pipe (2) to EVAP chassis tube. Refer to Plastic Collar Quick Connect Fitting Service .
3. Disconnect the EVAP engine tube (3) to throttle body. Refer to Plastic Collar Quick Connect Fitting Service .
4. Disconnect the wiring connector from the EVAP purge solenoid.
5. Remove the EVAP purge solenoid (1) from the vehicle.

Installation Procedure



1. Install the EVAP purge solenoid (1) to the vehicle.
2. Connect the wiring connector to the EVAP purge solenoid.
3. Connect the EVAP engine tube (3) to throttle body. Refer to Plastic Collar Quick Connect Fitting Service .
4. Connect the EVAP engine pipe (2) to EVAP chassis tube. Refer to Plastic Collar Quick Connect Fitting Service .

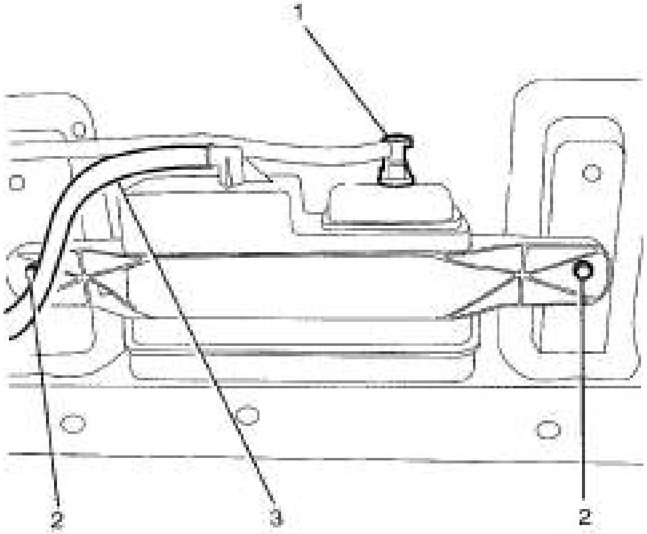
Evaporative Emission Canister Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

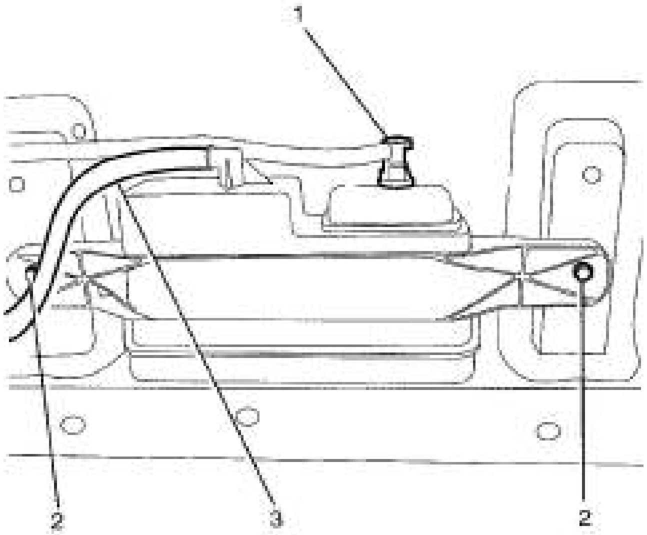
1. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear frame. Refer to Rear Frame Replacement.



3. Disconnect the canister purge tube (1) from the canister.
4. Remove the canister vent tube (3) from the canister by twisting and pulling it away from the canister.
5. Remove the canister to under body retaining bolts (2).
6. Remove the evaporative emission canister from the vehicle.

Installation Procedure

1. Install the evaporative emission canister to the vehicle.



2. Install the evaporative emission canister retaining bolts (2), hand tighten only.

   Notice: Refer to Fastener Notice in the Preface section.

3. Tighten the evaporative emission canister to vehicle retaining bolts.

   Tighten
   Tighten the bolts to 6 N·m (53 lb in).

4. Install the canister vent pipe (3) to the canister vent port.
5. Align the canister purge pipe quick connector (1) with the canister purge pipe port and push the connector firmly onto the port.
6. Install the rear frame. Refer to Rear Frame Replacement.
7. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 2038147

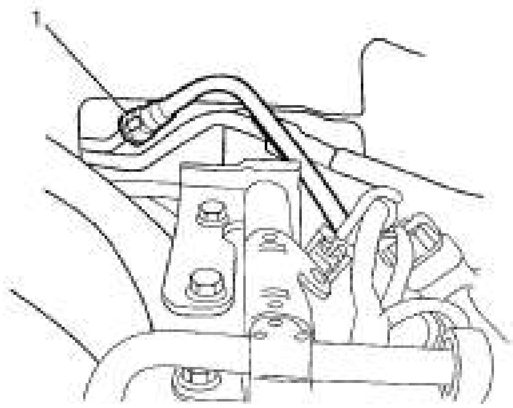
Evaporative Emission Hoses/Pipes Replacement - Engine

Removal Procedure

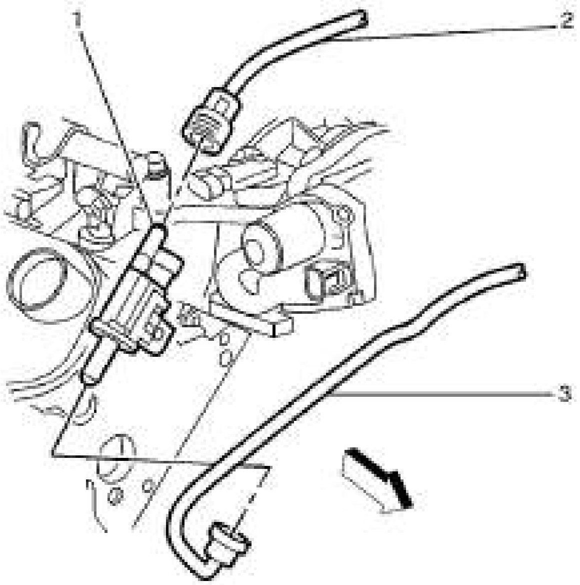
Notice: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

1. Loosen the fuel filler cap to relieve any vapour pressure.
2. Disconnect the negative battery cable.
3. Remove the engine cover. Refer to Engine Cover Replacement .

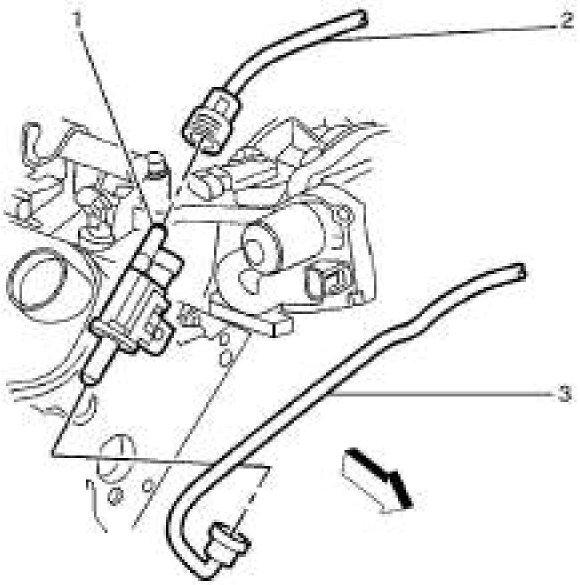


4. Disconnect the EVAP engine tube (1) from the evaporative emission chassis pipe. Refer to Plastic Collar Quick Connect Fitting Service.

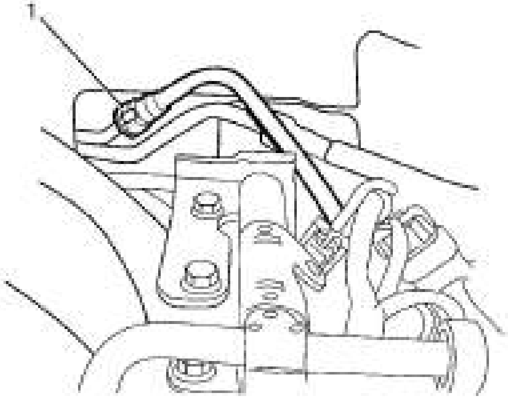


5. Disconnect the EVAP engine tube (2) from the EVAP valve solenoid. Refer to Plastic Collar Quick Connect Fitting Service.
6. Remove the EVAP engine tube (2) from the engine compartment.

Installation Procedure



1. Install the EVAP engine tube (2) to the EVAP valve solenoid. Refer to Plastic Collar Quick Connect Fitting Service.



2. Connect the EVAP engine tube (1) to the EVAP chassis pipe. Refer to Plastic Collar Quick Connect Fitting Service.
3. Install the oil filler cap.
4. Connect the negative battery cable.
5. Install the engine cover. Refer to Engine Cover Replacement .

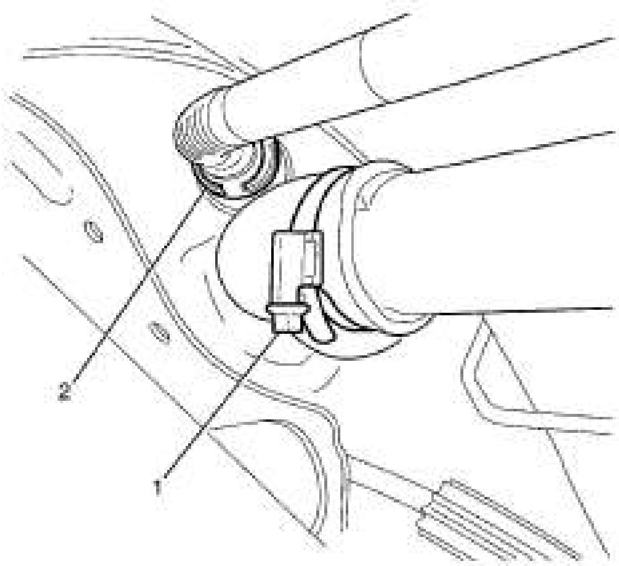
Filler Tube Replacement

Removal Procedure

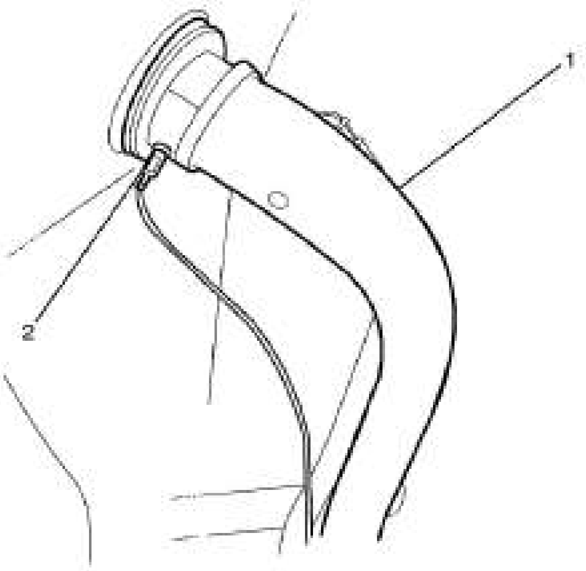
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

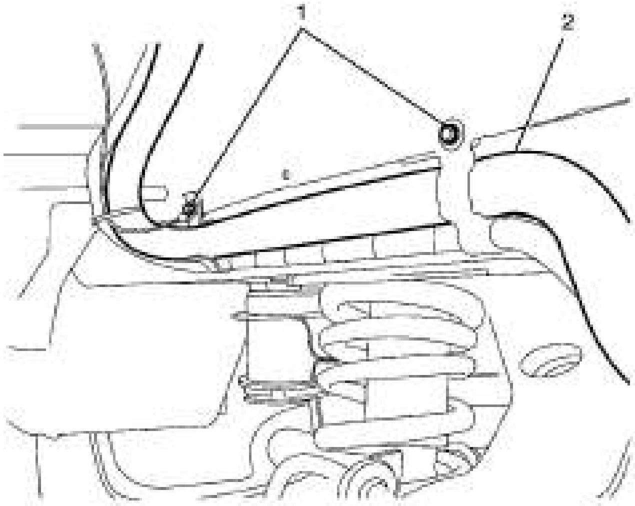
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the fuel filler cap.
3. Drain the fuel tank below the level of the fuel filler hose. Refer to Fuel Tank Draining .
4. Remove the right rear wheel. Refer to Tire and Wheel Removal and Installation .
5. Remove the rear bumper fascia. Refer to Rear Bumper Fascia Replacement .
6. Remove the rear wheelhouse liner. Refer to Rear Wheelhouse Panel Liner Replacement .



7. Loosen the fuel filler tube to fuel tank neck retaining clamp (1).
8. Remove the fuel filler tube to fuel tank neck.
9. Disconnect the fuel filler vent tube (2) from the fuel tank. Refer to Plastic Collar Quick Connect Fitting Service .



10. Remove the fuel filler tube to upper fuel filler neck rubber seal surround.
11. Remove the earth lead connector (2) to upper fuel filler neck.

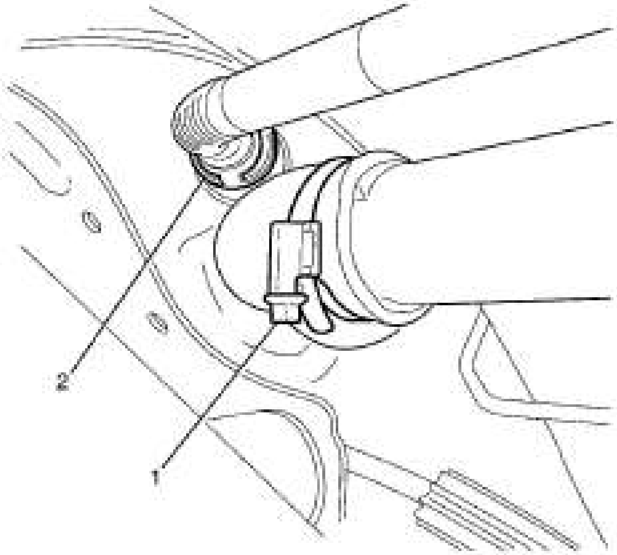


12. Remove the fuel filler tube to chassis retaining bolts (1).
13. Remove the fuel filler tube from the vehicle (2).

Installation Procedure

1. Install the fuel filler tube to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

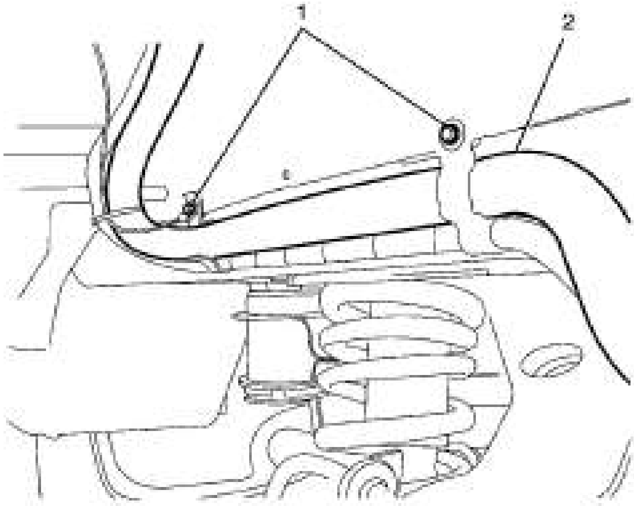


2. Install the fuel filler tube to fuel tank neck retaining clamp (1).

   Tighten
   Tighten the clamp to 3.5 N·m (31 lb in).

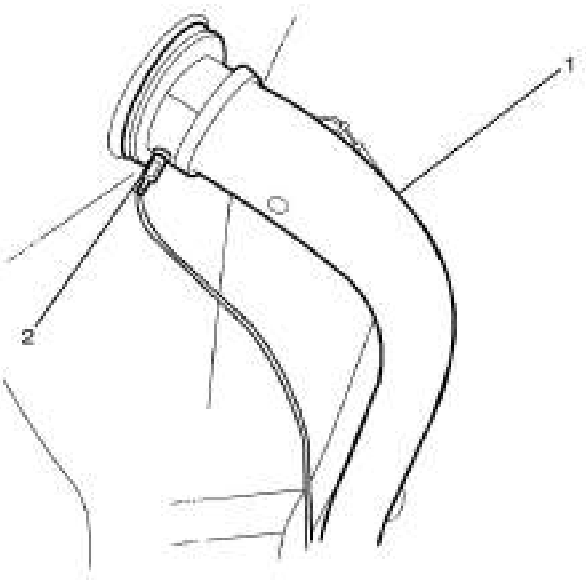
3. Connect the fuel filler vent tube (2) to the fuel tank. Refer to Plastic Collar Quick Connect Fitting Service .

   Notice: Refer to Fastener Notice in the Preface section.



4. Install the fuel filler tube to chassis retaining bolts (1).

Tighten
Tighten the bolts to 9 N·m (80 lb in).



5. Install the fuel filler tube to upper fuel filler neck rubber seal surround.
6. Install the earth lead connector (2) to upper filler neck.
7. Install the rear wheelhouse liner. Refer to Rear Wheelhouse Panel Liner Replacement .
8. Install the rear bumper fascia. Refer to Rear Bumper Fascia Replacement .
9. Install the right rear wheel. Refer to Tire and Wheel Removal and Installation .
10. Add fuel to the fuel tank.
11. Inspect for fuel leaks.
12. Install the fuel filler cap.

Fuel Filter Replacement

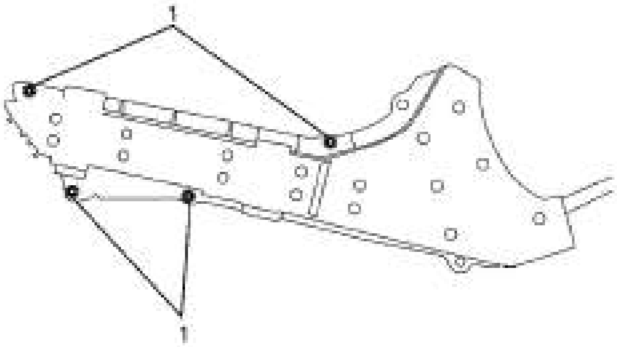
The fuel filter is an integral part of the fuel pump assembly and must be replaced as an assembly. For replacement refer to Primary Fuel Tank Module Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2037117**

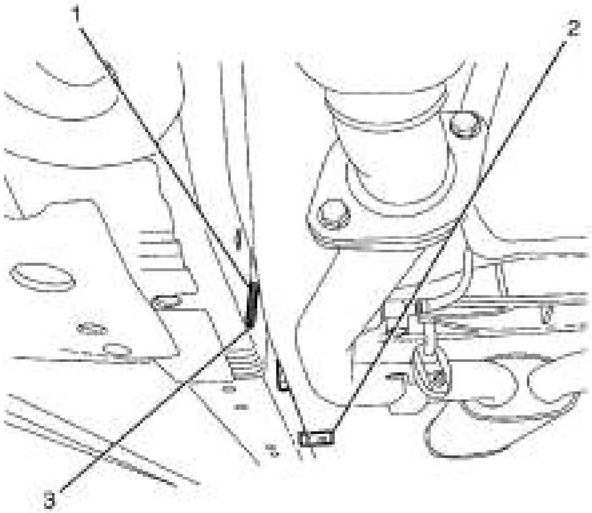
Fuel Hose/Pipes Replacement - Chassis

Removal Procedure

1. Before you service any fuel system connection, relieve the fuel system pressure. Refer to the Metal Collar Quick Connect Fitting Service.
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Disconnect the fuel and evaporative emission (EVAP) lines at the engine compartment. Refer to Fuel Hose/Pipes Replacement - Engine Compartment.
4. Remove the engine. Refer to Engine Replacement.
5. Disconnect the fuel and EVAP lines at the fuel tank. Refer to Fuel Tank Replacement.



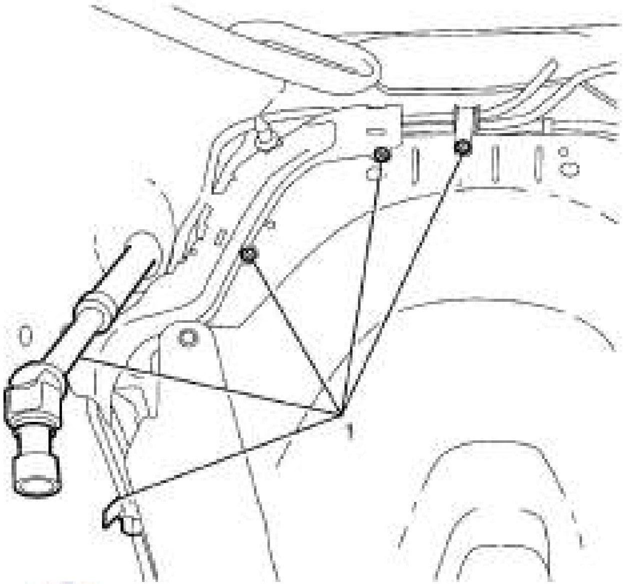
6. Remove the stone guard to under body retaining nuts (1).



7. Remove the fuel line bracket to under body pop rivet retainer (1) and discard.

   Discard the pop rivet.

8. Remove the fuel line insulators (2 and 3) from the chassis fuel lines.



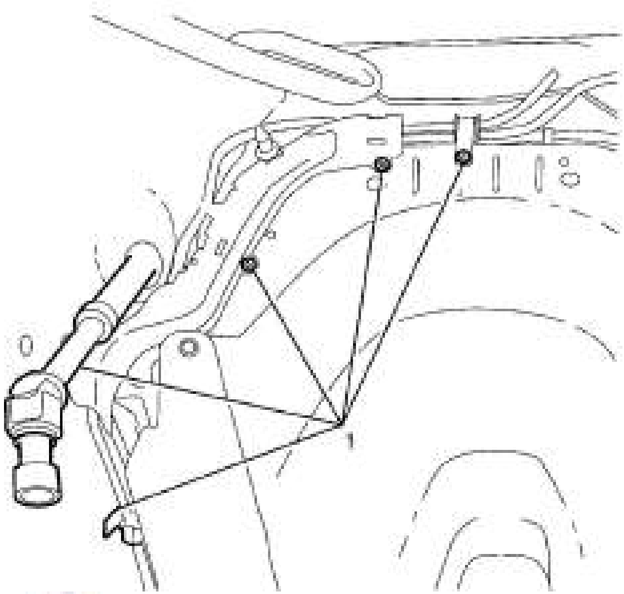
9. Remove the fuel line brackets to engine bay pop rivet retainers (1) and discard.

   Discard the pop rivet.

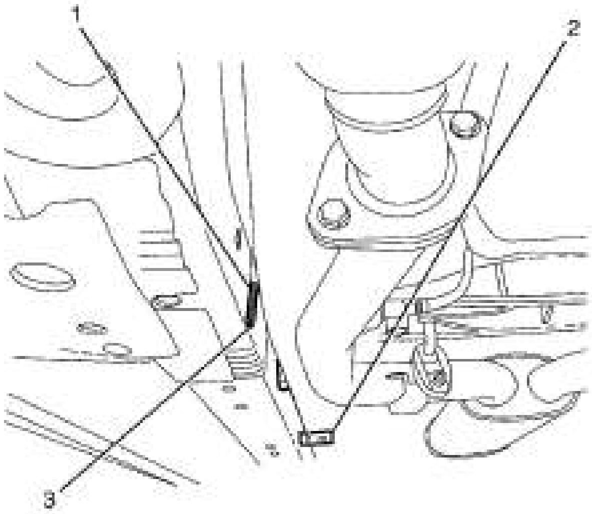
10. Remove the fuel line insulators from the engine bay fuel lines.
11. Remove the fuel and EVAP lines from the vehicle.

Installation Procedure

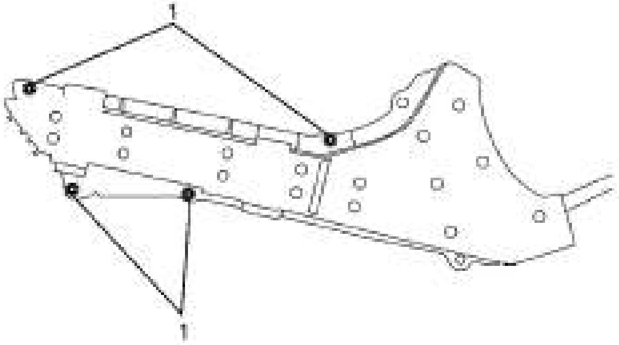
1. Install the fuel and EVAP lines to the vehicle.
2. Install the fuel line insulators to the engine bay fuel lines.



3. Install the fuel line brackets to the engine bay.
4. Install the NEW fuel line brackets to engine bay pop rivet retainers (1).



5. Install the fuel line insulators (2 and 3) to the chassis fuel lines.
6. Install the NEW fuel line retaining bracket to under body pop rivet retainer (1).



7. Install the fuel line stone guard to under body retaining nuts (1).

   Tighten
   Tighten the bolts to 5 N·m (44 lb in).

8. Install the fuel and EVAP lines at the fuel tank. Refer to Fuel Hose/Pipes Replacement - Engine Compartment.
9. Install the engine. Refer to Engine Replacement.
10. Install the fuel and EVAP lines at the engine compartment. Refer to Fuel Tank Replacement.
11. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
12. If re-programming is required. Refer to Control Module References.
    12.1. Turn ON the ignition for 2 seconds.
    12.2. Turn OFF the ignition for 2 seconds.
    12.3. Turn ON the ignition.
    12.4. Inspect for fuel leaks.

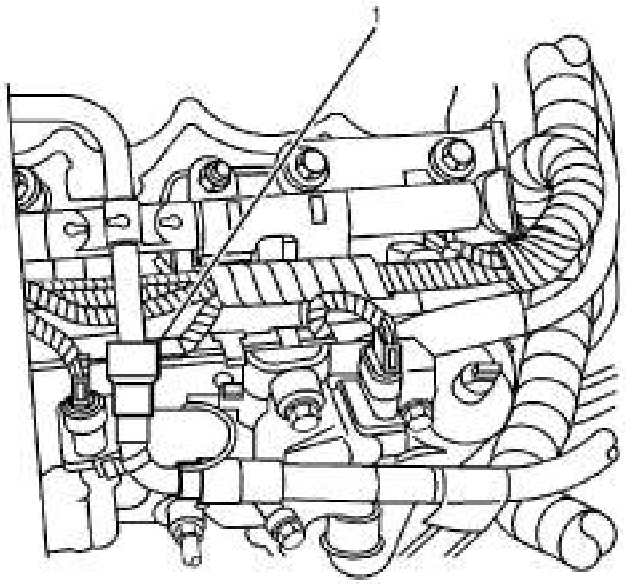
Fuel Hose / Pipes Replacement - Engine Compartment

Removal Procedure

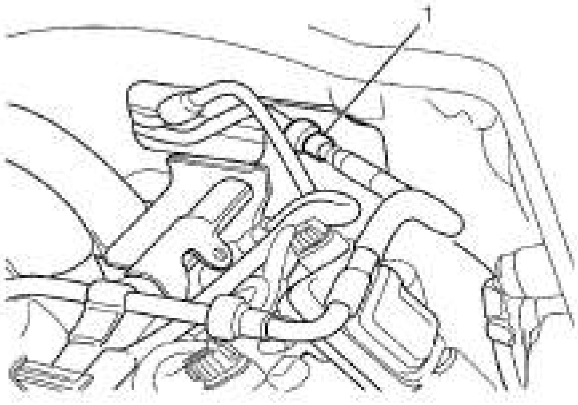
Notice: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

1. Remove the engine cover. Refer to Engine Cover Replacement .
2. Relieve the fuel system pressure. Refer to Fuel Pressure Relief.
3. Loosen the fuel filler cap to relieve any vapour pressure.
4. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

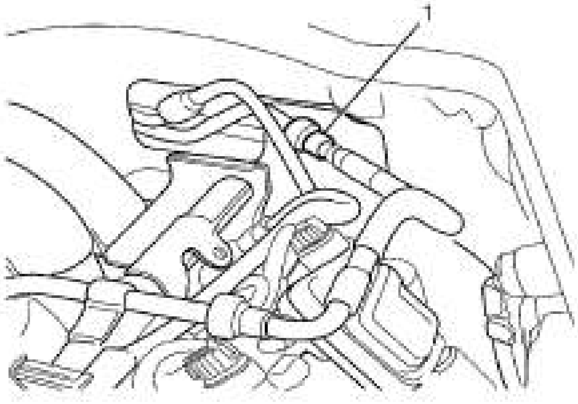


5. Disconnect the engine compartment fuel feed pipe (1) at the fuel rail. Refer to Metal Collar Quick Connect Fitting Service.

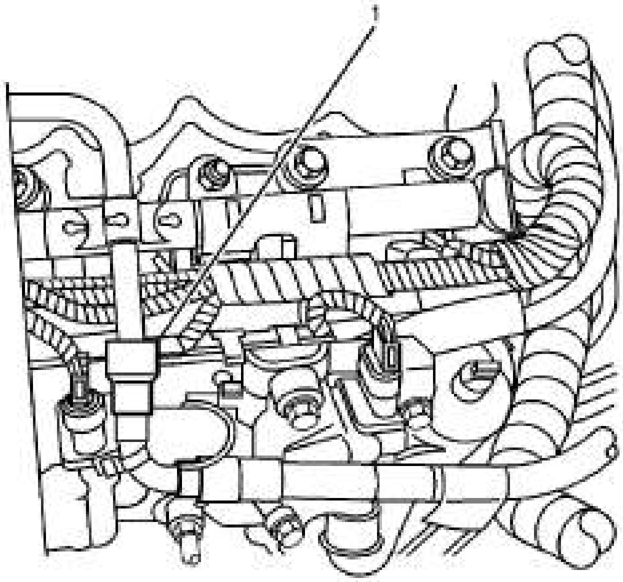


6. Disconnect the fuel feed pipe (1) from the fuel feed line. Refer to Metal Collar Quick Connect Fitting Service.
7. Cap the fuel pipe to prevent possible fuel system contamination.

Installation Procedure



1. Connect the fuel feed pipe (1) from the fuel feed line. Refer to Metal Collar Quick Connect Fitting Service.



2. Install the engine compartment fuel feed pipe (1) at the fuel rail. Refer to Metal Collar Quick Connect Fitting Service.
3. Install the fuel filler cap.
4. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
    - 4.1. Turn ON the ignition for 2 seconds.
    - 4.2. Turn OFF the ignition for 2 seconds.
    - 4.3. Turn ON the ignition.
    - 4.4. Inspect for fuel leaks.
5. Install the engine cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2037118**

Fuel Injection Fuel Rail Assembly Replacement

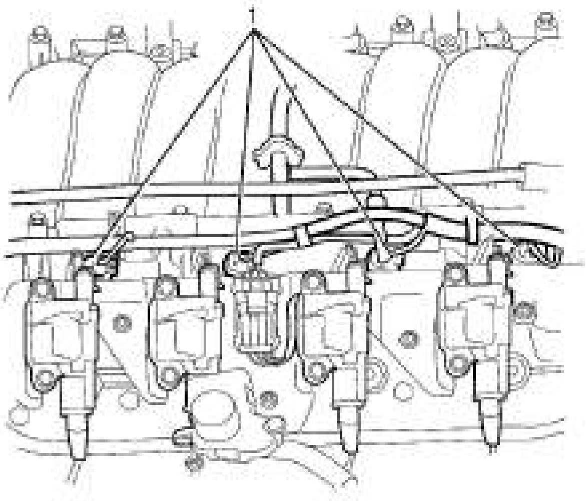
Removal Procedure

1. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief .
2. Before removal, clean the fuel rail assembly with a spray type engine cleaner, if necessary. Follow the package instructions. Do not soak fuel rails in liquid cleaning solvent.

Notice:

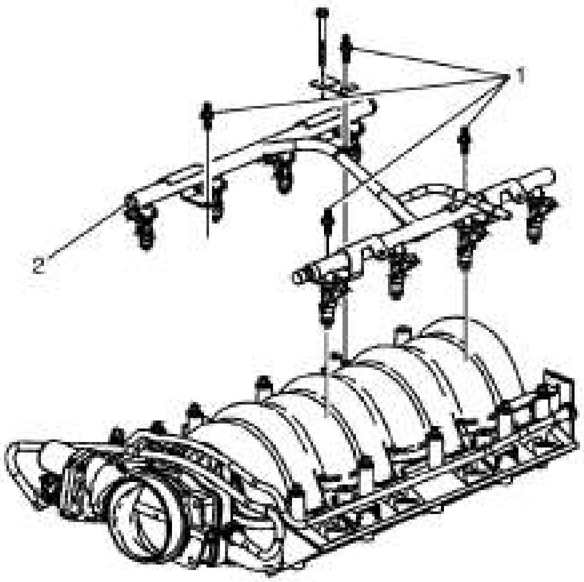
- Remove the fuel rail assembly carefully in order to prevent damage to the injector electrical connector terminals and the injector spray tips. Support the fuel rail after the fuel rail is removed in order to avoid damaging the fuel rail components.
- Cap the fittings and plug the holes when servicing the fuel system in order to prevent dirt and other contaminants from entering open pipes and passages.

3. Disconnect the fuel feed hose from the fuel rail. Refer to Metal Collar Quick Connect Fitting Service .

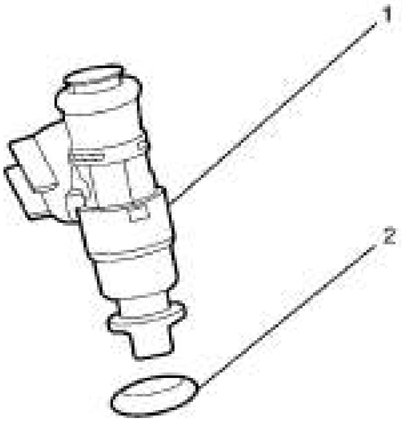


Important: Identify the connectors to their corresponding injectors to make sure correct sequential injector firing order after reassembly.

4. Disconnect the injector electrical connectors (2) to the injectors.



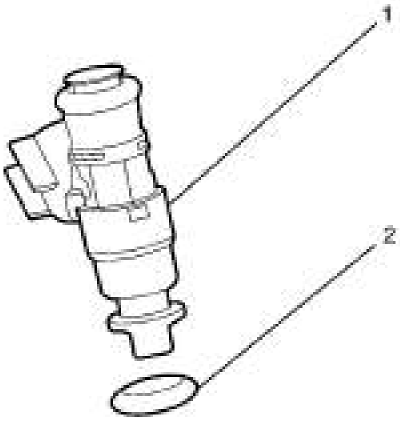
5. Disconnect the electrical harness from the fuel rail brackets.
6. Remove the fuel rail ground strap to intake manifold retaining bolt (1).
7. Remove the fuel rail to intake manifold retaining bolts (2).
8. Lift evenly on both sides of the fuel rail , and remove the fuel rail assembly.



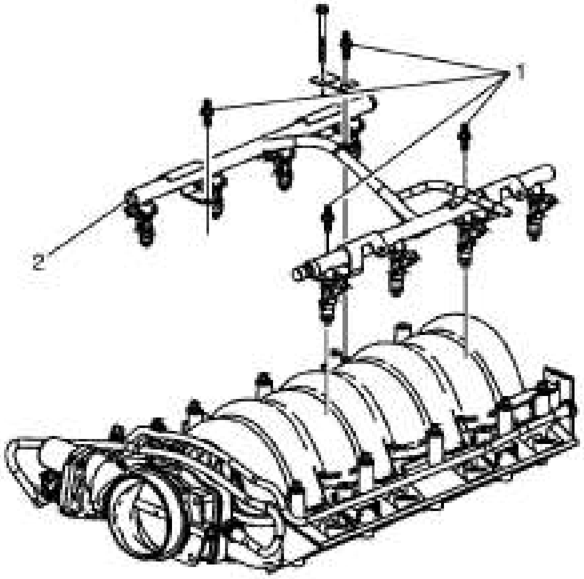
9. Remove the injector lower O-ring seal (2) from the spray tip end of each injector and discard.

   Discard the O-ring seals.

Installation Procedure



1. Lubricate the NEW lower injector O-ring seals (2) with clean engine oil.
2. Install the new O-ring seals (2) on the spray tip end of each injector.



3. Install the fuel rail assembly to the intake manifold.
4. Apply a 0.5 mm (0.020 in) band of approved threadlock to the threads of the fuel rail retaining bolts.

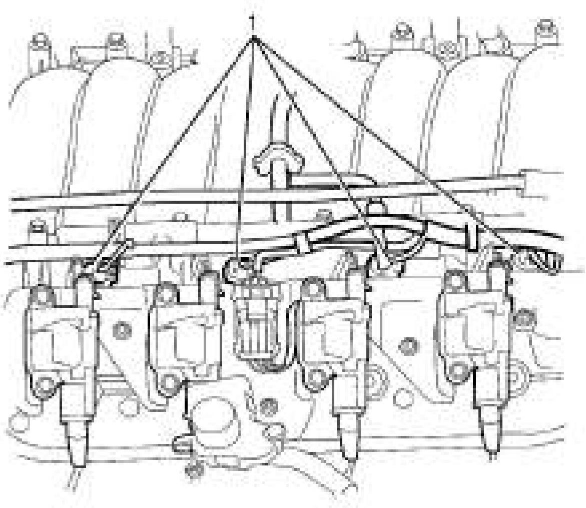
   Notice: Refer to Fastener Notice in the Preface section.

5. Install the fuel rail to intake manifold retaining bolts (2).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

6. Install the fuel rail ground strap to intake manifold retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



7. Connect the injector electrical connectors (1) to the injectors.
   - Install each connector on the proper injector in order to make sure correct sequential injector firing order.
   - Rotate the injectors as required in order to avoid stretching the wire harness.
8. Connect the electrical harness to the fuel rail brackets.
9. Connect the fuel feed hose to the fuel rail fuel pipe. Refer to Metal Collar Quick Connect Fitting Service .
10. Connect the negative battery cable.
11. Inspect for leaks.
    11.1. Turn ON the ignition for 2 seconds.
    11.2. Turn OFF the ignition for 10 seconds.
    11.3. Turn ON the ignition.
    11.4. Inspect for fuel leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 2037120

Fuel Injector Cleaning

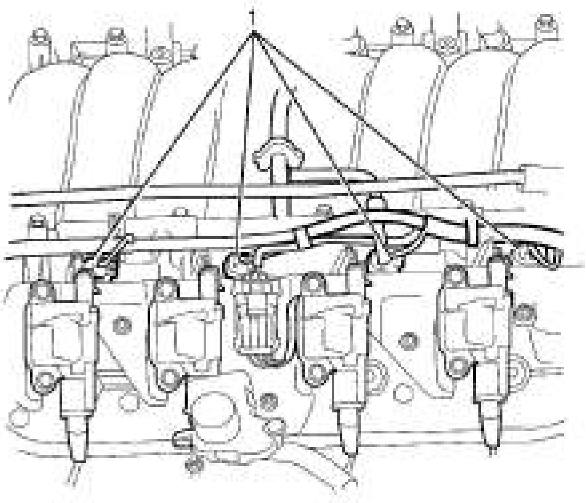
Removal Procedure

1. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief .
2. Before removal, clean the fuel rail assembly with a spray type engine cleaner, if necessary. Follow the package instructions. Do not soak fuel rails in liquid cleaning solvent.

Notice:

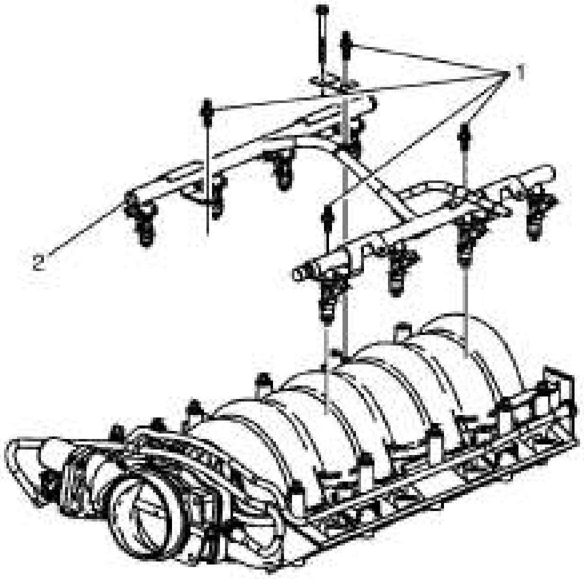
- Remove the fuel rail assembly carefully in order to prevent damage to the injector electrical connector terminals and the injector spray tips. Support the fuel rail after the fuel rail is removed in order to avoid damaging the fuel rail components.
- Cap the fittings and plug the holes when servicing the fuel system in order to prevent dirt and other contaminants from entering open pipes and passages.

3. Disconnect the fuel feed hose from the fuel rail. Refer to Metal Collar Quick Connect Fitting Service .

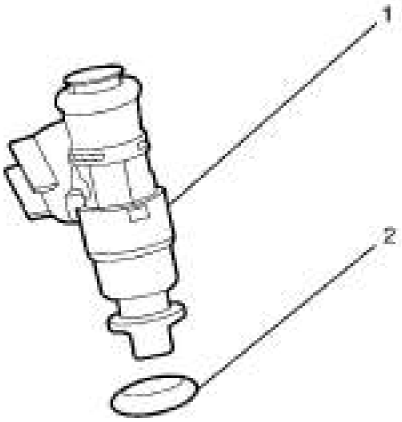


Important: Identify the connectors to their corresponding injectors to make sure correct sequential injector firing order after reassembly.

4. Disconnect the injector electrical connectors (2) to the injectors.



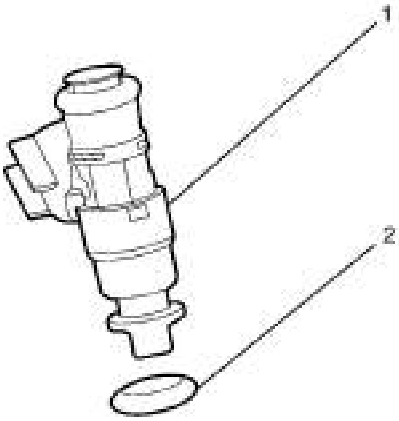
5. Disconnect the electrical harness from the fuel rail brackets.
6. Remove the fuel rail ground strap to intake manifold retaining bolt (1).
7. Remove the fuel rail to intake manifold retaining bolts (2).
8. Lift evenly on both sides of the fuel rail , and remove the fuel rail assembly.



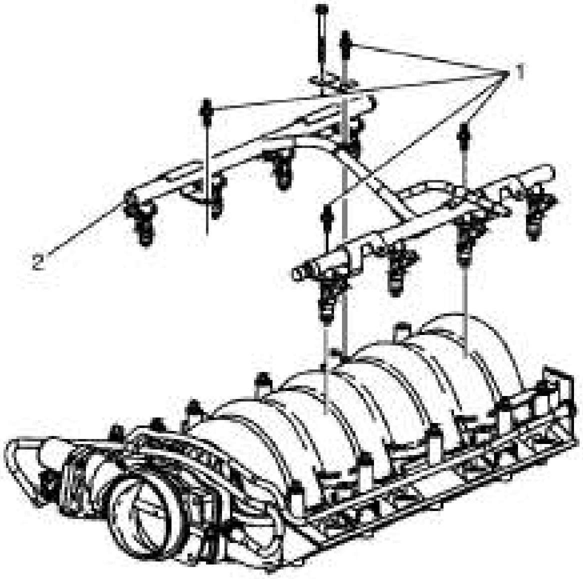
9. Remove the injector lower O-ring seal (2) from the spray tip end of each injector and discard.

   Discard the O-ring seals.

Installation Procedure



1. Lubricate the NEW lower injector O-ring seals (2) with clean engine oil.
2. Install the new O-ring seals (2) on the spray tip end of each injector.



3. Install the fuel rail assembly to the intake manifold.
4. Apply a 0.5 mm (0.020 in) band of approved threadlock to the threads of the fuel rail retaining bolts.

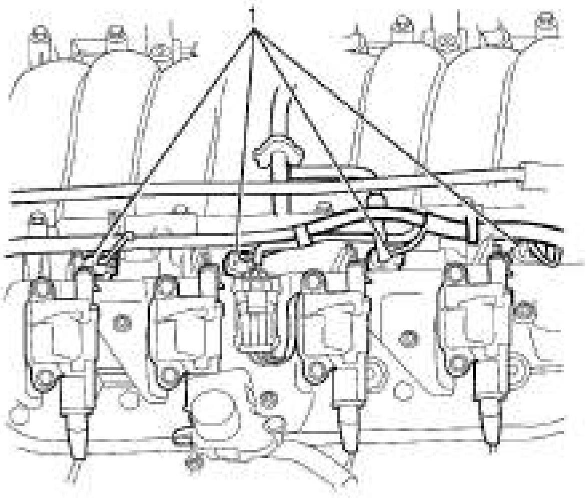
   Notice: Refer to Fastener Notice in the Preface section.

5. Install the fuel rail to intake manifold retaining bolts (2).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

6. Install the fuel rail ground strap to intake manifold retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



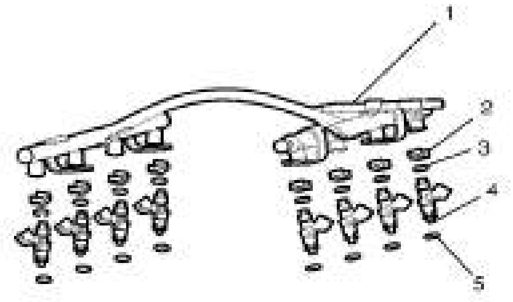
7. Connect the injector electrical connectors (1) to the injectors.
   - Install each connector on the proper injector in order to make sure correct sequential injector firing order.
   - Rotate the injectors as required in order to avoid stretching the wire harness.
8. Connect the electrical harness to the fuel rail brackets.
9. Connect the fuel feed hose to the fuel rail fuel pipe. Refer to Metal Collar Quick Connect Fitting Service .
10. Connect the negative battery cable.
11. Inspect for leaks.
    - 11.1. Turn ON the ignition for 2 seconds.
    - 11.2. Turn OFF the ignition for 10 seconds.
    - 11.3. Turn ON the ignition.
    - 11.4. Inspect for fuel leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 2037119

Fuel Injector Replacement

Removal Procedure

1. Remove the fuel rail assembly. Refer to Fuel Injection Fuel Rail Assembly Replacement.



2. Remove the fuel injector to fuel rail assembly retaining clips (2).

   Notice: Use care in removing the fuel injectors in order to prevent damage to the fuel injector electrical connector pins or the fuel injector nozzles. Do not immerse the fuel injector in any type of cleaner. The fuel injector is an electrical component and may be damaged by this cleaning method.

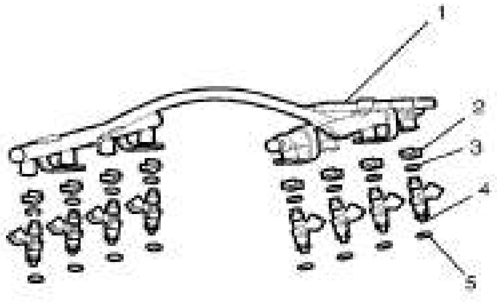
3. Remove the fuel injector (4) from the fuel rail (1).
4. Remove the injector lower O-ring seal (5) from the spray tip end of each injector and discard.

   Discard the O-ring seals.

5. Remove the injector upper O-ring seal (3) from the fuel rail end of each injector and discard.

   Discard the O-ring seals.

Installation Procedure



1. Apply a small amount of clean motor oil to the O-rings (3) and (5), before installing the new fuel injector.
2. Install the NEW injector upper O-ring seals (3) to the injectors.
3. Install the NEW injector lower O-ring seals (5) to the injectors.
4. Install the fuel injector (4) in the fuel rail (1).
5. Install the retaining clips for the fuel injector (3).
6. Install the fuel rail assembly. Refer to Fuel Injection Fuel Rail Assembly Replacement.
    - 6.1. Turn the ignition switch ON for 2 seconds.
    - 6.2. Turn the ignition switch OFF for 10 seconds.
    - 6.3. Turn the ignition switch ON.
    - 6.4. Inspect for fuel leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2053073**

Fuel Level Sensor Replacement

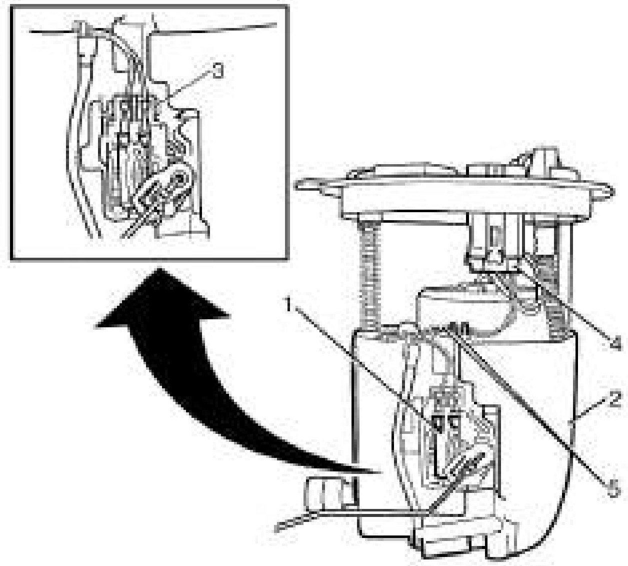
Removal Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

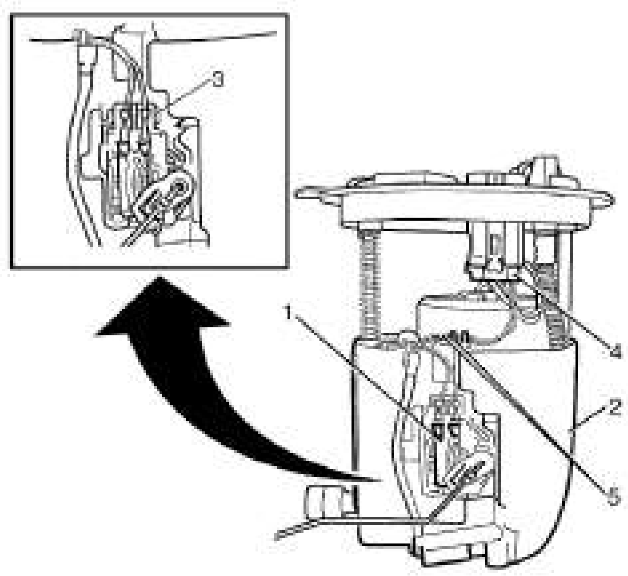
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Remove the fuel tank. Refer to Fuel Tank Replacement .
2. Remove the primary fuel tank module assembly from the fuel tank. Refer to Primary Fuel Tank Module Replacement .



3. Disconnect the fuel level sensor connector (4) and unclip the wiring from the harness securing clips (5).
4. Remove the fuel level sensor from the primary fuel tank module assembly.
5. Unlock the locking clip (3) and gently push the fuel level sensor upwards.
6. Remove the fuel level sensor from the primary fuel tank module assembly.

Installation Procedure



1. Locate and install the fuel tank level sensor (1) to the primary fuel tank module assembly (2). Make sure that the locking clip (3) engages.
2. Connect the fuel level sensor connector (4) and route the wiring through the harness securing clips (5).
3. Install the fuel level sensor to the primary fuel tank module assembly.
4. Install the primary fuel tank module assembly to the fuel tank. Refer to Primary Fuel Tank Module Replacement .
5. Install the fuel tank. Refer to Fuel Tank Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2039718**

Fuel Pressure Gage Installation and Removal

Tools Required

- DW100-010
- AU-453

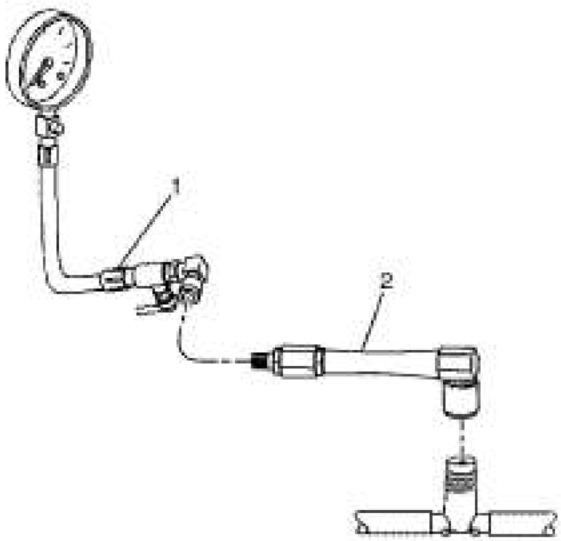
Installation Procedure

Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

> **Caution:** Wrap a shop towel around the fuel pressure connection in order to reduce the risk of fire and personal injury. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gage. Place the towel in an approved container when the connection of the fuel pressure gage is complete.

> **Notice:** Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:
> - The fuel pipe connections
> - The hose connections
> - The areas surrounding the connections

1. Remove the engine covers. Refer to Engine Cover Replacement .



2. Remove the fuel pressure service connection dust cap from the fuel rail.
3. Connect the AU-453 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the AU-453 (1) in order to avoid spillage.
4. Connect the DW100-010 (2) fuel pressure gauge to the AU-453 (1). Wrap a shop towel

around the fitting while connecting the gauge in order to avoid spillage.

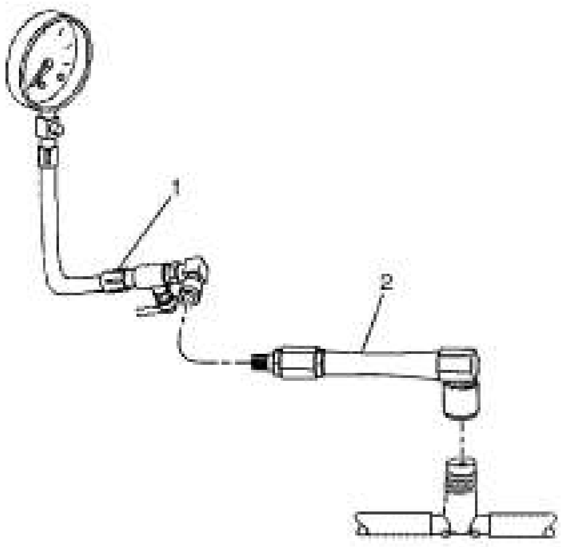
5. Turn ON the ignition.

Caution: Do not drain the fuel into an open container. Never store the fuel in an open container due to the possibility of a fire or an explosion.

6. Place the bleed hose of the fuel pressure gauge into a suitable container.
7. Open the bleed valve on the fuel pressure gauge in order to bleed the air from the fuel pressure gauge.
8. Command the fuel pump ON with a scan tool.
9. Close the bleed valve on the fuel pressure gauge.
10. Inspect for fuel leaks.

Removal Procedure

1. Turn OFF the ignition.
2. Command the fuel pump OFF with the scan tool.
3. Open the bleed valve on the fuel pressure gauge in order to bleed the remaining fuel from the fuel pressure gauge.
4. Remove the bleed hose from the fuel pressure gauge.



5. Disconnect the DW100-010 (2) fuel pressure gauge from the AU-453 (1). Wrap a shop towel around the fitting while connecting the gauge in order to avoid spillage.
6. Disconnect the AU-453 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the AU-453 (1) in order to avoid spillage.
7. Install the fuel pressure service connection dust cap to the fuel rail.
8. Install the engine covers. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1993894**

Fuel Pressure Relief

Tools Required

- J 29658-D Fuel Pressure Gauge
- AU-453 Fuel Pressure Test Hose Adapter

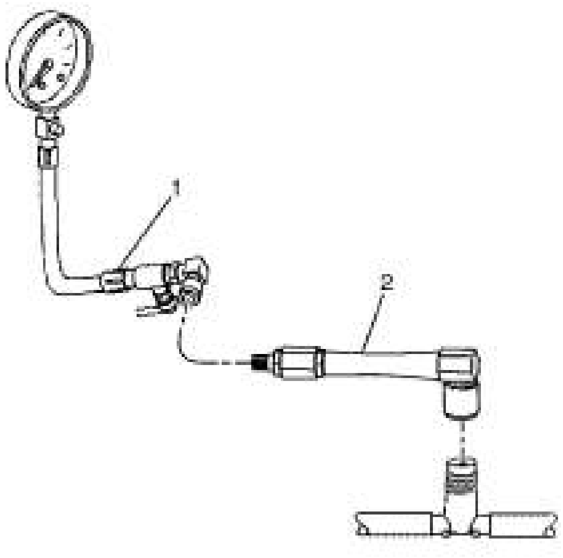
Caution: Gasoline or gasoline vapors are highly flammable. A fire could occur if an ignition source is present. Never drain or store gasoline or diesel fuel in an open container, due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.

Caution: Relieve the fuel system pressure before servicing fuel system components in order to reduce the risk of fire and personal injury.

After relieving the system pressure, a small amount of fuel may be released when servicing the fuel lines or connections. In order to reduce the chance of personal injury, cover the regulator and the fuel line fittings with a shop towel before disconnecting. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn the ignition OFF.
2. Disconnect the negative battery cable in order to avoid possible fuel discharge if an accidental attempt is made to start the engine. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the fuel injector sight shield.



4. Connect the EN-47620 (1) fuel pressure test hose adapter to the fuel pressure connection. Wrap a shop towel around the fitting while connecting the J 29658-D (1) in order to avoid spillage.
5. Connect the J 29658-D (2) fuel pressure gauge to the EN-47620 (1). Wrap a shop towel

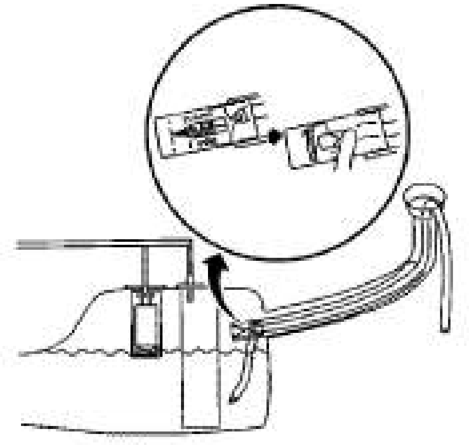
around the fitting while connecting the gauge in order to avoid spillage.

6. Install the bleed hose into an approved container.
7. Open the valve in order to bleed the system pressure. Fuel connections are now safe for servicing.
8. Drain any fuel remaining in the gauge into an approved container.
9. Install the fuel injector sight shield.
10. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

Fuel Tank Draining

Tools Required

- J 45004 Fuel Tank Drain Hose
- J 42960-2 Fuel Flapper Door Holder



Caution: Never drain or store fuel in an open container. Always use an approved fuel storage container in order to reduce the chance of fire or explosion.

Notice: Do not run the fuel pump unless the fuel pump is submerged in fuel in order to prevent damage to the fuel pump.

1. Remove the fuel filler cap.
2. Install the J 42960-2 into the fuel fill pipe in order to hold the door open.
3. Insert the J 45004 into the fuel tank until the hose reaches the bottom of the fuel tank.
4. Use an air operated pump device in order to drain as much fuel through the fuel fill pipe as possible.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2195302**

Fuel Tank Replacement

Special Tools

- EN-46843
- 7370
- 7371
- EN-48536

Removal Procedure

1. Ignition OFF.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

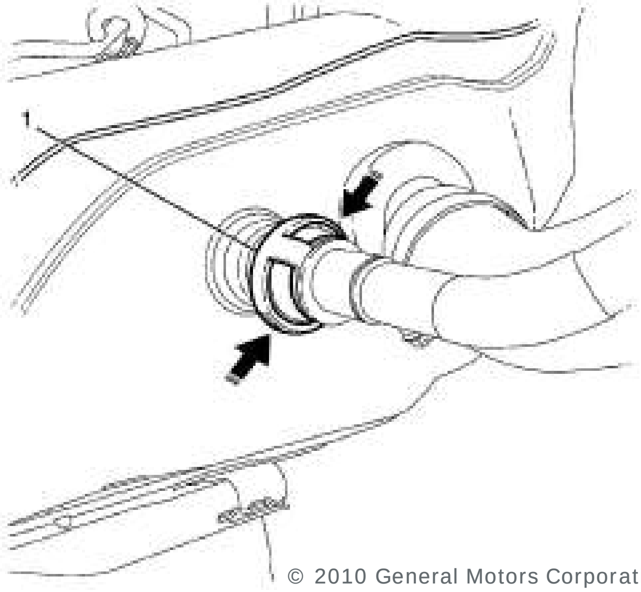
   Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

3. Drain the fuel tank into a suitable container. Refer to Fuel Tank Draining.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

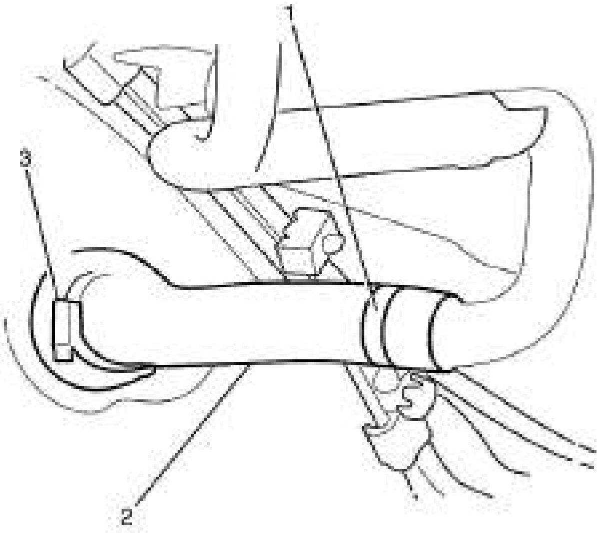
   Caution: Refer to Safety Glasses Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the right rear wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the exhaust system for access. Refer to Exhaust System Replacement.
7. Remove the propeller shaft. Refer to Propeller Shaft Replacement.
8. Remove the park brake cables. Refer to Parking Brake Rear Cable Replacement.

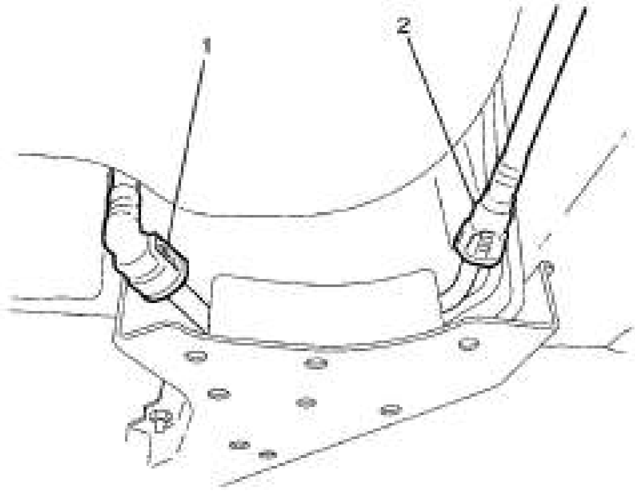


Important: Squeezes the collar of the EVAP canister hose connector (1) to release the connector.

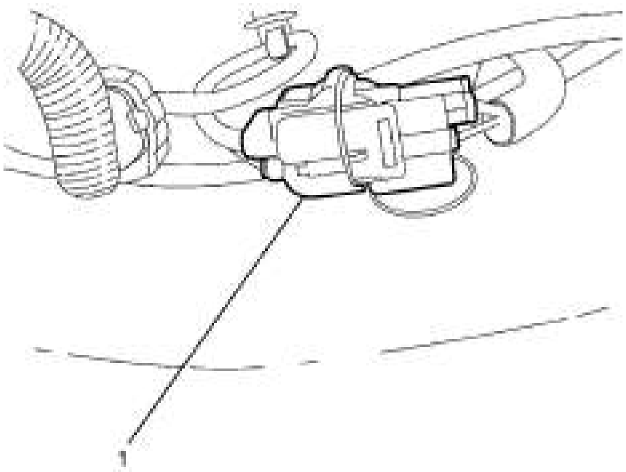
9. Disconnect the filler vent tube connector (1) from the fuel tank assembly.



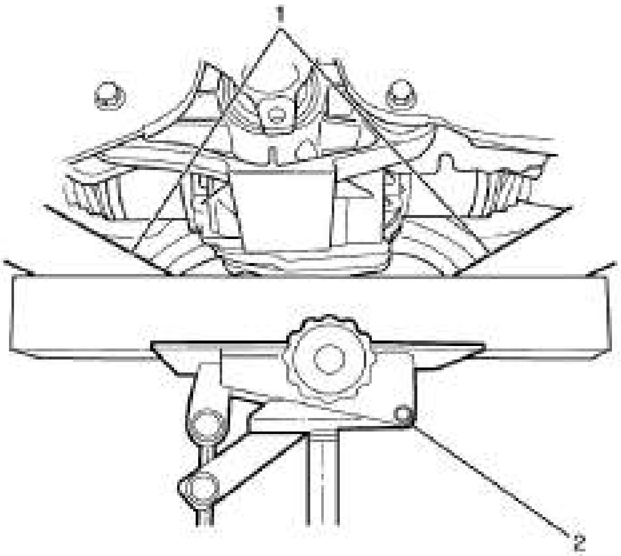
10. Remove the retaining hose clamp (1) from the fuel filler hose (2).
11. Remove the retaining hose clamp (3) from the fuel filler hose (2).
12. Remove the fuel filler hose (2) from the vehicle.



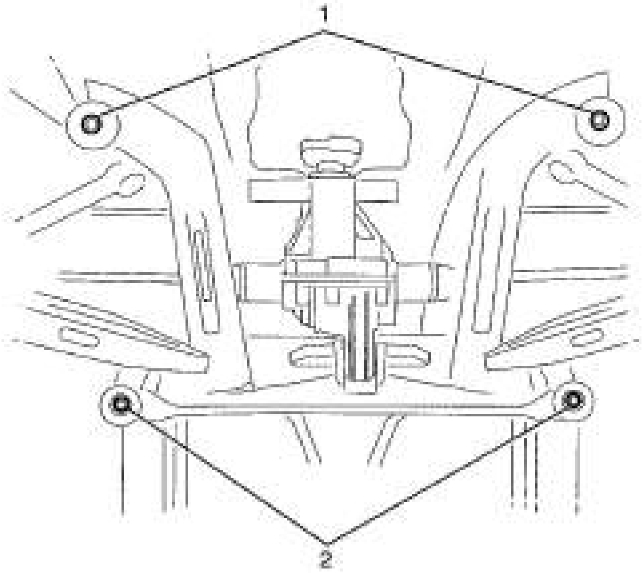
13. Disconnect the fuel feed line connector (1) using 7371 .
14. Disconnect the EVAP line (2). Refer to Plastic Collar Quick Connect Fitting Service.



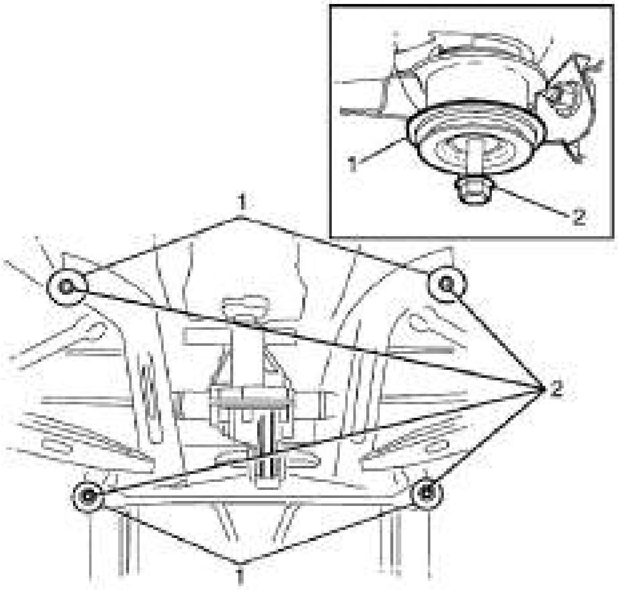
15. Disconnect the fuel tank electrical connector (1) from the chassis electrical harness.



16. Support the rear frame assembly (1) using a suitable tool (2).



17. Remove the rear frame to chassis retaining bolts (1) and discard.
18. Remove the rear frame to chassis retaining bolts (2) and discard.

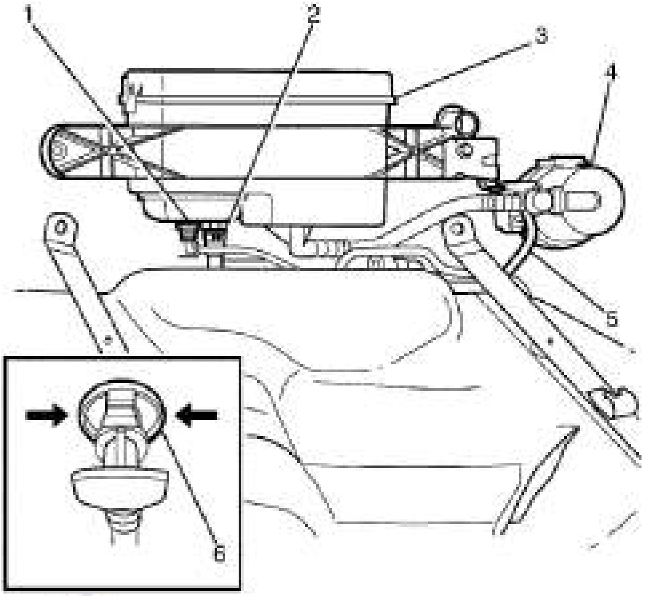


Important: Make sure that the bolts (2) extends 50mm (2 in) from the rear frame.

19. Install the bolts (2) of EN-48536 to the rear frame mounts (1).

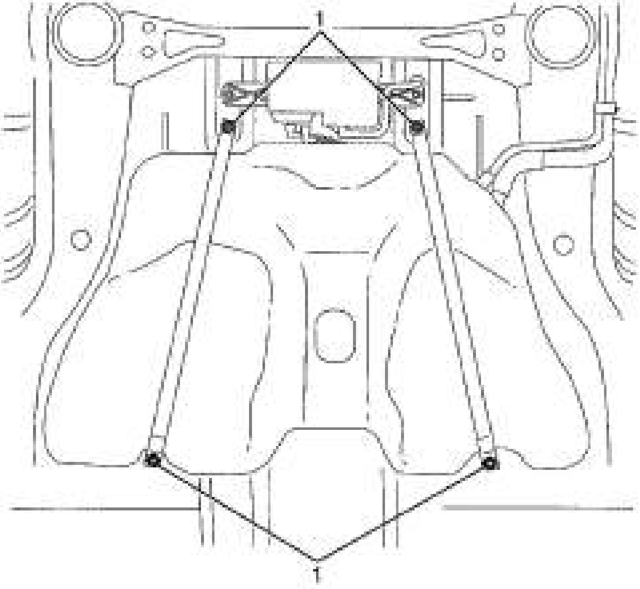
Important: When lowering the rear frame do not to damage the rear brake hoses.

20. Lower the rear frame onto the bolts (2) of EN-48536 .



Important: Squeezes the collar (6) of the EVAP canister hose connector to release the connector (1).

21. Detach the EVAP canister hose connector (1) from the EVAP canister (3).
22. Detach the EVAP canister hose connector (2) from the EVAP canister (3). Refer to Plastic Collar Quick Connect Fitting Service.
23. Disconnect the electrical connector (5) from the EVAP canister vent solenoid (4).



Important: Take care not to damage the following components when lowering the fuel tank assembly.

- The fuel tank assembly wiring harness.

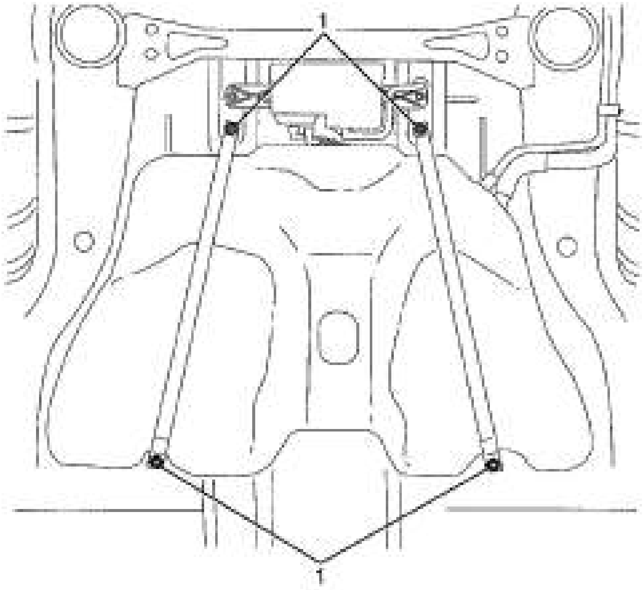
- The fuel feed pipe.
- The EVAP pipes.

Important: Support the fuel tank assembly with a suitable tool before removing the fuel tank assembly straps to chassis retaining bolts (1)

24. Remove the fuel tank strap to chassis retaining bolts (1).
25. With the aid of an assistant, carefully manoeuvre the fuel tank assembly from the vehicle.
26. Remove the following components if replacing the fuel tank:
    - The primary fuel tank module--Refer to Primary Fuel Tank Module Replacement.
    - The secondary fuel tank module--Refer to Secondary Fuel Tank Module Replacement.
    - The fuel tank pressure sensor. Refer to Fuel Tank Pressure Sensor Replacement.
    - The fuel tank assembly electrical harness.
    - The fuel tank EVAP pipes.

Installation Procedure

1. If the fuel tank was replaced, install the following components:
    - The primary fuel tank module--Refer to Primary Fuel Tank Module Replacement.
    - The secondary fuel tank module--Refer to Secondary Fuel Tank Module Replacement.
    - The fuel tank pressure sensor. Refer to Fuel Tank Pressure Sensor Replacement.
    - The fuel tank assembly electrical harness.
    - The fuel tank EVAP pipes.



Important: Take care not to damage the following components when installing the fuel tank assembly to the vehicle:

- The fuel tank assembly wiring harness.

- The fuel feed pipe.
- The EVAP pipes.

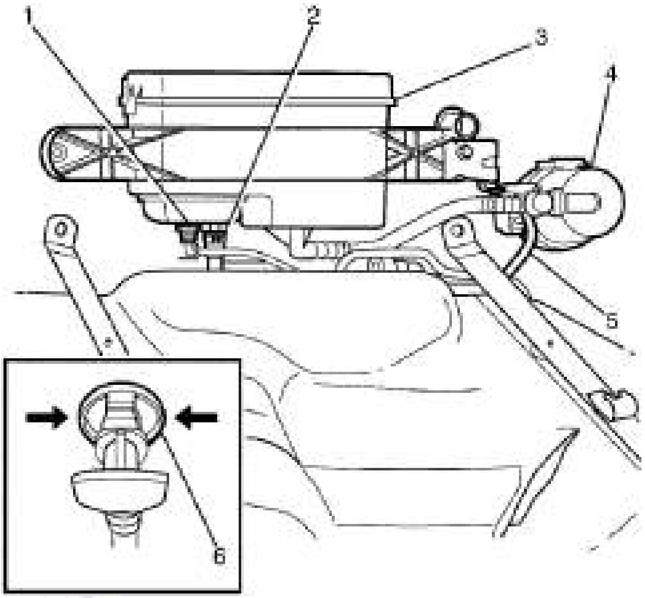
Important: Support the fuel tank assembly with a suitable tool while installing the fuel tank assembly straps to chassis retaining bolts (1).

2. With the aid of an assistant, carefully manoeuvre and install the fuel tank assembly to the vehicle.

Notice: Refer to Fastener Notice in the Preface section.

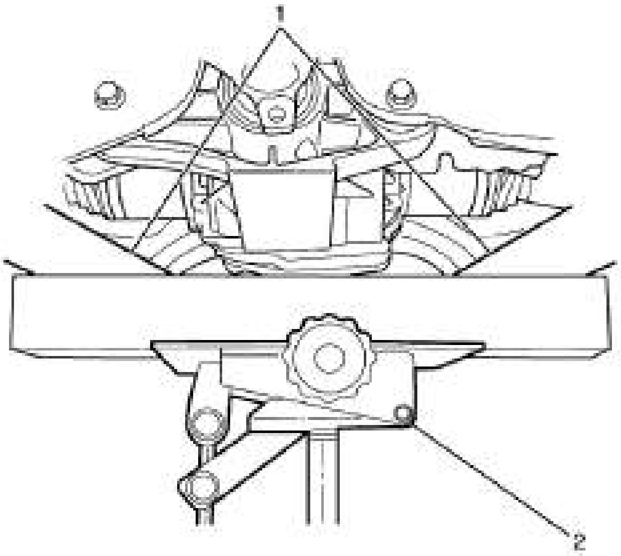
3. Install the fuel tank assembly strap to chassis retaining bolts (1).

Tighten
Tighten the fuel tank strap bolts to 20 N·m (15 lb ft)

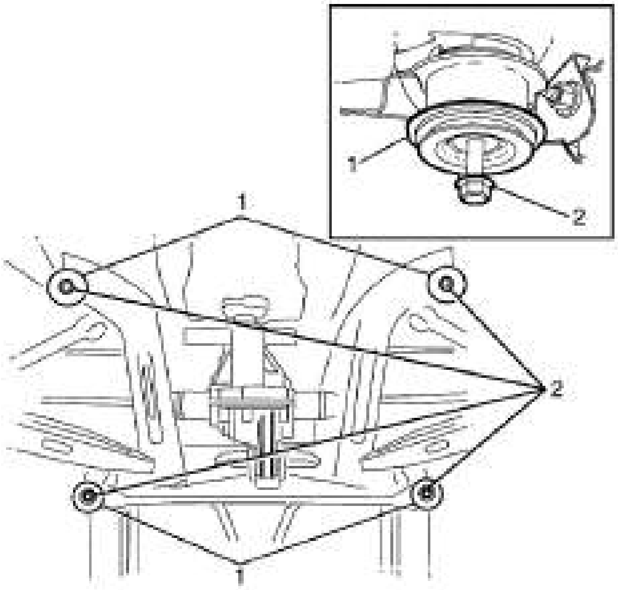


Important: Listen for an audible click to confirm correct installation.

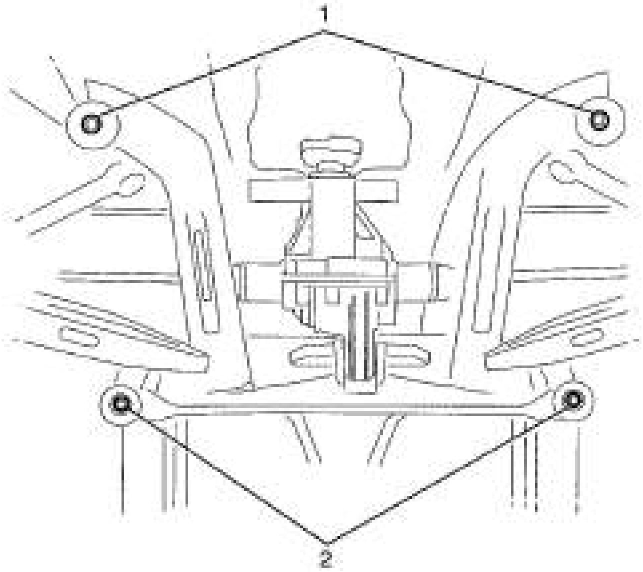
4. Attach the EVAP canister hose connector (1) to the EVAP canister (3).
5. Attach the EVAP canister hose connector (2) to the EVAP canister (3). Refer to Plastic Collar Quick Connect Fitting Service.
6. Connect the electrical connector (5) to the EVAP canister vent solenoid (4).



7. Raise and support the rear frame assembly (1) into its position using a suitable tool (2).



8. Remove the bolts (2) of EN-48536 from the rear frame mounts (1).



Important: Using a suitable tool clean the threaded holes of the rear frame to chassis retaining bolts.

9. Install the NEW rear frame to chassis retaining bolts (2).

   Do not fully tighten at this stage.

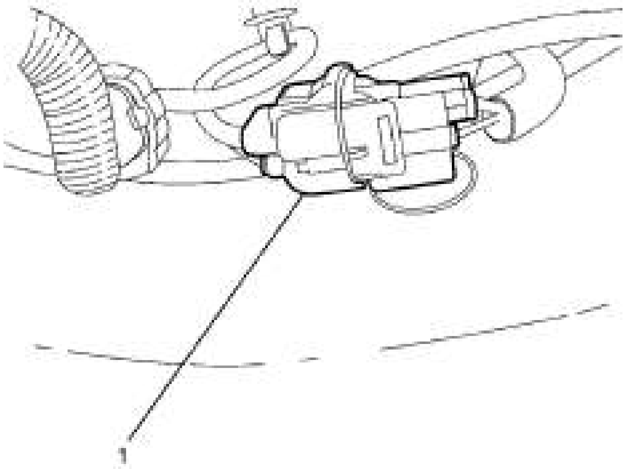
10. Install the NEW rear frame to chassis retaining bolts (1).

    Do not fully tighten at this stage.

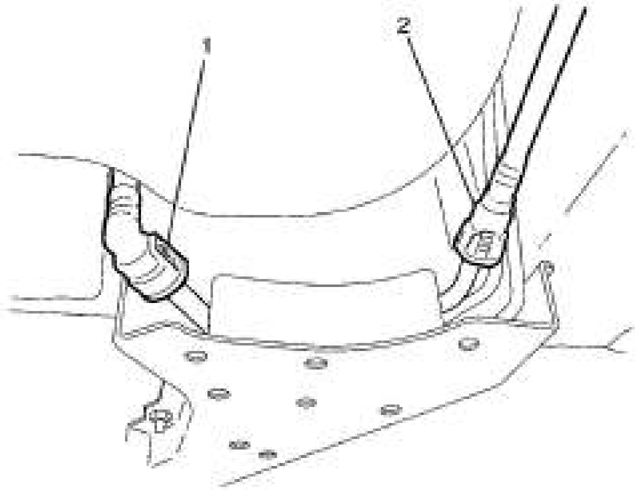
11. Tighten the NEW rear frame to chassis retaining bolts (1) and (2) to:

    First Pass
    Tighten the bolts to 65 N·m (48 lb ft)

    Final Pass
    Tighten the bolts a further 125 degrees.

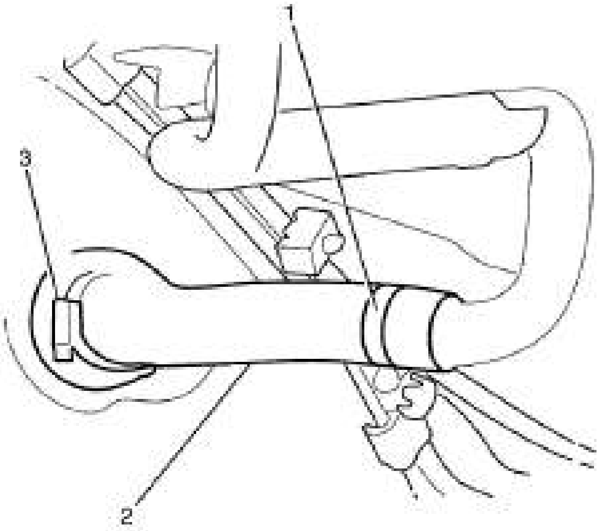


12. Connect the fuel tank assembly electrical connector (1) to the chassis electrical harness.



Important: Listen for an audible click to confirm correct installation.

13. Connect the EVAP line (2) to the EVAP chassis pipe. Refer to Plastic Collar Quick Connect Fitting Service.
14. Connect the fuel feed line (1) to the chassis fuel feed pipe.

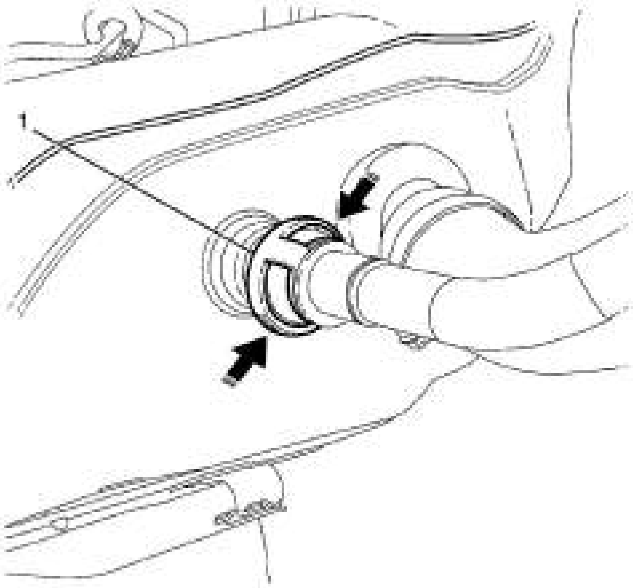


15. Install the fuel filler hose (2) to the vehicle.
16. Install the retaining hose clamp (1) to the fuel filler hose (2).

    Tighten
    Tighten the fuel filler hose to 4 N·m (35 lb in).

17. Install the retaining hose clamp (3) to the fuel filler hose (2).

    Tighten
    Tighten the fuel filler hose to 4 N·m (35 lb in).



Important: Listen for an audible click to confirm correct installation.

18. Connect the filler vent tube connector (1) to the fuel tank assembly.
19. Install the park brake cables. Refer to Parking Brake Rear Cable Replacement.
20. Install the propeller shaft. Refer to Propeller Shaft Replacement.
21. Install the exhaust system. Refer to Exhaust System Replacement.
22. Install the right rear wheel. Refer to Tire and Wheel Removal and Installation.
23. Lower the vehicle to the ground.
24. Fill the fuel tank with the drained fuel.
25. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
26. Inspect for fuel leaks using the following procedure:
    - Turn ON the ignition, with the engine OFF for 2 seconds.
    - Turn OFF the ignition, for 10 seconds.
    - Turn ON the ignition, with the engine OFF.
    - Inspect for leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1993905**

Heated Oxygen Sensor Replacement - Bank 1 Sensor 1

Important: Allow the exhaust system to cool to an ambient temperature before removal of the oxygen sensor. Failure to adhere may result in personal injury.

When removing the catalytic converters (1), it is necessary to disconnect the wiring harness connectors from the pre-catalytic oxygen sensor.

Service Precautions

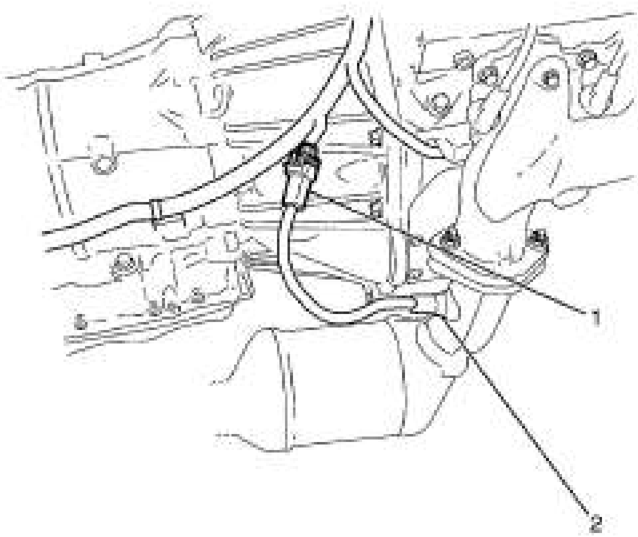
- Keep the oxygen sensor free of contaminates. Do not use any solvents to clean the sensor.
- Do not attempt to repair any part of the sensor including the wiring and connector. Replace the sensor if any damage is evident.
- When the exhaust system is cold the oxygen sensor may be difficult to remove. Excessive force may damage the threads in the exhaust assembly.
- If reusing the old oxygen sensor apply an anti-seize compound to the thread. New oxygen sensors come with the compound already applied.

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

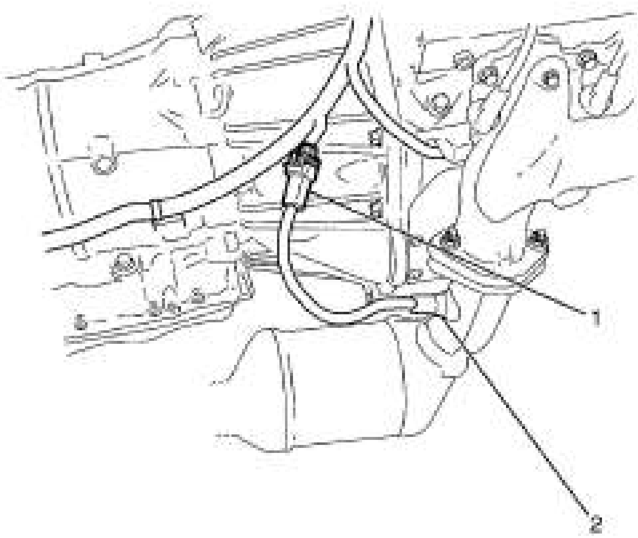


3. Disconnect the wiring harness connector (1) to the oxygen sensor wiring harness.
4. Remove the right catalytic converter from the vehicle. Refer to Catalytic Converter

Replacement - Right Side .

5. Loosen and remove the oxygen sensor (2). Take care not to damage the oxygen sensor.

Installation Procedure



Important: If using the old oxygen sensor (2) coat the threads with an anti-seize compound.

1. Install the oxygen sensor (2) to the right catalytic converter.

   Tighten
   Tighten the oxygen sensor to 40 N·m (30 lb ft).

2. Install the right catalytic converter to the vehicle. Refer to Catalytic Converter Replacement - Right Side .
3. Connect the wiring harness connector (1) to the oxygen sensor harness.
4. Lower the vehicle.
5. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
6. If re-programming is required. Refer to Control Module References .
7. Check for codes using a suitable scanner,

Heated Oxygen Sensor Replacement - Bank 1 Sensor 2

When removing the front exhaust pipes, it is necessary to disconnect the wiring harness connectors from the post-catalytic oxygen sensors.

Service Precautions

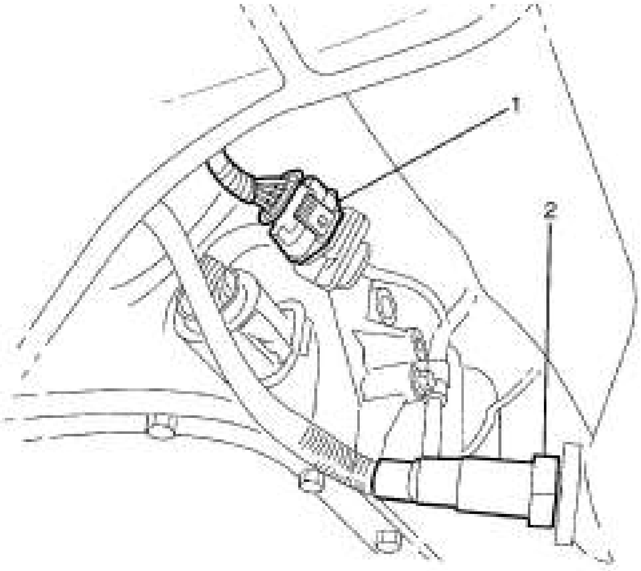
- Keep the oxygen sensor free of contaminates. Do not use any solvents to clean the sensor.
- Do not attempt to repair any part of the sensor including the wiring and connector. Replace the sensor if any damage is evident.
- When the exhaust system is cold the oxygen sensor may be difficult to remove. Excessive force may damage the threads in the exhaust assembly.
- If reusing the old oxygen sensor apply an anti-seize compound to the thread. New oxygen sensors come with the compound already applied.

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

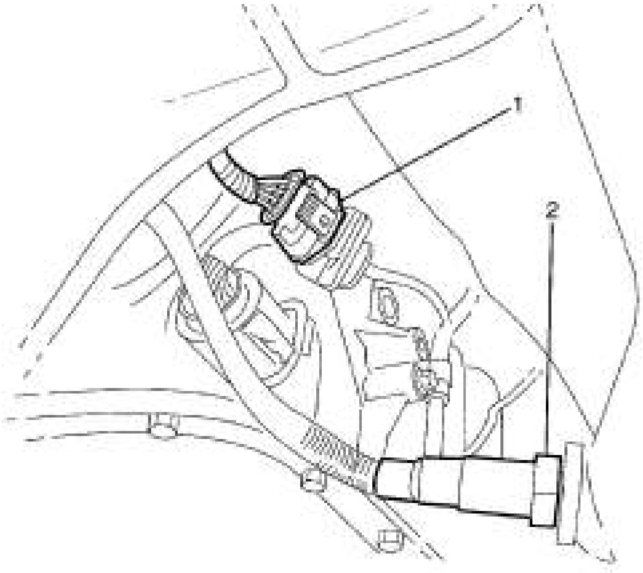
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



3. Disconnect the wiring harness connector (1) for the oxygen sensor wiring harness.
4. Loosen and remove the oxygen sensor (2) to catalytic converter. Take care not to damage the oxygen sensor.

Installation Procedure



Important: If using the old oxygen sensor (2) coat the threads with an anti-seize compound.

1. Install the oxygen sensor (2) to the right catalytic converter.

   Tighten
   Tighten the oxygen sensor to 40 N·m (30 lb ft).

2. Connect the wiring harness connector (1) to the oxygen sensor wiring harness.
3. Lower the vehicle.
4. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
5. If re-programming is required. Refer to Control Module References .
6. Check for codes using a suitable scanner.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 1993909**

Heated Oxygen Sensor Replacement - Bank 2 Sensor 1

When removing the catalytic converters (1), it is necessary to disconnect the wiring harness connectors from the pre-catalytic oxygen sensor.

Service Precautions

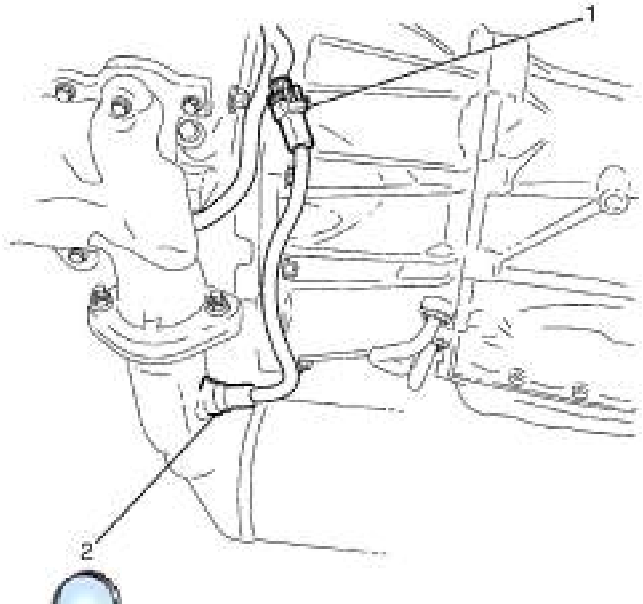
- Keep the oxygen sensor free of contaminates. Do not use any solvents to clean the sensor.
- Do not attempt to repair any part of the sensor including the wiring and connector. Replace the sensor if any damage is evident.
- When the exhaust system is cold the oxygen sensor may be difficult to remove. Excessive force may damage the threads in the exhaust assembly.
- If reusing the old oxygen sensor apply an anti-seize compound to the thread. New oxygen sensors come with the compound already applied.

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

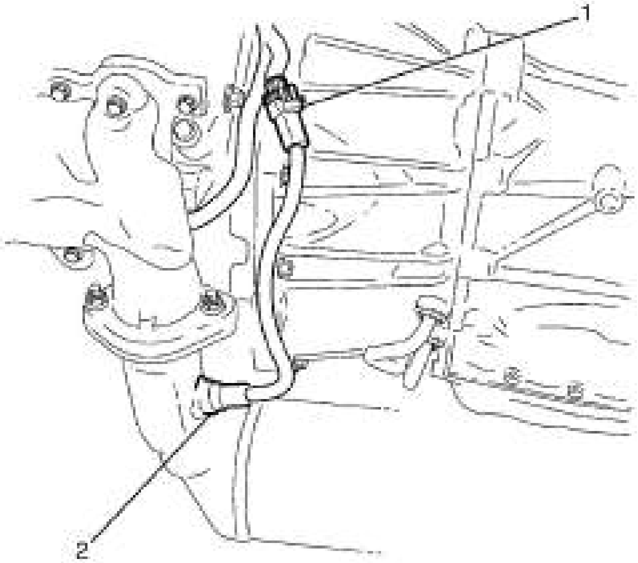
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



3. Disconnect the wiring harness connector (1) to the oxygen sensor wiring harness.
4. Remove the left catalytic converter from the vehicle. Refer to Catalytic Converter Replacement - Left Side .
5. Loosen and remove the oxygen sensor (2). Take care not to damage the oxygen sensor.

Installation Procedure

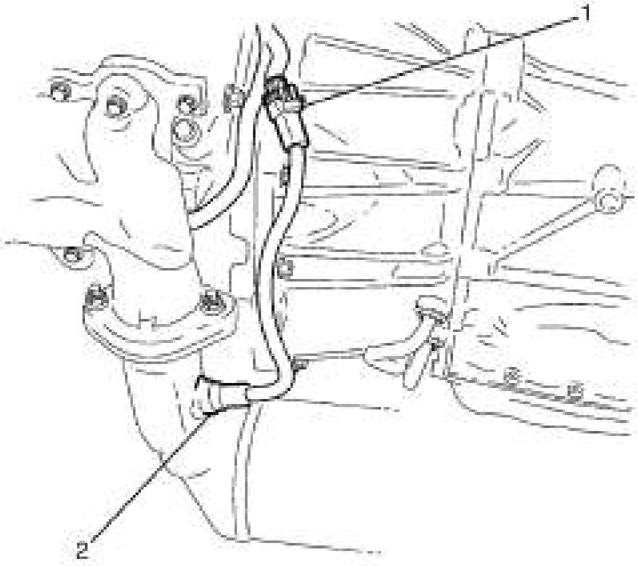


Important: If using the old oxygen sensor (2) coat the threads with an anti-seize compound.

1. Install the oxygen sensor (2) to the left catalytic converter.

   Tighten
   Tighten the oxygen sensor to 40 N·m (30 lb ft).

2. Install the left catalytic converter to the vehicle. Refer to Catalytic Converter Replacement - Left Side .



3. Connect the wiring harness connector (1) to oxygen sensor wiring harness.
4. Lower the vehicle.
5. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
6. If re-programming is required. Refer to Control Module References .
7. Check for codes using a suitable scanner,

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2037114**

Heated Oxygen Sensor Replacement - Bank 2 Sensor 2

When removing the front exhaust pipes, it is necessary to disconnect the wiring harness connectors from the post-catalytic oxygen sensors.

Service Precautions

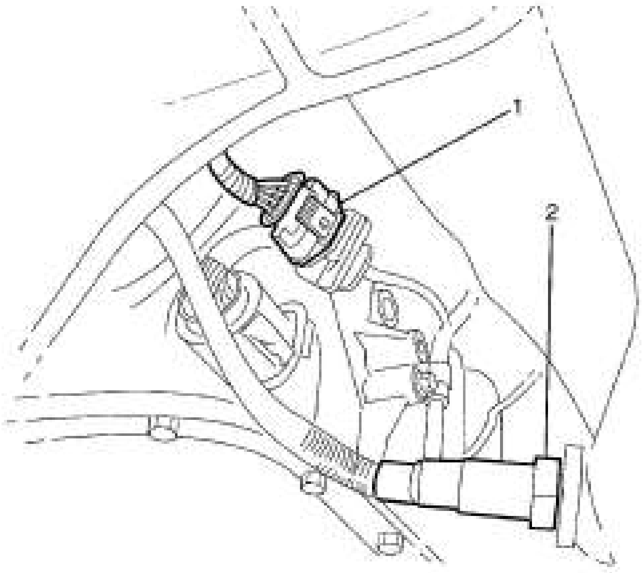
- Keep the oxygen sensor free of contaminates. Do not use any solvents to clean the sensor.
- Do not attempt to repair any part of the sensor including the wiring and connector. Replace the sensor if any damage is evident.
- When the exhaust system is cold the oxygen sensor may be difficult to remove. Excessive force may damage the threads in the exhaust assembly.
- If reusing the old oxygen sensor apply an anti-seize compound to the thread. New oxygen sensors come with the compound already applied.

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

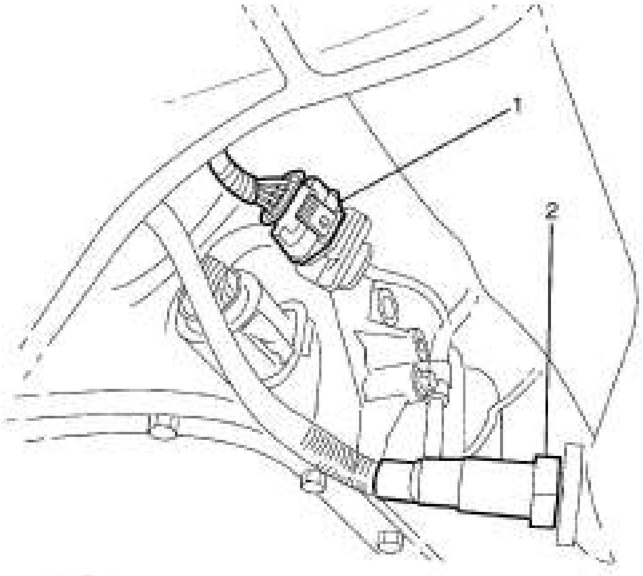
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



3. Disconnect the wiring harness connector (1) to the oxygen sensor wiring harness.
4. Loosen and remove the oxygen sensor (2). Take care not to damage the oxygen sensor.

Installation Procedure

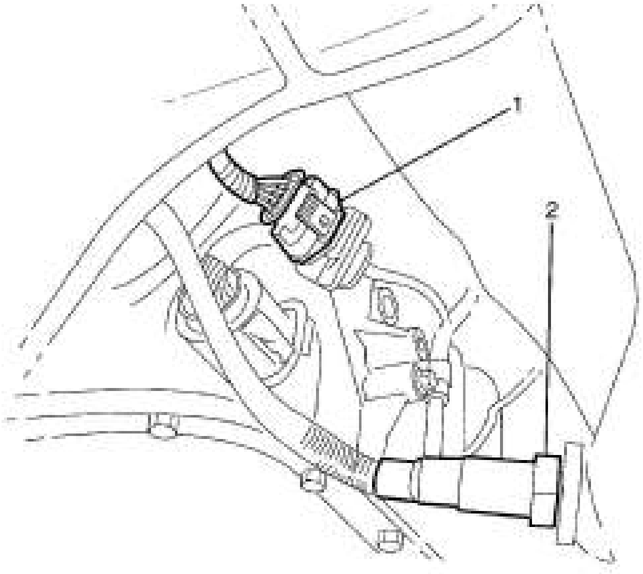


Important: If using the old oxygen sensor (2) coat the threads with an anti-seize compound.

1. Install the oxygen sensor (2) to the right catalytic converter.

   Tighten
   Tighten the oxygen sensor to 40 N·m (30 lb ft).

2. Tighten the oxygen sensor. Refer to Fastener Tightening Specifications .



3. Connect the wiring harness connector (1) to the oxygen sensor wiring harness.
4. Lower the vehicle.

5. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
6. If re-programming is required. Refer to Control Module References .
7. Check for codes using a suitable scanner.

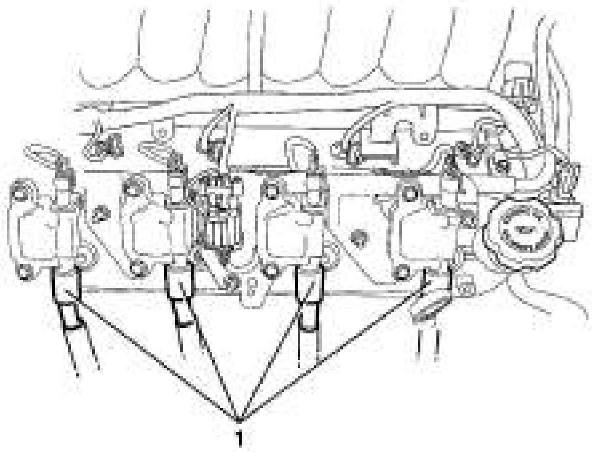
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 2039383

Ignition Coil Replacement

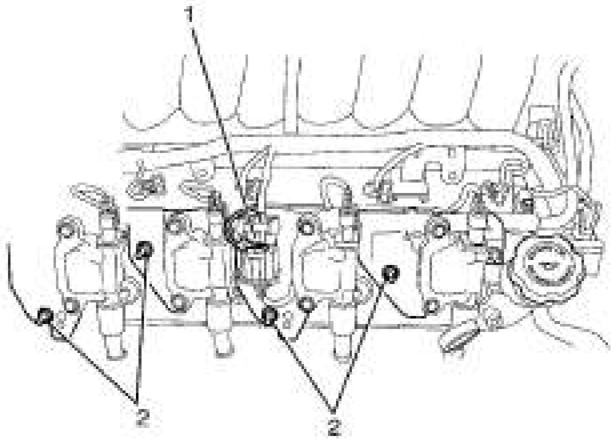
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

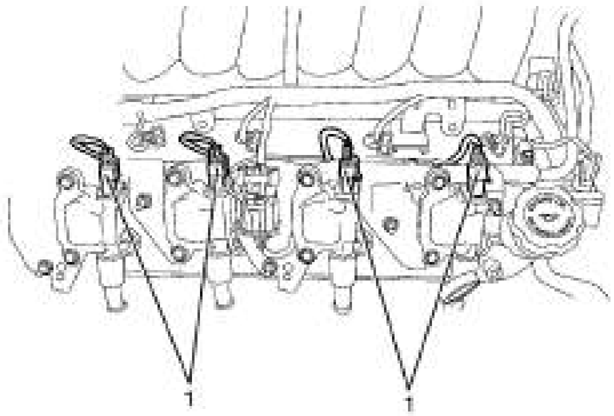
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine cover. Refer to Engine Cover Replacement .



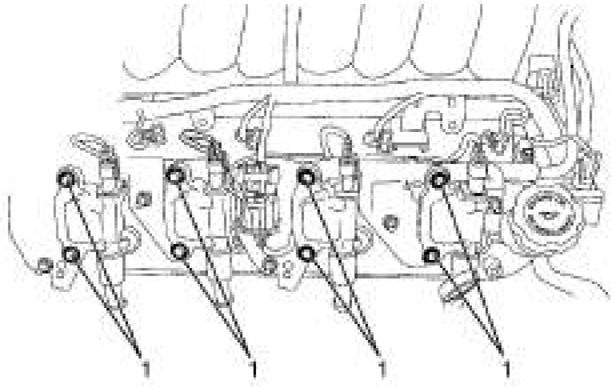
3. Disconnect the spark plug wires (1) from the ignition coils.



4. Disconnect the main ignition coil harness connector (1) from the ignition coil assembly.
5. Remove the ignition coil assembly to rocker cover retaining bolts (2).

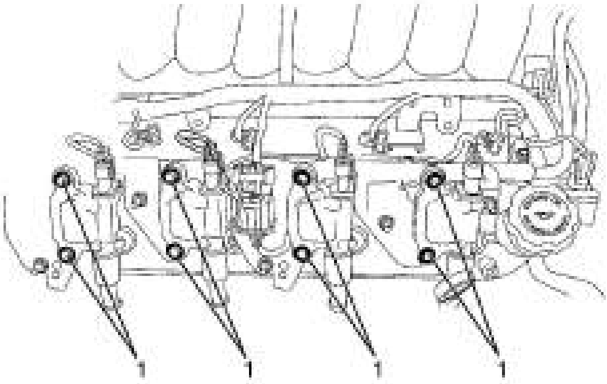


6. Remove the ignition coil assembly from the engine
7. Disconnect the ignition coil to ignition coil wiring harness connectors (1)



8. Remove the ignition coil to ignition coil assembly retaining bolts (1)
9. Remove the ignition coils from the ignition coil assembly.

Installation Procedure

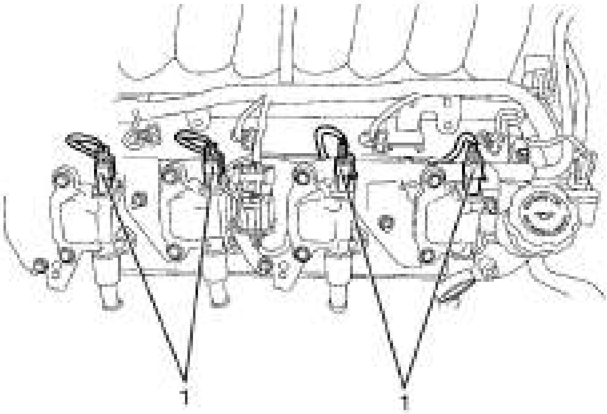


1. Install the ignition coil assembly.

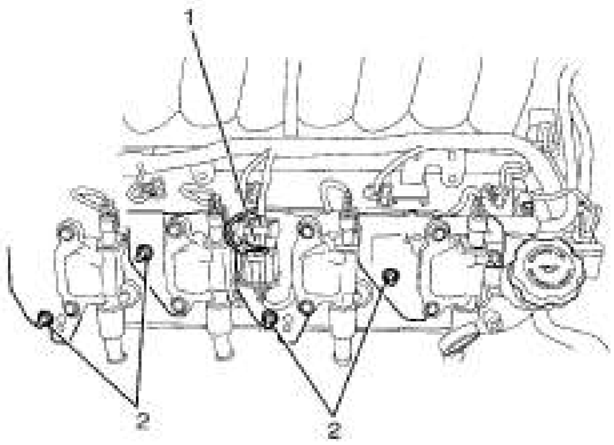
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the ignition coil to ignition coil assembly retaining bolts (1).

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).



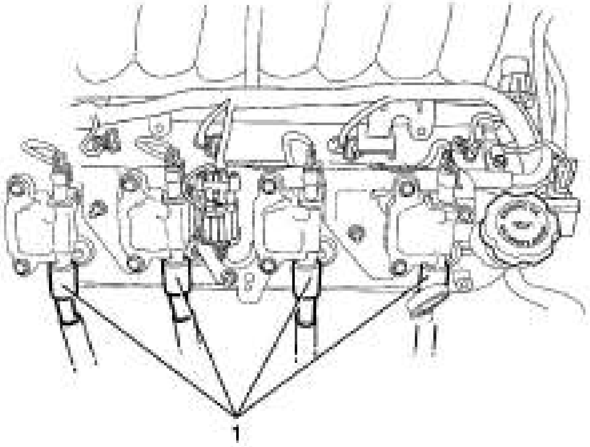
3. Connect the ignition coil to ignition coil wiring harness connectors (1).
4. Install the ignition coil assembly to the engine.



5. Install the ignition coil assembly to rocker cover retaining bolts (2)

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

6. Connect the main ignition coil harness connector (1) to the ignition coil assembly.



7. Connect the spark plug wires (1) to the ignition coils.
8. Install the engine cover. Refer to Engine Cover Replacement .
9. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 1994359

Knock Sensor Replacement

Removal Procedure

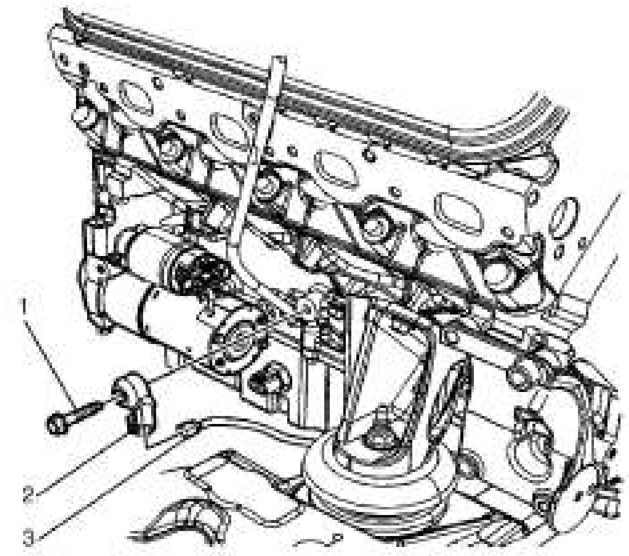
Right Bank

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

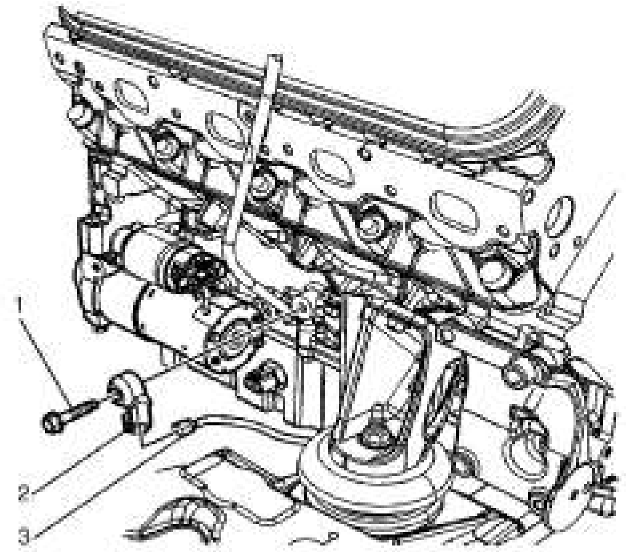
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the starter motor. Refer to Starter Motor Replacement.



4. Disconnect the engine wiring harness (3) from the knock sensor (2).
5. Remove the knock sensor to engine block retaining bolt (1).
6. Remove the knock sensor (2) from the engine block.

Installation Procedure



1. Connect the engine wiring harness (3) to the knock sensor (2).
2. Position the knock sensor (2) on the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the knock sensor to engine block retaining bolt (1).

   Tighten
   Tighten the bolt to 20 N·m (15 lb ft).

4. Install the starter motor. Refer to Starter Motor Replacement.
5. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

Removal Procedure

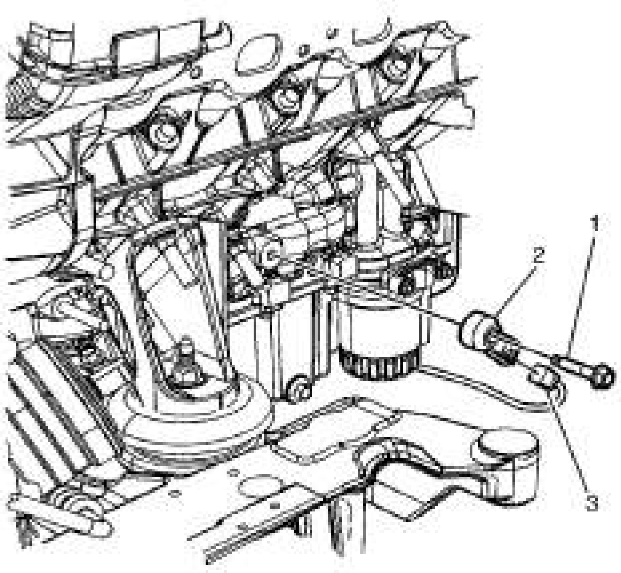
Left Bank

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

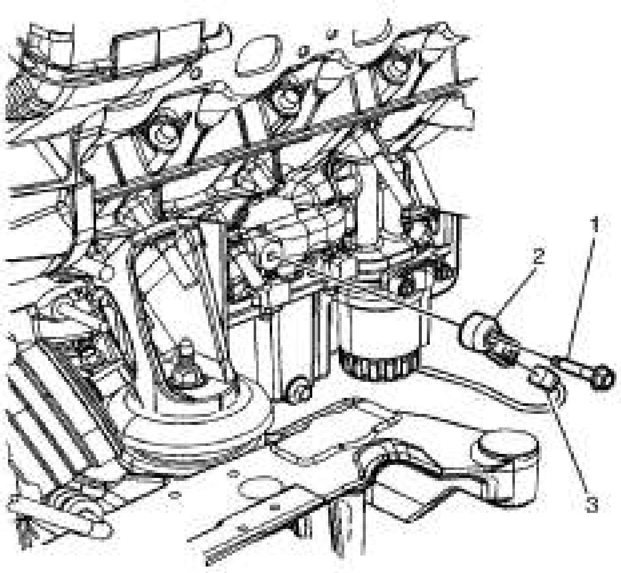
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



3. Disconnect the engine wiring harness (3) from the knock sensor (2).
4. Remove the knock sensor to engine block retaining bolt (1).
5. Remove the knock sensor (2) from the engine block.

Installation Procedure



1. Connect the engine wiring harness (3) to the knock sensor (2).
2. Position the knock sensor (2) on the engine block.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the knock sensor to engine block retaining bolt (1).

Tighten
Tighten the bolt to 20 N·m (15 lb ft).

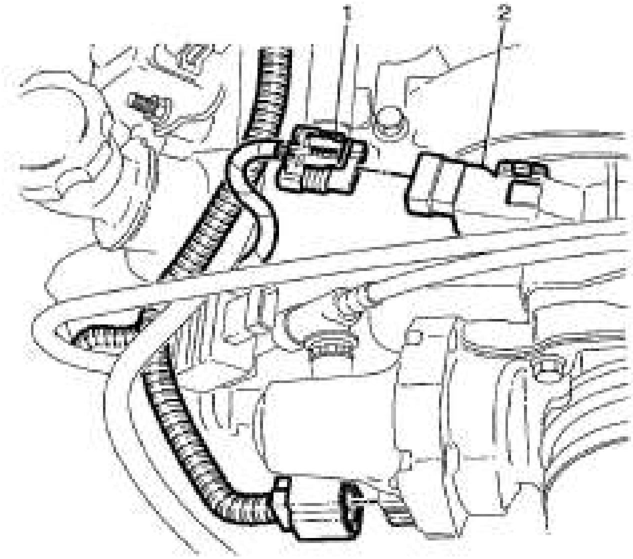
4. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 2038139

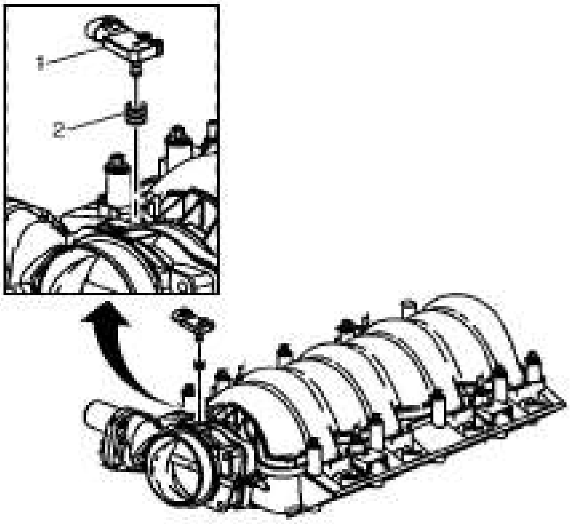
Manifold Absolute Pressure Sensor Replacement

Removal Procedure

1. Remove the oil filler cap.
2. Remove the engine cover. Refer to Engine Cover Replacement.

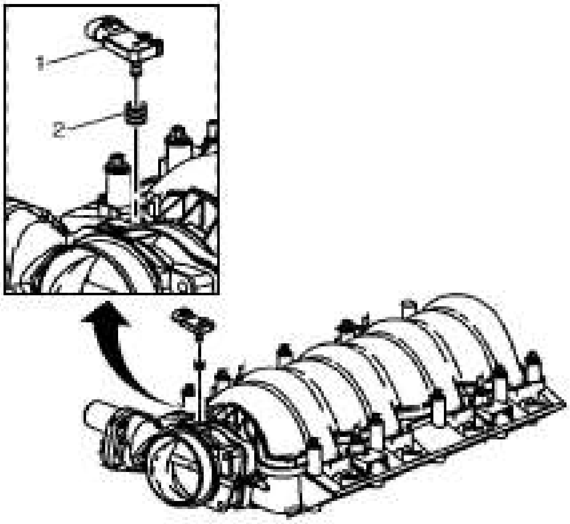


3. Disconnect the manifold absolute pressure (MAP) sensor wiring harness connector (1).
4. Disengage the MAP sensor (2) to MAP sensor retaining clip.

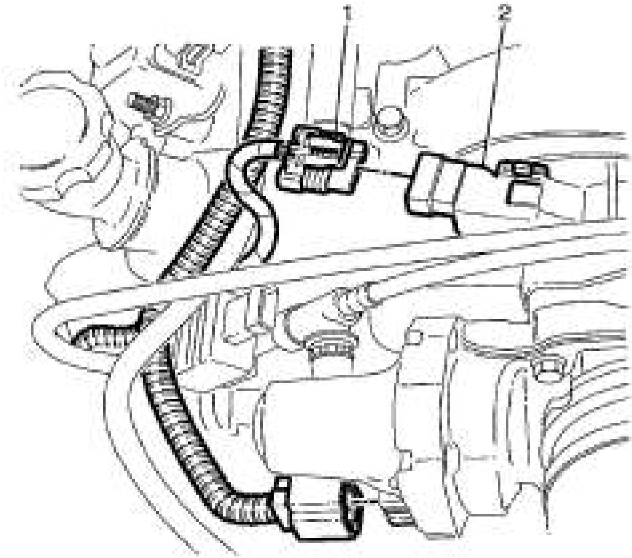


5. Remove the MAP sensor (1) from the intake manifold.
6. Check the MAP sensor seal (2) for deterioration, replace if necessary.

Installation Procedure



1. Install the MAP sensor (1) to the intake manifold.



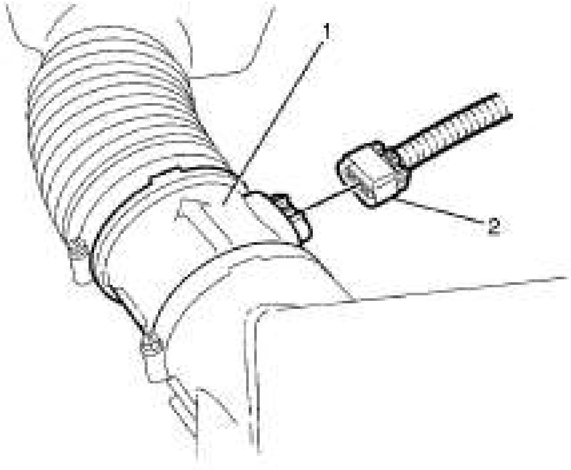
2. Make sure that the MAP sensor (2) is engaged into the MAP sensor retaining clip.
3. Connect the MAP sensor wiring harness connector (1) to the MAP sensor.
4. If re-programming is required. Refer to Control Module References .
5. Install the engine cover. Refer to Engine Cover Replacement .
6. Install the oil filler cap.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | Document ID: 1993902

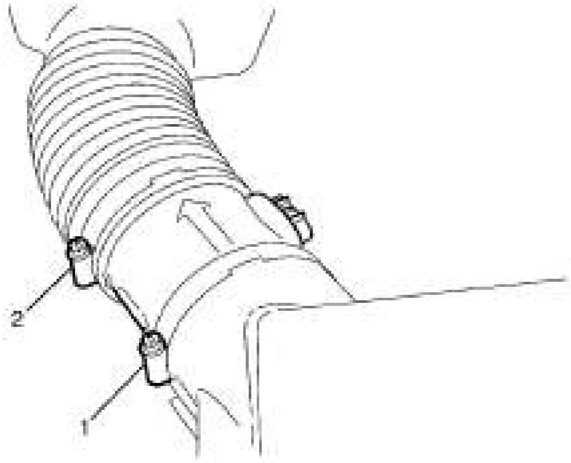
Mass Airflow Sensor with Intake Air Temperature Sensor Replacement

Removal Procedure

1. Remove the radiator and air baffle. Refer to Radiator Air Upper Baffle and Deflector Replacement .

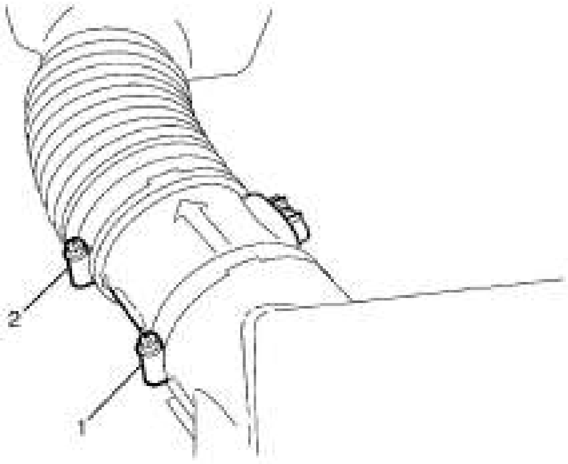


2. Disconnect the mass air flow (MAF)/air intake temperature (IAT) wiring harness connector (2) to mass air flow (MAF)/air intake temperature (IAT) sensor (1).



3. Loosen the air intake duct to MAF/IAT sensor retaining clamp (2).
4. Loosen the upper air cleaner body to MAF/IAT sensor retaining clamp (1).
5. Remove the air intake duct from the mass air flow MAF/IAT sensor.
6. Remove the MAF/IAT sensor (3) from the upper air cleaner body.

Installation Procedure



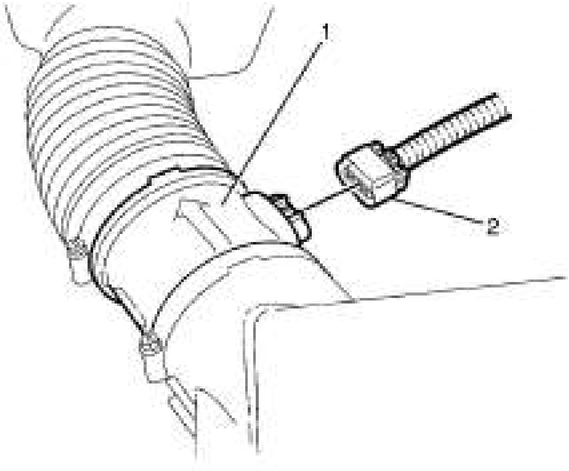
Important: Make sure that the arrow on the MAF/IAT sensor is pointing to the front, radiator, indicate the proper air flow direction. The arrow must point toward the engine.

1. Install the MAF/IAT sensor to the upper air cleaner body.
2. Install the air intake duct to the MAF/IAT sensor.
3. Position the retaining clamps (1 and 2) to the MAF/IAT sensor.

Notice: Refer to Fastener Notice in the Preface section.

4. Tighten the MAF/IAT retaining clamps (1 and 2).

Tighten
Tighten the clamps to 4 N·m (35 lb in).



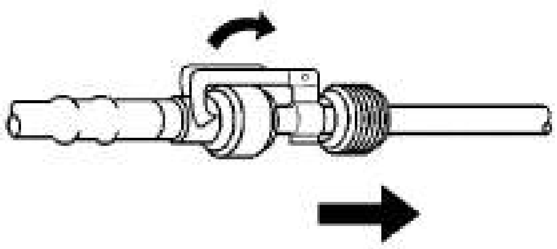
5. Connect the MAF/IAT wiring harness connector (2) to the MAF/IAT sensor.
6. If re-programming is required. Refer to Control Module References .
7. Install the radiator and air baffle. Refer to Radiator Air Upper Baffle and Deflector Replacement .

Metal Collar Quick Connect Fitting Service

Tools Required

- 7370 Fuel Line Quick Connect Separator
- 7371 Fuel Line Quick Connect Separator
- J 37088-A Fuel Line Quick Connect Separator

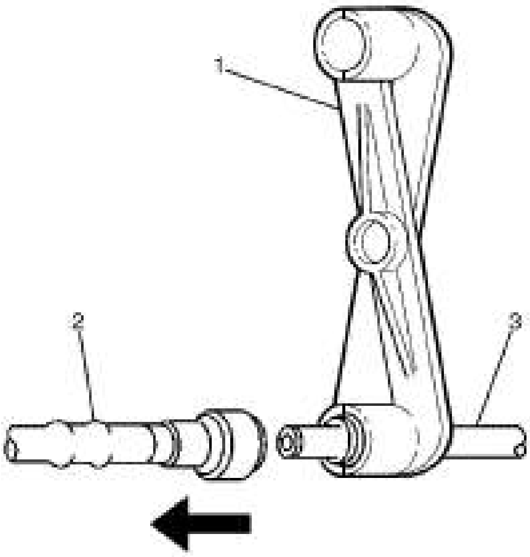
Removal Procedure



1. Before you service any fuel system connection, relieve the fuel system pressure Refer to the Fuel Pressure Relief.
2. Slide the dust cover from the quick-connect fitting if fitted.
3. Disconnect the fuel hose clip verifier from the quick connect fitting.

Caution: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

4. Use compressed air in order to blow any dirt from the fitting.

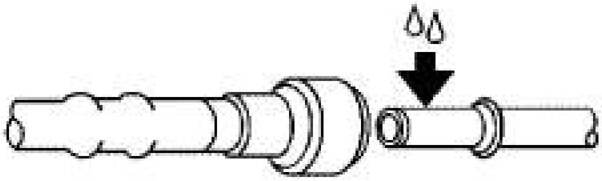


5. Choose the correct tool (1) for the size of the fitting from J 37088-A , 7370 or 7371 . Insert the selected tool into the male connector (3), then push inward in order to release the locking tabs.
6. Pull the female connector (2) away from the male connector.
7. Remove the J 37088-A Fuel Line Quick Connect Separator, 7370 or 7371 from the male connector.

Notice: If necessary, remove rust or burrs from the fuel pipes with an emery cloth. Use a radial motion with the fuel pipe end in order to prevent damage to the O-ring sealing surface. Use a clean shop towel in order to wipe off the male tube ends. Inspect all the connections for dirt and burrs. Clean or replace the components and assemblies as required.

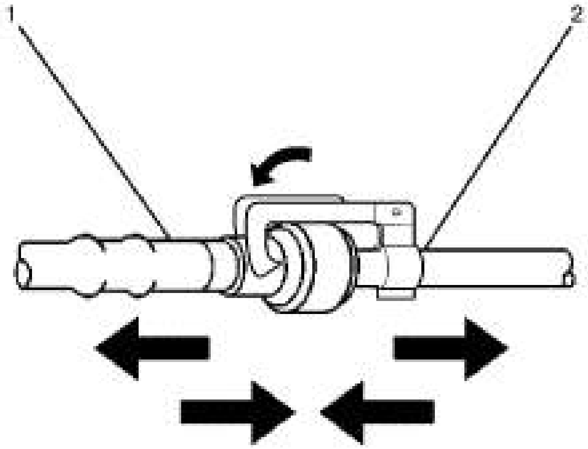
8. Using a clean shop towel, wipe off the male pipe end.
9. Inspect both ends of the fitting for dirt and for burrs. Clean or replace the components as required.

Installation Procedure

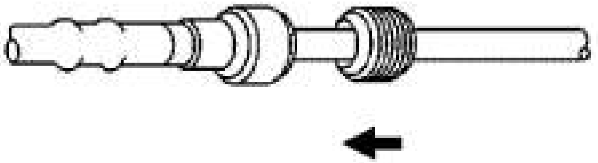


Caution: Always apply a few drops of clean engine oil to the male pipe ends before connecting the fuel pipe fittings in order to reduce the risk of fire and personal injury. This will ensure proper reconnection and prevent a possible fuel leak. During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.

1. Apply a few drops of clean engine oil to the male pipe end.
2. Push both sides of the fitting together in order to cause the retaining tabs to snap into place.



3. Pull and push repeatedly on both sides (1 and 2) of the fitting to make sure the connection is secure.
4. Connect the fuel hose clip verifier from the quick connect fitting.



5. Reposition the dust cover over the quick-connect fitting if fitted.

Plastic Collar Quick Connect Fitting Service

Tools Required

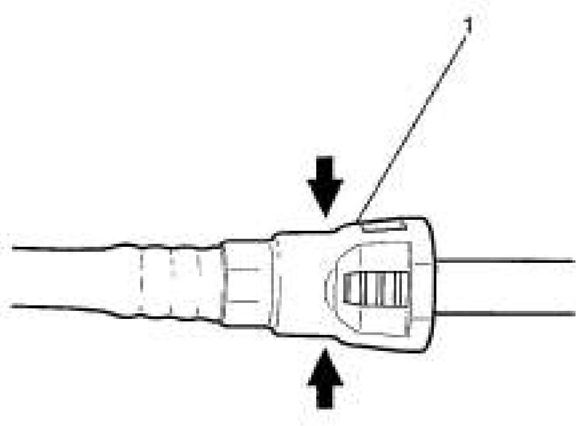
AU-533

Removal Procedure

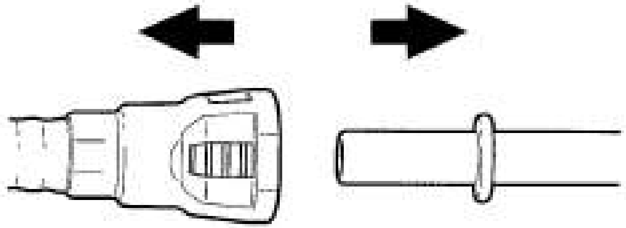
Caution: Refer to Gasoline/Gasoline Vapors Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Relieve the fuel system pressure. Refer to Fuel Pressure Relief .
2. Blow dirt out of the fitting using compressed air.



3. Install the quick connect tool over the quick connect fitting (1).



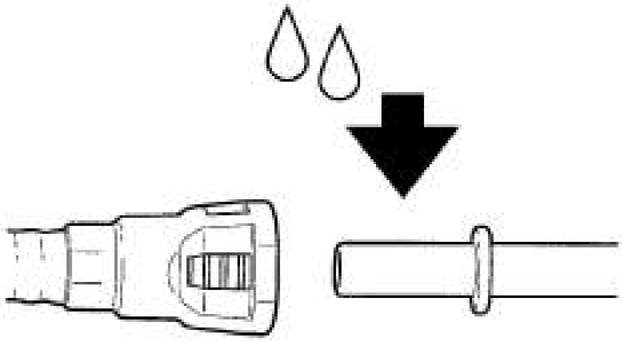
4. Pull the connection apart.
5. Using a clean shop towel, wipe off the male pipe end
6. Inspect both ends of the fitting for dirt and burrs.
7. Clean or replace the components as required.

Installation Procedure

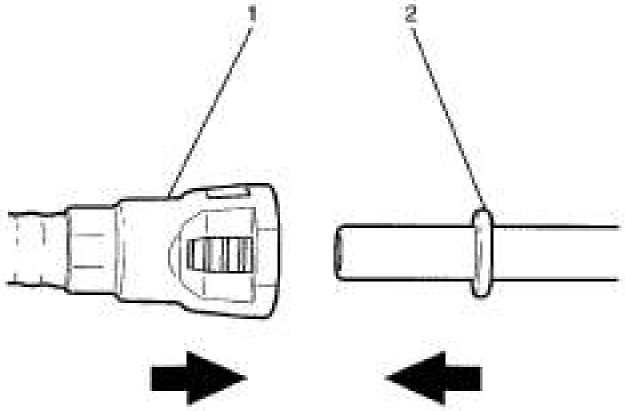
Caution: In order to reduce the risk of fire and personal injury, before connecting fuel pipe fittings, always apply a few drops of clean engine oil to the male pipe ends.

This will ensure proper reconnection and prevent a possible fuel leak.

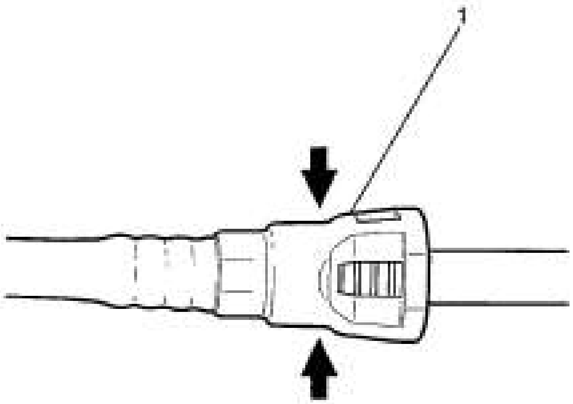
During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.



1. Apply a few drops of clean engine oil to the male pipe end.



2. Push both sides (1 & 2) of the quick-connect fitting together to cause the retaining tabs/fingers to snap into place.



3. Pull on both sides of the quick-connect fitting (1) to make sure the connection is secure.
4. Inspect for leaks using the following procedure:
    - 4.1. Turn the ignition ON, with the engine OFF for 2 seconds.
    - 4.2. Turn the ignition OFF, for 10 seconds.
    - 4.3. Turn the ignition ON, with the engine OFF for 2 seconds.
    - 4.4. Turn the ignition OFF.
    - 4.5. Inspect for leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2037121**

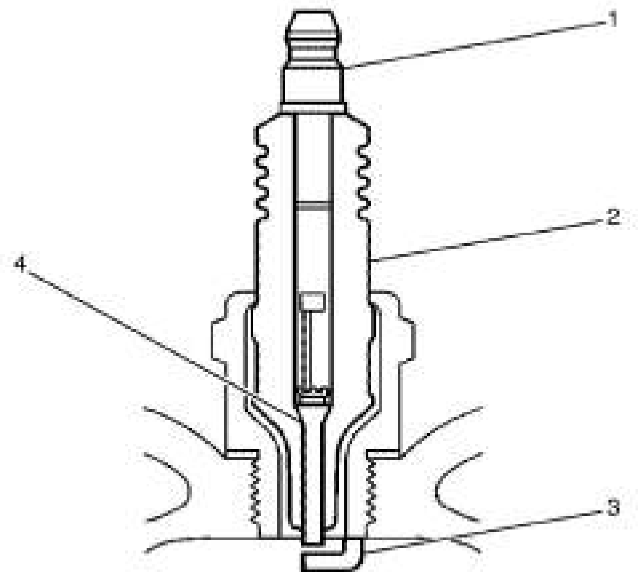
Spark Plug Inspection

Spark Plug Usage

- Make sure that the correct spark plug is installed. An incorrect spark plug causes poor driveability conditions. Refer to Ignition System Specifications .
- Make sure that the spark plug has the correct heat range. An incorrect heat range causes the following conditions:
  - Spark plug fouling due to a colder plug
  - A pre-ignition condition, causing spark plug and/or engine damage due to a hotter plug

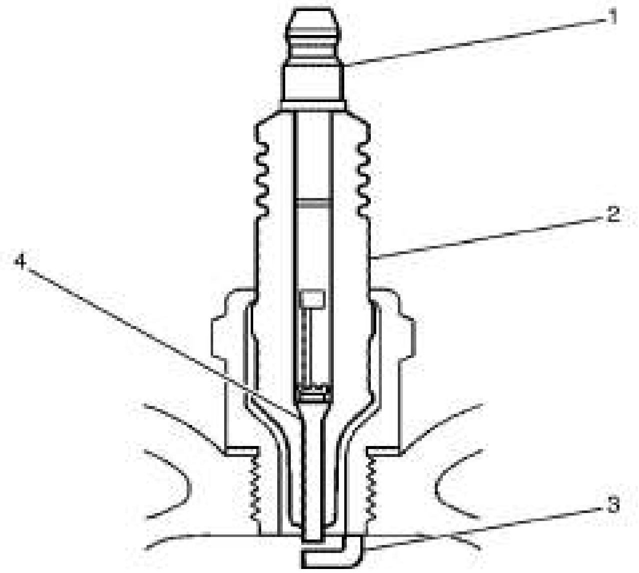
Spark Plug Inspection

- 
  - Inspect the terminal post (1) for damage.
  - Inspect for a bent or broken terminal post (1).
  - Test for a loose terminal post (1) by twisting and pulling the post. The terminal post (1) should NOT move.
-



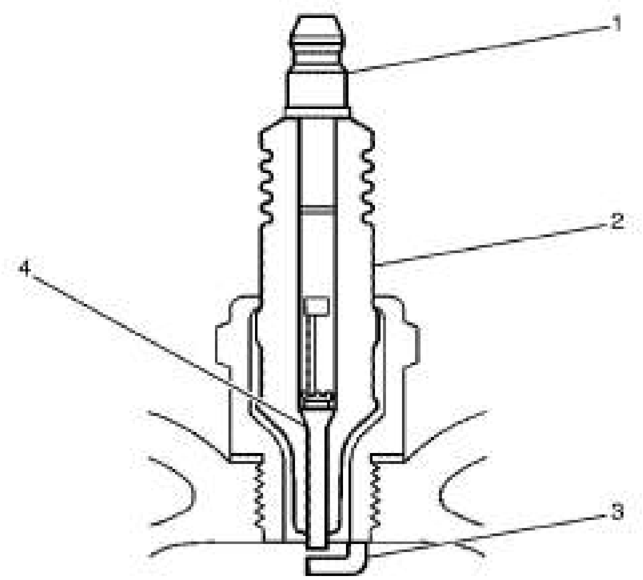
- Inspect the insulator (2) for flashover or for carbon tracking soot. This condition is caused by the electrical charge travelling across the insulator (2) between the terminal post (1) and ground. Inspect for the following conditions:
  - Inspect the spark plug boot for damage.
  - Inspect the spark plug recess area of the cylinder head for moisture from such as oil, coolant, or from water. A saturated spark plug boot causes arcing to ground.

•



- Inspect the insulator (2) for cracks. All or part of the electrical charge may arc through the crack instead of through the electrodes (3, 4).

•



- l Inspect for evidence of incorrect arcing.
- Measure the gap between the centre electrode (4) and the side electrode (3) terminals. Refer to Ignition System Specifications.
- Inspect for the correct spark plug torque. Refer to Ignition System Specifications . Insufficient torque can prevent correct spark plug operation. An over-torqued spark plug causes the insulator (2) to crack.
- Inspect for signs of tracking that occurred near the insulator tip instead of at the centre electrode (4).
- Inspect for a side electrode (3) that is broken or worn.
- Inspect for a broken, worn, or loose centre electrode (4) by shaking the spark plug.
- A rattling sound indicates internal damage.
- A loose centre electrode (4) reduces the spark intensity.
- Inspect for bridged electrodes (3 and 4). Deposits on the electrodes reduce or eliminate the gap.
- Inspect for worn or missing platinum pads on the electrodes (3 and 4), if equipped.
- Inspect for excessive fouling.
- l Inspect the spark plug recess area of the cylinder head for debris. Dirty or damaged threads can cause the spark plug not to seat correctly during installation.

Spark Plug Visual Inspection

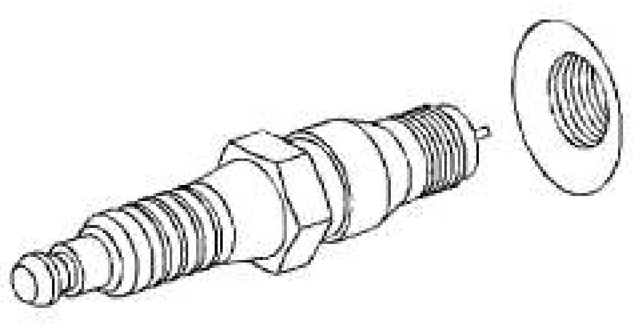
- l Normal operation. Brown to grayish-tan spark plugs, with small amounts of white powdery deposits are normal combustion by-products from fuels with additives.
- l Carbon-fouled plugs. Dry, fluffy black carbon or soot caused by the following conditions:
- Rich fuel mixtures
- Leaking fuel injectors
- Excessive fuel pressure

- Restricted air filter element
- Incorrect combustion
- Reduced ignition system voltage output
  - Weak coils
  - Worn ignition wires
  - Incorrect spark plug gap
- Excessive idling or slow speeds during light loads can keep the spark plug temperatures so low that the normal combustion deposits may not burn off.
- Deposit fouling. Oil, coolant, or additives that include substances such as silicone, evidenced by a very white coating, reduces the spark intensity. Most powdery deposits will not affect spark intensity unless they form into a glazing over the electrode.

Spark Plug Replacement

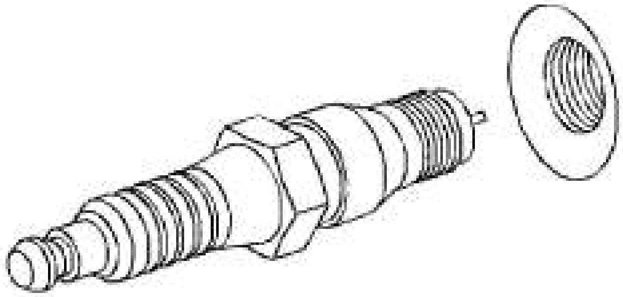
Removal Procedure

1. Remove the engine cover. Refer to Engine Cover Replacement .
2. Remove the spark plug wires. Refer to Spark Plug Wire Replacement .



3. Loosen each spark plug 1 or 2 turns.
4. Use a brush, or use compressed air in order to remove any dirt from the spark plugs.
5. Remove the spark plugs one at a time and place each plug in a tray marked with the corresponding cylinder numbers.

Installation Procedure



1. Inspect each spark plug gap. Adjust each plug as needed.

   Specification
   Spark plug gap: 1.524 mm (0.060 in).

   Notice: Refer to Fastener Notice in the Preface section.

2. Hand start the spark plugs in the corresponding cylinders.
3. Tighten the spark plugs.

   Tighten
   - Tighten the engine spark plug on a NEW cylinder head to 20 N·m (15 lb ft).
   - Tighten the engine spark plug on subsequent installations to 15 N·m (11 lb ft).
4. Install the spark plug wires. Refer to Spark Plug Wire Replacement .
5. Install the engine cover. Refer to Engine Cover Replacement .

Spark Plug Wire Inspection

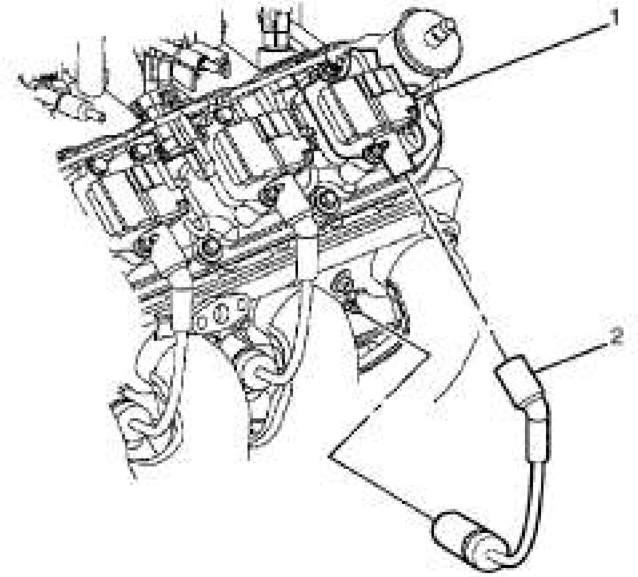
Important: Spark plug wire integrity is vital for proper engine operation. A thorough inspection will be necessary to accurately identify conditions that may affect engine operation. Inspect for the following conditions:

1. Correct routing of the spark plug wires. Incorrect routing may cause cross-firing.
2. Inspect for any signs of cracks or splits in the wires.
3. Inspect each boot for the following conditions:
    - Tearing
    - Piercing
    - Arcing
    - Carbon tracking
    - Corroded terminals
4. If corrosion, carbon tracking or arcing are indicated on a spark plug wire boot or on a terminal, replace the wire and the component connected to the wire.

Spark Plug Wire Replacement

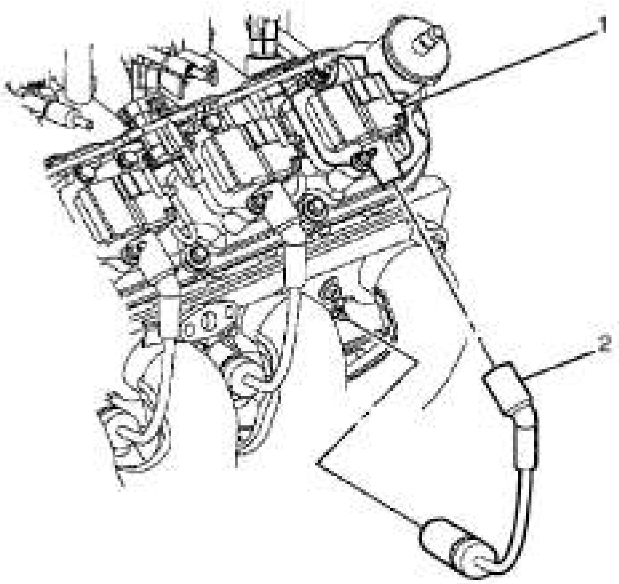
Removal Procedure

1. Remove the engine cover. Refer to Engine Cover Replacement .



2. Disconnect the spark plug wire (2) to the spark plug.
   - Twist each spark plug boot 1/2 turn.
   - Pull only on the boot in order to remove the wire from each spark plug.
3. Disconnect the spark plug wire from the ignition coil (1).
   - Twist each spark plug boot 1/2 turn.
   - Pull only on the boot in order to remove the wire from the ignition coil.

Installation Procedure



1. Install the spark plug wire to the ignition coil (1).
2. Install the spark plug wire (2) to the spark plug.
3. Inspect the spark plug wire for proper installation:
   - Push sideways on each spark plug boot in order to inspect the seating.
   - Reinstall any loose spark plug boot.
4. Install the engine cover. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L | Repair Instructions | **Document ID: 2038138**

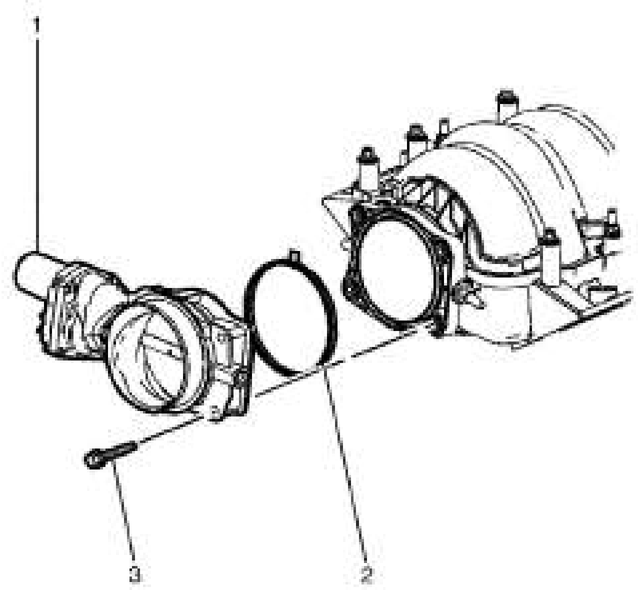
Throttle Body Assembly Replacement

Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

Notice: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

Notice: Handle the electronic throttle control components carefully. Use cleanliness in order to prevent damage. Do not drop the electronic throttle control components. Do not roughly handle the electronic throttle control components. Do not immerse the electronic throttle control components in cleaning solvents of any type.



Important: The intake manifold, throttle body, fuel injection rail, and fuel injectors may be removed as an assembly. If not servicing the individual components, remove the manifold as a complete assembly.

2. Remove the electrical wire harness connector from the throttle body.
3. Remove the throttle body to intake manifold retaining bolts (3).
4. Remove the throttle body (1).

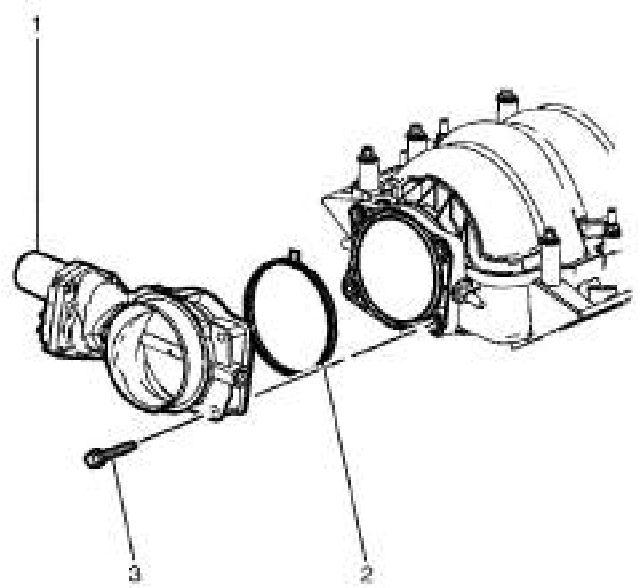
Important: The throttle body gasket is a single use part. The gasket must be discarded after removal.

5. Remove the throttle body to intake manifold gasket (2), and discard.

Discard the throttle body gasket.

6. Clean the throttle body and intake manifold mating surfaces.

Installation Procedure



Important: DO NOT use the throttle body gasket again. Install a NEW gasket during assembly.

1. Install a new throttle body to intake manifold gasket (2). Align the locating tab of the gasket with the notch in the manifold.
2. Install the throttle body (1) to the intake manifold.

Notice: Refer to Fastener Notice in the Preface section.

3. Install the throttle body to intake manifold retaining bolts (3).

Tighten
Tighten the bolts to 12 N·m (106 lb in).

4. Install the electrical wire harness connector from the throttle body.
5. Install the air intake duct to the throttle body. Refer to Air Cleaner Inlet Duct Replacement.
6. If re-programming is required. Refer to Control Module References.

Throttle Body Cleaning

Important: Over extended time and mileage, deposits may accumulate on the back of the throttle valve plate. Occasionally the deposit may accumulate to a point where perceived pedal effort is affected. This procedure should not be performed on vehicles with low mileage, under 80 450 kilometers (50,000 miles).

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

   Notice: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

2. Inspect the throttle body bore and inspect the throttle valve plate for deposits. The throttle valve must be opened in order to inspect all surfaces.

   Notice: Do not use any solvent that contains Methyl Ethyl Ketone (MEK). This solvent may damage fuel system components.

3. Clean the throttle body bore and the throttle valve plate using a clean shop towel with an approved Top Engine Cleaner.
4. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

Throttle Learn

Description

The engine control module (ECM) learns the airflow through the throttle body to ensure the correct idle. The learned airflow values are stored within the ECM. These values are learned to adjust for production variation and will continuously learn during the life of the vehicle to compensate for reduced airflow due to coking. Anytime the throttle body airflow rate changes, for example due to cleaning or replacing, the values must be relearned.

A vehicle that had a heavily coked throttle body that has been cleaned or replaced may take several drive cycles to learn out the coking. To accelerate the process, the scan tool has the ability to reset all learned values back to zero. A new ECM will also have values set to zero.

The idle may be unstable or a DTC may set if the learned values do not match the actual airflow.

Conditions for Running the Throttle Learn Procedure

With Scan Tool - Reset Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0220, P0222, P0223, P0300, P0351, P0352, P0353, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P1516, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, or P2176 are not set.
- Ignition ON, engine OFF.
- The vehicle speed sensor (VSS) is 0 km/h (0 mph).

Without Scan Tool - Learn Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0220, P0222, P0223, P0300, P0351, P0352, P0353, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P1516, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, or P2176 are not set.
- The engine speed is between 450-4,000 RPM.
- The manifold absolute pressure (MAP) is greater than 5 kPa.
- The mass air flow (MAF) is greater than 2 g/s.
- The ignition 1 voltage is greater than 10 volts.

Throttle Learn

With Scan Tool - Reset Procedure

1. Ignition ON, engine OFF, with a scan tool, perform the Idle Learn Reset in Module Setup.
2. Start the engine, monitor the TB Idle Airflow Compensation parameter. The TB Idle Airflow

Compensation value should equal 0 percent and the engine should be idling at a normal idle speed.

3. Clear the DTCs and return to the diagnostic that referred you here.

Without Scan Tool - Learn Procedure

Important: Do NOT perform this procedure if DTCs are set. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

1. Start and idle the engine in PARK for 3 minutes.
2. With a scan tool, monitor desired and actual RPM.
3. The ECM will start to learn the new idle cells and Desired RPM should start to decrease.
4. Ignition OFF for 60 seconds.
5. Start and idle the engine in PARK for 3 minutes.
6. After the 3 minute run time the engine should be idling normal.

   Important: During the drive cycle the check engine light may come on with idle speed DTCs. If idle speed codes are set, clear codes so the ECM can continue to learn.

   If the engine idle speed has not been learned the vehicle will need to be driven at speeds above 70 km/h (44 mph) with several decelerations and extended idles.

7. After the drive cycle, the engine should be idling normally.

   If the engine idle speed has not been learned, turn OFF the ignition for 60 seconds and repeat step 6.

8. Once the engine speed has returned to normal, clear DTCs and return to the diagnostic that referred you here.

Cylinder Deactivation (Active Fuel Management) System Description

To provide maximum fuel economy under light load driving conditions, the engine control module (ECM) will command the cylinder deactivation system ON to deactivate engine cylinders 1 and 7 on the left bank, and cylinders 4 and 6 on the right bank, switching to a V4 mode. The engine will operate on 8 cylinders, or V8 mode, during engine starting, engine idling, and medium to heavy throttle applications.

When commanded ON, the ECM will determine what cylinder is firing, and begin deactivation on the next closest deactivated cylinder in firing order sequence. The Gen IV engine has a firing order of 1-8-7-2-6-5-4-3. If cylinder number 1 is on its combustion event when cylinder deactivation is commanded ON, the next cylinder in the firing order sequence that can be deactivated is cylinder number 7. If cylinder number 5 is on its combustion event when cylinder deactivation is commanded ON, then the next cylinder in the firing order sequence that can be deactivated is cylinder number 4.

Cylinder deactivation is accomplished by not allowing the intake and exhaust valves to open on the selected cylinders by using special valve lifters. The deactivation lifters contain spring loaded locking pins that connect the internal pin housing of the lifter to the outer housing. The pin housing contains the lifter plunger and pushrod seat which interfaces with the pushrod. The outer housing contacts the camshaft lobe through a roller. During V8 mode, the locking pins are pushed outward by spring force, locking the pin housing and outer housing together causing the lifter to function as a normal lifter. When V4 mode is commanded ON, the locking pins are pushed inward with engine oil pressure directed from the valve lifter oil manifold (VLOM) assembly solenoids. When the lifter pin housing is unlocked from the outer housing, the internal pin housing will remain stationary, while the outer housing will move with the profile of the camshaft lobe, which results in the valve remaining closed. One VLOM solenoid controls both the intake and exhaust valves for each deactivating cylinder. There are 2 distinct oil passages going to each cylinder deactivation lifter bore, one for the hydraulic lash-adjusting feature of the lifter, and one for controlling the locking pins used for cylinder deactivation.

Although both intake and exhaust valve lifters are controlled by the same solenoid in the VLOM, the intake and exhaust valves do not become deactivated at the same time. Cylinder deactivation is timed so that the cylinder is on an intake event. During an intake event, the intake cam lobe is pushing the valve lifter upwards to open the intake valve against the force of the valve spring. The force exerted by the valve spring is acting on the side of the lifter locking pins, preventing them from moving until the intake valve has closed. When the intake valve lifter reaches the base circle of the camshaft lobe, the valve spring force is reduced, allowing the locking pins to move, deactivating the intake valve. However, when cylinder deactivation is commanded ON, the exhaust valve for the deactivated cylinder is in the closed position, allowing the locking pins on the valve lifter to move immediately, and deactivate the exhaust valve.

By deactivating the exhaust valve first, this allows the capture of a burnt air/fuel charge or exhaust gas charge in the combustion chamber. The capture of exhaust gases in the combustion chamber will contribute to a reduction in oil consumption, noise and vibration levels, and exhaust emissions when operating in V4 mode. During the transition from V8 to V4 mode, the fuel injectors will be turned OFF on the deactivated cylinders. The ignition system secondary voltage or spark is still present across the spark plug electrodes on the deactivated cylinders. If all enabling conditions are met and maintained for cylinder deactivation operation, the ECM calibrations will limit cylinder deactivation to a cycle time of 10 minutes in V4 mode, and then return to V8 mode for 1 minute.

Switching between V8 and V4 mode is accomplished in less than 250 milliseconds, making the transitions seamless and transparent to the vehicle operator. The 250 milliseconds includes the time for the ECM to sequence the transitions, the response time for the VLOM solenoids to energize, and the time for the valve lifters to deactivate, all within 2 revolutions of the engine crankshaft.

The cylinder deactivation system consists of the following components:

- The VLOM assembly
- Eight special valve lifters, 2 per deactivating cylinder
- The engine oil pressure regulator valve for cylinder deactivation operation
- Gen IV cylinder deactivation engine block
- The ECM

Valve Lifter Oil Manifold (VLOM) Assembly

The cylinder deactivation system uses an electro-hydraulic actuator device called the valve lifter oil manifold (VLOM) assembly. The VLOM is bolted to the top of the engine valley, below the intake manifold assembly. The VLOM consists of 4 electrically operated Normally Closed Solenoids. Each solenoid controls the application of engine oil pressure to the intake and exhaust valve lifters on the cylinders selected to deactivate. Engine oil pressure is routed to the VLOM assembly from a passage on the rear of the cylinder block.

All 4 VLOM solenoids are connected in parallel to a fused ignition 1 voltage circuit, supplied by the powertrain relay. The ground or control circuit for each solenoid is connected to the engine control module (ECM).

When all enabling conditions are met for cylinder deactivation, the ECM will ground each solenoid control circuit in firing order sequence, allowing current to flow through the solenoid windings. With the coil windings energized, the solenoid valve opens, redirecting engine oil pressure through the VLOM into 8 separate vertical passages in the engine lifter valley. The 8 vertical passages, 2 per cylinder, are connected to the valve lifter bores of the cylinders to be deactivated. When vehicle-operating conditions require a return to V8 mode, the ECM will turn OFF the control circuit for the solenoids, allowing the solenoid valves to close. With the solenoid valves closed, engine oil pressure in the control ports is exhausted through the body of the solenoids into the engine block lifter valley. The housing of the VLOM incorporates several bleeds in the oil passages to purge any air trapped in the VLOM or engine block.

To control any contamination to the hydraulic circuits, a small replaceable oil screen is located in the VLOM oil inlet passage, below the oil pressure sensor. The oil pressure sensor is a 3-wire sensor which provides oil pressure information to the ECM.

During service, use extreme care in keeping the VLOM assembly free of any contamination or foreign material.

Engine Control Module (ECM)

The engine control module (ECM) is responsible for the management and control of all engine functions. Each ECM comes equipped with a specific set of software/calibrations designed for that engine and vehicle application. The ECM will determine engine operating parameters, based upon information from a network of switches, sensors, modules and communication with other controllers located throughout vehicle. Internal to the ECM is an integrated circuit device called a low-side driver. The low-side driver is designed to operate internally, like an electronic switch. An individual low-side driver controls each valve lifter oil manifold (VLOM) solenoid. When enabling conditions for V4 mode are met, the ECM will command the low-side driver to ground each VLOM solenoid control circuit, in firing order sequence. Internal to the low-side driver is a fault detection circuit, which monitors the solenoid control circuit for an incorrect voltage level. If an incorrect voltage level, such as an open, high resistance, or short to ground, is detected, the low-side driver, along with the fault detection circuit, will communicate the condition to the central processor in the ECM. The ECM will then command a return to V8 mode, set a corresponding DTC, and illuminate the malfunction indicator lamp (MIL) on the instrument panel.

Cylinder Deactivation Inhibit Reasons

Listed below are the powertrain conditions that will inhibit V4 mode, while operating under light load driving conditions:

- Engine manifold vacuum low
- Brake booster vacuum pressure low
- Accelerator pedal position rate of increase too high, electronic throttle control
- Accelerator pedal position too high, electronic throttle control
- Ignition voltage out of range
- Engine oil pressure out of range
- Engine oil temperature out of range
- Engine RPM out of range
- Transmission gear incorrect
- Transmission range incorrect
- Transmission gear shift in progress
- All cylinders activated via scan tool output control
- Minimum time in V8 mode not met
- Maximum V4 mode time exceeded
- Engine oil aeration present
- Decel fuel cutoff active
- Fuel shut-off timer active
- Minimum heater temp low, HVAC system
- Reduced engine power active, electronic throttle control
- Brake torque management active
- Axle torque limiting active
- Engine metal over temperature protection active
- Catalytic converter over temperature protection active
- Piston protection active, knock detected
- Hot coolant mode active
- Engine over speed protection active
- Fault Active or Fault Pending--cylinder deactivation is disabled for the following faults:
    - Brake Booster Vacuum Sensor

- Manifold Absolute Pressure Sensor
- Engine Oil Pressure Sensor
- Engine Coolant Temperature Sensor
- Vehicle Speed Sensor
- Crankshaft Position Sensor
- Engine Misfire Detected
- Cylinder Deactivation Solenoid Driver Circuit

The scan tool output control is used to deactivate half of the engine cylinders, V4 mode, by commanding all of the solenoids ON, or deactivate one cylinder switching to a V7 mode, by commanding ON one solenoid. Listed below are the powertrain conditions that will inhibit V4 mode, or V7 mode, with the engine running, while using the scan tool output control function:

- Engine speed out of range
- Manifold absolute pressure (MAP) sensor fault
- Accelerator pedal position too high, electronic throttle control
- Piston protection active, knock detected
- Engine oil temperature out of range
- Engine oil pressure out of range
- Engine oil aeration present
- Engine metal over temperature protection active
- Accelerator pedal position rate of increase too high, electronic throttle control
- Cylinder deactivation solenoid driver circuit fault
- Engine coolant temperature sensor fault
- Catalytic converter over temperature protection active
- Brake booster vacuum pressure low
- Brake Booster Vacuum Pressure Sensor Fault
- Axle torque limiting active
- Brake torque management active
- Vehicle speed sensor fault
- Engine coolant temperature too high
- Engine not running
- Vehicle speed not zero
- Engine coolant temperature low
- Reduced Engine Power Active, electronic throttle control
- Transmission gear incorrect
- Transmission range incorrect
- Ignition voltage out of range
- Maximum V4 mode time exceeded

Listed below are the powertrain conditions that will inhibit a cylinder deactivation solenoid from being energized, with the ignition ON and the engine OFF, while using the scan tool output control function:

- Engine speed not zero
- Vehicle speed not zero
- Transmission not in park or neutral
- Ignition voltage out of range

Electronic Ignition (EI) System Operation

The electronic ignition (EI) system produces and controls the high energy secondary spark. This spark ignites the compressed air/fuel mixture at precisely the correct time, providing optimal performance, fuel economy, and control of exhaust emissions. The engine control module (ECM) primarily collects information from the crankshaft position (CKP) and camshaft position (CMP) sensors to control the sequence, dwell, and timing of the spark.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of the teeth and slots of the reluctor wheel on the crankshaft. The reluctor wheel is spaced at 60-tooth spacing, with 2 missing teeth for the reference gap. The reference gap is used to identify the crankshaft position at each start-up. The CKP sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The CKP sensor sends a digital signal to the ECM as each tooth on the reluctor wheel rotates past the CKP sensor. The ECM uses each CKP signal pulse to determine crankshaft speed position. This information is then used to determine the optimum ignition and injection points of the engine. The ECM also uses CKP sensor output information to determine the camshaft relative position to the crankshaft, to control camshaft phasing, and to detect cylinder misfire.

Camshaft Position (CMP) Sensor

The sensor detects magnetic flux changes between the four narrow and wide tooth slots on the reluctor wheel. The CMP sensor provides a digital ON/OFF DC voltage of varying frequency per each camshaft revolution. The ECM will recognize the narrow and wide tooth patterns to identify camshaft position, or which cylinder is in compression and which is in exhaust. The information is then used to determine the correct time and sequence for fuel injection and ignition spark events.

Knock Sensor (KS)

The knock sensor (KS) system enables the control module to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation, also known as spark knock. The KS system uses one or 2 flat response 2-wire sensors. The sensor uses piezo-electric crystal technology that produces an AC voltage signal of varying amplitude and frequency based on the engine vibration or noise level. The amplitude and frequency are dependant upon the level of knock that the KS detects. The control module receives the KS signal through the signal circuit. The KS ground is supplied by the control module through the low reference circuit.

The control module learns a minimum noise level, or background noise, at idle from the KS and uses calibrated values for the rest of the RPM range. The control module uses the minimum noise level to calculate a noise channel. A normal KS signal will ride within the noise channel. As engine speed and load change, the noise channel upper and lower parameters will change to accommodate the normal KS signal, keeping the signal within the channel. In order to determine which cylinders are knocking, the control module only uses KS signal information when each cylinder is near top dead center (TDC) of the firing stroke. If knock is present, the signal will range outside of the noise channel.

If the control module has determined that knock is present, it will retard the ignition timing to attempt to eliminate the knock. The control module will always try to work back to a zero compensation level, or no spark retard. An abnormal KS signal will stay outside of the noise channel or will not be present. KS diagnostics are calibrated to detect faults with the KS circuitry inside the control module, the KS wiring, or the KS voltage output. Some diagnostics are also calibrated to detect constant noise from an outside influence such as a loose/damaged component or excessive engine mechanical noise.

Ignition Coils

Each ignition coil has an ignition 1 voltage feed and a ground circuit. The engine control module (ECM) supplies a low reference and an ignition control (IC) circuit. Each ignition coil contains a solid state driver module. The ECM will command the IC circuit ON, which allows the current to flow through the primary coil windings. When the ECM commands the IC circuit OFF, this will interrupt current flow through the primary coil windings. The magnetic field created by the primary coil windings will collapse across the secondary coil windings, which induces a high voltage across the spark plug electrodes.

Engine Misfire Detection

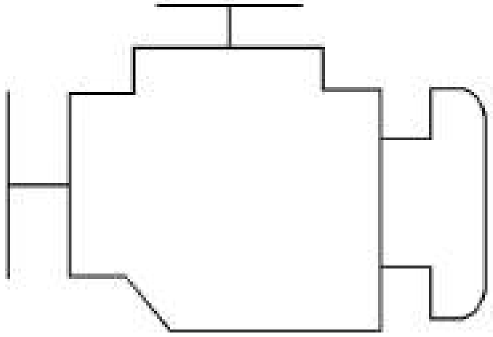
The CKP sensor is used to determine when an engine misfire is occurring. The CMP sensor is used to determine which cylinder is misfiring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. For accurate detection of engine misfire, the ECM must distinguish between crankshaft deceleration caused by actual misfire and deceleration caused by rough road conditions. The antilock brake system (ABS) can detect if the vehicle is on a rough road based on wheel acceleration/deceleration data supplied by the wheel speed sensors. If the ABS detects rough road above a predetermined threshold, this information is sent to the ECM. The ECM uses the rough road information when calculating engine misfire. Under certain driving conditions, a misfire rate can be high enough to cause the 3-way catalytic converter (TWC) to overheat damaging the converter. The malfunction indicator lamp (MIL) will flash ON and OFF when converter overheating, damaging conditions are present.

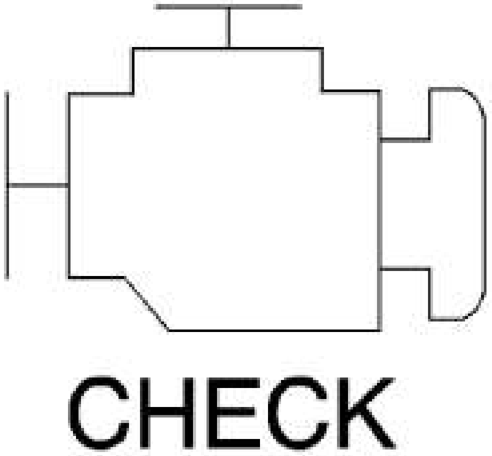
Engine Control Module Description

The powertrain has electronic controls to reduce exhaust emissions while maintaining excellent driveability and fuel economy. The engine control module (ECM) is the control center of this system. The ECM monitors numerous engine and vehicle functions. The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect vehicle performance and emissions. The ECM also performs the diagnostic tests on various parts of the system. The ECM can recognize operational problems and alert the driver via the malfunction indicator lamp (MIL). When the ECM detects a malfunction, the ECM stores a diagnostic trouble code (DTC). The problem area is identified by the particular DTC that is set. The control module supplies a buffered voltage to various sensors and switches. Review the components and wiring diagrams in order to determine which systems are controlled by the ECM.

Malfunction Indicator Lamp (MIL) Operation

The malfunction indicator lamp (MIL) is located in the instrument panel cluster. The MIL will display as either SERVICE ENGINE SOON or one of the following symbols when commanded ON:





The MIL indicates that an emissions related fault has occurred and vehicle service is required.

The following is a list of the modes of operation for the MIL:

- The MIL illuminates when the ignition is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate.
- The MIL turns OFF after the engine is started if a diagnostic fault is not present.
- The MIL remains illuminated after the engine is started if the control module detects a fault. A diagnostic trouble code (DTC) is stored any time the control module illuminates the MIL due to an emissions related fault. The MIL turns OFF after three consecutive ignition cycles in which a Test Passed has been reported for the diagnostic test that originally caused the MIL to illuminate.
- The MIL flashes if the control module detects a misfire condition which could damage the catalytic converter.
- When the MIL is illuminated and the engine stalls, the MIL will remain illuminated as long as the ignition is ON.
- When the MIL is not illuminated and the engine stalls, the MIL will not illuminate until the ignition is cycled OFF and then ON.

Evaporative Emission Control System Description

EVAP System Operation

The evaporative emission (EVAP) control system limits fuel vapors from escaping into the atmosphere. Fuel tank vapors are allowed to move from the fuel tank, due to pressure in the tank, through the vapor pipe, into the EVAP canister. Carbon in the canister absorbs and stores the fuel vapors. Excess pressure is vented through the vent line and EVAP vent solenoid valve to the atmosphere. The EVAP canister stores the fuel vapors until the engine is able to use them. At an appropriate time, the control module will command the EVAP purge solenoid valve ON, allowing engine vacuum to be applied to the EVAP canister. With the EVAP vent solenoid valve OFF, fresh air is drawn through the vent solenoid valve and the vent line to the EVAP canister. Fresh air is drawn through the canister, pulling fuel vapors from the carbon. The air/fuel vapor mixture continues through the EVAP purge pipe and EVAP purge solenoid valve into the intake manifold to be consumed during normal combustion. The control module uses several tests to determine if the EVAP system is leaking.

Large Leak Test

This tests for large leaks and restrictions to the purge path in the evaporative emission (EVAP) system. When the enabling criteria has been met, the control module commands the EVAP vent solenoid valve ON and the EVAP purge solenoid valve ON, allowing vacuum into the EVAP system. The control module monitors the fuel tank pressure (FTP) sensor voltage to verify that the system is able to reach a predetermined level of vacuum within a set amount of time.

Small Leak Test

The engine off natural vacuum (EONV) diagnostic is the small-leak detection diagnostic for the evaporative emission (EVAP) system. While previous leak detection methods were performed with the engine running, the EONV diagnostic monitors the EVAP system pressure or vacuum with the ignition OFF. Because of this, it may be normal for the control module to remain active for up to 40 minutes after the ignition is turned OFF. This is important to remember when performing a parasitic draw test on vehicles equipped with EONV.

The EONV utilizes the temperature changes in the fuel tank immediately following a drive cycle to use the naturally occurring vacuum or pressure in the fuel tank. When the vehicle is driven, the temperature rises in the tank. After the vehicle is parked, the temperature in the tank continues to rise for a period of time, then starts to drop. The EONV diagnostic relies on this temperature change and the corresponding pressure change in a sealed system, to determine if an EVAP system leak is present.

The EONV diagnostic is designed to detect leaks as small as 0.51 mm (0.020 in). The diagnostic can determine if a small leak is present based on vacuum or pressure readings in the EVAP system. When the system is sealed, a finite amount of pressure or vacuum will be observed. When a 0.51 mm (0.020 in) leak is present, often little or no pressure or vacuum is observed. If the test reports a failing value, DTC P0442 will set.

Canister Vent Restriction Test

If the evaporative emission (EVAP) vent system is restricted, fuel vapors will not be properly purged from the EVAP canister. The control module tests this by commanding the EVAP purge solenoid valve ON, commanding the EVAP vent solenoid valve OFF, and monitoring the fuel tank pressure (FTP) sensor for an increase in vacuum. If the vacuum increases more than a calibrated value, DTC P0446 will set.

Purge Solenoid Valve Leak Test

If the evaporative emission (EVAP) purge solenoid valve does not seal properly fuel vapors could enter the engine at an undesired time, causing driveability concerns. The control module tests for this by commanding the EVAP purge solenoid valve OFF and the vent solenoid valve ON, sealing the system, and monitors the fuel tank pressure (FTP) for an increase in vacuum. If the control module detects that the EVAP system vacuum increases above a calibrated value, DTC P0496 will set.

Check Gas Cap Message

The control module sends a class 2 message to the driver information center (DIC) illuminating the Check Gas Cap message when a malfunction in the evaporative emission (EVAP) system and a large leak test fails.

EVAP System Components

The evaporative emission (EVAP) system consists of the following components:

EVAP Canister

The canister is filled with carbon pellets used to absorb and store fuel vapors. Fuel vapor is stored in the canister until the control module determines that the vapor can be consumed in the normal combustion process.

EVAP Purge Solenoid Valve

The EVAP purge solenoid valve controls the flow of vapors from the EVAP system to the intake manifold. The purge solenoid valve opens when commanded ON by the control module. This normally closed valve is pulse width modulated (PWM) by the control module to precisely control the flow of fuel vapor to the engine. The valve will also be opened during some portions of the EVAP testing, allowing engine vacuum to enter the EVAP system.

EVAP Vent Solenoid Valve

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. The valve is normally open. The control module commands the valve ON, closing the valve during some EVAP tests, allowing the system to be tested for leaks.

Fuel Tank Pressure Sensor

The fuel tank pressure (FTP) sensor measures the difference between the pressure or vacuum in the fuel tank and outside air pressure. The control module provides a 5-volt reference and a ground to the FTP sensor. The FTP sensor provides a signal voltage back to the control module that can vary between 0.1-4.9 volts. A high FTP sensor voltage indicates a low fuel tank pressure or vacuum. A low FTP sensor voltage indicates a high fuel tank pressure.

Fuel System Description

System Overview

The fuel tank stores the fuel supply. An electric fuel pump, located in the fuel tank with the fuel sender assembly that pumps the fuel to the fuel rail assembly. The pump provides the fuel at a pressure greater than is needed by the injectors. The fuel pressure regulator, part of the fuel sender assembly, keeps the fuel available to the injectors at a regulated pressure. The fuel system is returnless.

Fuel Tank

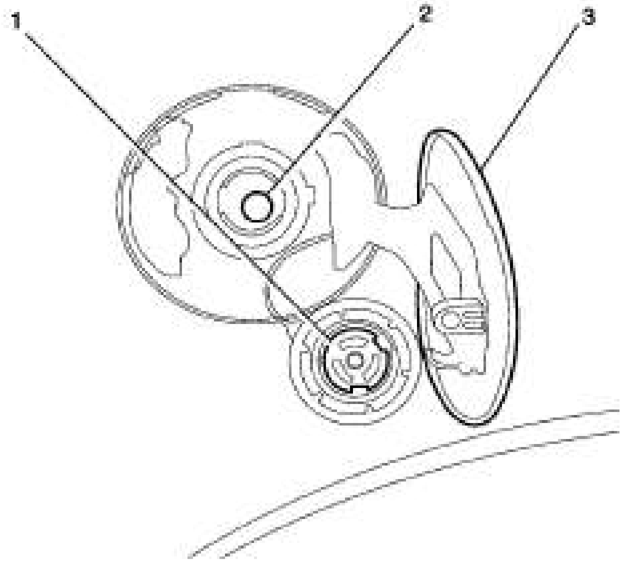
The fuel storage tank is made of high density polyethylene. The fuel storage tank is held in place by 2 metal straps that are attached to the under body of the vehicle. The tank shape includes a sump in order to maintain a constant supply of fuel around the fuel pump strainer during low fuel conditions or during aggressive manoeuvres.

The fuel tank also contains a fuel vapor vent valve with a roll-over protection. The vent valve also features a 2-phase vent calibration which increases the fuel vapor flow to the canister when the operating temperatures increase the tank pressure beyond an established threshold.

Fuel Tank Filler Pipe

In order to prevent refuelling with leaded fuel, the fuel filler pipe has a built-in restrictor and a deflector. The opening in the restrictor will accept only the smaller unleaded gasoline fuel nozzle which must be fully inserted in order to bypass the deflector. The tank is vented during filling by an internal vent tube inside of the filler pipe.

Fuel Filler Cap



(1) Fuel Tank Filler Cap
(2) Fuel Tank Filler Pipe
(3) Fuel Filler Door

Notice: If a fuel tank filler cap requires replacement, use only a fuel tank filler cap with the same features. Failure to use the correct fuel tank filler cap can result in a serious malfunction of the fuel and EVAP system.

The fuel filler cap (1) is a screw-on type, with an integrated tightening torque limiting mechanism. When installing the cap, tighten it until a ratcheting (clicking) sound is heard, indicating the cap is properly tightened. The fuel tank filler cap is tethered to the fuel filler pocket. The fuel tank filler cap requires a quarter of a turn in order to be removed.

Modular Fuel Sender

(7) Fuel Pump
(8) Fuel Strainer/Pick up
(9) Return Fuel Check Valve for Reservoir
(10) Return Fuel Jet Pump
(11) Fuel Transfer Line

(12) Fuel Strainer/Pickup

The modular fuel sender assembly mounts to the threaded opening of the plastic fuel tank with a seal and a retainer ring. The reservoir, containing the exterior inlet strainer, the electric fuel pump and the pump strainer, maintains contact with the tank bottom. This design provides:

- Optimum fuel level in the integral fuel reservoir during all fuel tank levels and during driving conditions
- An improved tank fuel level measuring accuracy
- An improved coarse straining and added pump inlet filtering
- More extensive internal fuel pump isolation for noiseless operation

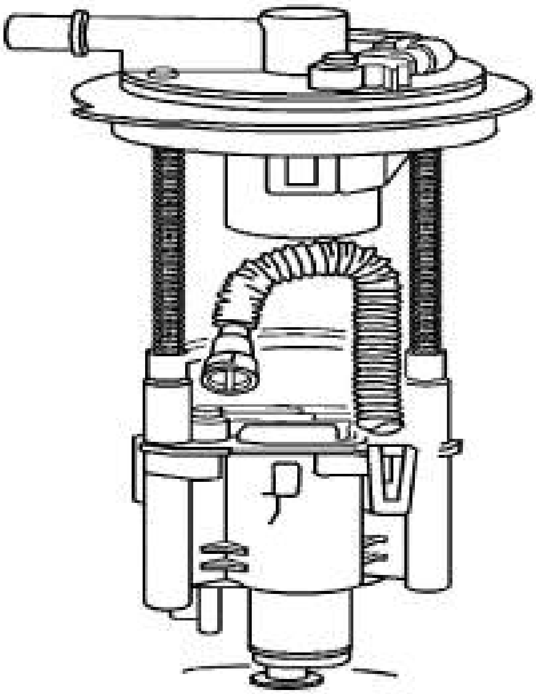
The modular fuel sender assembly maintains an optimum fuel level in the reservoir (bucket). The fuel entering the reservoir is drawn in by the following components:

- The first stage of the fuel pump through the external strainer

  and/or
- The secondary umbrella valve

  or
- The return fuel line, whenever the level of fuel is below the top of the reservoir

Fuel Pump



The fuel pump is incorporated into the design of the modular fuel sender assembly inside the fuel tank and is an electric, high pressure, single turbine design. The fuel pump provides fuel to the fuel rail assembly at a specified flow and pressure. The fuel pump delivers a constant flow of fuel to the engine, even during low fuel conditions or aggressive vehicle manoeuvres. The engine control module (ECM) controls the electric fuel pump operation through the fuel pump relay.

Fuel Pressure Regulator Assembly

The fuel pressure regulator is a diaphragm-operated relief valve located in the modular fuel pump and sender assembly. Its principal function is to maintain a controlled pressure at the injectors at all times by regulating fuel flow into the fuel feed line. With the ignition ON and the engine OFF, system fuel pressure at the pressure test connection should be 380-440 kPa (55-64 psi).

Fuel Pump Strainer

The fuel strainer connects onto the fuel pump inlet port on the end cap of the fuel pump assembly and consists of a finely woven plastic filter. A metal compression ring is fitted around the plastic strainer to fuel pump feed port and the complete fuel strainer assembly is fastened to the fuel pump end cap with a metal speed clip fastener. The strainers function is to filter fuel contaminants from within the fuel reservoir and also act to wick the fuel. The fuel strainer is serviced as part of the complete fuel pump and strainer assembly. Fuel stoppage at the strainer indicates an abnormal amount of sediment in the fuel tank which should be removed before reinstallation of the fuel tank into the vehicle.

Fuel Filter Assembly

The fuel filter assembly is contained within the modular fuel pump and sender assembly reservoir and forms the containment housing for the fuel pump. The filter comprises a paper element which traps particles in the fuel that may damage the fuel injection system. The fuel filter is made to withstand maximum fuel system pressure, changes in temperature and exposure to fuel additives.

Fuel Level Sender Assemblies

The fuel level sender assembly comprises of two fuel level float and wire arm assemblies, a ceramic variable resistor card assembly , and a detachable nylon wiper. The ceramic resistor card is attached to a plastic card holder which attaches to the reservoir. A metal contact fork with brushes is connected to the detachable nylon wiper. This assembly provides a variable circuit resistance to the engine control module (ECM) depending on wiper contact position. Two circuit wires run from the resistor card and extend up to connect with the modular fuel pump to cover assembly wiring connector on the underside of the modular fuel pump and sender assembly cover. The ECM averages out any slosh variation in the fuel tank and sends this signal to the fuel level indicator on the instrument panel fuel gauge.

Nylon Fuel Pipes

Caution: In order to reduce the risk of fire and personal injury observe the following items:

- Replace all nylon fuel pipes that are nicked, scratched or damaged during installation, do not attempt to repair the sections of the nylon fuel pipes
- Do not hammer directly on the fuel harness body clips when installing new fuel pipes. Damage to the nylon pipes may result in a fuel leak.
- Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never

expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period.

- Apply a few drops of clean engine oil to the male pipe ends before connecting fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

Important: The fuel pipe "O" rings are not a serviceable item

Nylon fuel pipes are designed to perform the same job as the steel or flexible fuel pipes or hoses. Nylon pipes are constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. There are three sizes of nylon pipes used: 3/8 in ID for the fuel feed, 5/16 in ID for the evaporative emission tube, and 1/2 in ID for the vent. Heat-resistant rubber hose and/or corrugated plastic conduit protect the sections of the pipes that are exposed to chafing, to high temperature or to vibration.

Nylon fuel pipes are somewhat flexible and can be formed around gradual turns under the vehicle. However, if nylon fuel pipes are forced into sharp bends, the pipes will kink and restrict the fuel flow. Once exposed to fuel, nylon pipes may become stiffer and are more likely to kink if the pipes are bent too far. Take special care when working on a vehicle with nylon fuel pipes.

Quick-Connect Fittings

Quick-connect fittings provide a simplified means of installing and connecting fuel system components. The fittings consist of a unique female connector and a compatible male pipe end. "O" rings, located inside the female connector, provide the fuel seal. Integral locking tabs or fingers hold the fittings together.

Fuel Pipe O-Rings

"O" rings seal the threaded connections in the fuel system. The fuel system "O" ring seals are made of a special material. The fuel pipe "O" rings are not a serviceable item.

EVAP Pipes and Hoses

The evaporative emission (EVAP) tubes extend from the fuel tank module and the EVAP canister vent to the EVAP canister. These tubes are located on the top rear of the fuel tank. The EVAP purge tube/pipe extends from the EVAP canister on top of the fuel tank to the EVAP purge solenoid in the engine compartment. The chassis EVAP purge pipe is constructed of steel.

On-Board Refueling Vapor Recovery System (ORVR)

The on-board refuelling vapour recovery system (ORVR) is an on-board vehicle system that is designed to recover the fuel vapours during the vehicle refuelling operation. The flow of liquid fuel down the fuel filler pipe provides a liquid seal, which prevents the vapour from leaving the fuel filler pipe. An evaporative emission (EVAP) pipe transports the fuel vapour to the EVAP canister for use by the engine. Listed below are the ORVR system components with a brief description of their operation:

- The EVAP canister. The EVAP canister receives refuelling vapour from the fuel system, stores the vapour and releases the vapour to the engine upon demand.

- The EVAP pipes. The EVAP pipes transport the fuel vapour from the fuel tank to the EVAP canister.
- The fuel filler pipe. The fuel filler pipe carries the fuel from the fuel nozzle to the fuel tank.
- The check valve. The check valve limits fuel spit back from the fuel tank during the refuelling operation by allowing the fuel flow only into the fuel tank. This check valve is located at the bottom of the fuel filler pipe.
- The modular fuel sender assembly. The assembly pumps the fuel to the engine from the fuel tank.
- The fill limiter vent valve (FLVV). This valve acts as a shut-off valve. The FLVV is located at the top of the fuel sender assembly. This valve is not serviced separately. The FLVV has the following functions:
  - The FLW controls the fuel tank fill level by closing the primary vent from the fuel tank.
  - The FLW prevents the fuel from exiting the fuel tank via the EVAP pipe to the canister.
  - The FLW provides fuel-spillage protection in the event of a vehicle roll over by closing the vapour path from the tank to the EVAP canister.

Modes of Operation

The engine control module (ECM) looks at voltages from several sensors to determine how much fuel to give the engine. The fuel is delivered under one of several conditions called modes. The ECM controls all modes.

Starting Mode

With the ignition ON, before engaging the starter, the engine control module (ECM) energizes the fuel pump relay for two seconds allowing the fuel pump to build up pressure. The ECM first checks speed density, then switches to the mass air flow (MAF) sensor. The ECM also uses the engine coolant temperature (ECT), throttle position (TP), and manifold absolute pressure (MAP) sensors to determine the proper air/fuel ratio for starting. The ECM controls the amount of fuel delivered in the starting mode by changing the pulse width of the injectors. This is done by pulsing the injectors for very short times.

Clear Flood Mode

If the engine is flooded with fuel during starting and will not start, the Clear Flood Mode can be manually selected. To select Clear Flood Mode, push the accelerator to wide open throttle (WOT). With this signal, the ECM will completely turn OFF the injectors and will maintain this stage as long as the ECM indicates a WOT condition with engine speed below 1,000 RPM.

Run Mode

The Run Mode has 2 conditions: Open Loop operation and Closed Loop operation. When the engine is first started and the engine speed is above 480 RPM, the system goes into Open Loop operation. In Open Loop operation, the ECM ignores the signals from the oxygen sensors and calculates the required injector pulse width based primarily on inputs from the MAF, IAT and ECT sensors.

In Closed Loop, the ECM adjusts the calculated injector pulse width for each bank of injectors based on the signals from each oxygen sensor.

Acceleration Mode

The ECM monitors the changes in the TP and the MAF sensor signals in order to determine when the vehicle is being accelerated. The ECM will then increase the injector pulse width in order to provide more fuel for improved performance.

Deceleration Mode

The ECM monitors changes in TP and MAF sensor signals to determine when the vehicle is being decelerated. The ECM will then decrease injector pulse width or even shut OFF injectors for short periods to reduce exhaust emissions, and for better (engine braking) deceleration.

Battery Voltage Correction Mode

The ECM can compensate in order to maintain acceptable vehicle driveability when the ECM sees a low battery voltage condition. The ECM compensates by performing the following functions:

- Increasing the injector pulse width in order to maintain the proper amount of fuel being delivered
- Increasing the idle speed to increase the generator output

Fuel Cutoff Mode

The engine control module (ECM) cuts OFF fuel from the fuel injectors when the following conditions are met in order to protect the powertrain from damage and improve driveability:

- The ignition is OFF. This prevents engine run-on.
- The ignition is ON, but there is no ignition reference signal. This prevents flooding or backfiring.
- The engine speed is too high, above the red line.
- The vehicle speed is too high, above rated tire speed.
- During an extended, high speed, closed throttle coast down, this reduces emissions and increases engine braking.
- During extended deceleration, in order to prevent damage to the catalytic converters.
- The torque management enabled--Transmission shifts or abusive maneuvers.
- The traction control enabled--In conjunction with the front brakes applying

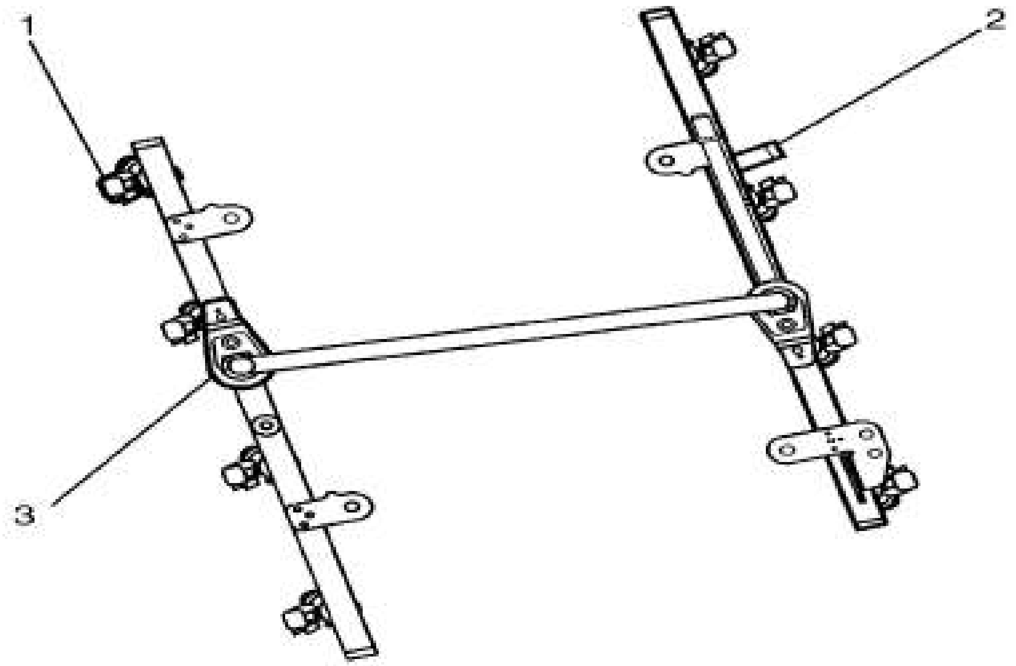
Fuel Trim

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy and emission control. The ECM monitors the heated oxygen sensor (HO2S) signal voltage while in Closed Loop and regulates the fuel delivery by adjusting the pulse width of the fuel injectors based on this signal. The ideal fuel trim values are around 0 percent for both short term and long term fuel trim. A positive fuel trim value indicates the ECM is adding fuel in order to compensate for a lean condition by increasing the pulse width. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition by decreasing the pulse width. A change made to the fuel delivery changes the short term and long term fuel trim values. The short term fuel trim values change rapidly in response to the HO2S signal voltage. These changes fine tune the engine fuelling. The long term fuel trim makes coarse adjustments to the fuelling in order to re-centre and restore control to short term fuel trim. A scan tool can be used to monitor the short term and long term fuel trim values. The long term fuel trim diagnostic is based on an average of several of the long term speed load learn cells. The ECM selects the cells based on the engine speed and engine load. If the ECM detects an excessive lean or rich condition, the ECM will set a fuel trim DTC.

Fuel Pump Electrical Circuit

When the ignition switch is in the ON position, before engaging the starter, the engine control module (ECM) energizes the fuel pump relay for two seconds, causing the fuel pump to pressurize the fuel system. If the ECM does not receive ignition reference pulses with the engine cranking or running within two seconds, the ECM shuts OFF the fuel pump relay, causing the fuel pump to stop.

Fuel Rail Assembly



The fuel rail assembly attaches to the engine intake manifold. The fuel rail assembly performs the following functions:

- Positions the injectors (3) in the intake manifold
- Distributes fuel evenly to the injectors through the fuel rail (2)
- Fuel Rail Feed Pipe (1)

Fuel Injectors

The top-feed fuel injector assembly is a solenoid-operated device, controlled by the engine control module (ECM), that meters pressurized fuel to a single engine cylinder. The ECM energizes the injector solenoid, which opens a ball valve, allowing the fuel to flow past the ball valve, and through a recessed flow director plate. The director plate has multiple machined holes that control the fuel flow, generating a conical spray pattern of finely atomized fuel at the injector tip. Fuel is directed at the intake valve, causing the fuel to become further atomized and vaporized before entering the combustion chamber. An injector that is stuck partly open can cause a loss of pressure after the engine shutdown. Consequently, long cranking times would be noticed on some engines.

Engine Fueling

The engine is fueled by eight individual injectors, one for each cylinder, that are controlled by the ECM. The ECM controls each injector by energizing the injector coil for a brief period once every other engine revolution. The length of this brief period, or pulse, is carefully calculated by the ECM to deliver the correct amount of fuel for proper driveability and emissions control. The period of time when the injector is energized is called the pulse width and is measured in milliseconds, thousandths of a second.

While the engine is running, the ECM is constantly monitoring the inputs and recalculating the appropriate pulse width for each injector. The pulse width calculation is based on the injector flow rate, mass of fuel the energized injector will pass per unit of time, the desired air/fuel ratio, and actual air mass in each cylinder and is adjusted for battery voltage, short term, and long term fuel trim. The calculated pulse is timed to occur as each cylinders intake valves are closing to attain largest duration and most vaporization.

Fueling during a crank is slightly different than fueling during an engine run. As the engine begins to turn, a prime pulse may be injected to speed starting. As soon as the ECM can determine where in the firing order the engine is, the ECM begins pulsing the injectors. The pulse width during the crank is based on the coolant temperature and the engine load.

The fueling system has several automatic adjustments in order to compensate for the differences in the fuel system hardware, the driving conditions, the fuel used, and the vehicle aging. The basis for the fuel control is the pulse width calculation that is described above. Included in this calculation are an adjustment for the battery voltage, the short term fuel trim, and the long term fuel trim. The battery voltage adjustment is necessary since the changes in the voltage across the injector affect the injector flow rate. The short term and the long term fuel trims are fine and gross adjustments to the pulse width that are designed in order to maximize the driveability and emissions control. These fuel trims are based on the feedback from the oxygen sensors in the exhaust stream and are only used when the fuel control system is in a Closed Loop operation.

Under certain conditions, the fueling system will turn OFF the injectors for a period of time. This is referred to as fuel shut-off. Fuel shut-off is used in order to improve traction, save fuel, improve emissions, and protect the vehicle under certain extreme or abusive conditions.

In case of a major internal problem, the ECM may be able to use a back-up fuel strategy for limp in mode that will run the engine until service can be performed.

Sequential Fuel Injection (SFI)

The ECM controls the fuel injectors based on information that the ECM receives from several information sensors. Each injector is fired individually in the engine firing order, which is called sequential fuel injection. This allows precise fuel metering to each cylinder and improves the driveability under all of the driving conditions.

The ECM has several operating modes for fuel control, depending on the information that has been received from the sensors.

Throttle Actuator Control (TAC) System Description

Purpose

The throttle actuator control (TAC) system delivers improved throttle response and greater reliability and eliminates the need for mechanical cable. The TAC system performs the following functions:

- Accelerator pedal position sensing
- Throttle positioning to meet driver and engine demands
- Throttle position sensing
- Internal diagnostics
- Cruise control functions
- Manage TAC electrical power consumption

The TAC system includes the following components:

- The accelerator pedal position (APP) sensors
- The throttle body assembly
- The engine control module (ECM)

Accelerator Pedal Position (APP) Sensor

The accelerator pedal contains two individual accelerator pedal position (APP) sensors within the assembly. The APP sensors one and two are potentiometer type sensors each with three circuits:

- A 5-volt reference circuit
- A low reference circuit
- A signal circuit

The APP sensors are used to determine the pedal angle. The engine control module (ECM) provides each APP sensor a 5-volt reference circuit and a low reference circuit. The APP sensors provide the ECM with signal voltage proportional to the pedal movement. The APP sensor 1 signal voltage at rest position is less than 1 volt and increases as the pedal is actuated. The APP sensor 2 signal voltage at rest position above 4 volts and decreases as the pedal is actuated.

Throttle Body Assembly

The throttle assembly contains the following components:

- The throttle blade
- The throttle actuator motor
- The throttle position (TP) sensor one and two

The throttle body functions similar to a conventional throttle body with the following exceptions:

- An electric motor opens and closes the throttle valve.
- The throttle blade is spring loaded in both directions and the default position is slightly open.
- There are two individual TP sensors within the throttle body assembly.

The TP sensors are used to determine the throttle plate angle. The TP sensors provide the engine control module (ECM) with a signal voltage proportional to throttle plate movement. The TP signal voltage for both 1 and 2 at closed throttle is below 1 volt and increases as the throttle plate is opened.

Throttle Body Relearn Procedure

The engine Control Module (ECM) stores values that include the lowest possible throttle position (TP) sensor positions-0 percent, the rest positions-7 percent, and the return rate of both springs. These values will only be erased or overwritten if the ECM is reprogrammed or if a throttle body relearn procedure is performed. Observe, if the battery is disconnected, the ECM will immediately perform a throttle body relearn procedure when the ignition is turned ON.

A throttle body relearn procedure is performed any time the ignition is turned ON, with the engine OFF for longer than 29 seconds when the following conditions have been met:

- The engine speed is less than 40 RPM.
- The vehicle speed is 0 km/h (0 mph).
- The engine coolant temperature (ECT) is between 5-85°C (41-185°F).
- The intake air temperature (IAT) is between than 5-60°C (41-140°F).
- The accelerator pedal position (APP) sensor angle is less than 14.9 percent.
- The ignition 1 voltage is more than 10 volts.

After 29 seconds, the ECM commands the throttle plate from the rest position to full closed, then to around 10 percent open. This procedure takes about 6-8 seconds. If any faults occur in the throttle actuator control (TAC) system, a DTC sets. At the start of this procedure, the scan tool TAC Learn Counter parameter should display 0, then count up to 11 after the procedure is completed. If the counter did not start at 0, or if the counter did not end at 11, a fault has occurred and a DTC should set.

Engine Control Module

The engine control module (ECM) is the control centre for the throttle actuator control (TAC) system. The ECM determines the drivers intent and then calculates the appropriate throttle response. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the TAC motor.

Modes of Operation

Normal Mode

During the operation of the throttle actuator control (TAC) system, several modes or functions are considered normal. The following modes may be entered during normal operation:

- Minimum pedal value. At first start-up, the engine control module (ECM) updates the learned minimum pedal value.
- Minimum throttle position (TP) values. At first start-up, the ECM updates the learned minimum TP value. In order to learn the minimum TP value, the throttle blade is moved to the closed position.
- Ice break mode. If the throttle is not able to reach a predetermined minimum throttle position, the ice break mode is entered. During the ice break mode, the ECM commands the maximum pulse width several times to the throttle actuator motor in the closing direction.
- Battery saver mode. After a predetermined time without engine RPM, the ECM commands the battery saver mode. During the battery saver mode, the TAC module removes the voltage from the motor control circuits, which removes the current draw used to maintain the idle position and allows the throttle to return to the spring loaded default position.

Reduced Engine Power Mode

When the ECM detects a condition with the TAC system, the ECM may enter a reduced engine power mode. Reduced engine power may cause one or more of the following conditions:

- Acceleration limiting. The ECM will continue to use the accelerator pedal for throttle control, however, the vehicle acceleration is limited.
- Limited throttle mode. The ECM will continue to use the accelerator pedal for throttle control, however, the maximum throttle opening is limited.
- Throttle default mode. The ECM will turn OFF the throttle actuator motor and the throttle will return to the spring loaded default position.
- Forced idle mode. The ECM will perform the following actions:
  - Limit engine speed to idle by positioning the throttle position, or by controlling the fuel and spark if the throttle is turned OFF.
  - Ignore the accelerator pedal input.
- Engine shutdown mode. The ECM will disable fuel and de-energize the throttle actuator.

Diagnostic Starting Point - Engine Cooling

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control module(s) which command the system.
- The ability of the control module(s) to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC P0480 or P0481

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

High Speed Cooling Fan Relay Coil Voltage Supply Circuit	P0481	P0481	P0481

Circuit/System Description

The engine control module (ECM) grounds the cooling fan relay control circuits through an internal solid state device called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line that is monitored by the ECM. When the ECM is commanding a component ON the voltage potential of the control circuit should be low, near 0 volts. When the ECM is commanding the control circuit to a component OFF the voltage potential of the circuit should be high near battery voltage. If the ECM detects that the actual state of the control circuit does not match the expected state, a DTC will set.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is between 9-18 volts.

Conditions for Setting the DTC

- An imcorrect voltage level has been detected on the cooling fan relay control circuit.
- The condition must be present for a minimum of 30 seconds.

Action Taken when the DTC Sets

DTCs P0480 and P0481 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0480 and P0481 are type B DTCs.

Circuit/System Verification

Ignition ON, command each relay ON and OFF with a scan tool. Feel or listen to verify that each relay turns ON and OFF with each command.

Circuit/System Testing

1. Ignition OFF, disconnect the fan relay.
2. Ignition ON, verify that a test lamp does not illuminate between the earth terminal and a known ground.

   If the test lamp illuminates, test the control circuit for a short to voltage.
3. Ignition ON, Connect a test lamp between the control circuit terminal and a known ground.

   Command the relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

If the test lamp is always ON, test the relay control circuit for a short to voltage. If the circuit tests normal replace the ECM.

If the test lamp is always OFF, test the relay control circuit for a short to ground or an open/high resistance. If the circuit tests normal replace the ECM.

4. Connect a test lamp between the Battery + terminal and a known ground.

   If the test lamp does not illuminates, test the Battery + for a short to ground or an open/high resistance.

5. Connect a 30-A fusible link wire between the battery positive post and the fan voltage supply circuit terminal and verify fan activation.

   If the fan does not activate, test the fan voltage supply circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the fan.

6. If all circuits test normal replace the affected relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Repair Verification

Ignition ON, command the relay ON and OFF with a scan tool. Feel or listen to verify that the relay turns ON and OFF with each command.

Circuit/System Description

The engine control module (ECM) commands the fans ON in either high speed or low speed, depending on cooling requirements. In low speed, both fans are turned ON at a reduced speed. High speed has both fans turned ON at full speed.

In low speed operation, the ECM applies ground to the coil side of the low speed fan 1 relay. This energizes the coil and applies voltage directly to the right cooling fan through the switch side of the relay. The right fan is connected in series to the left cooling fan through the de-energized fan 2 relay. The series circuit operates both fans at low speed.

In high speed operation, the ECM applies a ground to the coil side of the fan 1 relay, the fan 2 relay, and the high speed fan 3 relay. When energized, the fan 3 relay applies voltage directly to the left cooling fan through the switch side of the relay. Simultaneously, the fan 1 relay and the fan 2 relay provide ignition voltage and a direct path to ground for the left cooling fan. With both fans connected in a parallel circuit, each fan receives full voltage and operates at high speed.

Conditions for Running the DTC

- The ignition voltage is between 8-18 volts.
- The engine speed is more than 40 RPM.
- The ECM driver transitions from ON to OFF or from OFF to ON.

Conditions for Setting the DTC

P0480

The ECM detects an open on the low speed cooling fan 1 relay control circuit for more than 1 second.

P0481

The ECM detects an open circuit on the high speed cooling fan 2 relay control circuit for more than 1 second.

P0691

The ECM detects a short to ground on the low speed cooling fan 1 relay control circuit for more than 1 second.

P0692

The ECM detects a short to voltage on the low speed cooling fan 1 relay control circuit for more than 1 second.

P0693

The ECM detects a short to ground on the high speed cooling fan 2 relay control circuit for more than 1 second.

P0694

The ECM detects a short to voltage on the high speed cooling fan 2 relay control circuit for more than 1 second.

Action Taken When the DTC Sets

DTCs P0480, P0481, P0691, P0692, P0693, and P0694 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0480, P0481, P0691, P0692, P0693, and P0694 are Type B DTCs.

Circuit/System Verification

1. Ignition ON, command the appropriate fan relay ON and OFF with a scan tool. Listen or feel the relay click.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect all three cooling fan relays.

Note: The following test must be performed on all three fan relay circuits.

2. Ignition ON, verify that a test lamp illuminates between ground and the relay coil ignition circuit terminal listed below:
   - Fan 1 and Fan 3 relays terminal 85
   - Fan 2 relay terminal 86

   If the test lamp does not illuminate, test the relay coil ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the relay coil ignition circuit fuse is open, test all components connected to the ignition circuit and replace as necessary.

Note: The following test must be performed on all three fan relay circuits.

3. Test for 2.6-4.6 volts between ground and the relay coil control circuit terminal listed below:
   - Fan 1 and Fan 3 relays terminal 86
   - Fan 2 relay terminal 85

   If less than the specified range, test the relay coil control circuit for an open/high resistance or for a short to ground. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the relay coil control circuit for a short to voltage. If the circuit tests normal, replace the ECM.

Note: The following test must be performed on all three fan relay circuits.

4. Connect a test lamp between the relay coil control circuit and the relay coil ignition circuit, terminals 85 and 86.
5. Command the fan relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always OFF, replace the ECM.
6. If all the circuits test normal, test or replace the appropriate relay.

Component Testing

1. Ignition OFF, disconnect the cooling fan relay.
2. Test for 70-110 ohms between terminals 85 and 86.

   If the resistance is not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

     If not the specified range, replace the relay.

Note: This test only applies to 5 terminal relays.

4. Test for less than 2 ohms between terminals 30 and 87A.

   If greater than the specified range, replace the relay.
5. Install a 20A fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 ohms between terminals 30 and

87.

If greater than the specified range, replace the relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P1258

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of the diagnostic category.

DTC Descriptor

DTC P1258: Engine Coolant Overtemperature - Protection Mode Active

Circuit/System Description

The engine control module (ECM) uses the engine coolant temperature (ECT) sensor to monitor the engine for an over-termperature condition. This condition occurs when the coolant temperature is above a calibrated value for a calibrated length of time. The ECM will disable half of the cylinders by turning OFF the fuel injectors. By disabling half of cylinders, the ECM is able to reduce the temperature of the coolant.

Conditions for Running the DTC

- The engine is running for greater than 30 seconds.
- DTC P0116, P0117, P0118, or P0128 are not set.

Conditions for Setting the DTC

- The ECM detects that the engine coolant temperature is greater than 136°C (277°F) for more than 1 second or a cumulative time of 10 seconds - V6 applications.
- The ECM detects that the engine coolant temperature is greater than 131°C (267.8°F) for more than 7 seconds - V8 applications.

Action Taken When the DTC Sets

- DTC P1258 is a Type A DTC.
- The engine will operate in the Overheated Engine Protection Operating Mode.
- The instrument panel (IP) will illuminate the coolant indicator lamp and the driver information center (DIC), if equipped, may display a message.

Conditions for Clearing the DTC

DTC P1258 is a Type A DTC.

Circuit / System Verification

Note: If DTCs P0480, P0481, P0691, P0692, P0693, or P0694 are set, diagnose those DTCs first.

1. Observe the engine coolant level. The engine coolant level should be within operating range. Refer to Capacities - Approximate Fluid, and Engine Coolant in the Owner's Manual.
2. Ensure that the vehicle has the correct engine coolant, with correct concentration, and is not old, contaminated, or contains additives. Refer to Recommended Fluids and Lubricants in the Owner's Manual.
3. Inspect the cooling system for the following:
    - Cooling system leaks
    - Kinked or pinched hoses, especially at the radiator
    - Loose, missing, or damaged radiator air seals or deflectors
    - The radiator and A/C condenser for any air flow obstructions or bent fins--Refer to Symptoms - Engine Cooling.

    Note: A small delay occurs before the ECM changes the cooling fan speed.

4. Command the cooling fans in both low and high speed.

    If the cooling fans do not operate in both speeds, refer to Cooling Fan Inoperative.
5. Test the thermostat for the correct operation. Refer to Thermostat Diagnosis.
6. Test the engine cooling system for overheating. Refer to Engine Overheating.
7. Inspect the water pump and coolant flow for correct operation. Refer to Water Pump Replacement.
8. Inspect the engine for worn/leaking/cracked cylinder heads and engine block. Refer to Coolant in Combustion Chamber and Coolant in Engine Oil.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Cooling Fan Always On

Step	Action	Yes	No
Schematic Reference: Engine Cooling Schematics . *Connector End View Reference:* Component Connector End Views . DEFINITION: One or both engine cooling fan motors run continuously in high or low speed.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go To Diagnostic System Check - Vehicle
2	Ignition ON, engine OFF. Are both cooling fans operating at low speed?	Go to Step 4	Go to Step 3
3	Is the left cooling fan operating at high speed?	Go to Step 5	Go to Testing for Intermittent Conditions and Poor Connections in Wiring Systems.
4	Remove the low speed fan relay. Did the fans turn OFF?	Go to Step 6	Repair the cooling fan motor supply voltage circuit of the right cooling fan for a short to voltage. Refer to Wiring Repairs .
5	Remove the high speed fan relay. Did the left cooling fan turn OFF?	Go to Step 7	Repair the cooling fan motor supply voltage circuit of the left cooling fan for a short to voltage. Refer to Wiring Repairs .
6	Inspect for poor connections at the low speed fan relay. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	System OK	Replace the low speed fan relay.
7	Inspect for poor connections at the high speed fan relay. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	System OK	Replace the high speed fan relay.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Diagnostic Information and Procedures | **Document ID: 1990395**

Engine Fails To Reach Normal Operating Temperature

Step	Action	Yes	No
1	1. Ensure that the cooling system is full. 2. Allow the engine to cool. 3. Start the engine. 4. Turn the air conditioning system off. 5. Inspect the engine cooling fan(s). Is the electric cooling fan on?	Go to Step 2	Go to Step 3
2	1. Diagnose and repair the cooling fan system. Refer to Cooling Fan Always On. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 3	System OK
3	Install the Scan Tool to the DLC. Compare the Scan Tool coolant temperature reading to the I/P cluster coolant temperature. Is the I/P cluster coolant temperature close to the reading on the Scan Tool?	Go to Step 5	Go to Step 4
4	1. Diagnose and repair the coolant temperature gauge system. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 5	System OK
5	Inspect the thermostat for correct operation. Refer to Thermostat Diagnosis. Is the thermostat operating correctly?	System OK	Go to Step 6
6	1. Replace the thermostat. Refer to Engine Coolant Thermostat Replacement. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 1	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Diagnostic Information and Procedures | **Document ID: 1990389**

Cooling Fan Inoperative

Step	Action	Yes	No
Schematic Reference: Engine Cooling Schematics . *Connector End View Reference:* Component Connector End Views DEFINITION: One or both cooling fan motors are inoperative in either high, low, or both speeds.			
1	Did you perform the Diagnostic System Check - Vehicle?	Go to Step 2	Go to Diagnostic System Check - Vehicle .
2	1. Install the can tool. 2. Ignition ON, engine OFF. 3. With a scan tool, command the fans low speed ON and OFF. Do the low speed engine cooling fans turn ON and OFF with each command?	Go to Step 3	Go to Step 4
3	**Important:** A 3-second delay occurs before the engine control module (ECM) changes the cooling fan speed. With a scan tool, command the fans high speed ON and OFF. Do the high speed engine cooling fans turn ON and OFF with each command?	Go to Testing for Intermittent Conditions and Poor Connections .	Go to Step 6
4	**Important:** Do NOT remove the jumper wire that you will be connecting until your testing is completed. If the low speed fan fuse opens when you connect the fused jumper wire, repair the cooling fan motor supply voltage circuit of the right cooling fan motor for a short to ground. 1. Disconnect the low speed fan relay. 2. Connect a jumper wire between the battery positive voltage circuit and the cooling fan motor supply voltage circuit of the low speed fan relay. Do both cooling fans operate in low speed?	Go to Step 14	Go to Step 5
	1. Disconnect the fan relay. 2. With a test lamp connected to a good		

5	ground, probe the cooling fan low reference circuit at the low speed fan relay. Does the test lamp illuminate?	Go to Step 9	Go to Step 8
6	Does the right cooling fan operate at high speed?	Go to Step 15	Go to Step 7
7	Inspect the ground circuit of the Low Speed fan relay for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	System OK	Go to Step 15
8	1. Install the Low Speed fan relay. 2. Disconnect the right cooling fan electrical connector. 3. With a test lamp connected to a good ground, probe the cooling fan motor supply voltage circuit at the right cooling fan motor connector. Does the test lamp illuminate?	Go to Step 12	Go to Step 13
9	1. Install the low speed fan relay. 2. Disconnect the left cooling fan motor connector. 3. With a test lamp connected to a good ground, probe the cooling fan motor supply voltage circuit at the left cooling fan connector. Does the test lamp illuminate?	Go to Step 11	Go to Step 10
10	Inspect the cooling fan motor supply voltage circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	System OK	Go to Step 15
11	Inspect the ground circuit of the left cooling fan for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	System OK	Go to Step 17
12	Inspect the cooling fan low reference circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	System OK	Go to Step 16
13	Inspect the cooling fan motor supply voltage circuit of the right cooling fan for an open or high resistance. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	System OK	Inspect the battery positive voltage circuit for an open or high resistance. Refer to Wiring Repairs .

14	Inspect for poor connections at the low speed fan relay. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	System OK	Replace the low speed fan relay.
15	Inspect for poor connections at the high speed fan relay. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs .	System OK	Replace the high speed fan relay.
16	Inspect for poor connections at the harness connector of the right cooling fan. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	System OK	Replace the right cooling fan. Refer to Cooling Fan and Shroud Replacement .
17	Inspect for poor connections at the harness connector of the left cooling fan. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs . Did you find and correct the condition?	System OK	Replace the left cooling fan. Refer to Cooling Fan and Shroud Replacement .

Cooling System Leak Testing

Tools Required

- KM-6327 Pressure Tester Adapter (previously released for Vectra)
- KM-471 Pressure Tester Adapter (previously released for Vectra)
- J 24460-01 Cooling System and Cap Pressure Tester

Caution: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Caution: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

Remove the coolant pressure cap.

Test the operation of the coolant pressure cap. Refer to Pressure Cap Testing .

Ensure that the coolant level is correct.

> **Notice:** Refer to General Repair Instructions in the Preface section.

1. Install the coolant filler neck adapter (2) to commercially available cooling system pressure tester (1).
2. Install the assembly to the engine coolant filler neck.
3. Using compressed air, blow dry any spilled coolant around coolant filler neck.

> **Caution:** Refer to General Repair Instructions in the Preface section.

4. Using the cooling system pressure tester pump, pressurise the cooling system to 150 kPa (22 psi) absolute maximum and check for leaks at the following points:
   - All hose and hose connections.
   - Overflow hose connection at coolant outlet housing connection.
   - Radiator seams and core.
   - Corroded or damaged engine core plugs.
   - Water pump and gasket.
   - Thermostat housing and inlet pipe connection.
   - Radiator drain cock.
   - Vehicle heating system (e.g. heater core and water valve).
   - Check engine oil dipstick for evidence of engine oil contamination with the coolant.
5. Repair any leaks as required.

Notice: Refer to General Repair Instructions in the Preface section.

6. If pressure will not hold, there is a leak in the cooling system. Repair as necessary.

Black Light and Dye Leak Diagnosis Method

Caution: Refer to Cooling System Draining and Filling in the Preface section.

Caution: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Caution: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Remove the pressure cap.
2. Pour a specified amount of dye into the cooling system.
3. Road test the vehicle under normal operating conditions.
4. Direct the black light towards the suspect area. Any fluid leak will appear as a bright coloured path leading to the source.
5. Repair the fluid leak and carry out a second road test to ensure the leak has been rectified.
6. Refer to the manufacture's direction when preforming this method.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Diagnostic Information and Procedures | **Document ID: 1994305**

Pressure Cap Testing

Tools Required

- J 24460-01 EN-48501 Pressure Cap Adapter
- J 24460-01 J-48501 Radiator Cap Pressure Adapter
- J 24460-01 J-24460-01 Cooling System and Cap Pressure Tester

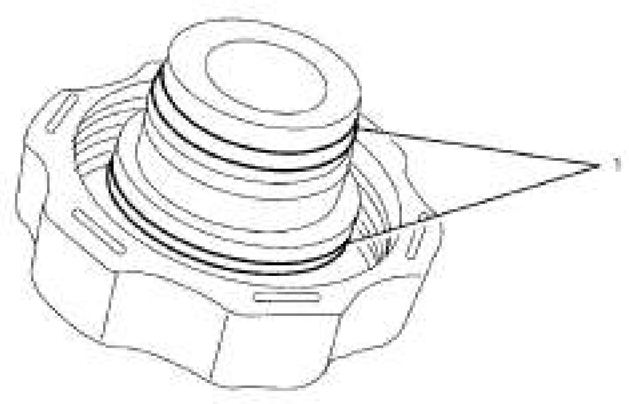
Caution: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Caution: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

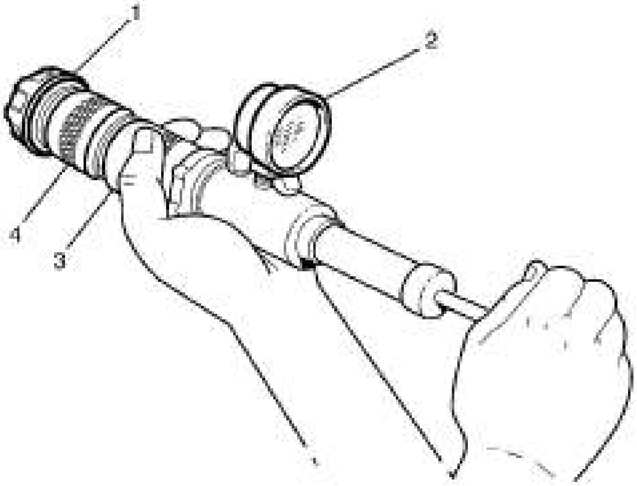
Caution: Refer to Safety Glasses Caution in the Preface section.

Ensure engine is below 50 C before removing the coolant pressure cap.



Caution: Refer to General Repair Instructions in the Preface section.

Inspect and clean the sealing O-rings (1) with a wet cloth.

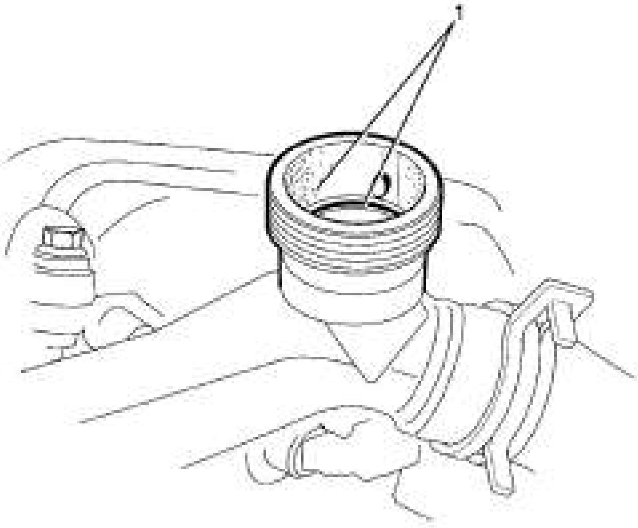


1. Attach the coolant filler cap (1) to a commercially available cooling system pressure tester (2), using the pressure cap adapter (4) and the pressure tester adapter (3).

   Notice: Refer to General Repair Instructions in the Preface section.

2. Slowly pressurise cap to 120 - 150 kPa (17 - 22 psi).

   Notice: Refer to General Repair Instructions in the Preface section.



3. Prior to installing the coolant pressure cap ensure that the coolant filler neck cap seating surface (1) is clean and free from obstruction.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the coolant pressure cap.

   Tighten
   Tighten the cap to 3.0 Nm (27 lb in).

Symptoms - Engine Cooling

Engine Control Module (ECM) Scan Tool Output Controls

Scan Tool Output Control	Additional Menu Selection(s)	Description
Fan Relay 1	Fan Relays	The scan tool displays a Commanded State of OFF or ON. This allows you to communicate with the ECM and activate or deactivate the cooling fan 1 relay, manually turning the low speed fans ON and OFF.
Fan Relays 2 and 3	Fan Relays	The scan tool displays a Commanded State of OFF or ON. This allows you to communicate with the ECM to activate or deactivate the cooling fan 2 relay and the cooling fan 3 relay. This turns the high speed fans ON and OFF.
Fan Relays 1, 2 and 3	Fan Relays	The scan tool displays a commanded state of OFF or ON. This allows you to communicate with the ECM to activate or deactivate the cooling fan 1 relay, manually turning the low speed fans ON. After a 3 second delay the ECM will activate the cooling fan 2 relay and the cooling fan 3 relay. This turns the high speed fans ON and OFF.

Thermostat Diagnosis

Tools Required

J 24731 Tempil stick

The coolant thermostat can be tested using a temperature (tempil) stick. The temperature stick is a pencil-like device which has a wax material containing certain chemicals that melt at a given temperature. Temperature sticks can be used to determine a thermostat's operating range by rubbing 87°C (188°F) and 97°C (206°F) sticks on the outlet coolant hose.

1. Use a tempilstick in order to find the opening and the closing temperatures of the thermostat.

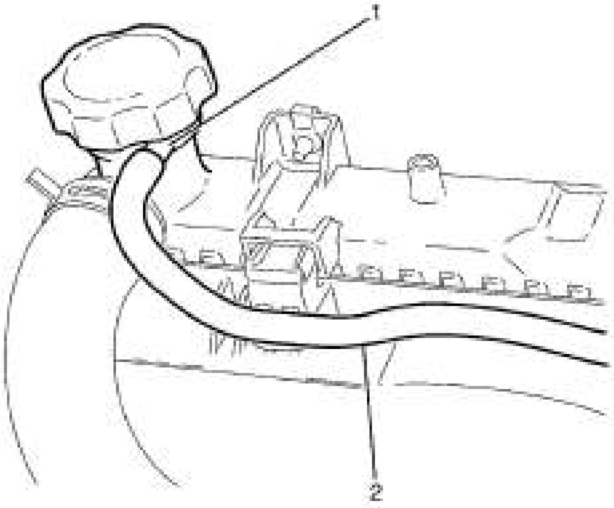
   J 24731 tempilstick melts at 87°C (188°F). The thermostat should begin to open at 82°C (181°F).

2. Replace the thermostat if it does not operate correctly between this temperature range.

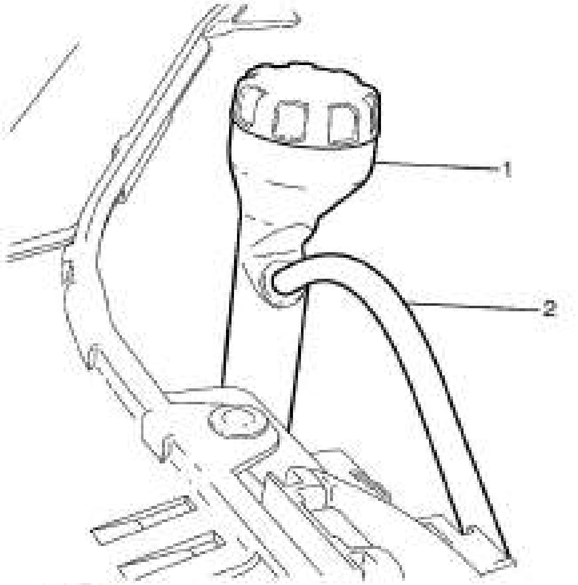
Coolant Recovery Reservoir Pipe Replacement (3.6L Engine)

Removal Procedure

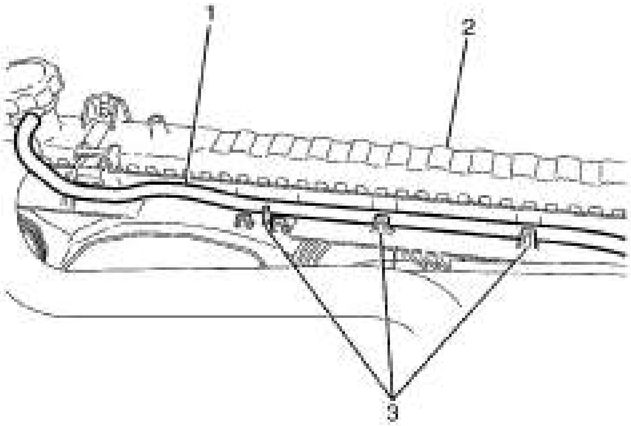
1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.



2. Detach the coolant recovery hose (2) from the radiator outlet pipe (1).

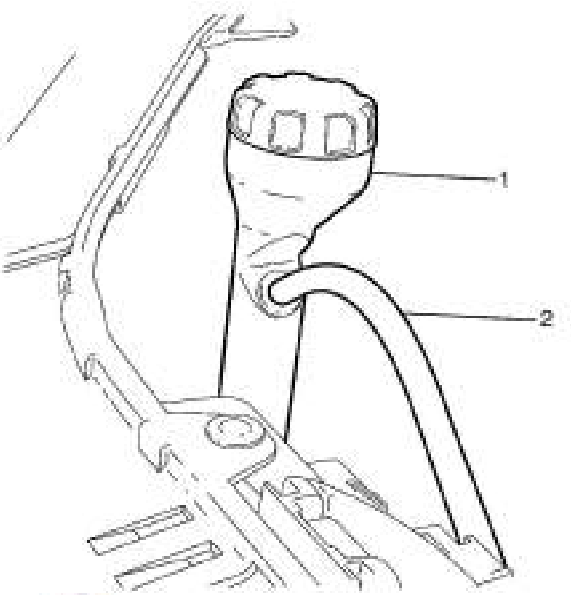


3. Remove the coolant recovery hose (2) from the coolant recovery reservoir filler neck (1).

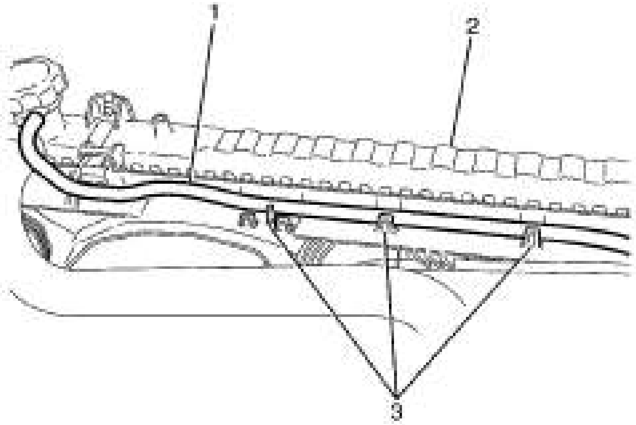


4. Detach and remove the coolant recovery reservoir hose (1) from the coolant recovery reservoir retaining locks (3) located on the radiator (2).

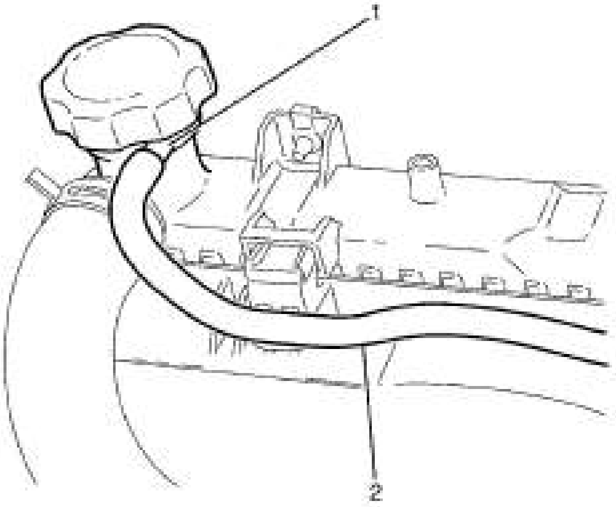
Installation Procedure



1. Install the coolant recovery reservoir hose (2) into the coolant recovery reservoir filler neck (1).



2. Attach the coolant recovery reservoir hose (1) into the coolant recovery reservoir retaining locks (3) located on the radiator (2).



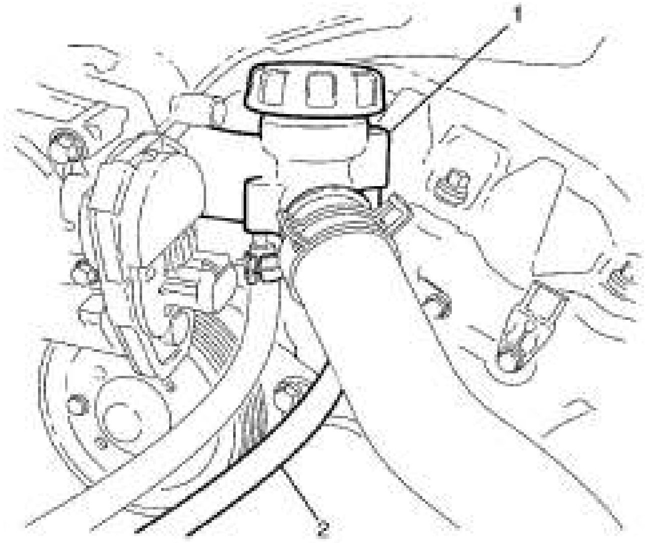
3. Attach the coolant recovery reservoir hose (2) to the radiator outlet pipe (1).
4. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
5. Check the coolant level. Refer to Cooling System Draining and Filling.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1994371

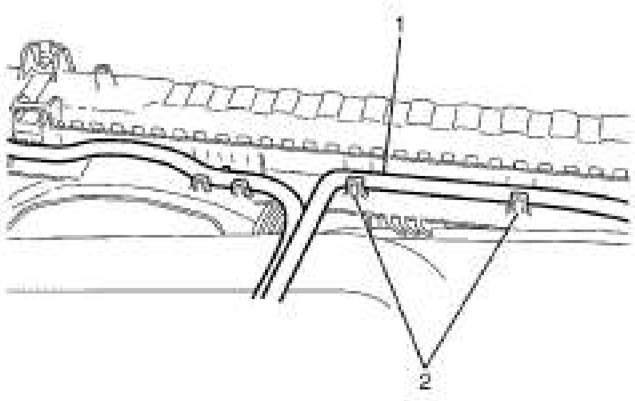
Coolant Recovery Reservoir Pipe Replacement (6.0L Engine)

Removal Procedure

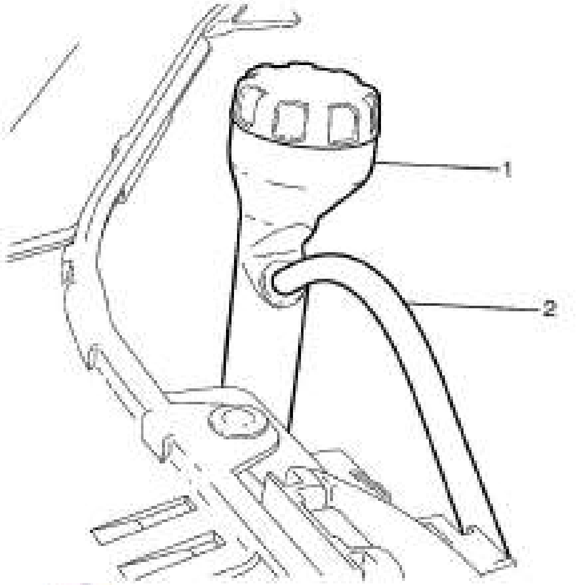
1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
2. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.



3. Detach the coolant recovery hose from the outlet housing (1).

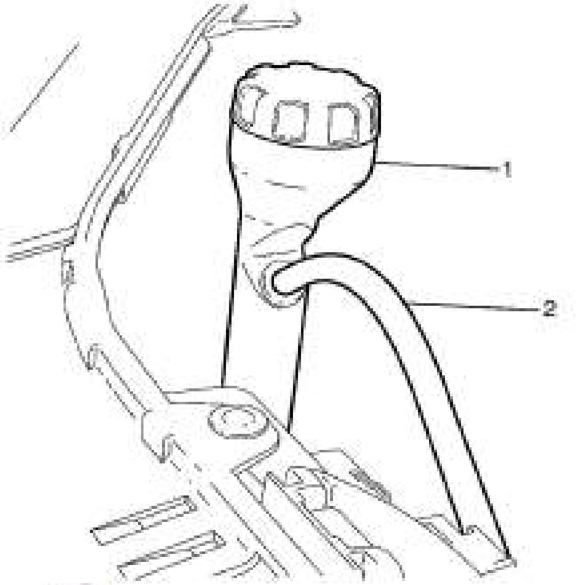


4. Detach the coolant recovery reservoir hose (1) from the radiator retaining clips (2).

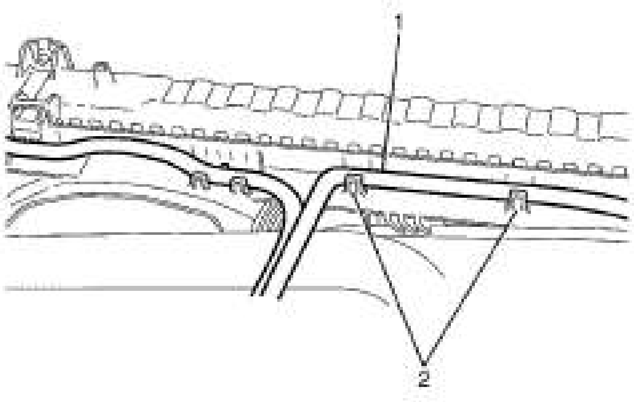


5. Detach and remove the coolant recovery hose (2) from the coolant recovery reservoir filler neck (1).

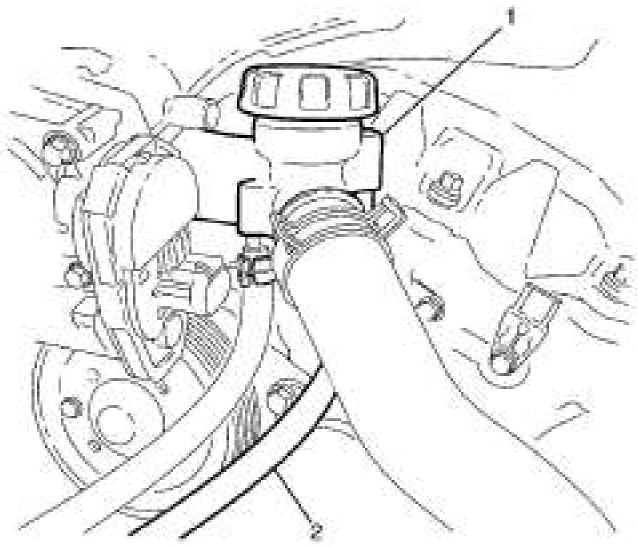
Installation Procedure



1. Attach the coolant recovery hose (2) to the coolant recovery reservoir filler neck (1).



2. Attach the coolant recovery reservoir hose (1) into the radiator (2) retaining clips (3).



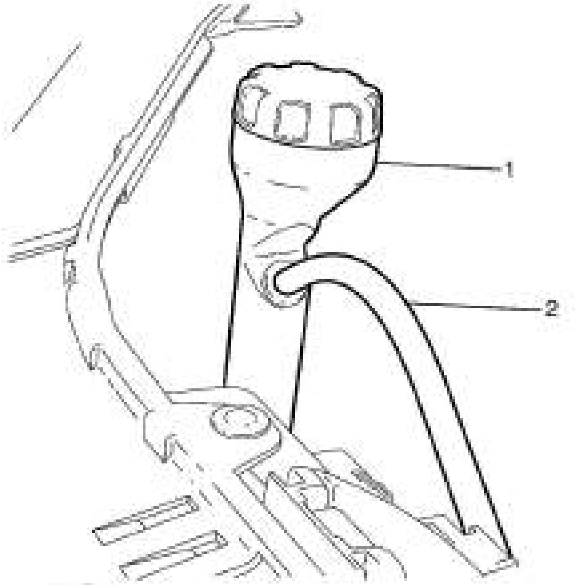
3. Attach the coolant recovery hose (2) to the outlet housing (1).
4. Inspect the coolant level and "top up" if necessary.
5. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
6. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1986553

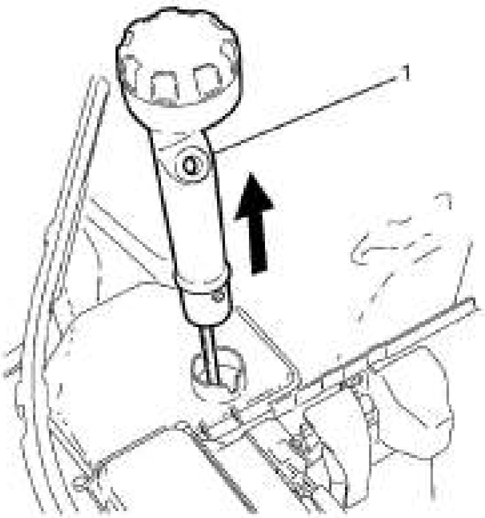
Coolant Recovery Reservoir Replacement

Removal Procedure

1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.



2. Disconnect the coolant recovery hose (2) from the coolant recovery reservoir filler neck (1).

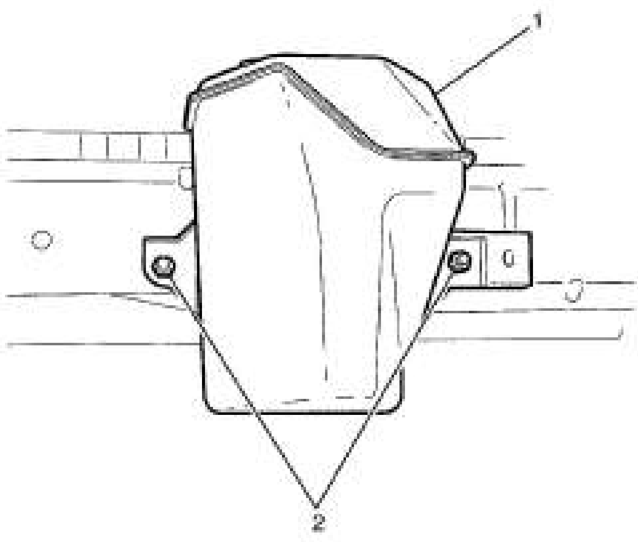


3. Remove the coolant recovery reservoir filler neck (1).

Caution: Refer to Safety Glasses Caution in the Preface section.

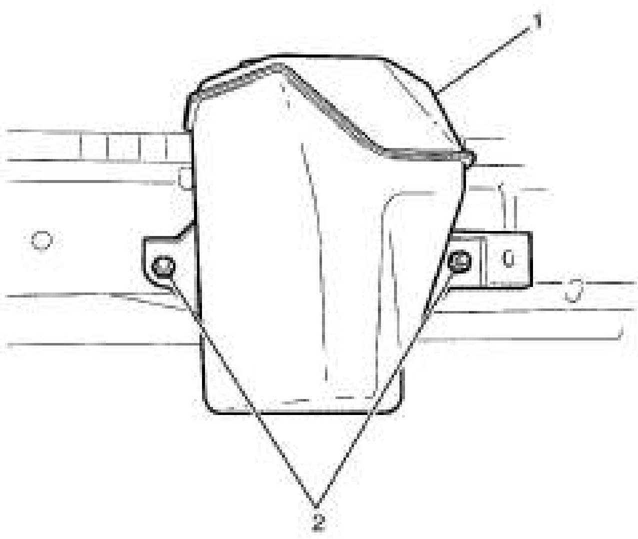
Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the right hand front wheel. Refer to Tire and Wheel Removal and Installation.
6. Remove the wheel house liner. Refer to Front Wheelhouse Liner Replacement.
7. Remove the air deflector. Refer to Front Air Deflector Replacement.



8. Remove the coolant recovery reservoir retaining nuts (2).
9. Remove the coolant recovery reservoir (1).

Installation Procedure



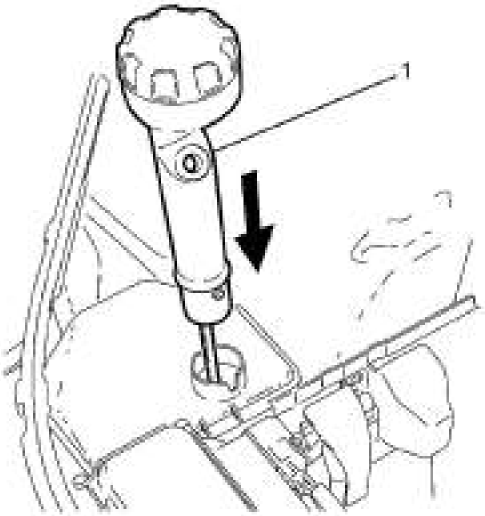
1. Install the coolant recovery reservoir (1).

Notice: Refer to Fastener Notice in the Preface section.

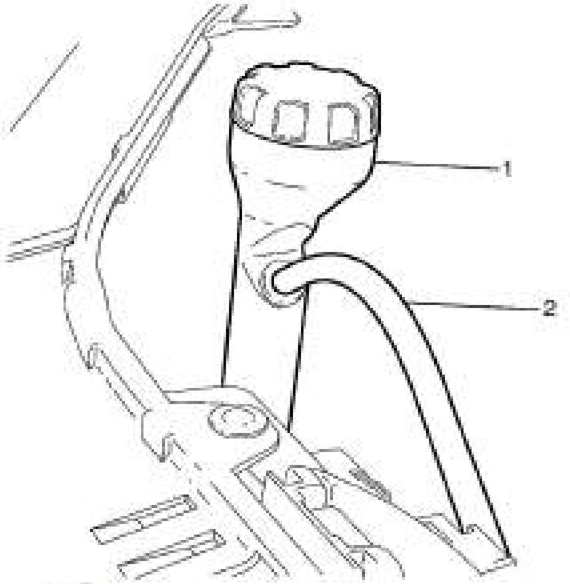
2. Install the coolant recovery retaining nuts (2).

Tighten
Tighten the nuts to 17 N·m (13 lb ft).

3. Install the air deflector. Refer to Front Air Deflector Replacement.
4. Install the wheel house liner. Refer to Front Wheelhouse Liner Replacement.
5. Install the right hand front wheel. Refer to Tire and Wheel Removal and Installation.
6. Lower the vehicle.



7. Install the coolant recovery reservoir filler neck (1).



8. Connect the coolant recovery reservoir hose (2) to the coolant recovery reservoir filler neck

(1)

9. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
10. Fill the coolant reservoir to the fill level. Refer to Cooling System Draining and Filling.
11. Inspect cooling system for leaks.

Coolant System Flushing

Radiator Flush

1. Drain the cooling system. Refer to Cooling System Draining and Filling .

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Remove the lower radiator outlet hose at the coolant inlet pipe connection.
3. Remove the upper radiator inlet hose at the coolant outlet housing connection.

   Notice: Refer to General Repair Instructions in the Preface section.

4. Attach a lead away hose to the open end of the upper radiator hose.
5. Attach a suitable piece of hose or adaptor between the flushing gun and the open end of the lower radiator hose.
6. Connect and operate the flushing equipment as recommended by the manufacturer.

   Caution: Refer to General Repair Instructions in the Preface section.

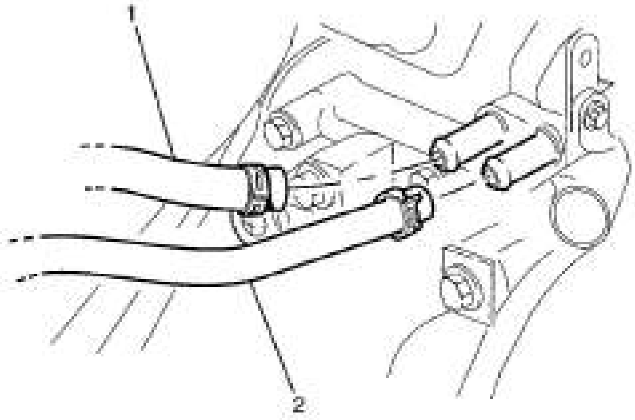
7. Continue flushing until water from the lead away hose runs clean and clear.
8. Install all disconnected hoses, ensuring that they are correctly position and securely clamped.
9. Fill the cooling system. Refer to Cooling System Draining and Filling .
10. Pressure test the cooling system. Refer to Cooling System Leak Testing .

Heater Hoses and Core

Important: Do not use a chemical flush.

Store used coolant in the correct manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.

1. Drain the cooling system. Refer to Cooling System Draining and Filling .

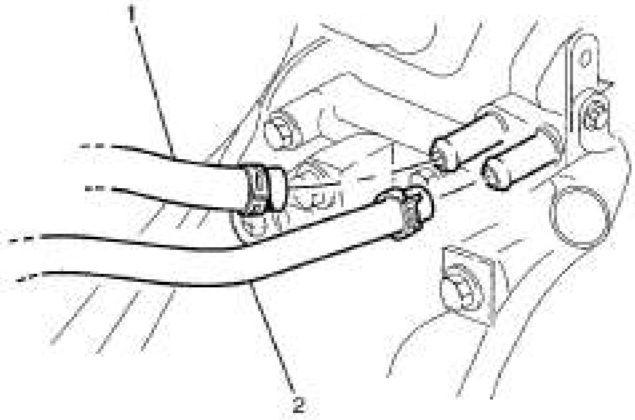


Important: Make a note of how the inlet and outlet hoses were removed for correct installation.

2. Remove both heater hoses (1) and (2) from their connections at the water pump.
3. Direct the hose (1) that was connected to the water pump's rear-most connection into a suitable container.

Caution: Refer to General Repair Instructions in the Preface section.

4. Attach the hose (2) from the front connection to the flushing gun.
5. Connect and operate the flushing gun.



6. Install the heater hoses (1) and (2), ensuring they are installed in the correct positions.

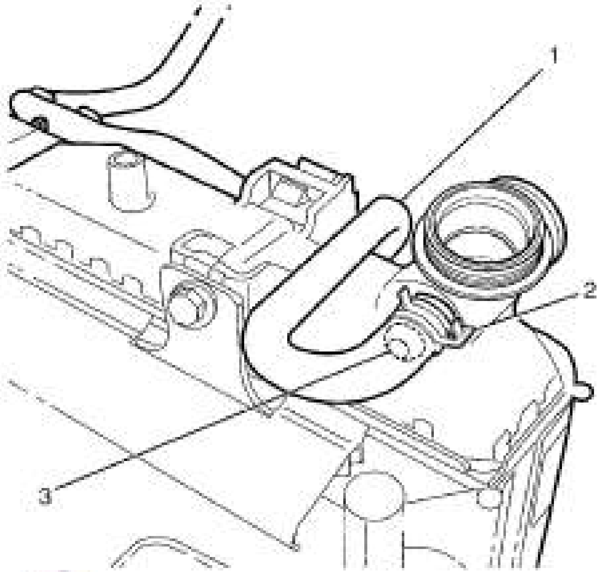
7. Fill the cooling system. Refer to Cooling System Draining and Filling .
8. Pressure test the cooling system. Refer to Cooling System Leak Testing .

Engine

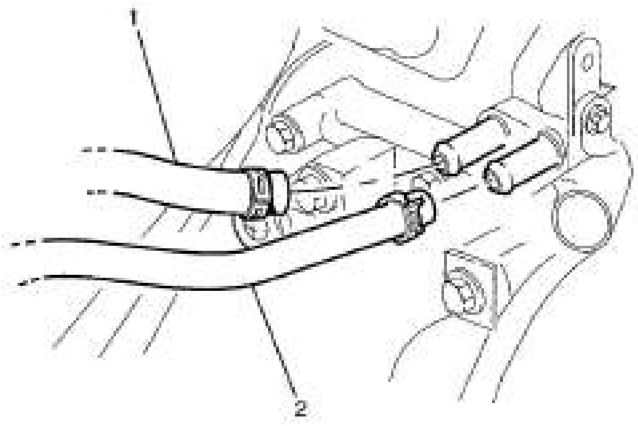
Important: Do not use a chemical flush.

Store used coolant in the correct manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.

1. Drain the cooling system. Refer to Cooling System Draining and Filling .
2. Detach the inlet hose. Refer to Radiator Inlet Hose Replacement .
3. Detach the outlet hose. Refer to Radiator Outlet Hose Replacement .
4. Remove the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement .
5. Remove the thermostat. Refer to Engine Coolant Thermostat Replacement .
6. Install the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement .

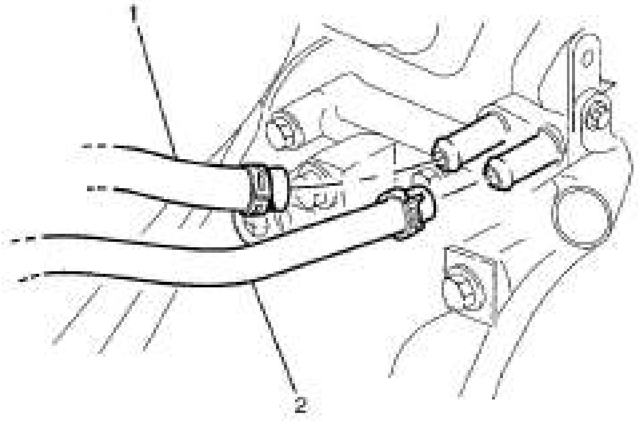


7. Remove the engine coolant air bleed hose (1) by releasing retaining hose clamp (2) and remove it from the radiator spigot (3) and temporarily plug the end of the hose.



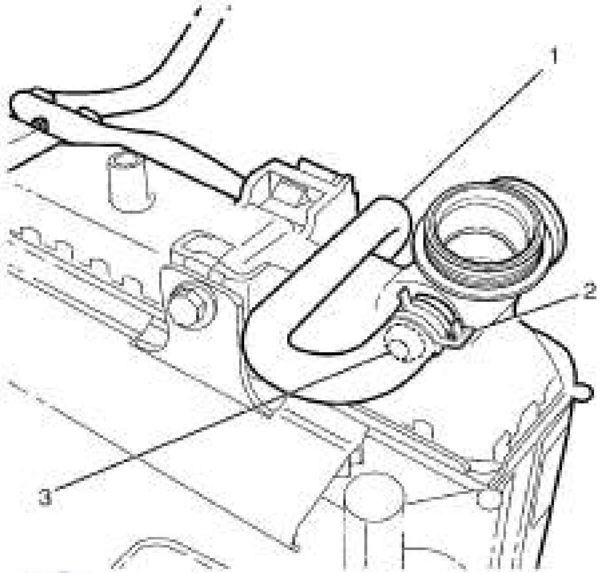
Important: Make a note of how the inlet and outlet hoses were removed for correct installation.

8. Remove the heater hoses (1) and (2) from their connections at the water pump. Seal the pump connections by looping the water pump heater inlet connection tothe outlet connection using a suitable piece of hose and two retaining clamps.
9. Install a lead-away hose to the thermostat housing and a length of suitable hose between the water pump outlet fitting and the flushing gun.
10. Connect and operate the flushing gun.
11. Unplug the air bleed hose and continue flushing until the water runs clear.



12. Install the heater hoses (1) and (2), ensuring they are installed in the correct positions.
13. Install the thermostat. Refer to Engine Coolant Thermostat Replacement .

14. Install the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement .



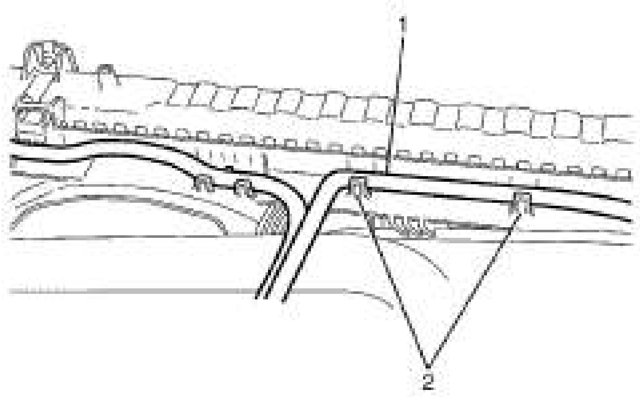
15. Attach the coolant air bleed hose (1) to the radiator spigot (3).
16. Secure the coolant air bleed hose (1) with the retaining hose clamp (2)
17. Attach the outlet hose. Refer to Radiator Outlet Hose Replacement .
18. Attach the inlet hose. Refer to Radiator Inlet Hose Replacement .
19. Fill the cooling system. Refer to Cooling System Draining and Filling .
20. Pressure test the cooling system. Refer to Cooling System Leak Testing .

Cooling Fan and Shroud Replacement

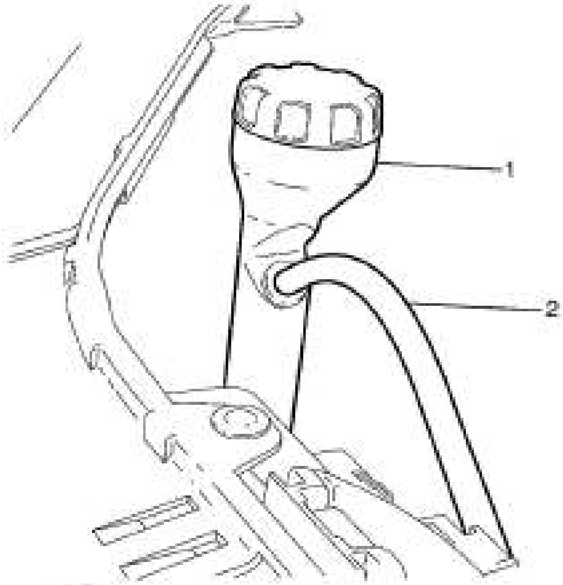
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

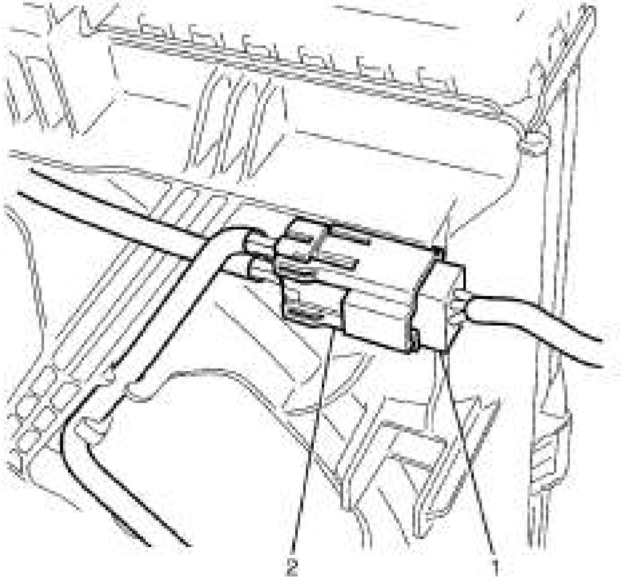
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection
2. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
3. Remove the Mass Air Flow sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 3.6L engine, or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
4. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement for 3.6L engine, or Air Cleaner Inlet Duct Replacement for 6.0L engine.
5. Remove the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .



6. Detach and remove the coolant recovery hose (1) from the coolant recovery hose retaining locks (2).



7. Detach the coolant recovery reservoir hose (2) from the coolant recovery reservoir (1).

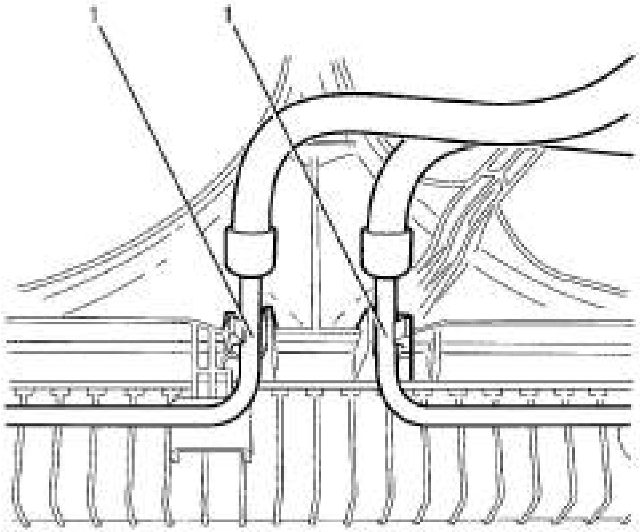


8. Detach the cooling fan motor electrical connector (2), from the main wiring harness (1).

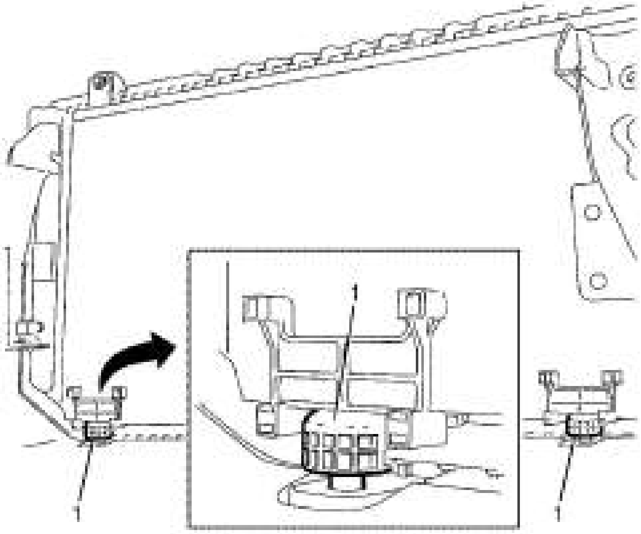
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

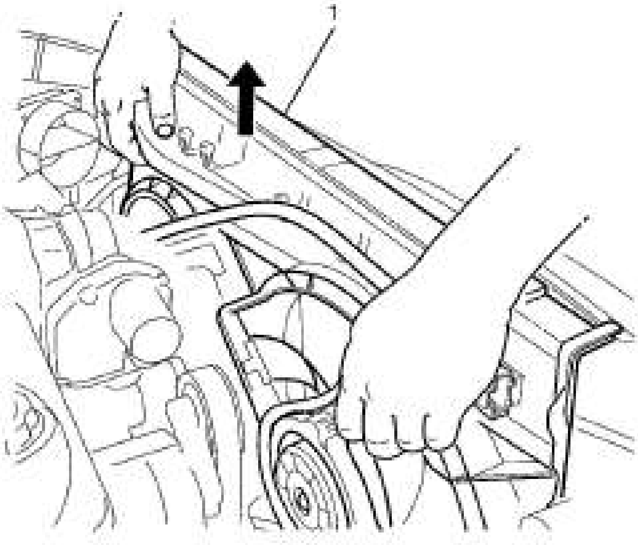
9. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



10. Detach the transmission cooling hoses (1) from the fan shroud.
11. Lower the vehicle.



12. Remove the fan shroud (3) by pressing down on retaining lugs (1) to release it from the radiator assembly (2).

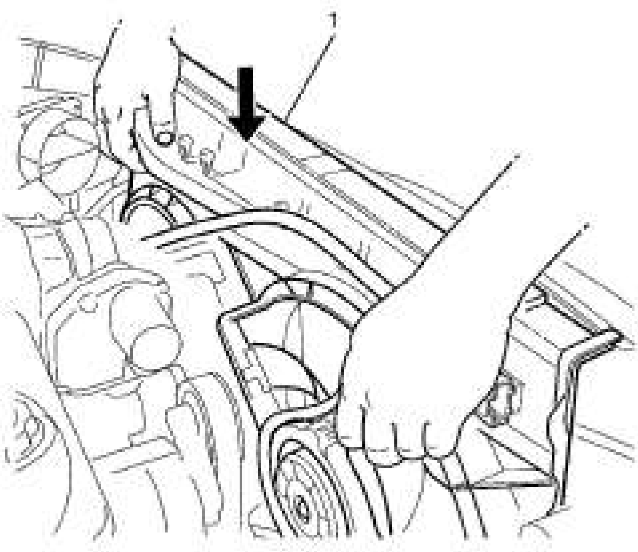


Important: When removing or installing the fan assembly always hold it by the fan motor mounting struts.

Important: Do not grasp the assembly by the fan rings as this may cause vibrations when the fans are in motion.

13. While holding the fan motor mounting struts remove the cooling fan and shroud assembly (1).

Installation Procedure

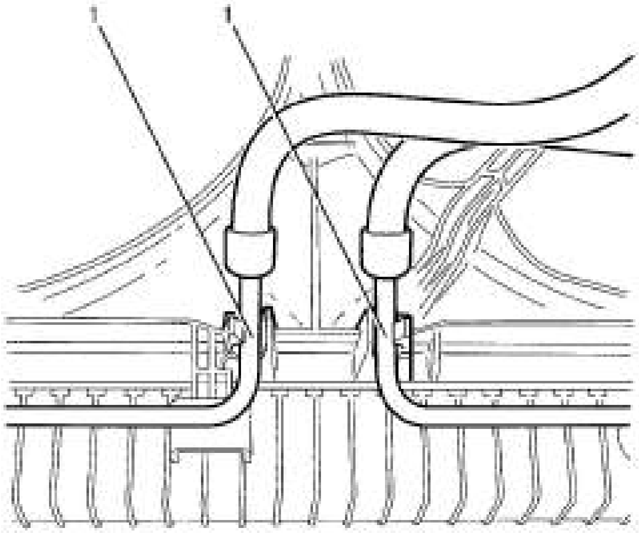


1. Install the cooling fan and shroud assembly (1).
2. Install the cooling fan and shroud assembly (1) onto the radiator (2) by pushing assembly forward until tabs lock into radiator retaining lugs. Listen for an audible click to confirm fitting.

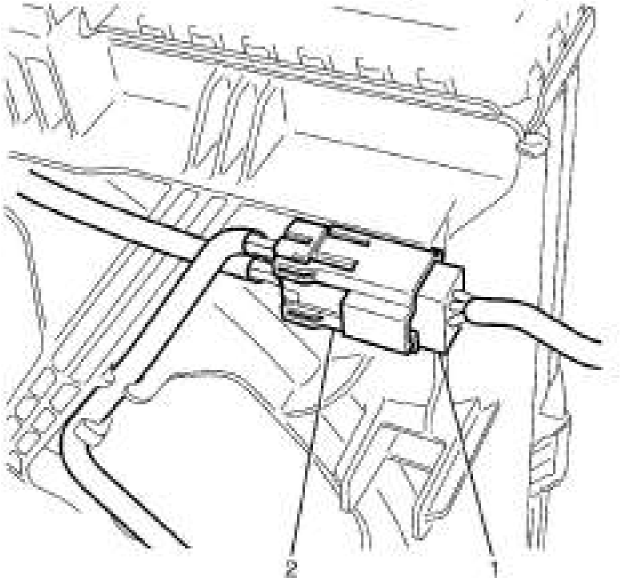
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

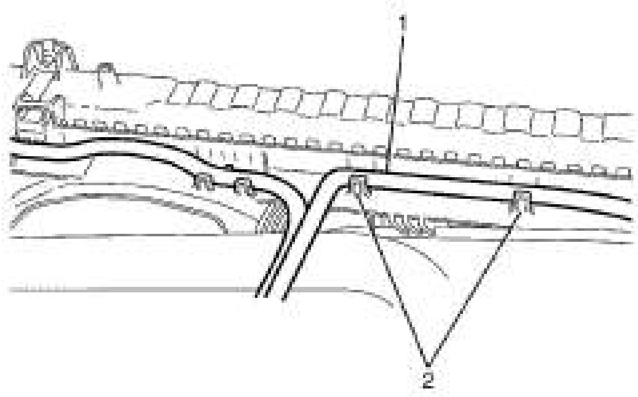
3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



4. Install the transmission cooling hoses (1) onto the fan assembly.



5. Attach the cooling fan electrical connector (2) to the main wiring harness (1).



6. Attach the coolant recovery hose (1) into the coolant recovery hose retaining locks (2).
7. Install the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .
8. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacementfor 3.6L engine, or Air Cleaner Inlet Duct Replacement for 6.0L engine.
9. Install the Mass Air Flow sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 3.6L engine, or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
10. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
11. Connect the battery ground lead to the vehicle. Refer to Battery Negative Cable Disconnection and Connection .
12. Start and run engine until the cooling fans are activated.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 1994315**

Cooling System Draining and Filling

Draining Procedure (3.6L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

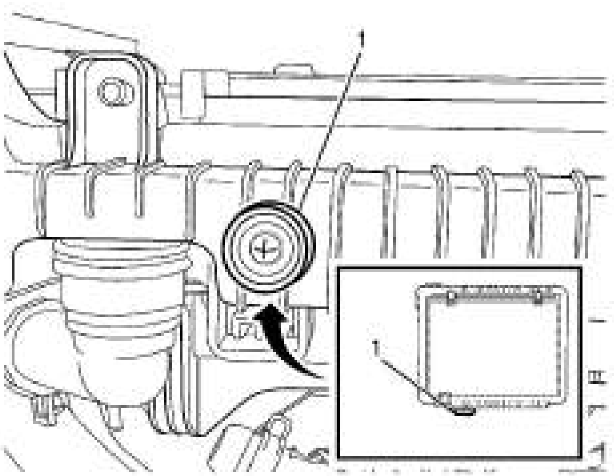
Caution: Refer to Radiator Cap Removal Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Ensure engine is below 50 C before removing the Coolant pressure cap.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

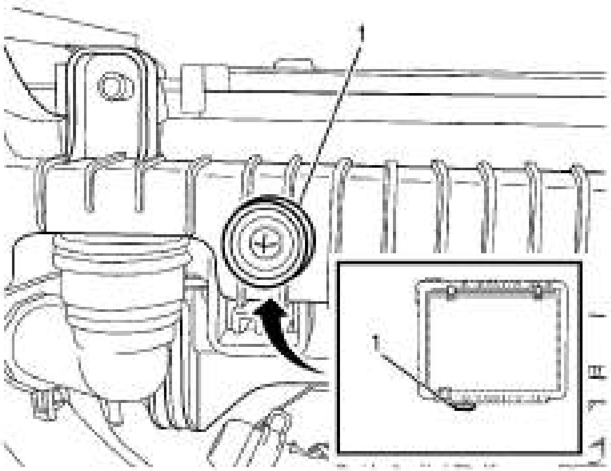


4. Place a drain pan under the drain cock (1).

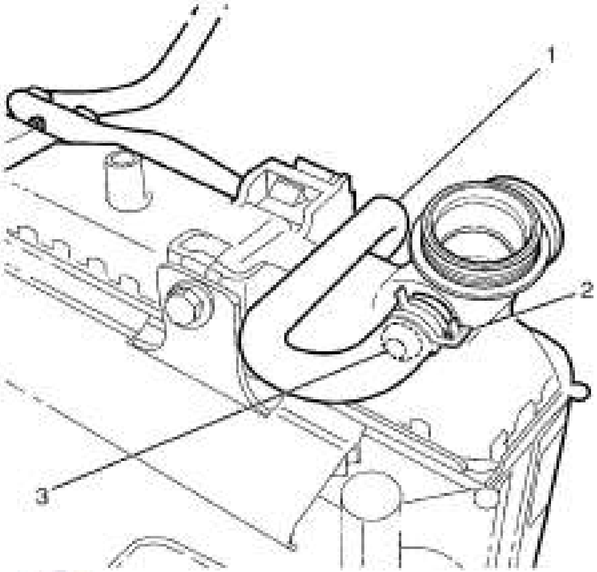
Important: If drain cock is not being replaced do not remove it from the radiator.

5. Loosen the drain cock until coolant flows out of the radiator.
6. Inspect the engine coolant for the following conditions:
   - Discolored appearance -- follow the flush procedure. Refer to Coolant System Flushing .
   - Normal in appearance -- follow the filling procedure. Refer to Cooling System Draining and Filling .

Filling Procedure



1. Tighten the drain cock (1).
2. Lower the vehicle.
3. With the engine off, remove the coolant filler cap.

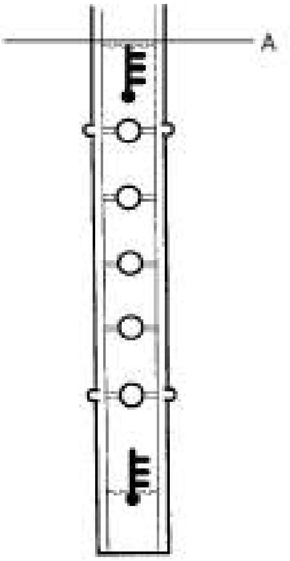


4. Remove the engine coolant air bleed hose (1) by releasing retaining hose clamp (2) and remove it from the radiator spigot (3).

   Notice: Refer to General Repair Instructions in the Preface section.

5. Slowly fill the cooling system with a mixture of 50/50 dex cool and water until coolant flows out of air bleed hose spigot. Refit air bleed hose.
6. Continue to fill the system until full. Wait several seconds and "top up" if levels drops.
7. Start engine.

8. With engine idling top up coolant until full, wait for several seconds and "top up" if level drops.
9. Stop engine, wait several seconds and "top up" if level drops.
10. When full, fit coolant filler cap and switch off engine.



11. Check coolant in coolant recovery reservoir. Adjust coolant in the reservoir to the top of the graphic mark (A) on the dipstick.

Draining Procedure (6.0L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

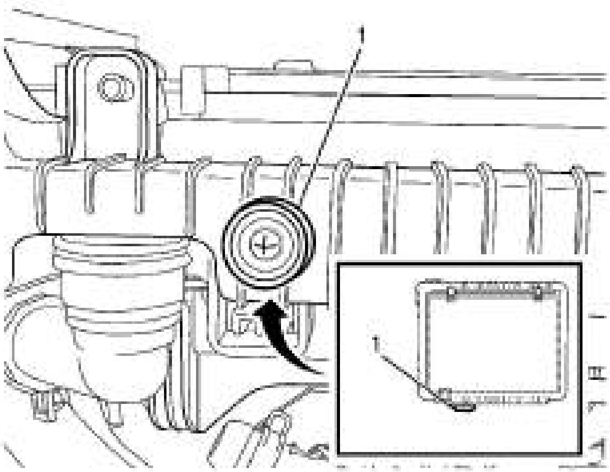
Caution: Refer to Radiator Cap Removal Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Ensure engine is below 50 C before removing the Coolant pressure cap.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

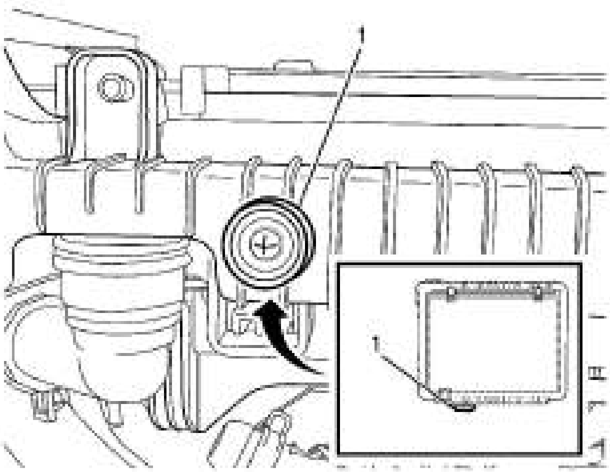


4. Place a drain pan under the drain cock (1).

   Important: If drain cock is not being replaced do not remove it from the radiator.

5. Loosen the drain cock until coolant flows out of the radiator.
6. Inspect the engine coolant for the following conditions:
   - Discolored appearance -- follow the flush procedure. Refer to Coolant System Flushing .
   - Normal in appearance -- follow the filling procedure. Refer to Cooling System Draining and Filling .

Filling Procedure



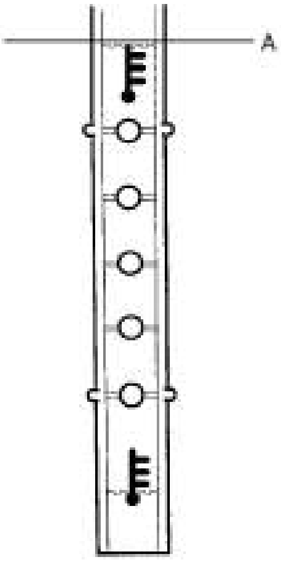
1. Tighten the drain cock (1).
2. Lower the vehicle.
3. With the engine off, remove the coolant filler cap.

Notice: Refer to General Repair Instructions in the Preface section.

4. Slowly fill the cooling system with a mixture of 50/50 Dex Cool and water until full, wait several seconds and "top up" if level drops.

Notice: Refer to General Repair Instructions in the Preface section.

5. Start engine.
6. With engine idling top up coolant until full, wait for several seconds and "top up" if level drops.
7. When full, fit coolant filler cap and switch off engine.



8. Check coolant level in coolant recovery reservoir. Adjust coolant level in the reservoir to the top of graphic mark (A) on the dipstick.

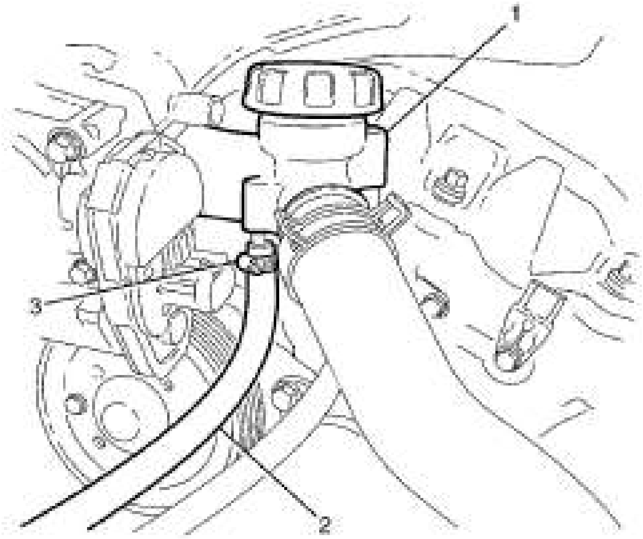
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 1986558**

Engine Coolant Air Bleed Hose Replacement (3.6L)

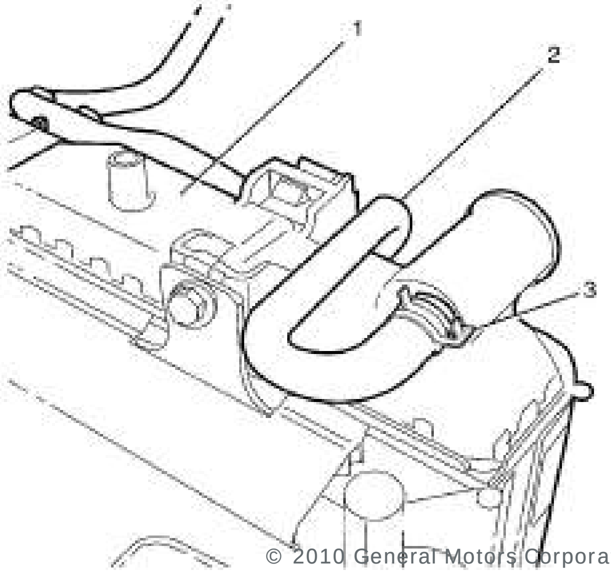
Removal Procedure

1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
2. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.

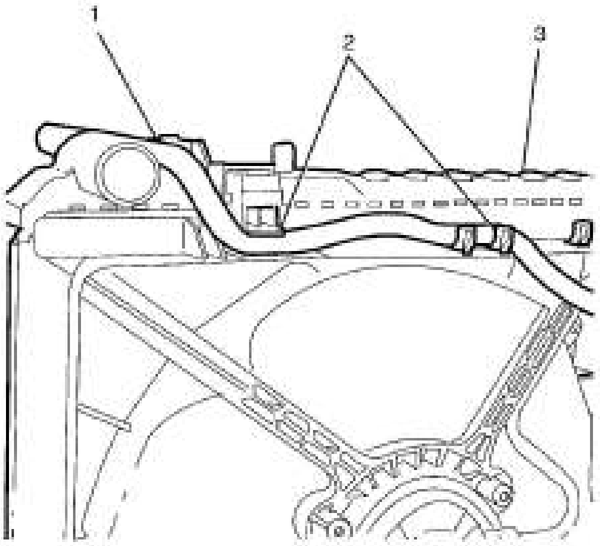
Caution: Refer to Safety Glasses Caution in the Preface section.



3. Release the hose clamp (3) and remove the coolant air bleed hose (2) from the outlet housing (1).

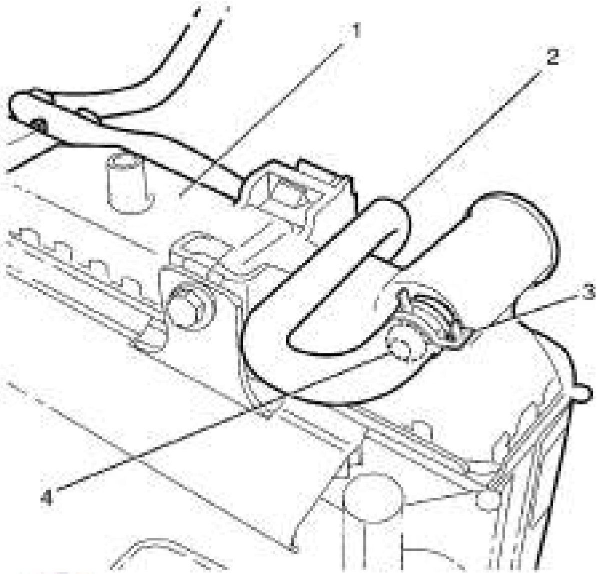


4. Release the hose clamp (3) and remove the coolant air bleed hose (2) from the radiator (1).

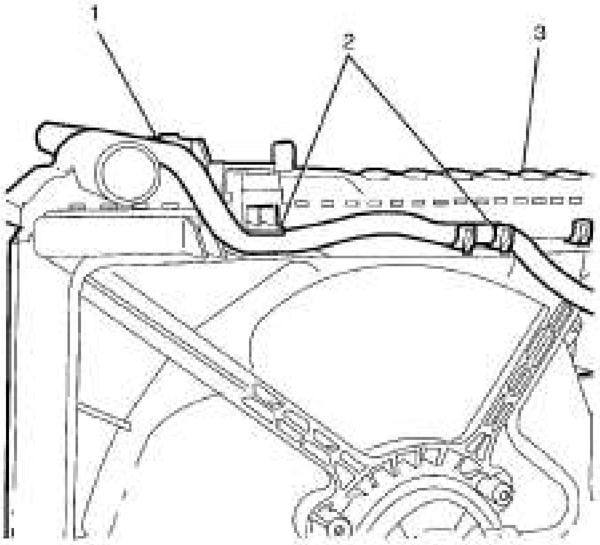


5. Detach and remove the coolant air bleed hose (1) from coolant air bleed hose retaining clips (2) located on the radiator (3).

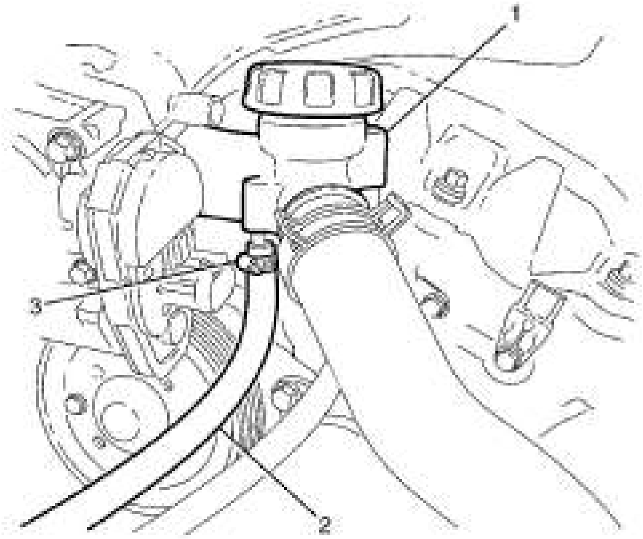
Installation Procedure



1. Install the air bleed hose (2) onto the radiator (1) spigot (4) and secure with the coolant air bleed hose clamp (3).



2. Attach the coolant air bleed hose (1) into the retaining clips (2) located on the radiator (3).



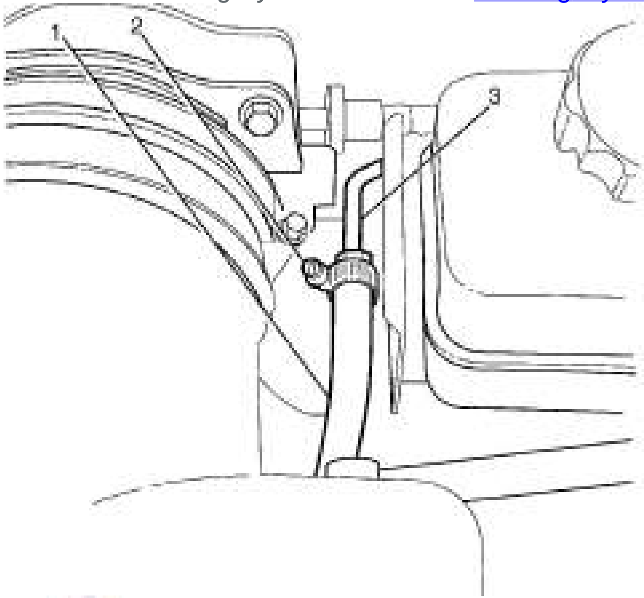
3. Install the coolant air bleed hose (2) onto the outlet housing (1) and secure with hose clamp (3).
4. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
5. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
6. Check the coolant level. Refer to Cooling System Draining and Filling.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1986561

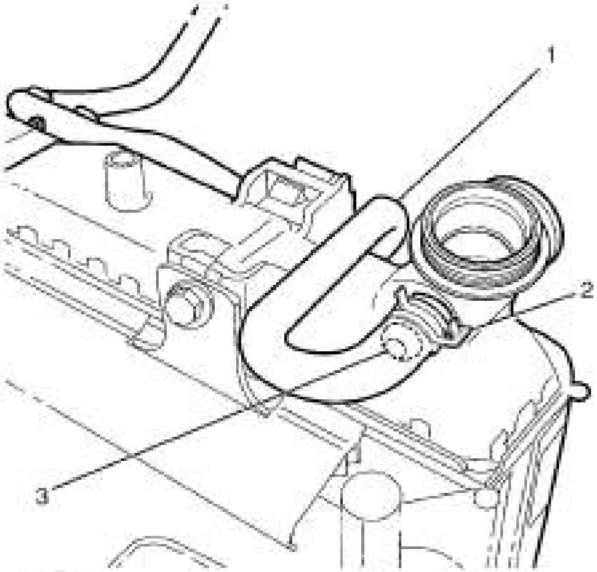
Engine Coolant Air Bleed Hose Replacement (6.0L)

Removal Procedure

1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
2. Drain the cooling system. Refer to Cooling System Draining and Filling.



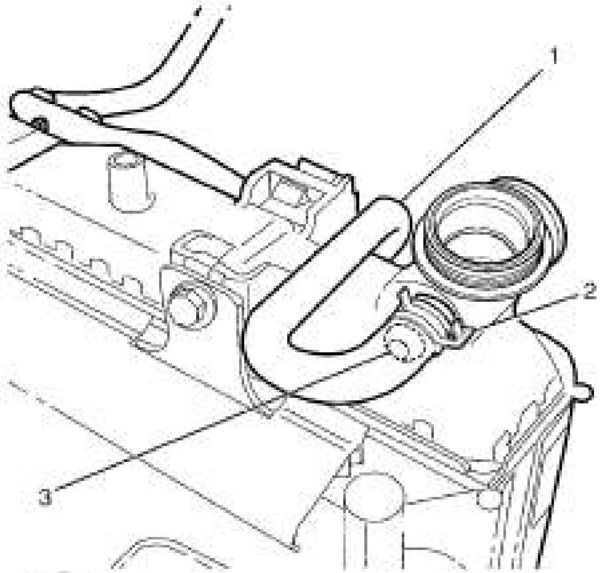
3. Release the coolant air bleed hose retaining clamp (2) and remove the coolant air bleed hose (1) from the coolant air bleed pipe (3).



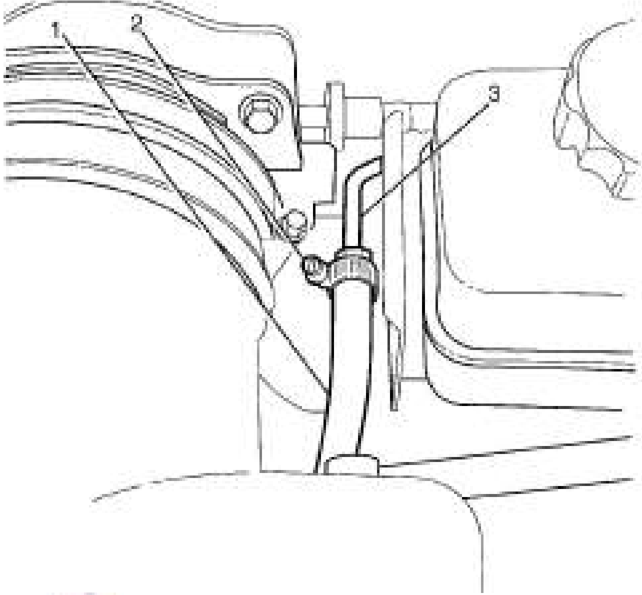
4. Release the retaining hose clamp (2) on the coolant air bleed hose (1) and remove it from

the radiator spigot (3).

Installation Procedure



1. Attach the coolant air bleed hose (1) to the radiator spigot (3)
2. Secure the coolant air bleed hose (1) with the retaining hose clamp (2)

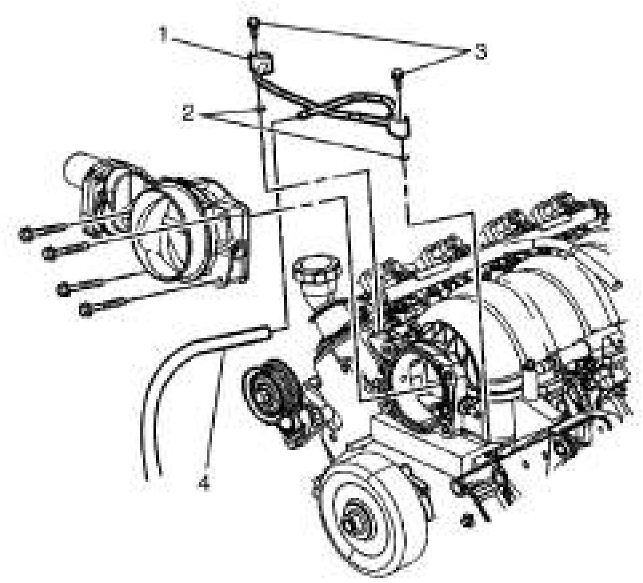


3. Attach and secure coolant air bleed hose (1) to the coolant air bleed pipe (3) and secure with the retaining hose clamp (2).
4. Fill the cooling system. Refer to Cooling System Draining and Filling.
5. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.

Engine Coolant Air Bleed Pipe Replacement

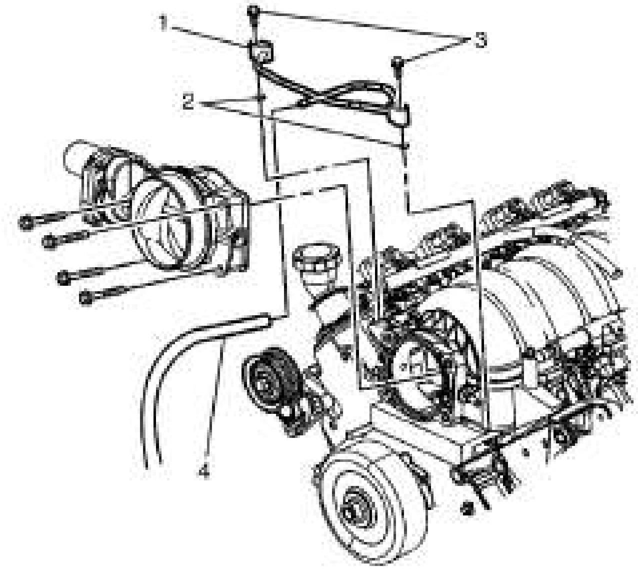
Removal Procedure

Important: Removal of the intake manifold is NOT required to service the coolant air bleed pipe, but is required to service the coolant air bleed pipe covers and/or gaskets.



1. Drain a gallon of coolant. Refer to Cooling System Draining and Filling.
2. Remove the throttle air body assembly. Refer to Throttle Body Assembly Replacement.
3. Remove the coolant air bleed hose (4).
4. Remove the coolant air bleed pipe mounting bolts (3).
5. Remove the coolant air bleed pipe (1) and O-rings (2).

Installation Procedure



1. Position the coolant air bleed pipe (1) and O-rings (2) on the cylinder heads.
2. Install the mounting bolts (3) for the coolant air bleed pipe (1).

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).

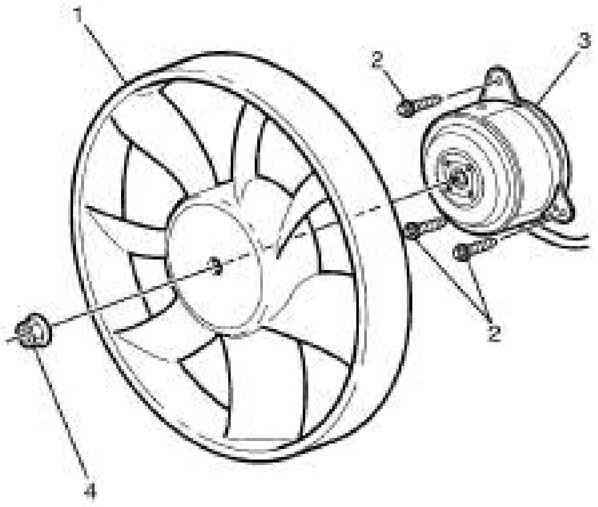
3. Install the coolant air bleed hose (4).
4. Install the throttle air body assembly. Refer to Throttle Body Assembly Replacement.
5. Fill the cooling system. Refer to Cooling System Draining and Filling.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1976108

Engine Coolant Fan Motor Replacement

Removal Procedure

1. Remove the cooling fan and shroud assembly. Refer to Cooling Fan and Shroud Replacement.

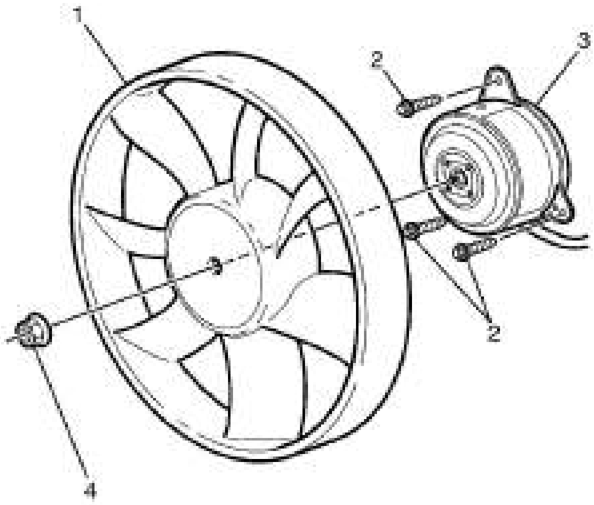


2. Disconnect electrical harness connector from motor.

Important: Armature shaft is left hand thread.

3. Remove the cooling fan motor (3) to fan retaining nut (4).
4. Separate fan blade (1) from the fan motor (3).
5. Remove the cooling fan motor to fan shroud retaining bolts (2).
6. Remove the cooling fan motor from shroud.

Installation Procedure



1. Install the cooling fan motor (3) to shroud.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install cooling fan motor to shroud retaining bolts (2).

   Tighten
   Tighten the bolts (2) to 10 N·m (89 lb in).

   Important: When replacing the fan and fan motor, ensure the fan to fan motor retaining nut is replaced.

3. Install the fan (1) to the cooling fan motor (3).
4. Install the fan (1) to the fan motor (2) retaining nut (4).

   Notice: Refer to Fastener Notice in the Preface section.

   Tighten
   Tighten the nut (3) to 6 N·m (53 lb in).

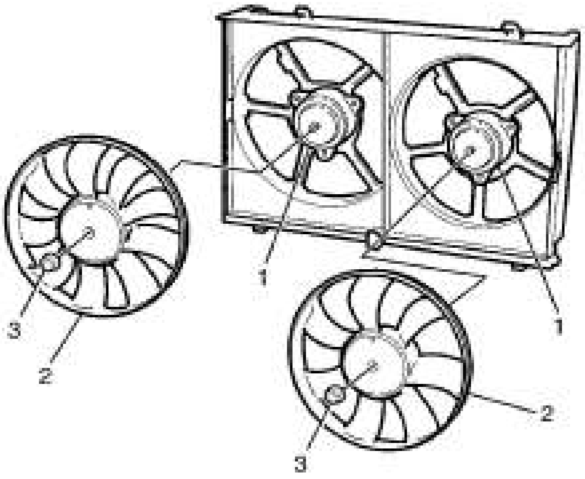
5. Install the cooling fan and shroud assembly. Refer to Cooling Fan and Shroud Replacement.
6. Start and run engine until the cooling fans are activated.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1976113

Engine Coolant Fan Replacement

Removal Procedure

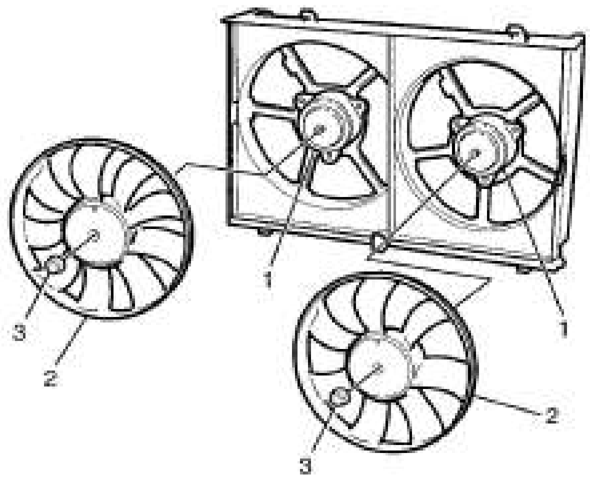
1. Remove the cooling fan and shroud assembly. Refer to Cooling Fan and Shroud Replacement.



Important: Armature shaft and nut is left hand thread.

2. Remove the cooling fans (2) retaining nuts (3).
3. Remove the cooling fans (2) from the cooling fan motor (1).

Installation Procedure



Important: When installing the cooling fans, ensure they are install as per removal.

1. Install the cooling fans (2) to the cooling fan motor (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the cooling fan (2) to fan motor retaining nut (3).

   Tighten
   Tighten the nut to 6.0 N·m (53 lb in).

3. Install the cooling fan and shroud assembly. Refer to Cooling Fan and Shroud Replacement.
4. Start and run engine until cooling fans are activated.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 1990433**

Engine Coolant Inlet Pipe Replacement

Removal Procedure

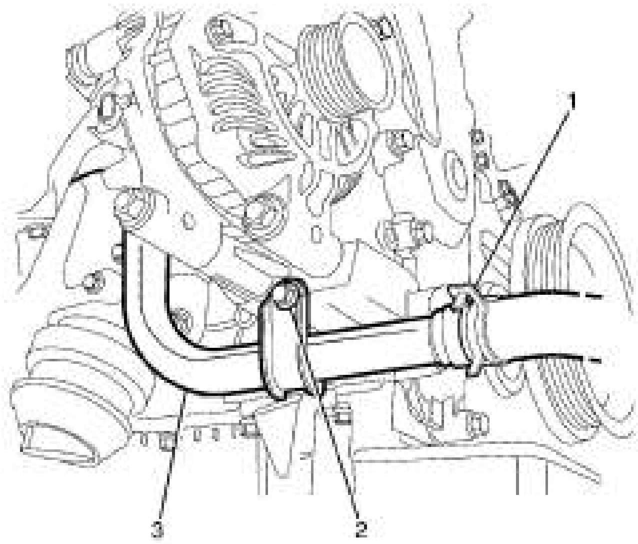
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

2. Ensure engine is below 50 C before removing the coolant pressure cap.
3. Remove the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
5. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
6. Drain the cooling system. Refer to Cooling System Draining and Filling.
7. Remove the right side catalytic converter. Refer to Catalytic Converter Replacement - Right Side.

Caution: Refer to Safety Glasses Caution in the Preface section.

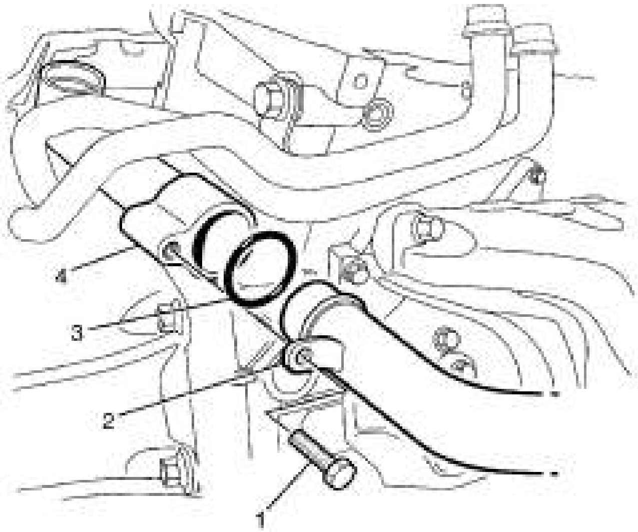


8. Detach the lower radiator hose by removing the retaining hose clamp (1) and removing it from the coolant inlet pipe (3).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

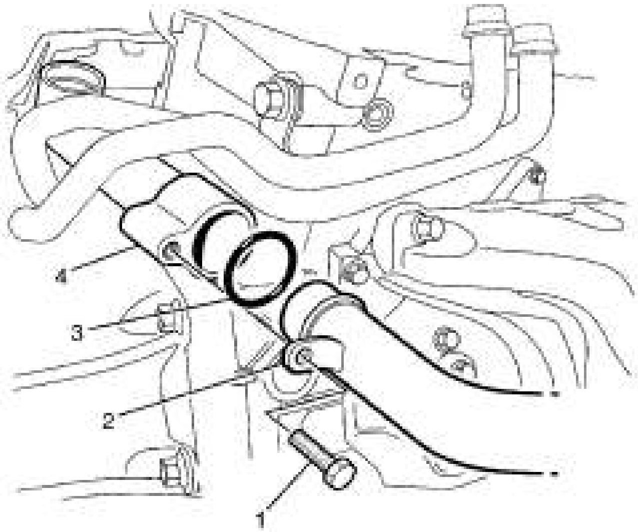
9. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
10. Remove the air deflector. Refer to Front Air Deflector Replacement.

11. Remove the coolant inlet pipe to alternator bracket retaining (2).
12. Lower vehicle



13. Remove the retaining bolt (1) which secures the inlet pipe (2) to the thermostat housing (4).
14. Manoeuvre the coolant inlet pipe towards the front of the engine and remove it from below, between the cross member and radiator.
15. Remove the coolant inlet pipe O-ring (3).

Installation Procedure



Important: Always renew the coolant inlet O-ring (3).

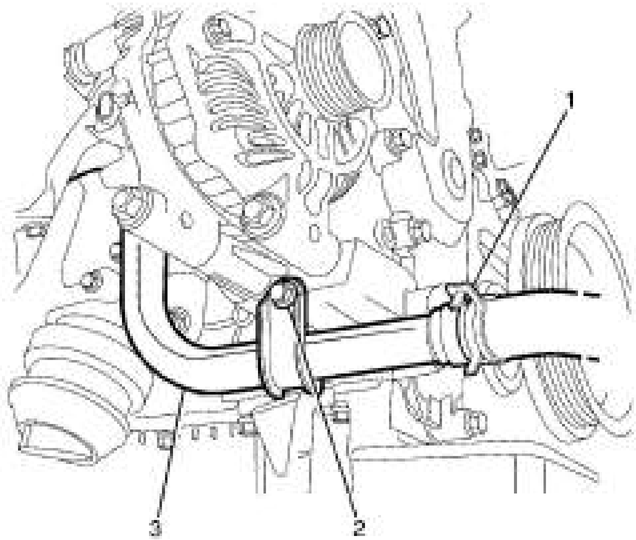
1. Ensure all mating surfaces are thoroughly cleaned, using only a fine abrasive material.
2. Install the coolant inlet pipe (2) at the thermostat end (4).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the coolant inlet pipe retaining bolt (1).

   Tighten
   Tighten the bolt to 35 N·m (26 lb ft).

4. Raise and support the front of the vehicle. Refer to Lifting and Jacking the Vehicle.



5. Install the coolant inlet pipe to alternator bracket retaining nut (2).

   Tighten
   Tighten the nut to 25 N·m (18 lb ft).

   Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

6. Attach the inlet hose to the inlet pipe (3) and secure with retaining hose clamp (1)
7. Install the air deflector. Refer to Front Air Deflector Replacement.
8. Lower the vehicle.
9. Install the right side catalytic converter. Refer to Catalytic Converter Replacement - Right Side.
10. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
11. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
12. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
13. Fill the cooling system. Refer to Cooling System Draining and Filling.
14. Inspect cooling system for coolant leaks.

Engine Coolant Thermostat Housing Replacement (3.6L Engine LWB)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
3. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
5. Remove the catalytic converter assembly from the vehicle. Refer to Catalytic Converter Replacement - Right Side.
6. Lower the transmission by 65mm. Refer to Transmission Replacement.

Important: Store used coolant in the correct manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.

7. Drain the cooling system. Refer to Cooling System Draining and Filling.

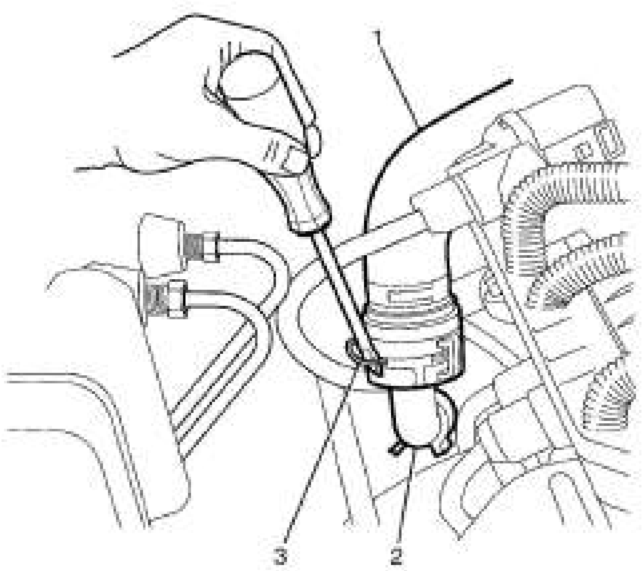
Important: Do NOT separate the upper and lower intake manifolds.

8. Remove the intake manifolds. Refer to Upper Intake Manifold Replacement and Refer to Lower Intake Manifold Replacement.

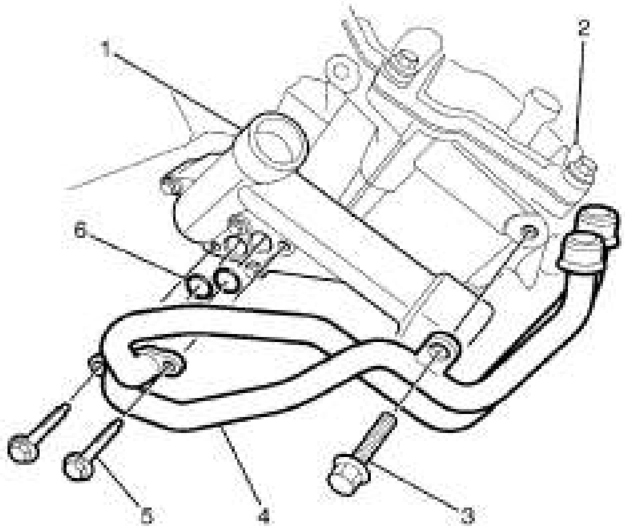
Important: Assure material used to cover intake ports is lint free to prevent any foreign matter entering the ports.

9. Cover the exposed intake ports.
10. Remove the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement in Engine Cooling.

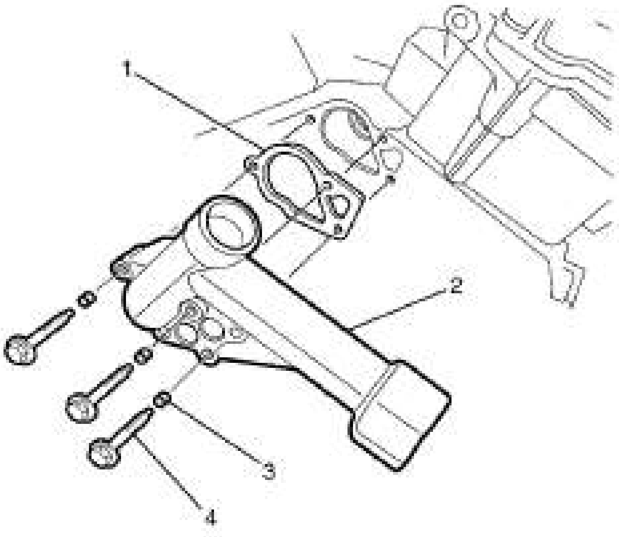
Caution: Refer to Safety Glasses Caution in the Preface section.



11. Detach the heater hose (1) quick connect fitting by releasing the retaining clip (3) with a suitable screwdriver, from the heater pipe (2).
12. Disconnect the heater hoses (1) from the heater pipes (1).
13. Disconnect the engine harness to obtain easier access to the heater hose flange and thermostat housing bolts. Refer to Ignition Coil Replacement - Bank 1 and Ignition Coil Replacement - Bank 2.



14. Remove the bolt (3) which secures the heater hose assembly (4) to the right hand cylinder head (2).
15. Remove the heater hose assembly to thermostat housing (1) retaining bolts (5).
16. Remove the heater hose assembly and discard the O-ring seals (6).



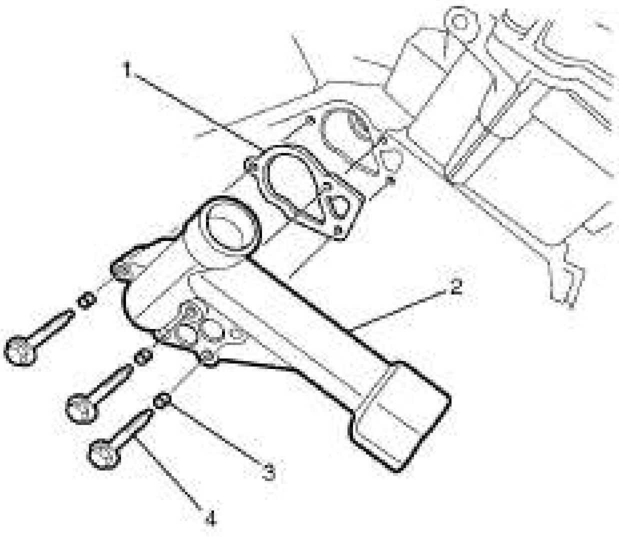
Important: The thermostat housing has one longer bolt which is located in the upper left of the housing.

Important: When replacing the thermostat housing always renew the block gasket (1).

17. Remove the thermostat housing retaining bolts (4) rubber grommets (3) then remove the thermostat housing (2).

Installation Procedure

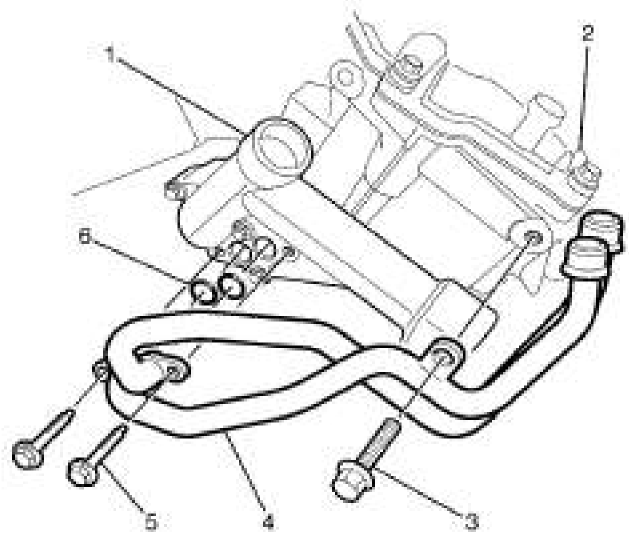
Notice: Refer to Fastener Notice in the Preface section.



1. Install the thermostat housing retaining bolts (4) ensuring a new block gasket (1) and rubber grommets (3) has been fitted.

   Tighten
   Tighten the bolts (4) to 10 N·m (89 lb in).

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the heater pipe assembly (4) to thermostat housing (1) retaining bolts ensuring new O-ring seals (6) have been fitted.

   Tighten
   Tighten the bolts (5) to 10 N·m (89 lb in).

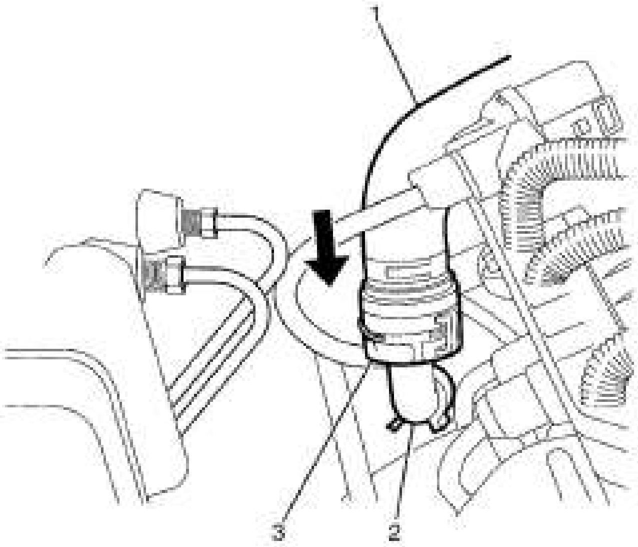
3. Install the heater pipe assembly (4) to cylinder head (2) retaining bolt (3).

   Tighten
   Tighten the bolts to 35 N·m (26 lb ft).

4. Install the engine harness. Refer to Ignition Coil Replacement - Bank 1 and Ignition Coil Replacement - Bank 2.

   Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

   Caution: Refer to Safety Glasses Caution in the Preface section.



5. Attach the heater hose (1) quick connect fitting (3) by pushing the hose onto the heater pipe (2) listen for a audible click to confirm fitting.
6. Install the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement in Engine Cooling.

Important: Do NOT separate the upper and lower intake manifolds.

7. Install the intake manifolds. Refer to Upper Intake Manifold Replacement and Refer to Lower Intake Manifold Replacement.
8. Install the air deflector. Refer to Front Air Deflector Replacement.
9. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
10. Install the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
11. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
12. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
13. Fill the cooling system. Refer to Cooling System Draining and Filling.
14. Inspect cooling system for leaks.

Engine Coolant Thermostat Housing Replacement (3.6L Engine SWB)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine cover. Refer to Engine Cover Replacement.
3. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
4. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
5. Remove the catalytic converter assembly from the vehicle. Refer to Catalytic Converter Replacement - Right Side.
6. Lower the transmission by 65mm. Refer to Transmission Replacement.

Important: Store used coolant in the correct manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.

7. Drain the cooling system. Refer to Cooling System Draining and Filling.

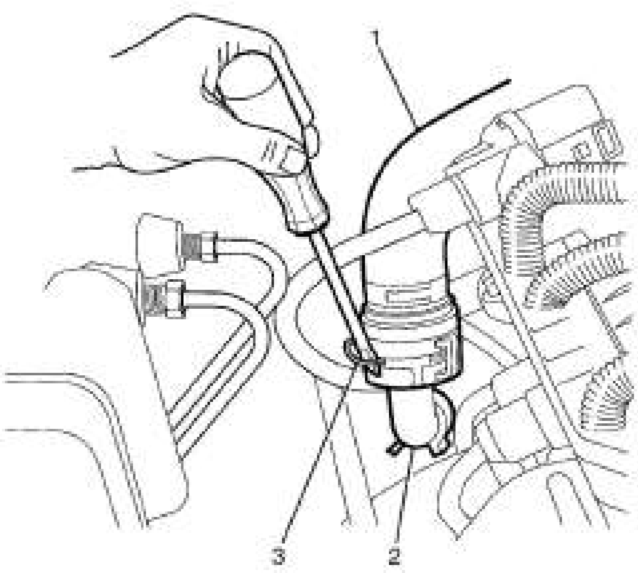
Important: Do NOT separate the upper and lower intake manifolds.

8. Remove the intake manifolds. Refer to Lower Intake Manifold Replacement.

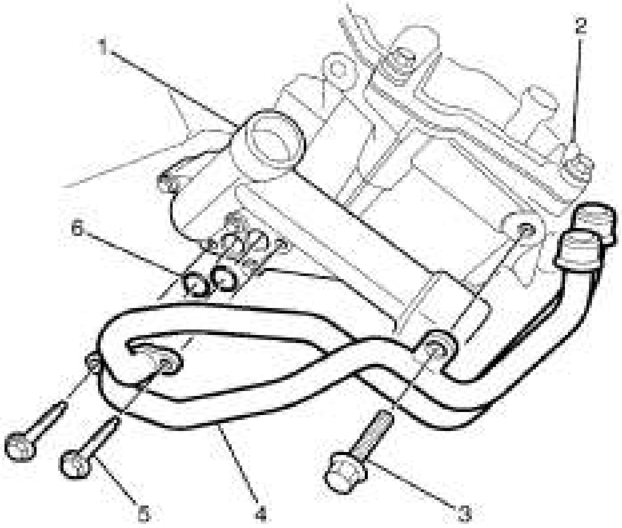
Important: Assure material used to cover intake ports is lint free to prevent any foreign matter entering the ports.

9. Cover the exposed intake ports.
10. Remove the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement.

Caution: Refer to Safety Glasses Caution in the Preface section.

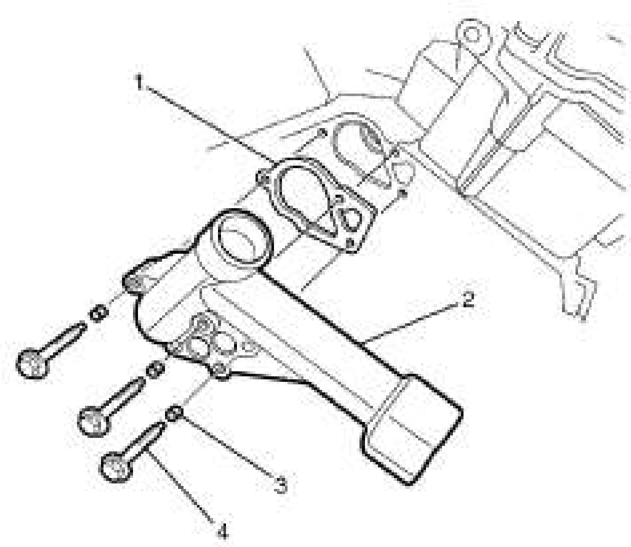


11. Detach the heater hose (1) quick connect fitting by releasing the retaining clip (3) with a suitable screwdriver, from the heater pipe (2).
12. Disconnect the heater hoses (1) from the heater pipes (2).
13. Disconnect the engine harness to obtain easier access to the heater hose flange and thermostat housing bolts. Refer to Ignition Coil Replacement - Bank 1 and Ignition Coil Replacement - Bank 2.



14. Remove the heater hose assembly to right hand cylinder head retaining bolt (3).
15. Remove the heater hose assembly to thermostat housing retaining bolts (5).
16. Remove the heater hose assembly (4) from the thermostat housing (1) and cylinder head (2).
17. Remove the O-ring seals (6)

    Discard the O-ring seals



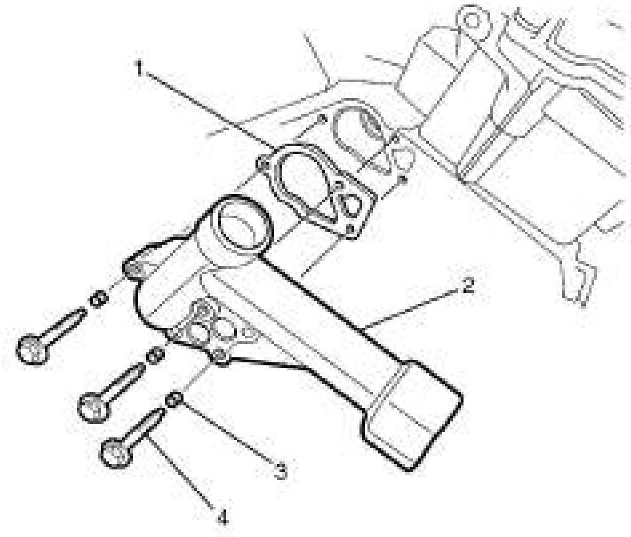
Important: The thermostat housing has one longer bolt which is located in the upper left of the housing.

Important: When replacing the thermostat housing always renew the block gasket (1).

18. Remove the thermostat housing retaining bolts (4) rubber grommets (3) then remove the thermostat housing (2).

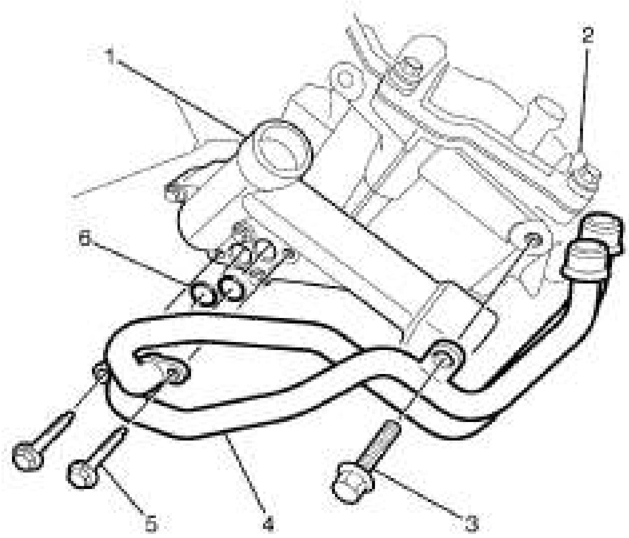
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the thermostat housing retaining bolts (4) ensuring a new block gasket (1) and rubber grommets (3) has been fitted.

   Tighten
   Tighten the bolts (4) to 10 N·m (89 lb in).



2. Install the NEW O-ring seals (6) to the thermostat housing (1).
3. Install the heater pipe assembly (4) to the thermostat housing (1) and cylinder head (2).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the heater hose assembly to thermostat housing retaining bolts (5).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

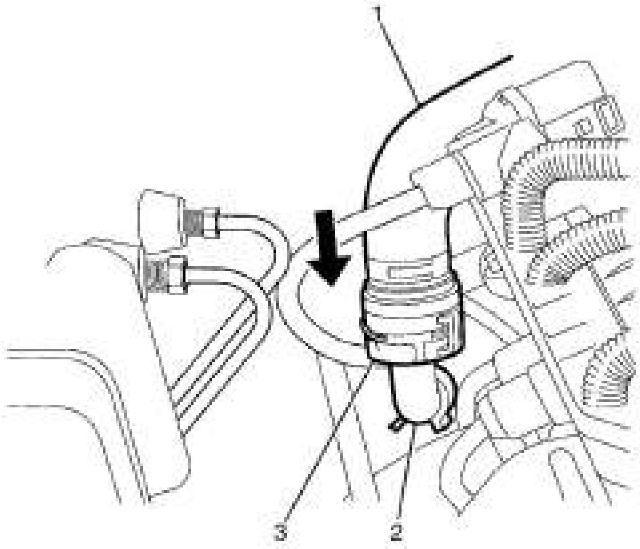
5. Install the heater hose assembly to right hand cylinder head retaining bolt (3)

   Tighten
   Tighten the bolt to 35 N·m (26 lb ft).

6. Install the engine harness. Refer to Ignition Coil Replacement - Bank 1 and Ignition Coil Replacement - Bank 2.

   Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

   Caution: Refer to Safety Glasses Caution in the Preface section.



7. Attach the heater hose (1) quick connect fitting (3) by pushing the hose onto the heater pipe (2) listen for a audible click to confirm fitting.
8. Install the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement.

Important: Do NOT separate the upper and lower intake manifolds.

9. Install the intake manifolds. Refer to Upper Intake Manifold Replacement and Refer to Lower Intake Manifold Replacement.
10. Install the air deflector. Refer to Front Air Deflector Replacement.
11. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
12. Install the engine cover. Refer to Engine Cover Replacement.
13. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
14. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
15. Fill the cooling system. Refer to Cooling System Draining and Filling.
16. Inspect cooling system for leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 2042174**

Engine Coolant Thermostat Housing Replacement (6.0L Engine)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

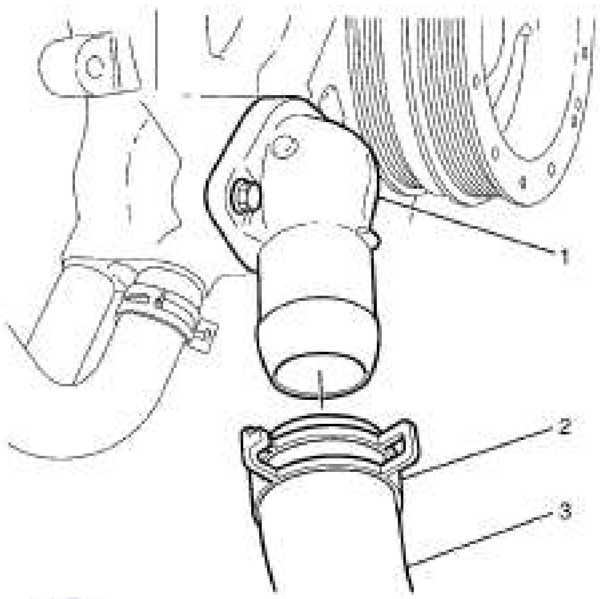
2. Ensure engine is below 50 C before removing the coolant pressure cap.
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
4. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

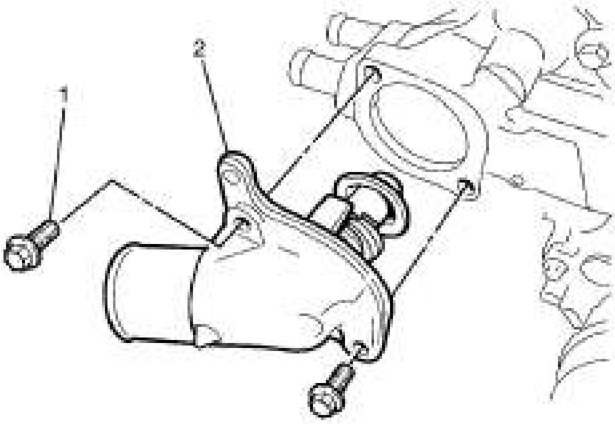
5. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
6. Drain the coolant into a suitable container. Refer to Cooling System Draining and Filling.
7. Lower the vehicle.

Caution: Refer to Safety Glasses Caution in the Preface section.



8. Release the retaining hose clamp (2) and detach the hose (3) from the thermostat housing

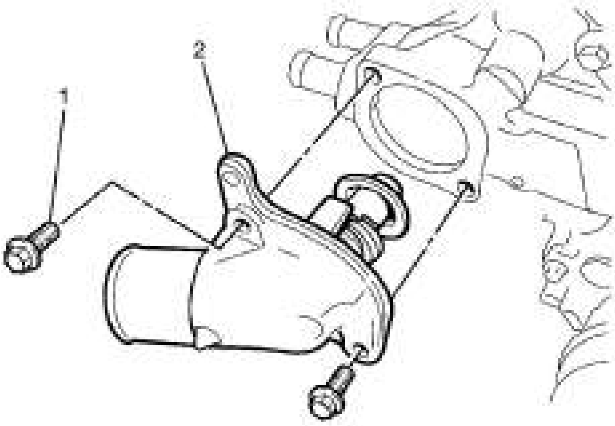
end (1).



9. Remove the thermostat housing (2) to water pump retaining bolts (1), and remove thermostat housing.
10. If the housing is to be replaced, discard the O-ring.

Installation Procedure

1. Install thermostat. Refer to Engine Coolant Thermostat Replacement.
2. Ensure all mating surfaces are thoroughly cleaned, using only a fine abrasive material.



Important: Ensure a new O-ring seal is used.

3. Install the thermostat housing (2).

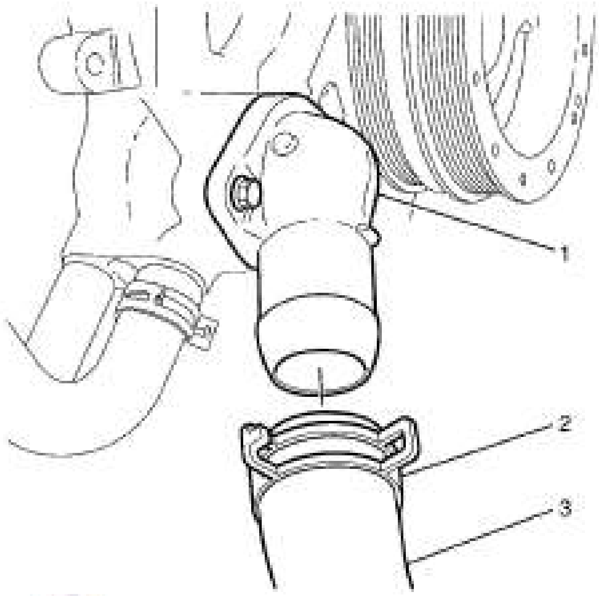
4. Install the thermostat housing to water Pump retaining bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.

   Tighten
   Tighten the bolts (1) to 14 N·m (124 lb in).

   Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

   Caution: Refer to Safety Glasses Caution in the Preface section.



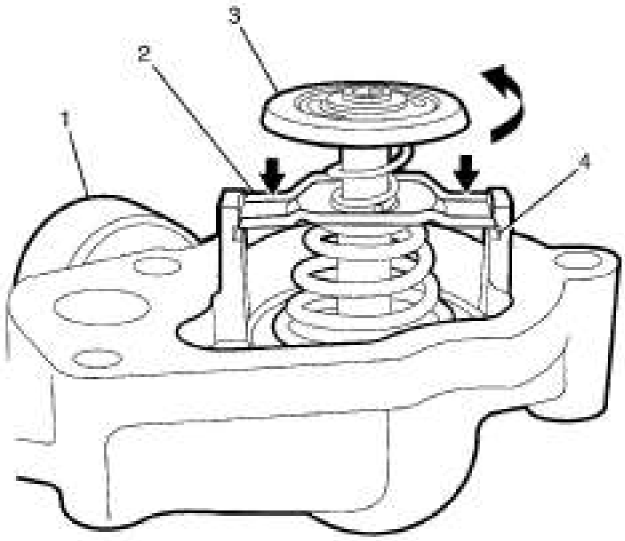
5. Install the hose (3) to the thermostat housing (1), by opening the retaining hose clamp (2) and securing it over the hose.
6. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement
7. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement
8. Fill the cooling system. Refer to Cooling System Draining and Filling.
9. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
10. Inspect cooling system for leaks.
11. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 1976109**

Engine Coolant Thermostat Replacement (3.6L Engine)

Removal Procedure

1. Remove the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement .



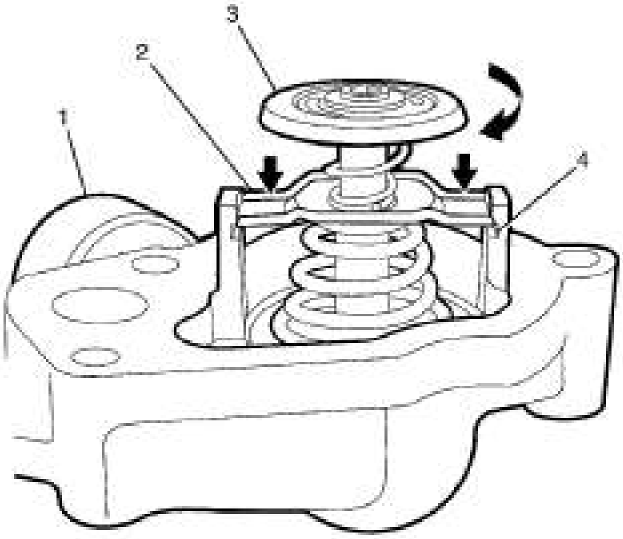
2. Place thermostat housing in a soft jaw vice.

   Caution: Refer to Safety Glasses Caution in the Preface section.

3. While depressing the thermostat (3) rotate the retaining bar (2) anti-clockwise in the housing (1) until it clears the retaining lugs (4).
4. Carefully release the thermostat spring force.
5. Remove the thermostat from it's housing.

Installation Procedure

1. Ensure that the thermostat housing in clean and free of damage.



2. While pressing the thermostat (3) rotate the retaining bar (2) clockwise in the housing (1) until it locks into the retaining lugs (4).
3. Install the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 2029922

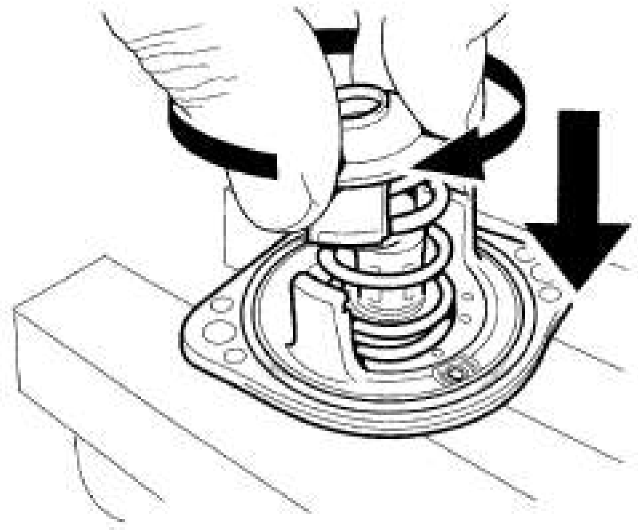
Engine Coolant Thermostat Replacement (6.0L Engine)

Removal Procedure

Notice: Refer to General Repair Instructions in the Preface section.

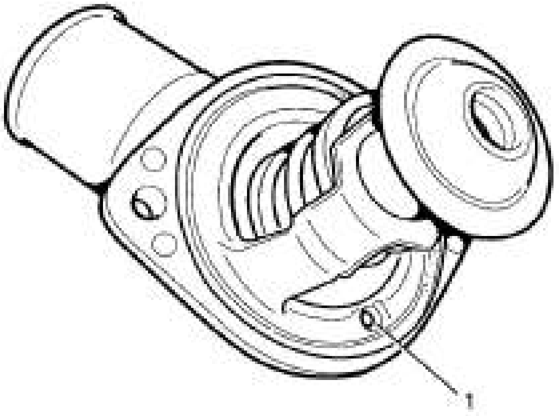
1. Remove the thermostat housing. Refer to Engine Coolant Thermostat Housing Replacement.
2. Place thermostat housing in a soft jaw vice.

   Caution: Refer to Safety Glasses Caution in the Preface section.

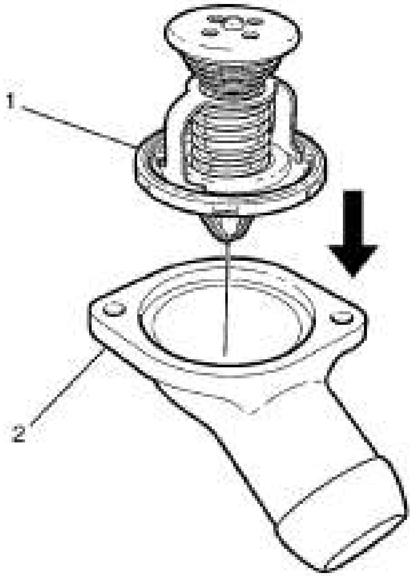


3. Press and rotate the springs of the thermostat to release it from the thermostat housing.
4. Remove the thermostat from the thermostat housing.

Installation Procedure



1. Assure that the air bleed ball (1) is not jammed by slightly shaking the assembly.



2. Place the thermostat (1) assembly into the thermostat housing (2).
3. Install the thermostat, by rotating and locking it into the thermostat housing.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | Document ID: 1994285

Radiator Air Lower Baffle and Deflector Replacement (LWB SWB)

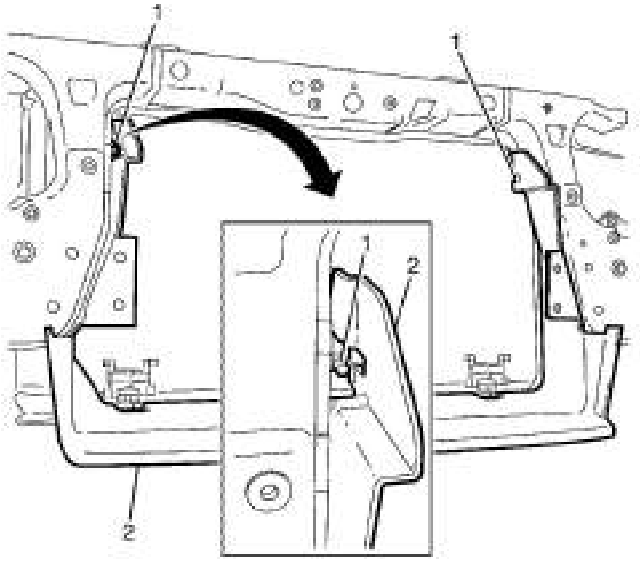
Removal procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the air deflector. Refer to Front Air Deflector Replacement.
3. Remove the front fascia. Refer to Front Bumper Fascia Replacement.
4. Remove the front impact bar. Refer to Front Bumper Impact Bar Replacement.
5. Lower the vehicle.
6. Detach the ambient sensor. Refer to Ambient Air Temperature Sensor Replacement.
7. Remove the washer solvent container. Refer to Windshield Washer Solvent Container Replacement.
8. Detach the wiring loom from the duct.

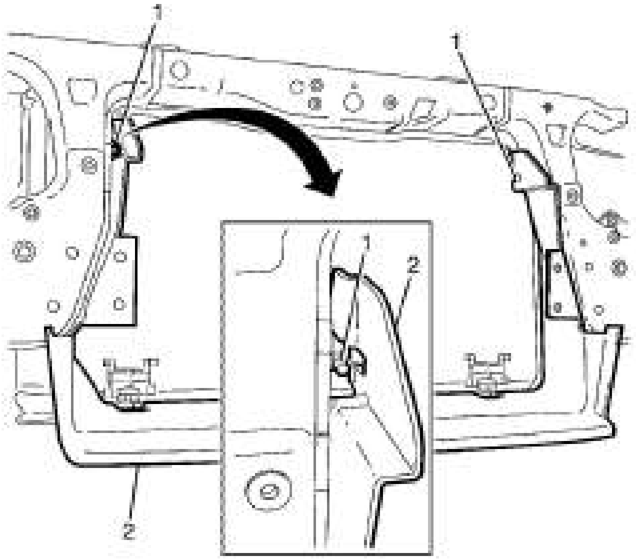
Caution: Refer to Safety Glasses Caution in the Preface section.



9. Remove the retaining pins (1) on either side of the air baffle (2).
10. Remove air baffle out of locating lugs and remove from front of vehicle.

Installation Procedure

1. Install the air baffle into the locating lugs.



2. Install the air baffle retaining pins (1) located at either side of the baffle (2).
3. Attach the wiring loom to the duct.
4. Attach the ambient sensor. Refer to Ambient Air Temperature Sensor Replacement.
5. Install the washer solvent container. Refer to Windshield Washer Solvent Container Replacement.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

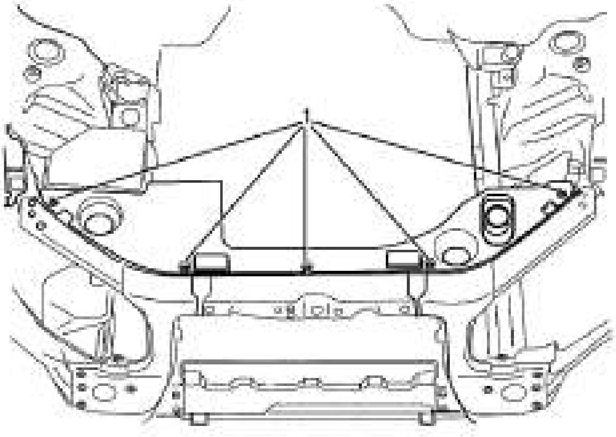
6. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle.
7. Install the front impact bar. Refer to Front Bumper Impact Bar Replacement.
8. Install the front fascia. Refer to Front Bumper Fascia Replacement.
9. Instal the air deflector. Refer to Front Air Deflector Replacement.
10. Lower vehicle.
11. Inspect vehicle for correct alignment of body panels. Refer to Dimensions - Body.

Radiator Air Upper Baffle and Deflector Replacement

Removal Procedure - Up to 05 Feb 2007

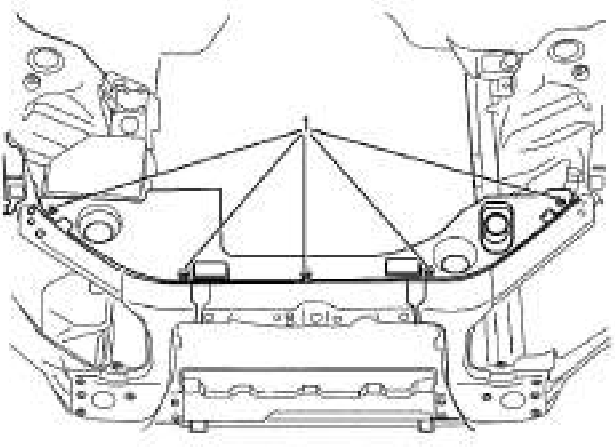
> **Important:** When a suitable hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

1. Install a suitable hood brace to the vehicle.



2. Remove the radiator air baffle and deflector to front end module retaining scrivets (1).
3. Remove the radiator air baffle and deflector from the front end module.

Installation Procedure - Up to 05 Feb 2007



1. Install the radiator air baffle and deflector to the front end module.
2. Install the radiator air baffle and deflector to front end module retaining scrivets (1).
3. Remove the suitable hood brace from the vehicle.

Radiator Cleaning

- **Caution:** NEVER spray water on a hot heat exchanger. The resulting steam could cause personal injury.

  Notice: The heat exchanger fins are necessary for good heat transfer. Do not brush the fins. This may cause damage to the fins, reducing heat transfer.

  Important: Remove bugs, leaves, dirt and other debris by blowing compressed air through the engine side of the radiator.

  - Some conditions may require the use of warm water and a mild detergent.
- Clean the A/C condenser fins.
- Clean between the A/C condenser and radiator.
- Clean the radiator cooling fins.
- Straighten any damaged cooling fins.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Cooling | Repair Instructions | **Document ID: 1976112**

Radiator Drain Cock Replacement

Replacement Procedure

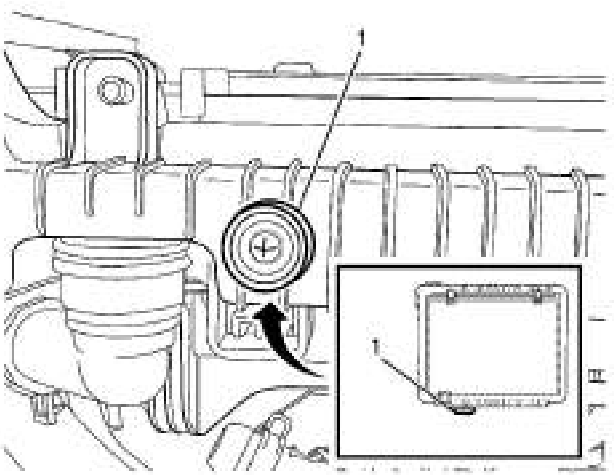
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

1. Remove the filler cap.

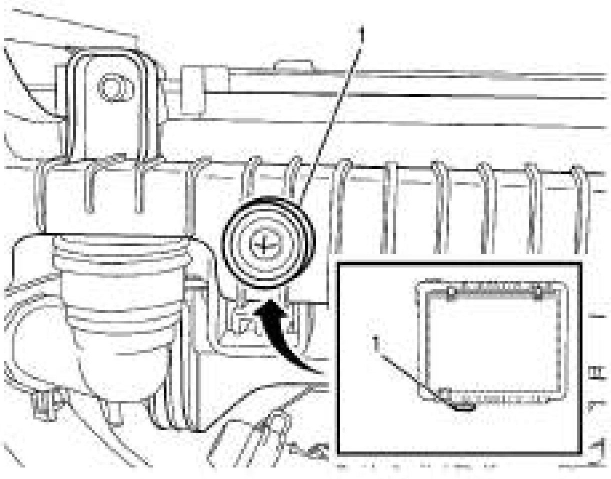
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the front of the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Drain the cooling system. Refer to Cooling System Draining and Filling.



4. Remove the drain cock (1).

Installation Procedure



1. Install the drain cock plug (1) ensuring a new O-ring is used.

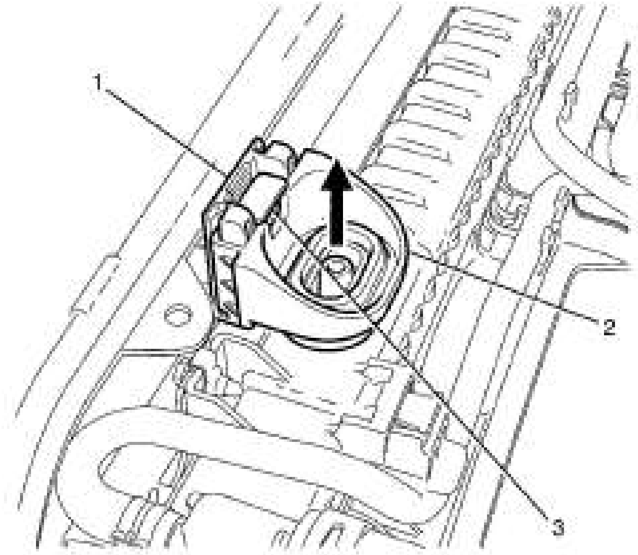
   Tighten
   Tighten the drain cock plug (1) to 2 N·m (18 lb in).

2. Lower the vehicle.
3. Fill the cooling system. Refer to Cooling System Draining and Filling.
4. Inspect the cooling system for leaks.

Radiator Hose Quick Connect Fitting

Removal Procedure

1. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
2. Drain the cooling system. Refer to Cooling System Draining and Filling.
3. Detach the radiator outlet hose. Refer to Radiator Outlet Hose Replacement.

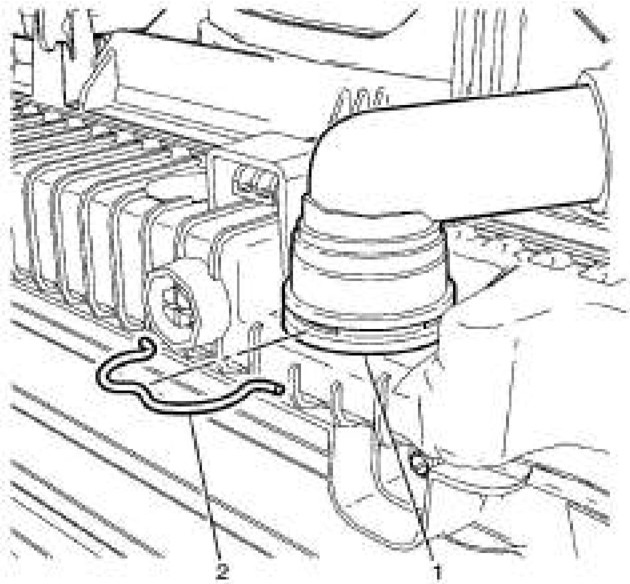


4. Remove the radiator support brackets (2) from top of radiator by rasing the securing lock (3) 10mm and then sliding the bracket off the radiator slide pin (1). Carry out same procedure for other bracket.
5. Raise and support the radiator assembly out of the rubber grommets located in the cross member.

Caution: Refer to Safety Glasses Caution in the Preface section.

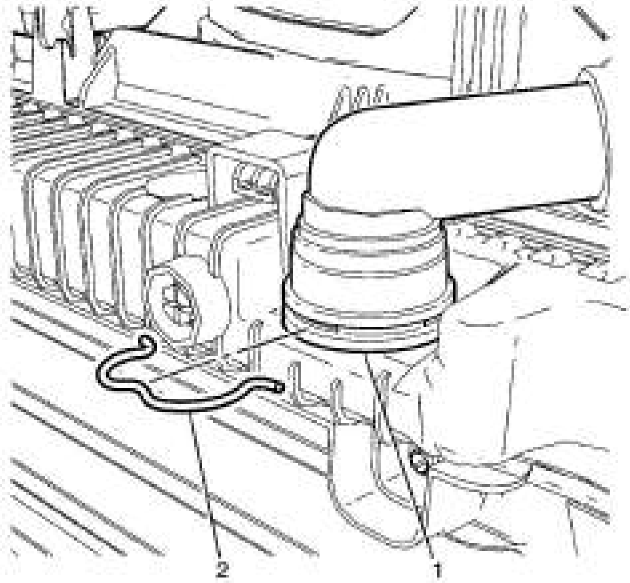
Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
7. Remove the air deflector. Refer to Front Air Deflector Replacement.



8. Remove the retaining clip (2) from the outlet hose quick connect fitting (1).
9. Remove the outlet hose quick connect fitting (1) from the radiator assembly.

Installation Procedure



1. Install the outlet hose quick connect fitting retaining clip (2) to the quick connect fitting (1).
2. Install the outlet hose quick connect fitting (1) to the radiator spigot.
3. Install the outlet hose quick connect fitting retaining clip (2) slightly pull on the quick connect fitting to confirm fitting.
4. Install the air deflector. Refer to Front Air Deflector Replacement.
5. Lower the vehicle.
6. Attach the radiator outlet hose. Refer to Radiator Outlet Hose Replacement.

7. Fill the cooling system. Refer to Cooling System Draining and Filling.
8. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.

Radiator Inlet Hose Replacement (3.6L Engine)

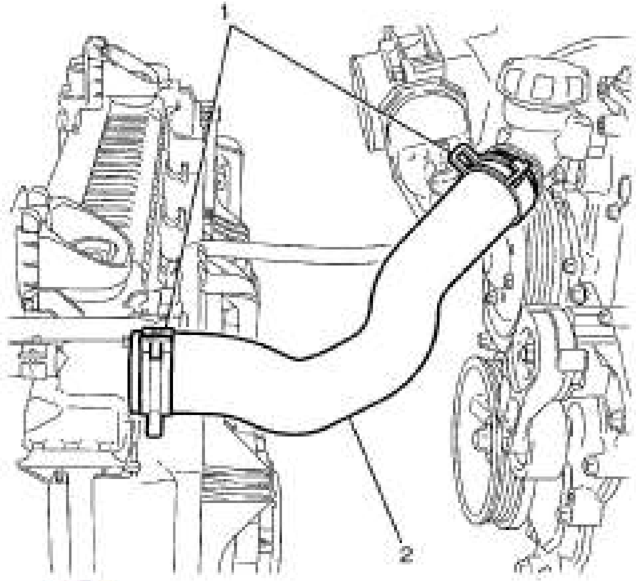
Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling.
2. Remove the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
4. Remove the mass air flow sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor Replacement.
5. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

6. Ensure engine is below 50 C before removing the coolant pressure cap.



7. Remove the retaining hose clamps (1) back on the inlet hose (2) at both ends.

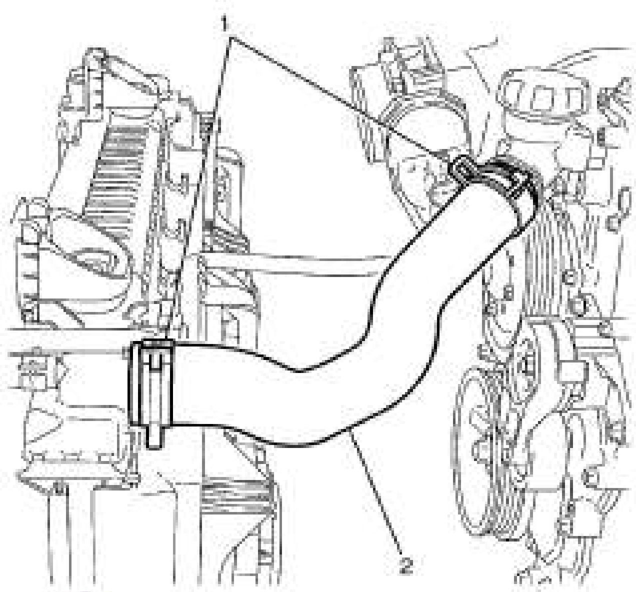
Important: If inlet hose (2) is not being replaced leave retaining clamp's (1) attached to hose.

8. Remove the inlet hose (2) at both ends.

Installation Procedure

Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.



1. Install the inlet hose (2).
2. Secure the inlet hose (2) at both ends, by opening the retaining hose clamps (1) and sliding them over the hose (2).
3. Install the mass air flow meter. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor Replacement.
4. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
5. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
6. Install the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
7. Fill the cooling system. Refer to Cooling System Draining and Filling.
8. Inspect cooling system for leaks.

Radiator Inlet Hose Replacement (6.0L Engine)

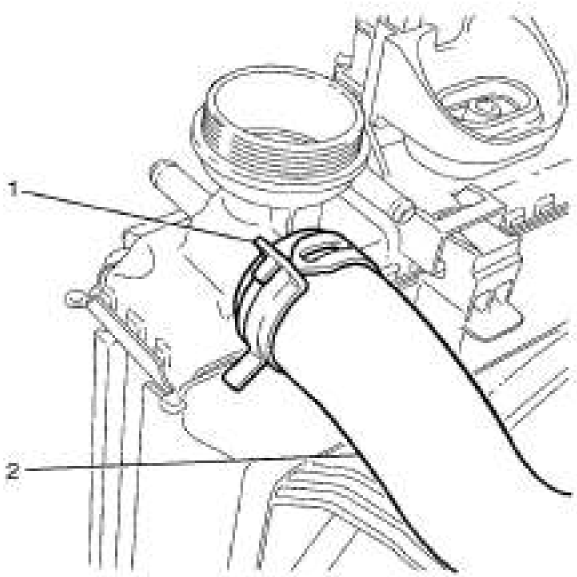
Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling .
2. Remove the engine cover. Refer to Engine Cover Replacement .
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
4. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
5. Remove the mass air flow meter. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement .

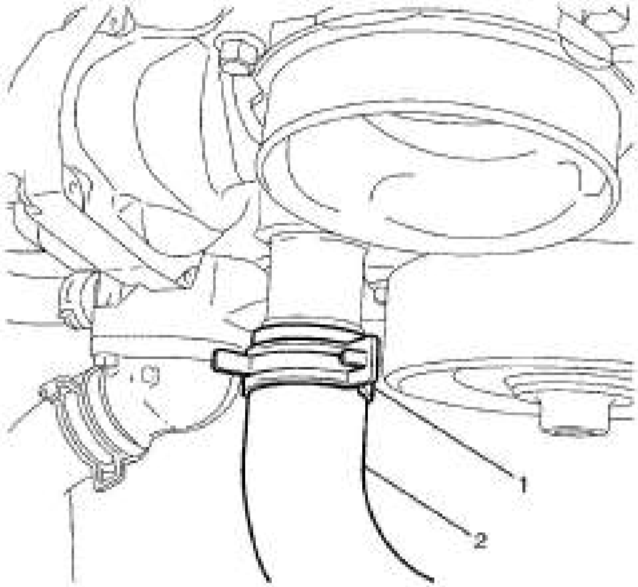
Caution: Refer to Radiator Cap Removal Caution in the Preface section.

6. Ensure engine is below 50 C before removing the coolant pressure cap.

Caution: Refer to Safety Glasses Caution in the Preface section.



7. Release the retaining hose clamp (1) and disconnect the radiator inlet hose (2) from the radiator.



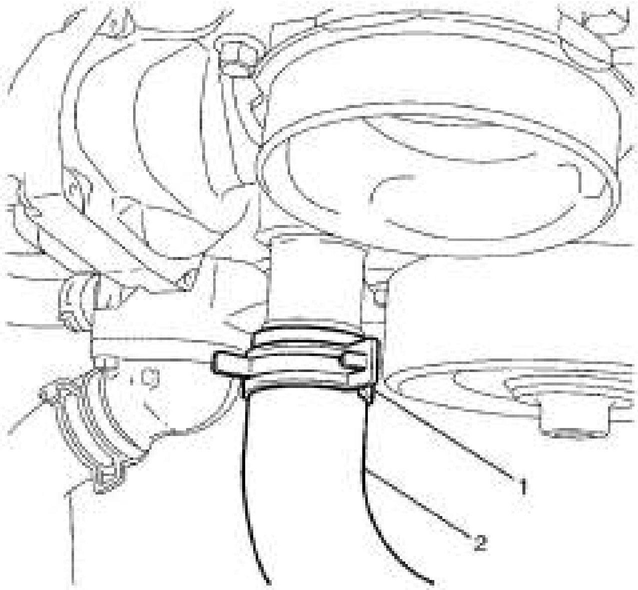
8. Release the retaining hose clamp (1) and disconnect the radiator inlet hose (2) from the water pump.

   Important: If the inlet hose (2) is not being replaced leave retaining clamp (1) attached to the inlet hose.

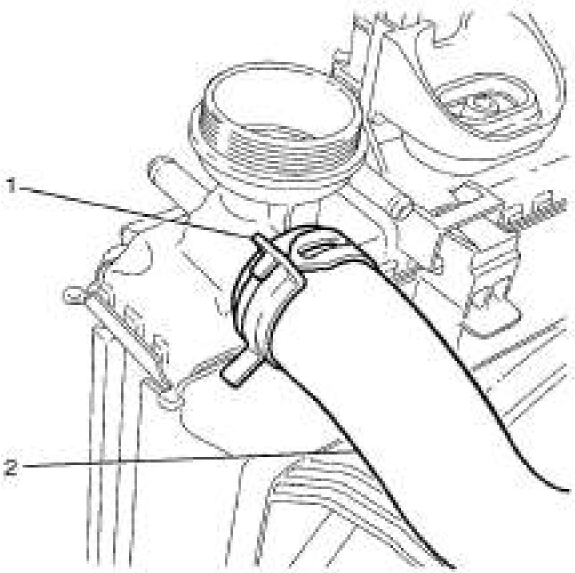
9. Remove the inlet hose (2) from both ends.

Installation Procedure

Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.



1. Install the inlet hose (2).
2. Secure the inlet hose (2) at the water pump end, by opening the retaining hose clamp (1) and securing it over the outlet hose (2).



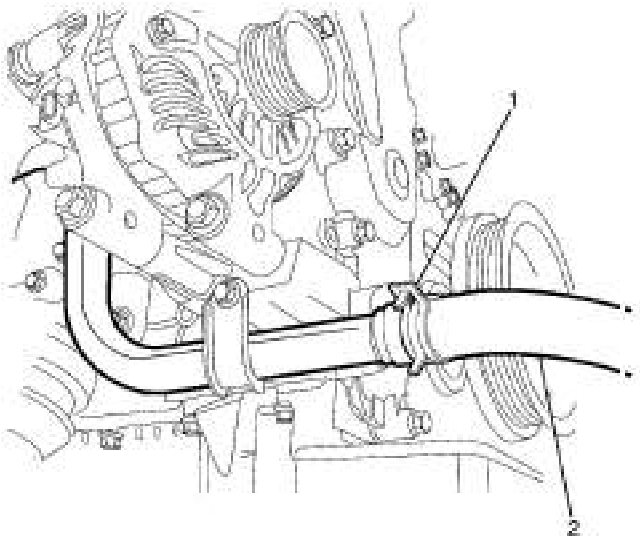
3. Secure the hose (2) at the radiator end by opening the retaining hose clamp (1) and retaining it over the hose (2).
4. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
5. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
6. Install the mass air flow sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement .
7. Install the engine cover. Refer to Engine Cover Replacement .
8. Fill the cooling system. Refer to Cooling System Draining and Filling .
9. Inspect cooling system for leaks.

Radiator Outlet Hose Replacement (3.6L Engine)

Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling .

   Caution: Refer to Safety Glasses Caution in the Preface section.

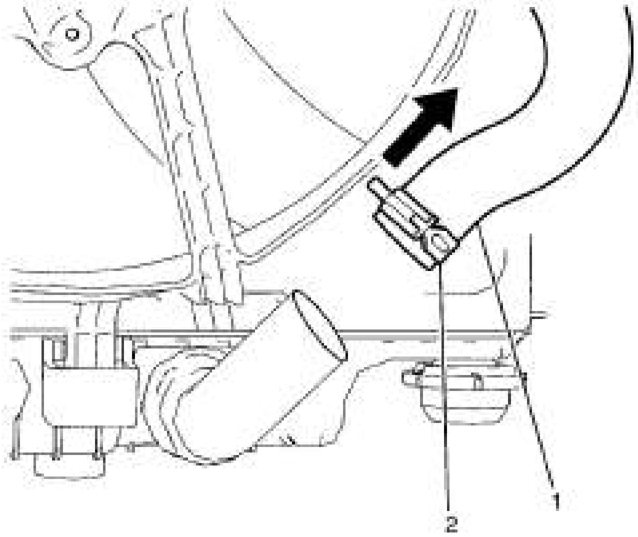


Important: If outlet hose (1) is not being replaced leave retaining clamp (2) attached to outlet hose.

2. Release the retaining hose clamp (1) and remove the outlet hose (2).

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the air deflector. Refer to Front Air Deflector Replacement .



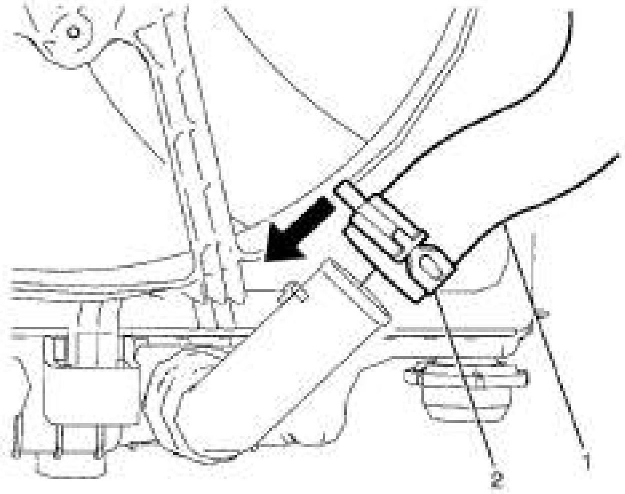
Important: If outlet hose (1) is not being replaced leave retaining clamp (2) attached to hose.

Important: Access to the outlet hose is restricted, removal of the cooling fan's will aid access. Refer to Cooling Fan and Shroud Replacement .

5. Remove the outlet hose (1) by releasing the retaining hose clamp (2)

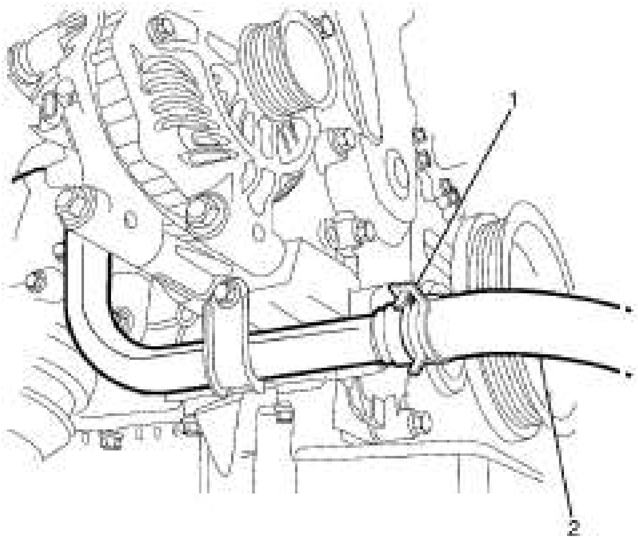
Installation Procedure

Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.



1. Install the outlet hose (1) and secure it with the retaining hose clamp (2).
2. Install the air deflector. Refer to Front Air Deflector Replacement .
3. Lower the vehicle.

Caution: Refer to Safety Glasses Caution in the Preface section.



4. Secure the outlet hose (2) by opening the retaining hose clamp (1) and sliding it over the hose (2).
5. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
6. Fill the cooling system. Refer to Cooling System Draining and Filling .
7. Inspect cooling system for leaks.

Radiator Outlet Hose Replacement (6.0L Engine)

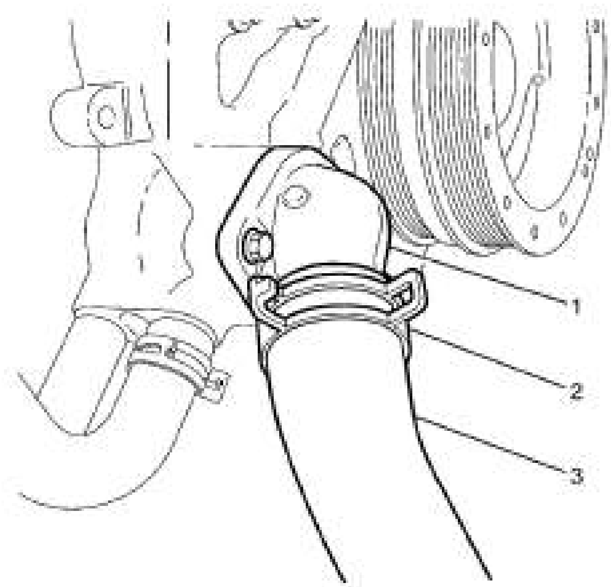
Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling.
2. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
3. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

4. Ensure engine is below 50 C before removing the radiator cap.

Caution: Refer to Safety Glasses Caution in the Preface section.

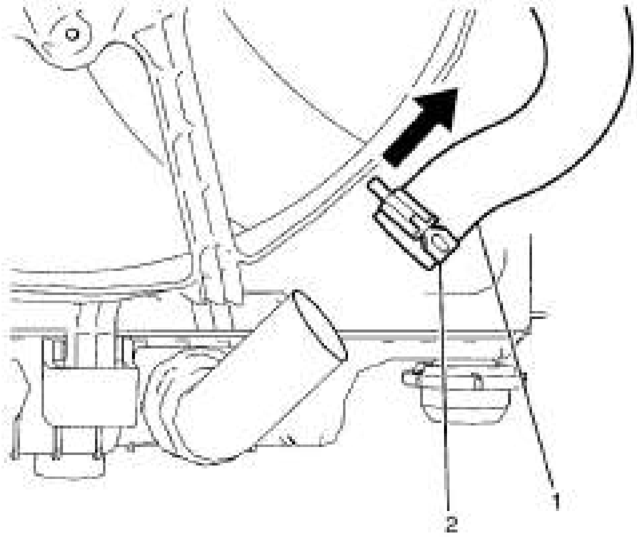


Important: If outlet hose (3) is not being replaced leave retaining clamp (2) attached to hose.

5. Release the outlet hose retaining hose clamp (2).
6. Detach the outlet hose (3) from the thermostat housing (1).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

7. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
8. Remove the air deflector. Refer to Front Air Deflector Replacement.



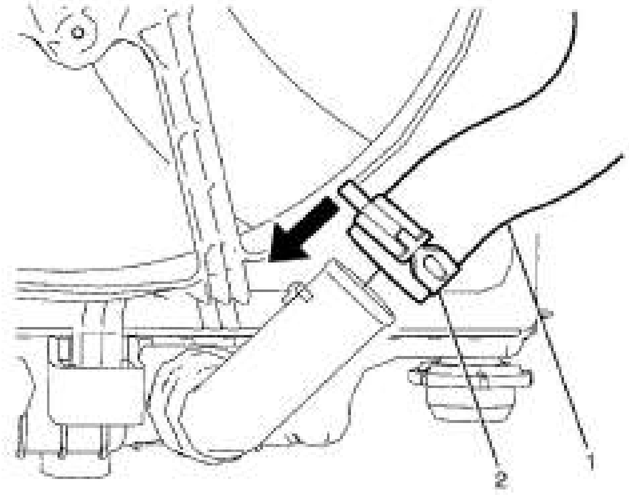
Important: If outlet hose (1) is not being replaced leave retaining clamp (2) attached to hose.

Important: Access to the outlet hose is restricted, removal of the cooling fan's will aid with access. Refer to Cooling Fan and Shroud Replacement.

9. Remove the outlet hose (1) by releasing the retaining hose clamp (2).
10. Remove the outlet hose (1).

Installation Procedure

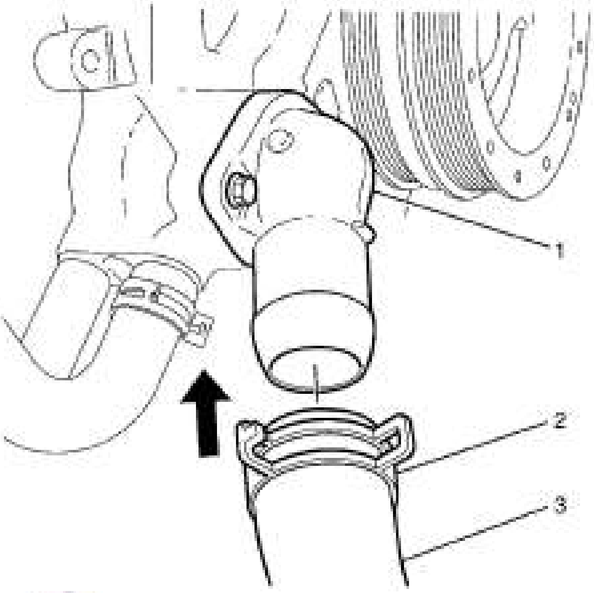
Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.



1. Install the bottom end of the outlet hose (1).

   Notice: Refer to General Repair Instructions in the Preface section.

2. Secure the hose by sliding the retaining hose clamp (2) over it.
3. Install the air deflector. Refer to Front Air Deflector Replacement.
4. Lower the vehicle.



5. Install the top end of the outlet hose (3), onto the thermostat housing (1).
6. Secure the outlet hose by sliding the retaining hose clamp (2) over it.
7. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
8. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
9. Fill the cooling system. Refer to Cooling System Draining and Filling.
10. Inspect cooling system for leaks.

Radiator Replacement

Tools Required

AU-525 Quick Connect Release Tool

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

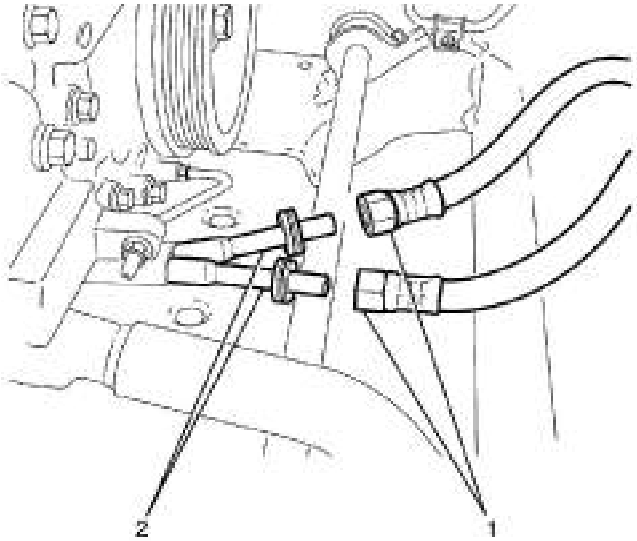
2. Ensure engine is below 50 C before removing the coolant pressure cap.
3. Drain the cooling system. Refer to Cooling System Draining and Filling .
4. Remove the engine cover. Refer to Engine Cover Replacement for 3.6L engine or Engine Cover Replacement for 6.0L engine.
5. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
6. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement for 3.6L engine or Air Cleaner Inlet Duct Replacement for 6.0L engine.
7. Remove the mass air flow meter. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacementfor 3.6L engine or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
8. Detach the radiator inlet hose. Refer to Radiator Inlet Hose Replacement.

Caution: Refer to Safety Glasses Caution in the Preface section.

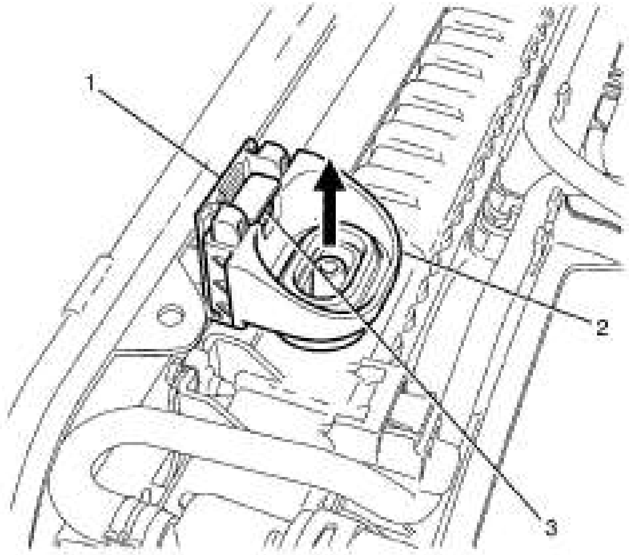
Caution: Refer to Vehicle Lifting Caution in the Preface section.

9. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle .
10. Remove the air deflector. Refer to Front Air Deflector Replacement .
11. Detach the radiator outlet hose. Refer to Radiator Outlet Hose Replacement.
12. Lower the vehicle.
13. Detach the coolant recovery reservoir hose. Refer to Coolant Recovery Reservoir Replacement .
14. Remove the coolant air bleed hose. Refer to Engine Coolant Air Bleed Hose Replacement .
15. Place a suitable container beneath the radiator and engine.

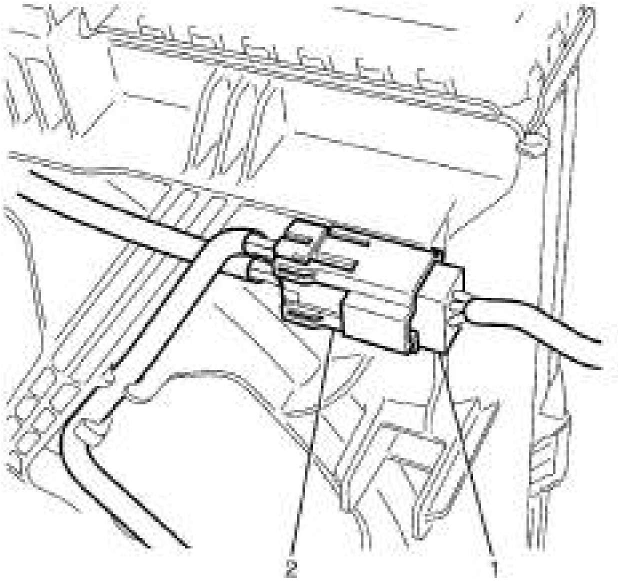
Caution: Refer to General Repair Instructions in the Preface section.



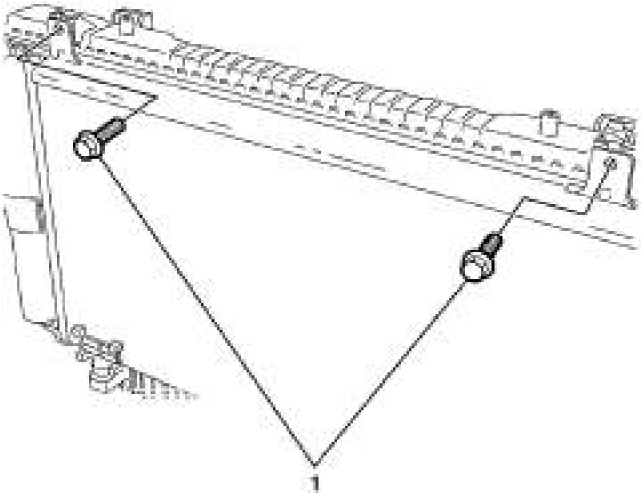
16. Disconnect the transmission cooler line (2) from the flexible hose (1) using the AU-525 .
    - Detach plastic cover from hose fitting and slide along pipe
    - Open the AU-525 then close and clip around the hose to be disconnected.
    - While holding the flexible hose (1) push the hose inwards with one hand, then pull back to separate from the steel hose piping (2).
    - Repeat procedure for the second fitting.



17. Remove the radiator support brackets (2) from top of radiator by rasing the securing lock (3) 10mm and then sliding the bracket off the radiator slide pin (1). Carry out same procedure for other bracket.

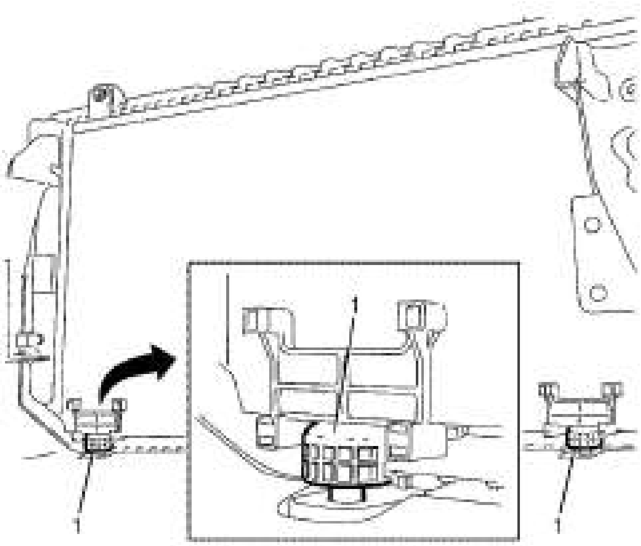


18. Disconnect the cooling fans electrical connector (2) from the main wiring loom connector (1).

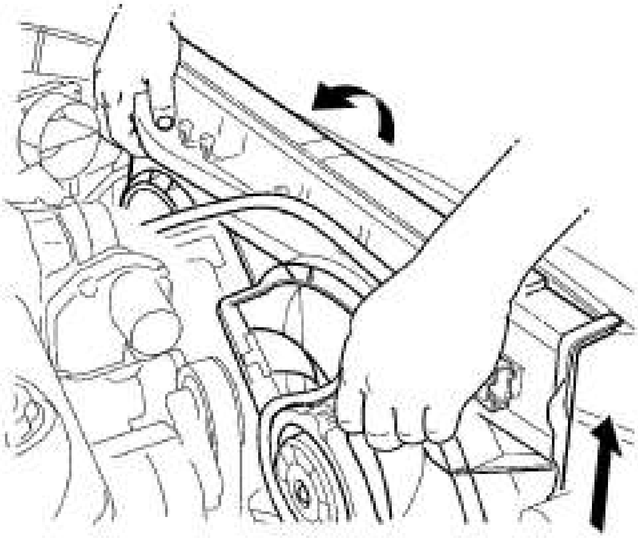


19. Remove the two radiator and condenser retaining bolts (1).

Notice: Refer to General Repair Instructions in the Preface section.

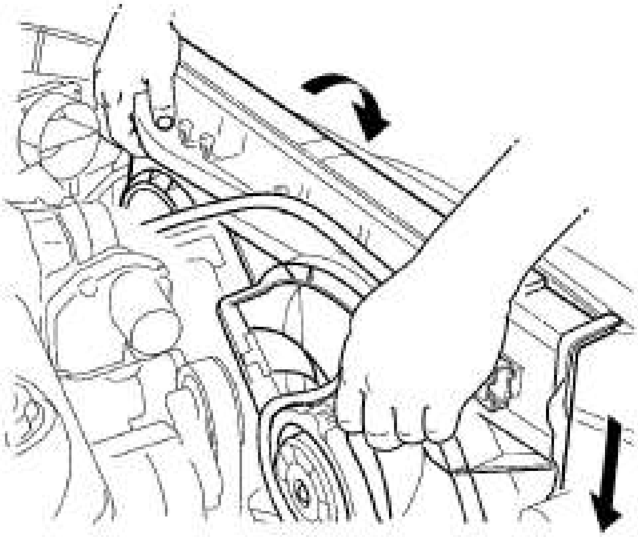


20. Detach the condenser by lifting it out of the retaining brackets located on the radiator assembly.

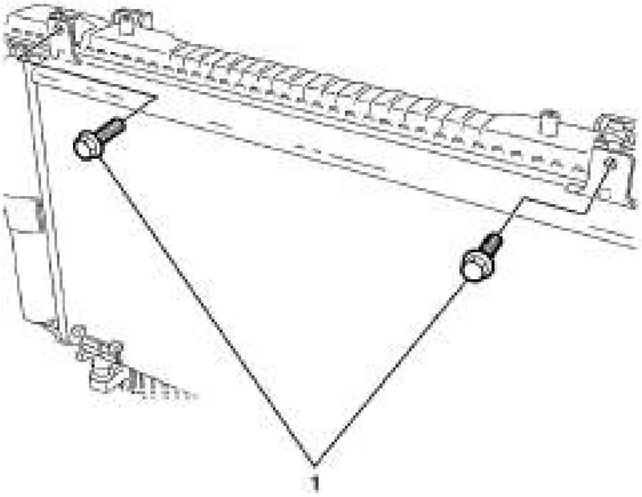


21. Remove the radiator and fan assembly, by tilting it forward and lifting it out of the rubber grommets located in the cross member.

Installation Procedure



1. Install the radiator into the rubber retaining grommets located in the cross member.

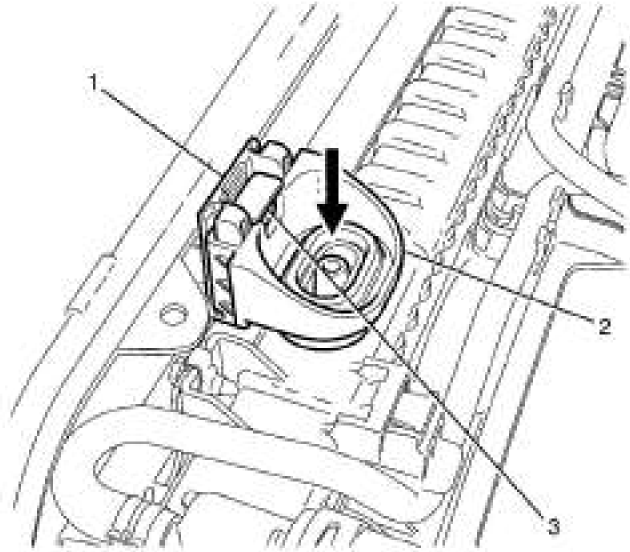


2. Install the condenser into the radiator

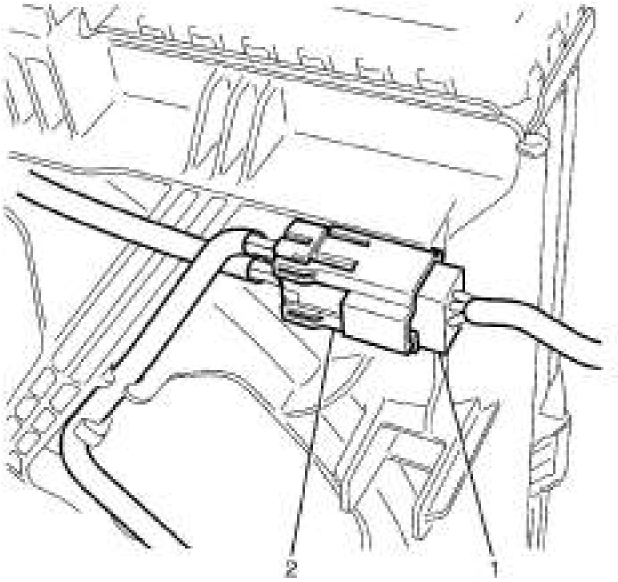
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the two radiator and condenser retaining bolts (1).

   Tighten
   Tighten the radiator and condenser bolts to 11 N·m (97 lb in).

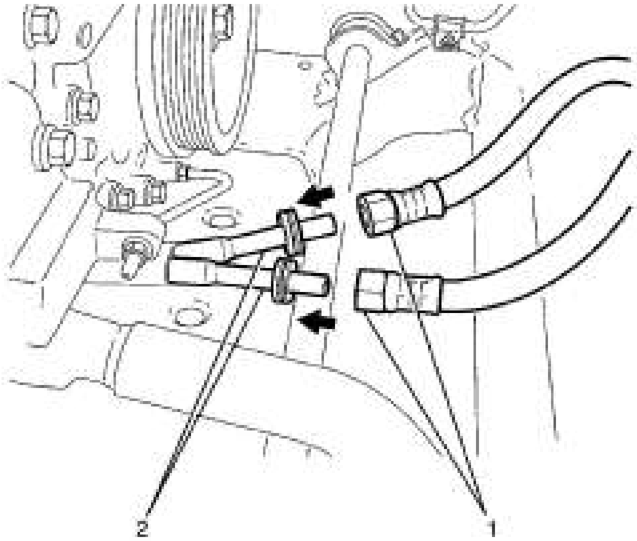


4. Install the radiator retaining brackets (2), onto the radiator slide pin (1).
5. Secure the retaining brackets by pushing the securing lock (3) downwards until lock reaches bottom of radiator bracket.



6. Connect the cooling fans electrical connector (2) to the main wiring loom connector (1)

Caution: Refer to General Repair Instructions in the Preface section.



7. Connect the flexible hoses (1) to the transmission cooler lines (2), listen for an audible click to confirm fitting.
8. Push plastic cover forward along pipe and clip onto hose fitting.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

9. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle .
10. Install the outlet hose to the radiator. Refer to Radiator Outlet Hose Replacement .
11. Lower vehicle.
12. Install the coolant air bleed hose. Refer to Engine Coolant Air Bleed Hose Replacement .
13. Install the coolant recovery reservoir hose. Refer to Coolant Recovery Reservoir Replacement .
14. Install the inlet hose. Refer to Radiator Inlet Hose Replacement .
15. Install the air deflector. Refer to Front Air Deflector Replacement .
16. Install the mass air flow meter. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 3.6L engine or Mass Airflow Sensor/Intake Air Temperature Sensor Replacement for 6.0L engine.
17. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement for 3.6L engine or Air Cleaner Inlet Duct Replacement for 6.0L engine.
18. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
19. Install the engine cover. Refer to Engine Cover Replacement for 3.6L engine or Engine Cover Replacement for 6.0L engine.
20. Install the battery ground lead to the vehicle. Refer to Battery Negative Cable Disconnection and Connection .
21. Fill the cooling system. Refer to Cooling System Draining and Filling .
22. Inspect cooling system for leaks.

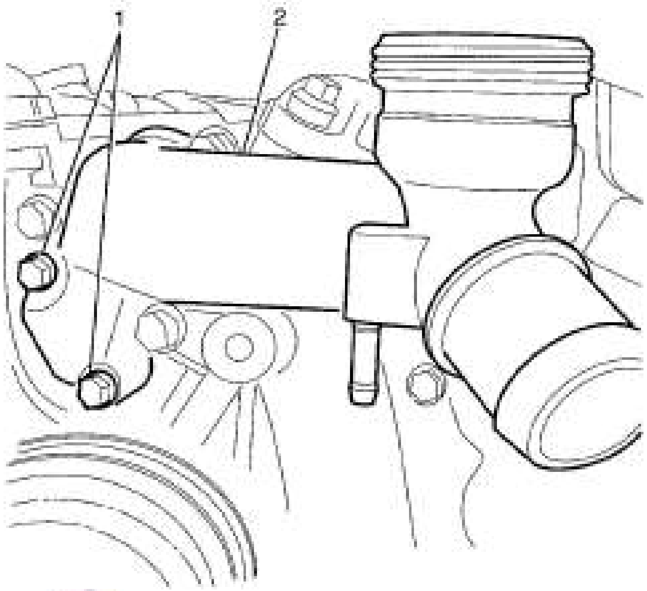
Water Outlet Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

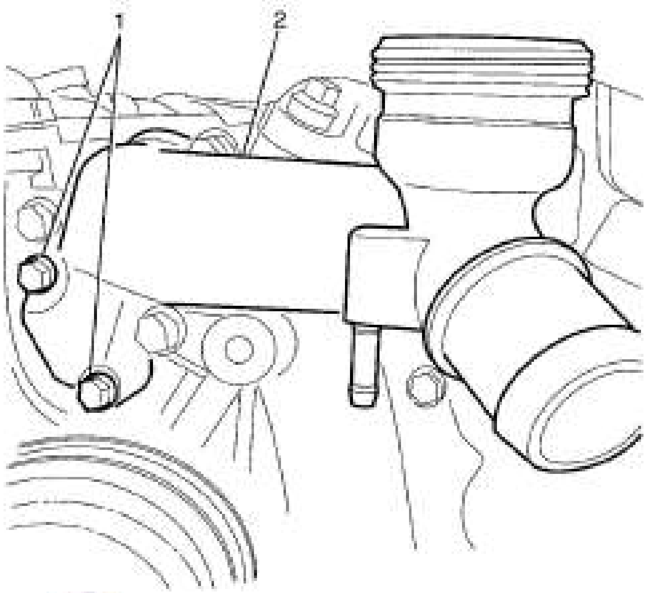
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Drain the cooling system. Refer to Cooling System Draining and Filling .
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
4. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
5. Remove the intake manifold. Refer to Intake Manifold Removal .
6. Detach the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .
7. Detach the coolant recovery reservoir hose. Refer to Coolant Recovery Reservoir Replacement .
8. Detach the coolant air bleed hose. Refer to Engine Coolant Air Bleed Hose Replacement .

Notice: Refer to General Repair Instructions in the Preface section.



9. Remove the water outlet housing (2) to intake manifold retaining bolts (1).
10. Remove the water outlet housing.
11. Discard the rubber O-ring and seal.

Installation Procedure



Important: Ensure a new rubber O-ring and seal is used when installing the water outlet housing.

1. Install the water outlet housing (2) to the intake manifold.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the water outlet housing (2) to intake manifold retaining bolts (1).

   Tighten
   Tighten the bolts to xx N·m (xx lb in).

3. Attach the coolant air bleed hose. Refer to Engine Coolant Air Bleed Hose Replacement .
4. Attach the coolant recovery reservoir hose. Refer to Coolant Recovery Reservoir Replacement .
5. Attach the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .
6. Install the intake manifold. Refer to Intake Manifold Removal .
7. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
8. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
9. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
10. Fill the cooling system. Refer to Cooling System Draining and Filling .
11. Inspect cooling system for leaks.

Water Pump Replacement (3.6L Engine)

Removal Procedure

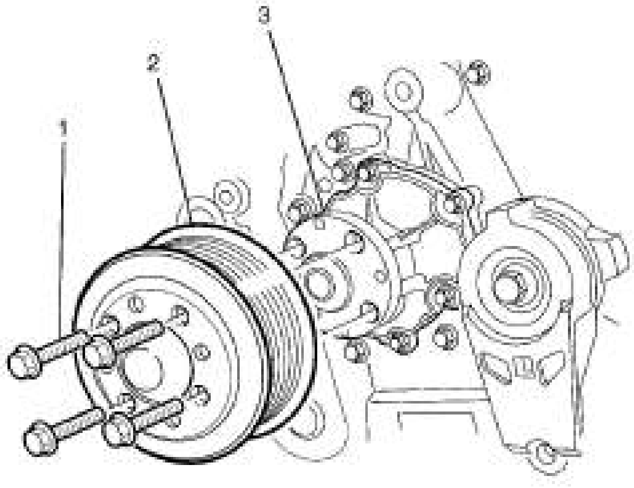
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Drain the cooling system. Refer to Cooling System Draining and Filling.
3. Remove the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
4. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
5. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
6. Remove the engine drive belt. Refer to Drive Belt Replacement.

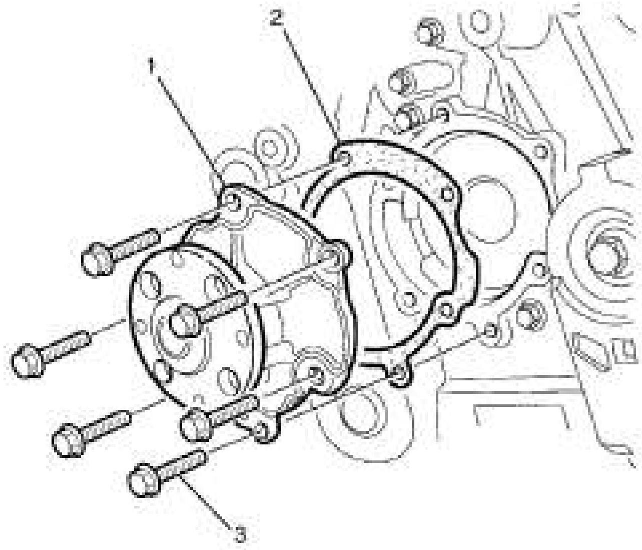
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

7. Ensure engine is below 50 C before removing the coolant pressure cap.



8. Remove the water pump pulley to water pump retaining bolts (1).
9. Remove the water pump pulley (2) from the water pump (3).



Important: Use a soft hammer to separate the water pump from the engine cover.

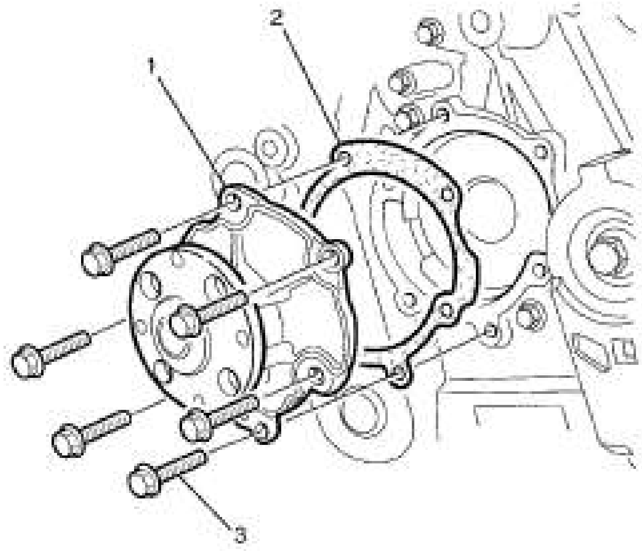
10. Remove the water pump to engine front cover retaining bolts (3).
11. Remove the water pump (1).
12. Remove the water pump gasket (2).

    Discard the gasket.

Installation Procedure

Important: Make sure all mating surfaces are clean and free of grease.

1. Using a water sealant install the water pump and gasket to front engine cover.
2. Make sure all retaining bolts are clean and free of debris.

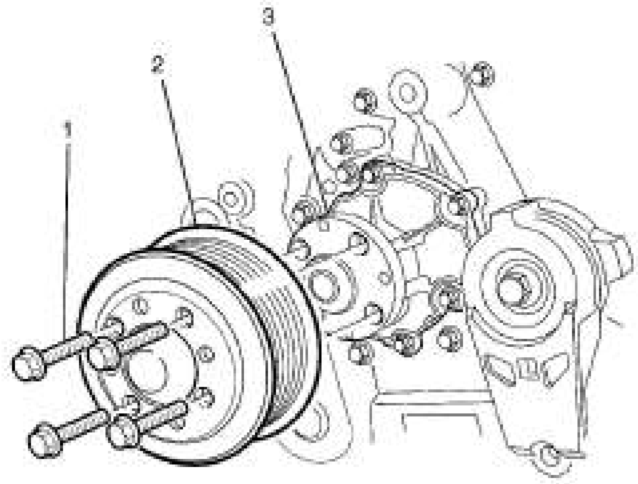


3. Install the water pump (1) and NEW gasket (2).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the water pump to engine front cover retaining bolts (3).

Tighten
Tighten the bolts to 10 N·m (89 lb in).



5. Install the water pump pulley (2) to the water pump (3)
6. Install the water pump pulley to water pump retaining bolts (1).

Tighten
Tighten the bolts to 10 N·m (89 lb in).

7. Install the drive belt. Refer to Drive Belt Replacement.
8. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
9. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement in Body Front End.
10. Install the engine cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
11. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
12. Fill cooling system. Refer to Cooling System Draining and Filling.
13. Start engine and check for leaks.

Water Pump Replacement (6.0L Engine)

Removal Procedure

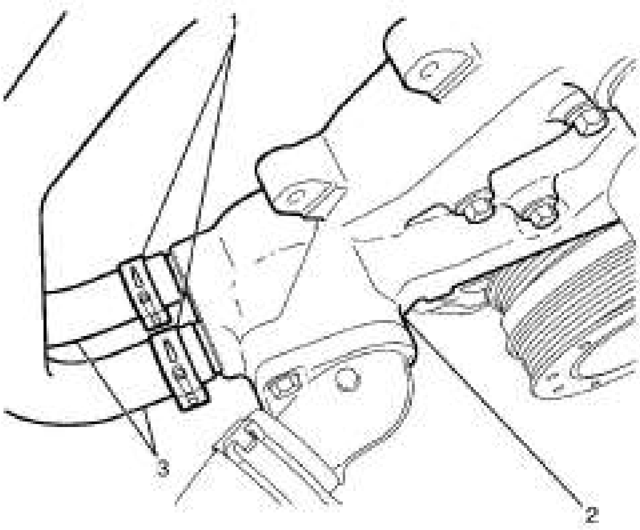
Caution: Refer to Battery Disconnect Caution in the Preface section.

Important: The water pump is not a serviceable item and should be replaced as an assembly.

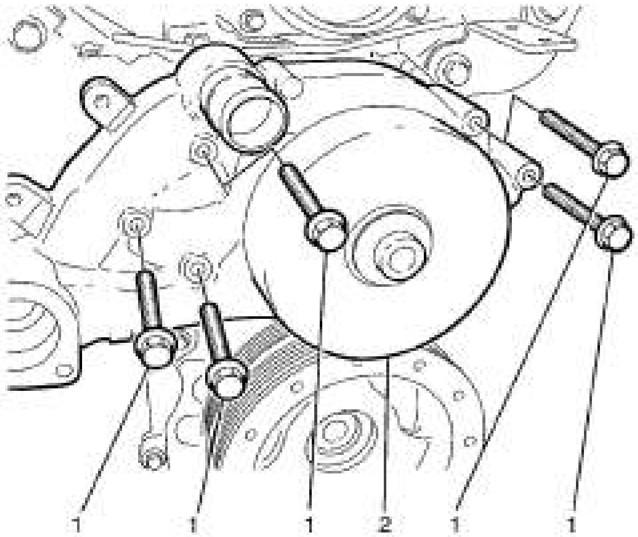
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Drain the cooling system. Refer to Cooling System Draining and Filling.
3. Remove the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement .
4. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
5. Remove the engine drive belt. Refer to Drive Belt Replacement - Accessory.

Caution: Refer to Radiator Cap Removal Caution in the Preface section.

6. Remove the coolant pressure cap.
7. Detach the inlet hose. Refer to Radiator Inlet Hose Replacement.
8. Detach the outlet hose. Refer to Radiator Outlet Hose Replacement.



9. Detach the heater hoses (1) from the water pump (2).
10. Remove drive belt tensioner. Refer to Drive Belt Tensioner Replacement - Accessory.

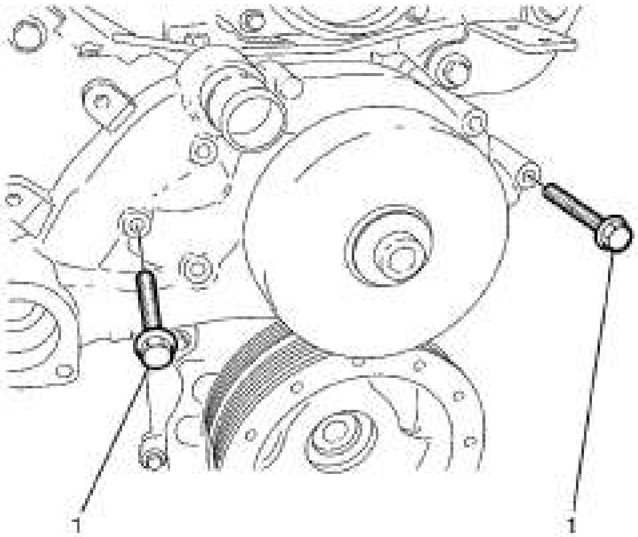


11. Remove the water pump (2) retaining bolts (1).

    Notice: Refer to General Repair Instructions in the Preface section.

12. Remove the water pump.

Installation Procedure



Important: Ensure all mating surfaces are clean and free of grease.

1. Insert two retaining bolts (1) at each end of the pump, place the new gasket of the bolts and use this as a guide to install the pump.

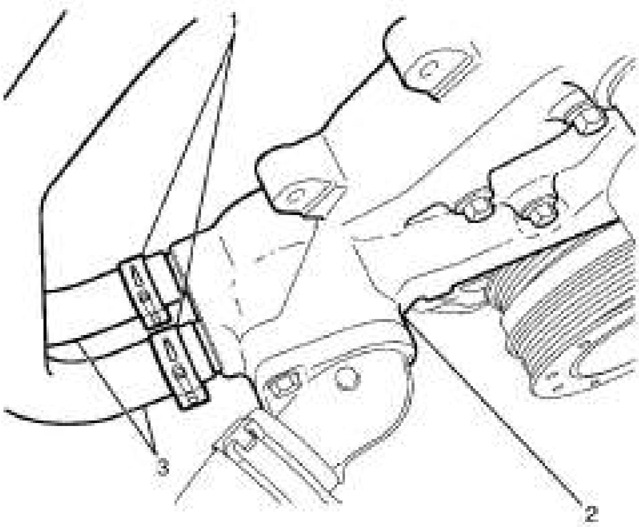
   Notice: Refer to Fastener Notice in the Preface section.

2. Install and tighten the remaining bolts.

   Tighten
   Tighten the bolts at first pass to 15 N·m (11 lb ft).

   Tighten the bolts at final pass to 25 N·m (18 lb ft).

3. Install drive belt tensioner. Refer to Drive Belt Tensioner Replacement - Accessory.
4. Install the outlet hose to the water pump. Refer to Radiator Outlet Hose Replacement.
5. Install the inlet hose to the water pump. Refer to Radiator Inlet Hose Replacement.



6. Install the heater hoses (1) to the water pump (2).
7. Install the engine drive belt. Refer to Drive Belt Replacement - Accessory.
8. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
9. Install the radiator air baffle and deflector. Refer to Radiator Air Upper Baffle and Deflector Replacement.
10. Install the ground battery lead to the vehicle. Refer to Battery Negative Cable Disconnection and Connection.
11. Fill the cooling system. Refer to Cooling System Draining and Filling.
12. Inspect cooling system for leaks.
13. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

The engine cooling fan system consists of 2 electrical cooling fans and 3 fan relays. The relays are arranged in a series parallel (S/P) configuration that allows the engine control module (ECM) to operate both fans together at low or high speeds, depending on cooling requirements. The cooling fans and fan relays receive battery positive voltage from the underhood fuse block. The ground path is provided at G104.

During low speed operation, the ECM supplies the ground path for the low speed fan 1 relay through the fan 1 relay or low speed control circuit. This energizes the low speed fan relay coil, closes the relay contacts, and supplies battery positive voltage from the FAN 1 fuse through the cooling fan motor supply voltage circuit to the right cooling fan. The ground path for the right cooling fan is through the cooling fan 2 relay and the left cooling fan. The result is a series circuit with both fans running at low speed.

During high speed operation the ECM supplies the ground path for the fan 1 relay through the fan 1 relay low speed control circuit. The ECM supplies a ground path for the high speed fan 3 relay and the fan 2 relay through the fan 2 relay or high speed control circuit. This energizes the fan 2 relay coil, closes the relay contacts, and provides a ground path for the right cooling fan. At the same time, the fan 3 relay coil is energized closing the relay contacts, and provides battery positive voltage from the FAN 2 fuse on the cooling fan motor supply voltage circuit, to the left cooling fan. During high speed fan operation, both engine cooling fans have their own ground path. The result is a parallel circuit with both fans running at high speed.

Cooling System Description and Operation

Cooling System

The cooling system's function is to maintain an efficient engine operating temperature during all engine speeds and operating conditions. The cooling system is designed to remove approximately one-third of the heat produced by the burning of the air-fuel mixture. When the engine is cold, the system cools slowly or not at all. This allows the engine to warm quickly.

Cooling Cycle

Coolant is drawn from the radiator outlet and into the water pump inlet by the water pump.

Coolant is also pumped through the water pump outlet and into the engine block. In the engine block, the coolant circulates through the water jackets surrounding the cylinders where it absorbs heat.

The coolant is then forced through the cylinder head gasket openings and into the cylinder heads. In the cylinder heads, the coolant flows through the water jackets surrounding the combustion chambers and valve seats, where it absorbs additional heat.

Operation of the cooling system requires correct functioning of all cooling system components. The cooling system consists of the following components:

Coolant

The engine coolant is a solution made up of a 50-50 mixture of DEX-COOL and clean drinkable water. The coolant solution carries excess heat away from the engine to the radiator, where the heat is dissipated to the atmosphere.

Radiator

The radiator is a heat exchanger. It consists of a core and 2 tanks. The aluminium core is a downflow tube and fin design. This is a series of tubes that extend vertically down from the inlet tank to the outlet tank. Fins are placed around the outside of the tubes to increase heat transfer from the coolant to the atmosphere. The inlet and outlet tanks are moulded with a high temperature, nylon reinforced plastic. A high temperature rubber gasket seals the tank flange edge. The tanks are clamped to the core with clinch tabs. The tabs are part of the aluminium header at each end of the core.

The radiator removes heat from the coolant passing through it. The fins on the core absorb heat from the coolant passing through the tubes. As air passes between the fins, it absorbs heat and cools the coolant.

During vehicle use, the coolant heats and expands. The coolant that is displaced by this expansion flows into the coolant recovery. As the coolant circulates, air is allowed to exit. This is an advantage to the cooling system. Coolant without bubbles absorbs heat much better than coolant with bubbles.

Screw On Pressure Cap

The pressure cap is a cap that seals and pressurizes the cooling system. It contains a blow off or pressure valve and a vacuum or atmospheric valve. The pressure valve is held against its seat by a spring of predetermined strength, which protects the radiator by relieving pressure if it exceeds 15 psi.

The pressure cap allows pressure in the cooling system to build up. As the pressure builds, the boiling point of the coolant goes up as well. Therefore, the coolant can be safely run at a temperature much higher than the boiling point of the coolant at atmospheric pressure. The hotter the coolant is, the faster the heat moves from the radiator to the cooler, passing air. The pressure in the cooling system can get too high. However, when the pressure exceeds the strength of the spring, it raises the pressure valve so that the excess pressure can escape. As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum causes the vacuum valve to open, allowing coolant from the recovery bottle to be sucked back into the cooling system. This equalizes the pressure in the cooling system with atmospheric pressure, preventing the radiator from collapsing.

Coolant Recovery System

The coolant recovery system consists of a plastic coolant recovery reservoir and overflow hose. The recovery reservoir provides an air space in the cooling system that allows the coolant to expand and contract. The coolant recovery system provides a coolant fill point and a central air bleed location. It is partially filled with coolant and is connected to the radiator fill neck with the overflow tube. Coolant can flow back and forth between the radiator and the reservoir.

In effect, a cooling system with a coolant recovery reservoir is a closed system. When the pressure in the cooling system gets too high, it will open the pressure valve in the pressure cap. This allows the coolant, which has expanded due to being heated, to flow through the overflow hose and into the recovery reservoir. As the engine cools down, the temperature of the coolant drops and a vacuum is created in the cooling system. This vacuum opens the vacuum valve in the pressure cap, allowing some of the coolant in the reservoir to be siphoned back into the radiator. Under normal operating conditions, no coolant is lost. Although the coolant level in the recovery reservoir goes up and down, the radiator and cooling system are kept full.

During vehicle use, the coolant heats and expands. The increased coolant volume flows into the recovery reservoir. As the coolant circulates, any air that is present in the cooling system will accumulate at the pressure cap as this is the highest point. When the pressure cap releases it is the air which is expelled first. When the systems goes into vacuum it will suck coolant back in.

Water Pump

The water pump is a centrifugal vane impeller type pump. The pump consists of a housing with coolant inlet and outlet passages and an impeller. The impeller is a flat plate mounted on the pump shaft with a series of flat or curved blades or vanes. When the impeller rotates, the coolant between the vanes is thrown outward by centrifugal force. The impeller shaft is supported by one or more sealed bearings. These sealed bearings never need to be lubricated. With a sealed bearing, grease cannot leak out, and dirt and water cannot get in.

The purpose of the water pump is to circulate coolant throughout the cooling system. The water pump is driven by the crankshaft via the drive belt.

Thermostat

The thermostat is a coolant flow control component. It's purpose is to regulate the operating temperature of the engine. It utilizes a temperature sensitive wax-pellet element. The element connects to a valve through a piston. When the element is heated, it expands and exerts pressure against a rubber diaphragm. This pressure forces the valve to open. As the element is cooled, it contracts. This contraction allows a spring to push the valve closed.

When the coolant temperature is below 86°C (186°F) for V8 and 82°C (180°F) for V6 the thermostat valve remains closed. This prevents circulation of the coolant to the radiator and allows the engine to warm up quickly. After the coolant temperature reaches 86°C (186°F) or 82°C (180°F) the thermostat valve will begin to open. The coolant is then allowed to circulate through the radiator where the engine heat is dissipated to the atmosphere. The thermostat also provides a restriction in the cooling system, even after it has opened. This restriction creates a pressure difference which prevents cavitation at the water pump and forces coolant to circulate through the engine block.

Transmission Oil Cooler

The transmission oil cooler is a heat exchanger. It is located inside the bottom of the radiator. The transmission fluid temperature is regulated by the temperature of the engine coolant that surrounds the oil cooler as the transmission fluid passes down through the cooler.

The transmission oil pump pumps the fluid through the transmission oil cooler feed line to the oil cooler. The fluid enters the oil cooler on the RHS, and then flows left through the cooler while the engine coolant absorbs heat from the fluid. The fluid is then pumped through the transmission oil cooler return line to the transmission.

Cooling Fan Operation

The cooling fans operate in two stages for V8 and three stages for V6; in both low and high stages both fans run. In stage 1 (low) the two fan motors are connected in series so both fans run at low speed. In stage 2 (high) each fan motor is connected to battery voltage so both fans run at high speed, (cooling fan operation is controlled by the engine control module (ECM) based on inputs from the following: V6 has a mid speed stage which has one fan at high speed and the other fan is off).

- The A/C request signal
- The A/C refrigerant pressure sensor
- The engine coolant temperature (ECT) sensor

Low Speed - Both Fans Operate at Low Speed

When the conditions for low speed operation are met the ECM provides a ground to the coil of engine cooling fan relay 1, causing it to operate (turn ON). The fan current path is then from the battery via the left radiator fan fuse, through the left fan motor, cooling fan relay 2, the right fan motor and cooling fan relay 1 to ground.

The conditions for low speed operation are:

- There is an A/C request and:
- A/C refrigerant pressure is greater than 1517 kPa (220 psi).
- ECT is greater than 109°C (228°F) for V6 or 104°C (219°F) V8.

- ECT is greater than 121°C (250°F) for V6 or 113°C (235°F) for V8 when the engine is switched off (in this case stage 1 will operate for approximately four minutes - this is referred to as low fan run-on).

Low speed operation will cease when:

- There is no A/C request and the ECT is less than 105°C (221°F) for V6 or 100°C (212°F) for V8.
- There is an A/C request and the A/C pressure is less than 1000 kPa (145 psi) and the ECT is less than 105°C (220°F) for V6 or 100°C (212°F) for V8.

Mid Speed - Left Fan Operates at High Speed (V6 Only)

When the conditions for mid speed operation are met the left fan gets battery voltage and operates at high speed. The right fan does not operate.

The conditions for Mid Speed operation are:

- The A/C has been requested and the A/C pressuer is greater than 1700 kPa (247psi).
- The ECT is greater than 112°C (234°F) for V6 .

  Mid speed operation will cease and revert to low speed operation when:
- ECT is less than 108°C (226°F) and there is no A/C request.
- There is an A/C request and the A/C pressure is less than 1200 kPa (174psi) and the ect is less than 108°C (226°F).

High Speed - Both Fans Operate at High Speed

When the conditions for high speed operation are met the ECM provides - in addition to that already provided for the coil of engine cooling fan relay 1 - a ground to the coils of engine cooling fan relays 2 and 3, causing them to operate (turn ON). For the left fan, the current path is then from the battery via the left radiator fan fuse, through the left fan motor and engine cooling fan relay 2 to ground. For the right fan, the current path is from the battery via the right radiator fan fuse, through engine cooling fan relay 3, through the right fan motor and engine cooling fan relay 1 to ground. The conditions for high speed operation are:

- The A/C has been requested and the A/C refrigerant pressure is greater than 2000 kPa (290 psi).
- The ECT is greater than 117.5°C (243°F) for V6 or 109°C (228°F) for V8.
- An ECT sensor fault is detected and a DTC is set.
- There is a body control module (BCM) message response fault, which will cause a powertrain interface module (PIM) DTC to set.

If low speed operation is off when the conditions for high speed operation are met, high speed operation will be initiated five seconds after initiation of low speed operation.

High speed operation will cease and revert to low or medium speed operation when:

- The ECT is less than 112°C (235°F) for V6 or 103°C (217°F) for V8 and there is no A/C request.

- There is an A/C request and the A/C refrigerant pressure is less than 1400 kPa (203 psi) and ect is less than 112°C (235°F) for V6 or 103°C (217°F) for V8.

Diagnostic Starting Point - Engine Electrical

Begin the system diagnosis with the Diagnostic System Check - Vehicle in Vehicle DTC Information. The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B1516 (Current)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08: Battery Current Sensor Signal Invalid

DTC B1516 66: Battery Current Sensor Wrong Mounting Position

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5-Volt Reference	B1516 08	B1516 08	--	--
Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	--	B1516 08	--	--

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the body control module (BCM). It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Conditions for Running the DTC

- The ignition is ON.
- The engine is running.

Conditions for Setting the DTC

B1516 08

The battery current signal is less than 4 percent or greater than 96 percent duty cycle for 2 minutes.

B1516 66

The battery current polarity is positive for 2 minutes.

Action Taken When the DTC Sets

The regulated voltage control (RVC) is disabled.

Conditions for Clearing the DTC

The DTC passes when the battery current returns to the normal range for 15 seconds.

Diagnostic Aids

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

Scan Tool Reference

for scan tool information

Circuit / System Testing

B1516 08

1. Ignition OFF, disconnect the harness connector at the battery current sensor.
2. Ignition OFF and scan tool disconnected, open and close the driver door, and wait 1 minute. Test for less than 5 Ω between the low reference circuit terminal B and ground.
   - If greater than specified range , test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the BCM.

3. Ignition ON, test for 4.8-5.2 V between the 5-volt reference circuit terminal A and ground.

   If less than the specified range , test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests, normal replace the BCM.

   If greater than the specified range , test the 5-volt reference circuit for a short to voltage. If the circuit tests, normal replace the BCM.
4. Ignition ON, test for 4.8-5.2 V between the signal circuit terminal C and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, replace the battery current sensor.

B1516 66

1. Verify that the battery current sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the battery.

   If the battery current sensor is not installed correctly, remove and reinstall the sensor properly.
2. Replace the battery current sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Battery Negative Cable Replacement for battery current sensor replacement.
- Control Module References for BCM replacement, setup, and programming

DTC B1516 (Update)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08: Battery Current Sensor Performance Signal Invalid

DTC B1516 66: Battery Current Sensor Performance Wrong Mounting Position

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	--	B1516 08	--	--

Typical Scan Tool Data

Battery Current - BCM

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON, engine OFF. Headlamps, HVAC, and all accessories Off. *Parameter Normal Range:* -3 amps to -25 amps			
5-Volt Reference	-59.9 amps	-59.9 amps	-6.2 amps
Signal	-59.9 amps	59.9 amps	59.9 amps
Low Reference	--	59.9 amps	--

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The body control module (BCM) supplies a 5 volt reference voltage and a ground circuit to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery and supplies a pulse width modulation (PWM) signal to the BCM. The BCM monitors the battery current signal and sets DTC B1516 08 if the signal is outside the normal range of 4-96 percent duty cycle. The BCM also monitors the current polarity, and sets DTC B1516 66 if reverse polarity is detected.

Conditions for Running the DTC

B1516 08

- The BCM is awake.
- The engine is running.

B1516 66

- The BCM is awake.
- The engine is OFF.

Conditions for Setting the DTC

B1516 08

The BCM detects the battery current sensor signal is less than 4 percent or greater than 96 percent duty cycle for 2 minutes.

B1516 66

The BCM detects the battery current sensor polarity is positive for 2 minutes.

Action Taken When the DTC Sets

- The regulated voltage control (RVC) is disabled.
- The "SERVICE VEHICLE SOON" warning message will be displayed on the driver information centre.

Conditions for Clearing the DTC

The DTC will clear when the battery current sensor signal returns to the normal for greater than 15 seconds.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, headlamps, HVAC and all accessories OFF, observe the scan tool BCM Battery Current parameter. The reading should be between -3 amps and -25 amps. Whilst observing the scan tool turn the headlamps and accessories ON and OFF, the scan tool parameter should change when headlamps and accessories are operated.

Circuit/System Testing

B1516 08

1. Ignition OFF, disconnect the harness connector at the battery current sensor.
2. Ignition OFF for 90 seconds, test for less than 5 ohms between the low reference circuit terminal B and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal A and ground.

   If less than the specified range , test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, then replace the BCM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, then replace the BCM.
4. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal C and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, replace the battery current sensor.

B1516 66

1. Verify that the battery current sensor is installed securely around the positive battery cable, with the tape tab pointing toward the positive terminal on the battery.

   If the battery current sensor is not installed correctly, remove and reinstall the sensor properly.
2. If the battery current sensor is installed correctly, replace the battery current sensor.

DTC Descriptors

DTC B1517 03: Battery Voltage Below Threshold

DTC B1517 07: Battery Voltage Above Threshold

DTC B1517 5A: Battery Voltage Plausibility Failure

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B1517 03, B1517 5A	B1517 03, B1517 5A	--	--
B+ High resolution	B1517 03, B1517 5A	B1517 03, B1517 5A	--	--
Ground	--	B1517 03, B1517 5A	--	--

Circuit/System Description

The body control module (BCM) has designated circuits for monitoring vehicle system voltage. The BCM monitors the system voltage to ensure that the voltage stays within the proper range. Damage to components, and incorrect data may occur when the system voltage is out of range. The BCM monitors the system voltage over an extended length of time. If the BCM detects the system voltage is outside an expected range for the calibrated length of time.

Conditions for Running the DTC

- The BCM has power and ground.
- The ignition is not in the START position.

Conditions for Setting the DTC

B1517 03

- The battery voltage is less than 11 V.

- The engine speed is greater than 1,100 RPM.
- The above conditions are met for 15 seconds.

B1517 07

- The battery voltage is greater than 16 V.
- The engine speed is greater than 1,100 RPM.
- The above conditions are met for 15 seconds.

B1517 5A

The battery voltage differs by 2 V on the BCM battery sense circuits for 10 seconds.

Action Taken When the DTC Sets

- The instrument panel cluster (IPC) illuminates the charge indicator.
- The driver information center (DIC) displays the SERVICE BATTERY CHARGING SYSTEM warning message.

Conditions for Clearing the DTC

- The DTC will clear current status when fault is no longer present.
- The history DTC will clear after 50 consecutive ignition cycles have occurred without a malfunction.

Diagnostic Aids

- A high or low voltage DTC set in multiple modules indicates a concern in the charging system. Refer to.
- This DTC may be set by overcharging with a battery charger, or jump by starting.
- Inspect the ground connection G409 and ensure that it is clean and tight.

Circuit/System Verification

1. Engine running, accessories OFF, measure and record the voltage at the battery voltage at the battery terminals. The voltage should be between 12.6 and 15.0 V

   If not within the specified range, refer to Charging System Test
2. Observe the scan tool BCM Battery Voltage parameter. The reading should be between 12.6 and 15.0 V

Circuit/System Testing

1. Ignition OFF, disconnect the harness connectors at the BCM.
2. Ignition OFF, test for less than 3 Ω between the ground circuit terminal 9 X4 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition On, verify that a test lamp illuminates between the B+ circuit and terminal 10X4 and ground.

   If the test lamp does not illuminate, test the B+ circuits for a short to ground or an open/high resistance.
4. If all circuits test normal, replace the BCM.

Repair Instructions

DTC B1527

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527: High Parasitic Load Detected

Circuit/System Description

The body control module (BCM) monitors the state of charge (SOC) of the electrical system. If the BCM senses that the SOC at ignition On is 30 percent lower than what it was when the engine was running.

Conditions for Running the DTC

The ignition must be in Accessory or Run mode for this code to set.

Conditions for Setting the DTC

The SOC at ignition On is 30 percent lower than when the engine was running and battery drain is more than 2 amps.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run SOC is greater than or equal to 80 percent.

DTC C0899

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC C0899: Device Voltage Low

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C0899	C0899	--	--
Ground	--	C0899	--	--

Circuit/System Description

The electronic brake control module (EBCM) monitors the ignition voltage level available for system operation. A low voltage condition prevents the system from operating properly.

Conditions for Running the DTC

ignition is ON.

Conditions for Setting the DTC

This DTC will set if the B+ voltage to EBCM is less than 9 V for 100 msec.

Action Taken When the DTC Sets

- The traction control system (TCS) and vehicle stability enhancement system (VSES) are disabled for the duration of the ignition cycle.
- The multi function display (MFD) displays the ABS Fault message.
- The brake warning indicator illuminates.
- The driver information center (DIC) displays the STABILITY CONTROL ASSISTANCE/STABILITY CONTROL OFF MESSAGE.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- A low voltage DTC in multiple modules indicates a concern in the charging system
- Inspect the ground connection G102 to ensure that it is clean and tight.

Circuit / System Verification

1. Engine running measure and record the voltage at the battery terminals. Verify that the battery voltage is 12.6-15.5 V.

   If not within the specified range, refer to Charging System Test

2. Observe the scan tool EBCM Battery Voltage Signal parameter. The reading should be between 12.6 and 15.5 V.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the EBCM.
2. Ignition OFF and scan tool disconnected, open and close the driver door, and wait 1 minute. Test for less than 5 Ω between the ground circuit terminals listed below and ground:

- Terminal 1
- Terminal 4

  If greater than the specified range, test the ground circuit for an open/high resistance.

3. Verify that a test lamp illuminates between the B+ circuit terminals listed below and ground:
   - Terminal 2
   - Terminal 3

   If the test lamp does not illuminate, test the B+ circuits for a short to ground or an open/high resistance.
4. If all circuits test normal, replace the EBCM.

DTC C0900

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC C0900 00: Device Voltage High

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C0899 00	C0899 00	--	--
Ground	--	C0899 00	--	--

Circuit/System Description

The EBCM monitors the ignition voltage. If the voltage level is too high, damage may result in the system. When a high voltage condition is detected the EBCM turns OFF the system relay which removes battery voltage from the solenoid valves and pump motor.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The system voltage is greater than 16 V for 100 msec.

Action Taken When the DTC Sets

- Traction Control System (TCS) and Vehicle Stability Enhancement System (VSES) disabled for the duration of the ignition cycle.
- ABS disabled if ignition voltage exceeds 19.5 V.
- The TCS indicator turns ON.
- The Antilock Brake System (ABS) indicator turns ON if voltage exceeds 19.5 V.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- A high voltage value in multiple modules indicates a concern in the charging system.
- DTC C0900 could be set by overcharging with a battery charger or jump starting.
- Inspect the ground connection G102 to ensure that it is clean and tight.

DTC Descriptor

DTC P0560: System Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
IGN I	P0560	P0560	--	--
Ground	--	P0560	--	--

Circuit/System Description

The engine control module (ECM) monitors the system voltage to ensure that the voltage stays within the proper range. Damage to components and incorrect data may occur when the voltage is out of range.

Conditions for Running the DTC

- The vehicle speed is below 40 km/h (25 mph).
- The system voltage is below 11 V or above 16 V.
- Engine speed is above 1,500 RPM.

Conditions for Setting the DTC

The ECM detects a system voltage out of range for 2 seconds.

Action Taken When the DTC Sets

DTC P0560 is a C type DTC.

Conditions for Clearing the DTC

DTC P0560 is a C type DTC.

Diagnostic Aids

- A high or low voltage DTC set in multiple modules indicates a concern in the charging system.
- A possible cause of this DTC could be overcharging with a battery charger or jump starting.
- A high or low voltage value in multiple modules indicates a concern in the charging system.
- Inspect the ECM ground connection, to verify that it is clean tight.

The engine control module (ECM) monitors the system voltage to ensure that the voltage stays within the proper range. Damage to components and incorrect data may occur when the voltage is out of range.

Conditions for Running the DTC

- The vehicle speed is above 8 km/h (5 mph).
- The system voltage is between 9.5-18 V.

Conditions for Setting the DTC

The ECM detects a system voltage above 16 V.

Action Taken when the DTC Sets

DTC P0563 is a type C Store Only DTC.

Conditions for Clearing the MIL/DTC

DTC P0563 is a type C Store Only DTC.

Diagnostic Aids

A possible cause of this DTC may be overcharging with a battery charger or jump starting.

Circuit/System Verification

Ignition ON, engine OFF, observe the Ignition voltage signal parameter in the ECM data list. The Ignition voltage signal parameter should read less than 16 V.

Circuit/System Testing

1. Measure the battery voltage and compare it with the Ignition circuit signal parameter in the ECM data list. Verify that battery and Ignition voltage signal readings do not differ more than 1 V.
   If greater than 1 V test the ignition circuit of the ECM for short to voltage or an open/high resistance, if the circuit tests normal replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0615

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0615: Starter Relay Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0615	P0615	P0615	--
Ground	--	P0615	--	--

Circuit/System Description

When the ignition switch is placed in the START position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the START position. The BCM then sends a message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the clutch pedal is depressed or the transmission is in Park/Neutral. If it is, the ECM then supplies 12 V to the control circuit of the STRTR relay. When this occurs, battery voltage is supplied through the switch of the STRTR relay to the starter solenoid.

Conditions for Running the DTC

- The Ignition is in the START position.
- The system voltage is between 9.5-18 V.

Conditions for Setting the DTC

The ECM detects improper voltage on the control circuit of the STRTR relay.

Action Taken When the DTC Sets

DTC P0615 is a C type DTC.

Conditions for Clearing the DTC

DTC P0615 is a C type DTC.

Circuit/System Verification

Ignition ON, theft deterrent or automatic transmission DTCs are set that would cause the ECM not to enable engine starting.

Circuit/System Testing

1. Ignition OFF, disconnect the STRTR relay.
2. Ignition OFF and scan tool disconnected, open and close the driver door, and wait 1 minute. Test for less than 5 Ω between the relay ground circuit terminal 85 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition OFF, connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
4. With the transmission range selector in park or neutral, cycle the ignition between the OFF and CRANK position. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the control circuit for short to voltage. If the circuit tests normal, replace the ECM.

   If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

5. If all circuits tests normal, replace the STRTR relay.

DTC Descriptor

DTC P0621: Generator L-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	P0622	P0622	--	--
Generator Turn ON Signal	P0621	P0621	P0621	--
Generator Field Duty Cycle Signal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator turn ON signal circuit to control the load of the generator on the engine. A high side driver in the ECM applies a voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON signal circuit. The ECM should detect low voltage on generator turn on signal circuit when the ignition is ON and the engine is OFF, or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the generator turn on signal circuit. The ECM performs the Ignition ON and RUN tests to determine the status of the generator turn on signal circuit.

Conditions for Running the DTC

- No generator, crankshaft position (CKP) sensors, or camshaft position (CMP) sensor DTCs are set.
- The ignition ON, engine OFF for ignition on test.
- The engine is running for the run test.

Conditions for Setting the DTC

- During the ignition on test, the ECM detects high voltage on the generator turn on signal circuit for 5 seconds.

- During the run test, the ECM detects low voltage on the generator turn on signal circuit for 15 seconds.

Action Taken When the DTC Sets

DTC P0621 is a C type DTC.

Conditions for Clearing the DTC

DTC P0621 is a C type DTC.

DTC Descriptor

DTC P0622: Generator F-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	P0622	P0622	--	--
Turn ON Signal	P0621	P0621	P0621	--
Field Duty Cycle Signal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator field duty cycle signal circuit, or F-terminal circuit, to monitor the duty cycle of the generator. The generator field duty cycle signal circuit connects to high side of the field windings in the generator. A pulse width modulated (PWM) high side driver in the voltage regulator turns the field windings ON and OFF. The ECM uses the PWM signal input to determine the generator load on the engine. This allows the ECM to adjust the idle speed to compensate for high electrical loads. The ECM monitors the status of the generator field duty cycle signal circuit. When the ignition is ON and the engine is OFF, the ECM should detect a duty cycle near 0 percent. When the engine is running, the duty cycle should be between 5-99 percent.

Conditions for Running the DTC

- No generator, crankshaft position (CKP) sensor, or camshaft (CMP) sensor DTCs are set.
- Ignition ON engine OFF, for the Ignition ON test.
- Engine running, engine speed less than 3,000 RPM for the RUN test.

Conditions for Setting the DTC

- DTC P0621 is not set.
- Ignition ON engine OFF, the ECM detects a PWM signal that is greater than 65 percent for 5 seconds.

- Engine running, the ECM detects a PWM signal that is less than 5 percent for 15 seconds.

Action Taken When the DTC Sets

DTC P0622 is a C type DTC.

Conditions for Clearing the DTC

DTC P0622 is a C type DTC.

Circuit/System Verification

Engine running, observe the scan tool GEN-F Terminal Signal parameter. The GEN-F Terminal Signal parameter should display between 5-95 percent.

Circuit/System Testing

1. Verify that a test lamp illuminates between the B+ circuit terminal 1 X2 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
2. Ignition OFF, disconnect the X1 harness connector at the generator.
3. Ignition ON, verify the scan tool ECM GEN-F Terminal Signal parameter displays less than 5 percent.

   If greater than the specified range, test the signal circuit terminal 2 for a short to voltage. If the circuit tests normal, replace the ECM.
4. Install a 3A fused jumper wire between B+ and the signal circuit.
5. Verify the scan tool ECM GEN-F Terminal Signal parameter displays greater than 95 percent.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal replace the generator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Generator Replacement

DTC P0625 or P0626

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0625: Generator F Terminal Low Voltage

DTC P0626: Generator F Terminal High Voltage

Circuit/System Description

The engine control module (ECM) uses the alternator field duty cycle signal circuit to monitor the duty cycle of the alternator. The alternator field duty cycle signal circuit connects to high side of the field windings in the alternator. A pulse width modulated (PWM) high side driver in the voltage regulator turns the field windings ON and OFF. The ECM uses the PWM signal input to determine the alternator load on the engine. This allows the ECM to adjust the idle speed to compensate for high electrical loads. The ECM monitors the status of the alternator field duty cycle signal circuit. When the key is in the RUN position and the engine is OFF, the ECM should detect a duty cycle near 0 percent. When the engine is running, the duty cycle should be between 5-95 percent.

Conditions for Running the DTC

- The vehicle speed is above 8 km/h (5 mph).
- The system voltage is between 9.5-18 volts.

Conditions for Setting the DTC

With the engine running, the ECM detects a PWM signal less than 5 percent for at least 15 seconds.

Action Taken when the DTC Sets

DTC's P0625 and P0626 are type C Store Only DTCs

Conditions for Clearing the MIL/DTC

DTC's P0625 and P0626 are type C Store Only DTCs

DTC P1668, P2500, or P2501

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P1668 : Generator L-Terminal Control Circuit

DTC P2500 : Generator L-Terminal Circuit Low Voltage

DTC P2501 : Generator L-Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Alternator L-Terminal Circuit	P2500	P1668	P2501	P1668

Circuit/System Description

The engine control module (ECM) uses the alternator turn ON signal circuit to control the load of the alternator on the engine. A high side driver in the ECM applies a voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the alternator turn ON signal circuit. The ECM should detect low voltage on alternator turn on signal circuit when the ignition is ON and the engine is OFF or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the alternator turn on signal circuit. The ECM performs key ON and RUN tests to determine the status of the alternator turn on signal circuit.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

With the engine running, the ECM detects low/high compared to a predetermined voltage on the alternator turn on signal circuit for at least 15 seconds.

Action Taken when the DTC Sets

DTCs P1668, P2500 or P2501 are type C store only DTCs.

Conditions for Clearing the MIL/DTC

DTCs P1668, P2500 or P2501 are type C store only DTCs.

Battery Charging

Special Tools

J 42000 Battery Tester

- For best results, use an automatic taper-rate battery charger with a voltage capability of 16 volts.
- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the J 42000 before charging.

Battery State of Charge

Note: Using voltage to determine the batteries state of charge (SOC) is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery SOC will only be an estimate.

The maintenance-free batteries SOC is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the batteries SOC:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
   - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
   - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 hours.

   Note: The table is accurate to 10 percent only after the battery has been at rest for 12 hours.

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the SOC according to the estimated battery temperature:

Battery Voltage	% Charge at 0°C (32°F)	% Charge at 25°C (75°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%

12.2 V	65%	45%
12.0 V	40%	20%

Use the SOC information as follows:

- A battery with a SOC that is below 65 percent must always be recharged before returning it to service or continuing storage.
- A battery with a SOC that is 65 percent or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90 percent, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity--The higher the charger amperage, the less time it will take to charge the battery.
- The SOC of the battery--A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 volts, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery--The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

Caution: Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may damage the ECM/PCM or other electronic components.

Caution: Refer to Fastener Caution in the Preface section.

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

Tighten
Tighten the battery side terminal adapters to 15 N·m (11 lb ft).

Use the following procedure to charge the battery:

1. Turn OFF the charger.
2. Ensure that all of the battery terminal connections are clean and tight.

3. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

   Caution: Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.

4. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
5. Turn ON the charger and set to the highest setting for normal charging.
6. Inspect the battery every half hour after starting the battery charger.
   - Charge the battery until the taper-rate charger indicates that the battery is fully charged.
   - Estimate the battery temperature by feeling the side of the battery. If it feels hot to the touch or its temperature is over 45°C (125°F), discontinue charging and allow the battery to cool before resuming charging.
7. After charging, test the battery. Refer to Battery Inspection/Test.

Battery Common Causes of Malfunction

A battery is not designed to last forever. With proper care, however, the battery will provide years of good service. If the battery tests good but still fails to perform well, the following are some of the more common causes:

- A vehicle accessory was left on overnight.
- The driving speeds have been slow with frequent stops, stop-and-go driving, with many electrical accessories in use, particularly air conditioning, headlights, wipers, heated rear window, cellular telephone, etc.
- The electrical load has exceeded the generator output, particularly with the addition of aftermarket equipment.
- Existing conditions in the charging system, including the following possibilities:
  - A slipping belt
  - A bad generator
- The battery has not been properly maintained, including a loose battery hold down or missing battery insulator if used.
- There are mechanical conditions in the electrical system, such as a short or a pinched wire, attributing to power failure. Refer to General Electrical Diagnosis.

Electrolyte Freezing

The freezing point of electrolyte depends on its specific gravity. A fully charged battery will not freeze until the ambient temperature gets below -54°C (-65°F). However, a battery with a low state of charge may freeze at temperatures as high as -7°C (20°F). Since freezing may ruin a battery, the battery should be protected against freezing by keeping it properly charged above 80 percent state of charge, the freezing point of the battery will be somewhere below -32°C (-25°F).

Battery Protection During Vehicle Storage

Certain devices on the vehicle maintain a small continuous current drain, parasitic load, on the battery. A battery that is not used for an extended period of time will discharge. Eventually permanent damage will result. Discharged batteries will also freeze in cold weather. Refer to Battery Inspection/Test.

In order to maintain the battery state of charge while storing the vehicle for more than 30 days:

Warning: Refer to Battery Disconnect Warning in the Preface section.

Disconnect the battery ground cable to protect the battery from discharge by parasitic current drains.

When the battery cannot be disconnected:

1. Maintain a high state of charge.
2. Establish a regular schedule for recharging the battery every 20-45 days.

A battery that has remained in a discharged state for a long period of time is difficult to recharge or may be permanently damaged.

Battery Electrical Drain / Parasitic Load Test

Special Tools

J 38758 Parasitic Draw Test Switch

Diagnostic Aids

- Be sure to rule out any possible obvious influences, such as customer error or aftermarket equipment.
- Customer driving habits, such as regular short trips. This does not allow enough time to properly charge the battery. Refer to Battery Description and Operation.
- Verify that the battery and charging system are in proper working order. Refer to Battery Charging and Charging System Test.
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStar®, and regulated voltage control (RVC), if equipped, are designed to wake-up, perform a task, and go back asleep at regular intervals. Refer to Body Control System Description and Operation for the system or modules description and operation.
- Remote keyless entry (RKE) will wake up due to an outside input. Refer to Keyless Entry System Description and Operation for the system description and operation.

Note: The battery specification listed below is a generic specification. Refer to Battery Usage when testing the battery.

- The battery run down time will vary depending on cold cranking amperage (CCA) and reserve capacity (RC). If the CCA and RC are higher, then the battery run down time would be longer. If the CCA and RC are lower, then the battery run down time would be shorter. The graph below indicates roughly how many days a 690 CCA battery with at 110 min. RC (60.5 AH) starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery rating and temperature will affect the results.

Current Drain	Days
25 mA	30.5
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Load Test

Warning: Refer to Battery Disconnect Warning in the Preface section.

Caution: Do not turn the parasitic draw test switch to the OFF position with the engine running. Damage will occur to the vehicle's electrical system.

Caution: The test switch must be in the ON position when removing the fuses in order to maintain continuity in the electrical system. This avoids damaging the digital multimeter due to accidental overloading, such as a door being opened to change a fuse.

Note: The test switch on the J 38758 is marked ON and OFF. When the test switch is in the ON position, the circuit is closed and electrical current will pass through the switch. When the test switch is in the OFF position, the circuit is open and electrical current will not pass through the switch.

1. Disconnect the battery negative cable from the battery negative terminal. Refer to Battery Negative Cable Disconnection and Connection.
2. Install the male end of the J 38758 to the battery ground terminal.
3. Turn the J 38758 test switch to the OFF position.
4. Install the battery negative cable to the female end of the J 38758 .
5. Turn the J 38758 test switch to the ON position.
6. Road test the vehicle and activate ALL of the accessories, including the radio and air conditioning. This may take up to 30 minutes.
7. Park the vehicle. Turn the ignition switch to the OFF position and remove the ignition switch key.
8. Connect a 10 A fused jumper wire to the test switch tool terminals.
9. Turn the J 38758 test switch to the OFF position. The current now flows through the jumper wire.
10. Wait 1 minute. If the fuse blows, install an inductive ammeter to locate the current draw.
11. Turn the test switch to ON and then remove the fused jumper wire.
12. Set a digital multimeter to the 10 A scale.
13. Connect the digital multimeter to the test switch tool terminals.
14. Turn the J 38758 test switch to the OFF position. The current flows now through the digital multimeter.
15. Wait 1 minute. Check and record the current reading.
    - 15.1. When there is a current reading of 2 A or less, turn the J 38758 test switch to the ON position. The electrical current will now pass through the switch.
    - 15.2. Then switch the digital multimeter down to the 2 A scale for a more accurate reading when the J 38758 test switch is turned OFF.
16. Turn the J 38758 test switch to the OFF position. Wait up to 45 minutes for most vehicles.
17. Check and record the current reading.
18. Note the battery reserve capacity, amp hour rating. Refer to Battery Usage.
    - 18.1. Divide the reserve capacity by 4, amp hour rating by 2.4.
    - 18.2. Compare this to the multimeter milliampere reading taken in the previous step. The parasitic current drain should not exceed this number. Example: If a battery has a reserve capacity of 100 minutes, (60 A/H) the current drain should not exceed 25 mA.
19. If excessive current drain is not found at this time and there are no other apparent causes, complete the following:
    - 19.1. Using the MIN/MAX function of the digital multimeter, monitor the parasitic drain overnight or during the day. This will determine if something has been activated during that time frame.

Caution: The test switch must be in the ON position when removing the fuses in order to maintain continuity in the electrical system. This avoids damaging the digital multimeter due to accidental overloading, such as a door being opened to change a fuse.

Note: Removing fuses, relays, and connectors to determine the failure area may wake up modules. You must wait for these modules to go to sleep or use the sleep function on the scan tool.

19.2. When the vehicle has an unacceptable amount of parasitic current drain, remove each fuse one at a time until the current drain falls to an acceptable level. This will indicate which circuit is causing the drain. Refer to Power Distribution Schematics to diagnose exactly which part of the suspect circuit is causing the parasitic drain. In some cases a non-fused circuit or component, such as a relay, is the cause of excessive parasitic current drain.

19.3. Repeat the parasitic current drain test procedure after any repair has been completed to make sure that the parasitic current drain is at an acceptable level.

19.4. When the cause of the excessive current drain has been located and repaired, remove the J 38758 .

20. Connect the battery negative cable to the battery negative terminal.

Battery Inspection/Test

Special Tools

J 42000 Battery Tester

Diagnostic Aids

Warning: Refer to Battery Disconnect Warning in the Preface section.

Note:

- The battery test using the J 42000 Battery Tester requires correct connections to the battery terminals. A failure to obtain the correct connections during the test may result in a failed test on a good battery.
- Use the Out of Vehicle test for each battery when testing a vehicle with dual batteries.

Follow these instructions in order to avoid an incorrect diagnosis because of connections:

- If testing the vehicle with the battery cables still connected, wiggle the J 42000 clips on the terminal bolt. This may cut through any coating or through any oxidation that may be present on the bolt.

  Even new bolts contain a protective coating that may insulate or cause a resistance in the test circuit.
- If correct connections to the battery terminal bolts in the vehicle are in doubt, perform the following steps:
  1. Disconnect the negative battery cable.
  2. Disconnect the positive battery cable.
  3. Install the test adapters on the terminals.
  4. Follow the instructions for testing a removed battery.
- If the tester displays a REPLACE BATTERY or BAD CELL-REPLACE result for a battery tested in the vehicle with the battery cables connected, perform the following steps:
  1. Disconnect the negative battery cable.
  2. Disconnect the positive battery cable.
  3. Install the tester adapters.

     Note: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the second, or Out of Vehicle test.
  4. Follow the instructions for testing a removed battery.
  5. Replace the battery only if the second test shows a REPLACE BATTERY or BAD CELL-REPLACE result.

Use the test code from the second test for any warranty purposes.

- Use the correct terminal adapters.

  Do not use any common bolts or a combination of bolts, of nuts, and of washers as adapters when testing the battery.

  Use the test adapters that are provided with the J 42000 or GM P/N 12303040 terminal adapters. If the adapters that are provided with the J 42000 require replacement, use GM P/N 12303040. Any other adapter may not contact the correct areas of the battery terminal, causing a resistance that may result in an invalid battery test result.

Circuit / System Testing

Warning: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

1. Inspect the battery for a cracked, broken, or damaged case, which may be indicated by battery acid leakage.

   If there is any apparent damage, replace the battery.
2. Verify the cold cranking amperage (CCA), and reserve capacity (RC) and/or amp hour (AH) rating of the battery to the original battery or original equipment (OE) specification. Refer to Battery Usage.

   If the battery does not meet or exceed specifications, replace the battery.
3. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in Fastener Tightening Specifications.

   If the battery cable(s) need to be cleaned, clean as required and tighten as specified.

   If the battery cable(s) are damaged, replace then tighten as specified.
4. Install the J 42000 and follow directions supplied by the tester.

   If the tester calls for charging the battery, refer to Battery Charging.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Battery Positive Cable Replacement
- Battery Negative Cable Replacement
- Battery Replacement

Charge Indicator Always On

Electrical Information Reference

- Testing for Intermittent Conditions and Poor Connections .
- Wiring Repairs .
- Battery Inspection/Test .
- Battery Electrical Drain/Parasitic Load Test .
- Battery Common Causes of Malfunction .
- Charging System Test .

The driver information center (DIC) may display a "Charging System Failure" message. This message being displayed is the result of a message being sent by the engine control module (ECM), instrument panel module (IPM), dash integration module (DIM) or the instrument panel cluster (IPC) to the DIC. Each module has a different criteria for requesting the message to be displayed.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Turn off all accessories.
2. With a scan tool, observe the Battery Voltage parameter in the IPM or DIM data list, ECM data list and the IPC) data list.
3. The voltage should be between 11.9 volts and 15.9 volts. If not within this range carry out charging system test.
4. The voltage should be within 1 volt of each other. If not within 1 volt carry out circuit testing.
5. If no fault in circuit replace the affected module.

Repair Instructions

Engine Control Module Replacement .

Charge Indicator Inoperative

Electrical Information Reference

- Diagnostic System Check - Vehicle.
- Circuit Testing.
- Testing for Intermittent Conditions and Poor Connections.

The alternator warning indicator is only illuminated for 6 seconds after the ignition is switched to the ON position with the engine OFF.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Carry out the Diagnostic System Check.
2. Ignition on alternator warning light should illuminate for 6 second.

   If the alternator warning does not illuminate, connect the scan tool and command the alternator warning light ON.

   If the light does not illuminate replace instrument panel cluster.

Repair Instructions

Instrument Cluster Replacement.

Charging System Test

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Reference Information

Description and Operation

Charging System Description and Operation

Electrical Information Reference

Testing for Intermittent Conditions and Poor Connections

Circuit/System Verification

Engine ON, observe the charge indicator on the instrument panel cluster (IPC) or message in the driver information center (DIC). The charge indicator on the IPC should be turned OFF and the DIC should not display charging system message.

If the charge indicator is not on the IPC and a charging system message is not displayed on the DIC, refer to Testing for Intermittent Conditions and Poor Connections.

If the charge indicator is on the IPC or a charging system message is displayed on the DIC, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition ON, verify that no generator or battery current sensor DTCs are set that would cause a charging system concern.
   If DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition OFF, measure the voltage across the battery terminals. The voltage should read 12.0 V or greater at room temperature.
   If not within specified value, refer to Battery Inspection/Test.
3. Connect a carbon pile tester to the battery.
4. Start the engine and increase the engine speed to 2,500 RPM. Observe the voltage reading on the tester. The voltage should read between 12.6-15.0 V.
   If not within specified range, replace the generator.
5. Adjust the carbon pile tester to the specified load test output value, refer to Generator Usage.
   If not within specified value, replace the generator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Generator Replacement

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Diagnostic Information and Procedures | **Document ID: 2194772**

Engine Cranks Slowly

Inspect the following items:

- Battery--Perform the Battery Inspection/Test. Refer to Battery Inspection/Test.
- Wiring--Inspect the wiring for damage. Inspect all connections to the starter motor, the solenoid, the battery, and all ground connections. Refer to:
  - Circuit Testing
  - Wiring Repairs
  - Testing for Intermittent Conditions and Poor Connections
  - Connector Repairs
- Engine--Verify that the engine is not seized.

If the battery, the wiring, and the engine are functioning properly, and the engine continues to crank slowly, replace the starter motor. Refer to Starter Replacement.

Generator Noise Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Aids

Noise from a generator may be due to electrical or mechanical noise. Electrical noise or magnetic whine usually varies with the electrical load placed on the generator and is a normal operating characteristic of all generators. When diagnosing a noisy generator, it is important to remember that loose or misaligned components around the generator may transmit the noise into the passenger compartment and that replacing the generator may not solve the problem.

Circuit/System Testing

1. Start the engine, verify the noise can be heard. Compare the concern to a similar vehicle.
2. Inspect the generator, generator mounting, wiring harness, heater hoses, A/C lines or other accessory equipment that may be misrouted or be the cause of noise being transmitted into the passenger compartment.
3. Ignition OFF, remove the engine drive belt. Verify the generator, idler pulley and tensioner pulley spin freely.

   If any of the pulleys do not spin freely, replace the affected component.
4. Loosen all generator mounting bolts and ensure the generator is properly aligned. Tighten mounting bolts to specification, refer to Generator Replacement.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Drive Belt Replacement for the 3.6L engine.
- Drive Belt Tensioner Replacement for the 3.6L engine.
- Drive Belt Idler Pulley Replacement for the 3.6L engine.
- Drive Belt Replacement - Accessory for the 6.0L and 6.2L.
- Drive Belt Tensioner Replacement - Accessory for the for the 6.0L and 6.2L.
- Drive Belt Tensioner Replacement - Air Conditioning for the 6.0L and 6.2L.
- Generator Removal

Starter Noise Diagnosis

Circuit / System Testing

1. Remove the flywheel inspection cover.
2. Inspect the flywheel for the following:
   - Loose flywheel bolts
   - Chipped gear teeth
   - Missing gear teeth
   - Bent flywheel

   If not within specifications, secure the flywheel bolts or replace the flywheel.

   If all inspections were within specification, replace the starter motor.

Repair Instructions

- Fastener Tightening Specifications for the 3.6L engine
- Fastener Tightening Specifications for the 6.0L and 6.2L engine
- Engine Flywheel Removal for the 3.6L engine
- Engine Flywheel Replacement for the 6.0L and 6.2L engine
- Starter Motor Replacement

Starter Solenoid Clicks, Engine Does Not Crank

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Verification

1. Verify that battery is sufficiently charged and that the battery cables are clean and tight.

   If battery not sufficiently charged, refer to Battery Charging.

   If battery cables are not within specified torque , refer to Fastener Tightening Specifications.
2. Place the ignition switch to the start position. The starter solenoid should click.

   If starter solenoid does not click. refer to Starter Solenoid Does Not Click
3. Remove the drive belts Refer to Drive Belt Replacement for the 3.6L engine or Drive Belt Replacement - Accessory for the 6.0L engine.
4. Place the ignition switch to the START position.

If the engine cranks, inspect the engine and belt drive system for mechanical binding, seized engine, or seized generator, etc.

If the engine does not crank, refer to Engine Will Not Crank - Crankshaft Will Not Rotate for the 3.6L engine or Engine Will Not Crank - Crankshaft Will Not Rotate for the 6.0L engine.

5. Test for less than 0.5 volts between the positive battery cable and terminal A X1 at the solenoid as the ignition switch is placed to the START position.

   If greater than the specified value, replace the positive battery cable.

6. Test for less than 0.5 volts between the negative battery cable and the starter motor case as the ignition switch is placed to the START position.

   If greater than the specified value, replace the negative battery cable.

7. If all circuits test normal, replace the starter motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Battery Positive Cable Replacement
- Battery Negative Cable Replacement
- Starter Replacement

Starter Solenoid Does Not Click

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ terminal 30	1	1	--	--
ECM Park/ Neutral Signal	2	1	--	--
Coil Control terminal 86	--	1	3	--
Control Output terminal 87	1	1	3	--
Coil Ground terminal 85	--	1	--	--
1. No crank 2. Cranks in any gear 3. Cranks all the time				

Circuit/System Description

When the ignition switch is placed in the START position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the START position. The BCM then sends a message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the transmission is in Park or Neutral. If it is, the ECM then supplies 12 V to the control circuit of the starter relay. When this occurs, battery voltage is supplied through the switch of the starter relay to the starter solenoid.

Description and Operation

Starting System Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, verify that no starter relay, clutch pedal, theft deterrent, or automatic transmission DTCs are set that would cause the ECM to disable engine starting.

   If DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition ON, observe the scan tool BCM Current Power Mode parameter. Place ignition switch in the crank position, the parameter should display Crank Request.

   If not the specified value, refer to Power Mode Mismatch.
3. Transmission range selector in park , verify the scan tool ECM PNP Switch and TCM IMS parameters display Park/Neutral.

   If the TCM IMS parameter does not indicate Park/Neutral. Refer to Transmission Internal Mode Switch Logic for the 5L40-E / 5L50-E transmission or Transmission Internal Mode Switch Logic for the 6L50-E / 6L80-E / 6L90-E transmission.

   If the ECM Park/Neutral parameter does not indicate Park/Neutral. Refer to ECM Park Switch Circuit Malfunction.
4. Transmission range selector in park or neutral, attempt to start the vehicle. The starter relay should click and the engine should begin cranking.

   If the starter relay does not click or the engine does not crank, refer to Starter Relay Circuit Malfunction.

Circuit/System Testing

ECM Park Switch Circuit Malfunction (5L40-E / 5L50-E)

1. Ignition OFF, disconnect the harness connector at the AT Inline 20-Way at the transmission.
2. Ignition ON, install a 3A fused jumper wire between the signal circuit terminal 2 and ground. Verify the scan tool ECM PNP switch parameter displays Park/Neutral.

   If not the specified value, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

3. If all circuits test normal, test or replace the internal mode switch (IMS).

ECM Park Switch Circuit Malfunction (6L50-E / 6L80-E / 6L90-E)

1. Ignition OFF, disconnect the harness connector at the AT Inline 16-Way at the transmission.
2. Ignition ON, test for B+ between terminal 3 and ground. (note this circuit will not light a test lamp)

   If not the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
3. If all circuits test normal, test or replace the internal mode switch (IMS).

Starter Relay Circuit Malfunction

1. Ignition OFF, disconnect the starter relay.
2. Ignition OFF, test for less than 5 Ω between the relay ground circuit terminal 85 and ground.

   If greater than the specified range , test the ground circuit for an open/high resistance.
3. Ignition ON, verify a test lamp illuminates between the relay switch B+ circuit terminal 30 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Ensure the parking brake is applied and the transmission is in PARK. Momentarily install a 40A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87. The starter solenoid should engage and the engine should begin cranking.

   If the solenoid does not engage, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the starter motor.
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. With the transmission range selector in park or neutral, cycle the ignition between the OFF and CRANK position. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.

   If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the starter relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the starter relay.
2. Test for 60-250 Ω between terminals 85 and 86.

   If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If not the specified value, replace the relay.

4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
    If greater than specified range, replace the relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Relay Replacement
- Starter Replacement
- Control Module References for ECM replacement, setup and programming

Symptoms - Engine Electrical

Important: The following steps must be completed before using the symptom tables.

- Perform Control Module References before using the Symptom Tables in order to verify that all of the following are true:
  - There are no DTCs set.
  - The control modules can communicate via the serial data link.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
  - Battery Description and Operation
  - Charging System Description and Operation
  - Electrical Power Management Description and Operation
  - Starting System Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the starting and charging systems. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

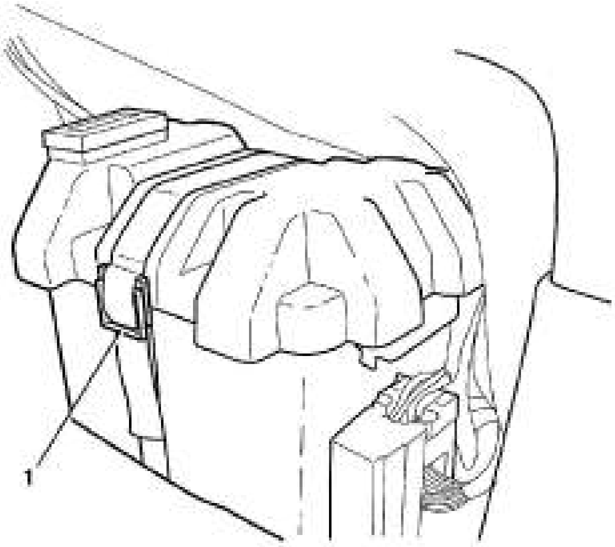
Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Battery Inspection/Test
- Battery Electrical Drain/Parasitic Load Test
- Battery Common Causes of Malfunction
- Charging System Test
- Generator Noise Diagnosis
- Starter Solenoid Does Not Click
- Starter Solenoid Clicks, Engine Does Not Crank
- Engine Cranks Slowly
- Starter Noise Diagnosis

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | Document ID: 2026353

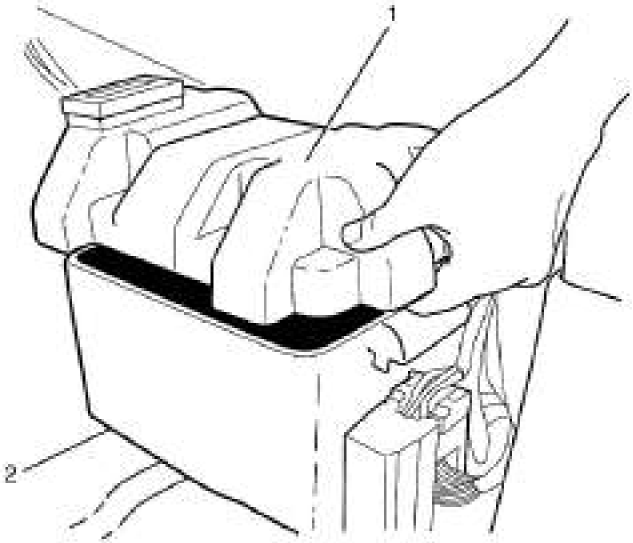
Auxiliary Battery Replacement

Removal Procedure

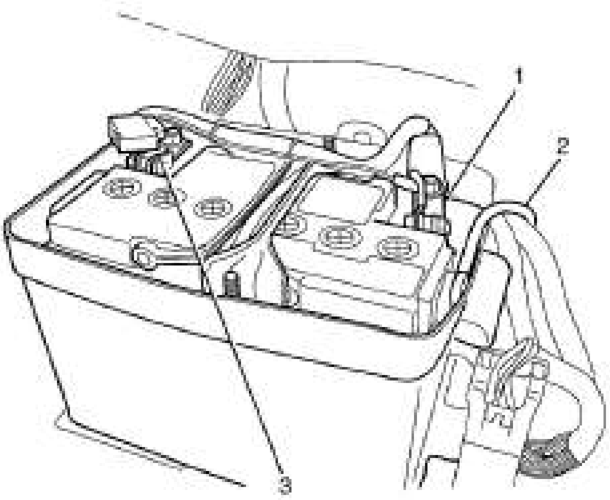


Important: The auxiliary battery is located in the luggage compartment in the RHS rear quarter panel cavity.

1. Loosen and detach the auxiliary battery top cover retaining strap (1).



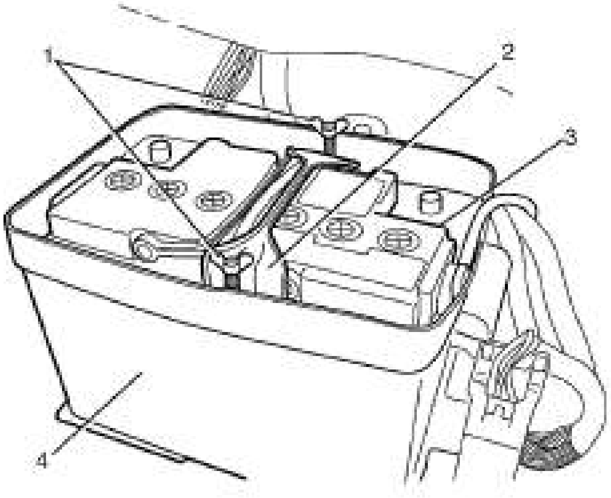
2. Remove the auxiliary battery top cover (1) from the auxiliary battery box (2).



3. Remove the auxiliary battery vent tube (2).
4. Disconnect the battery positive cable (3).

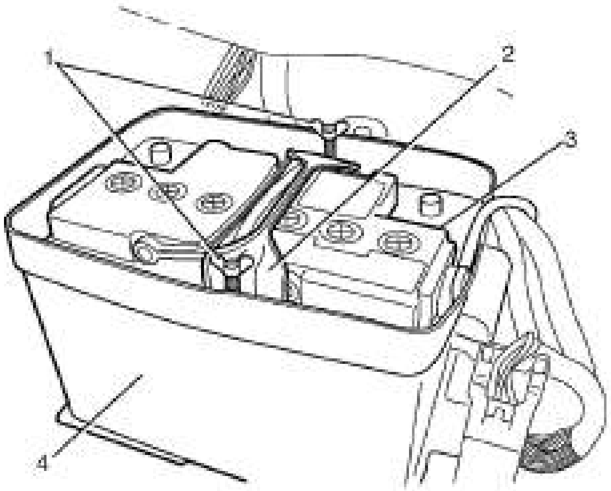
Caution: Refer to Battery Disconnect Caution in the Preface section.

5. Disconnect the auxiliary battery negative cable (1). Refer to Battery Negative Cable Disconnection and Connectionl.



6. Remove the auxiliary battery retaining wing nuts (1) and remove the battery retainer (2).
7. Remove the auxiliary battery (3) out of the auxiliary battery box (4).

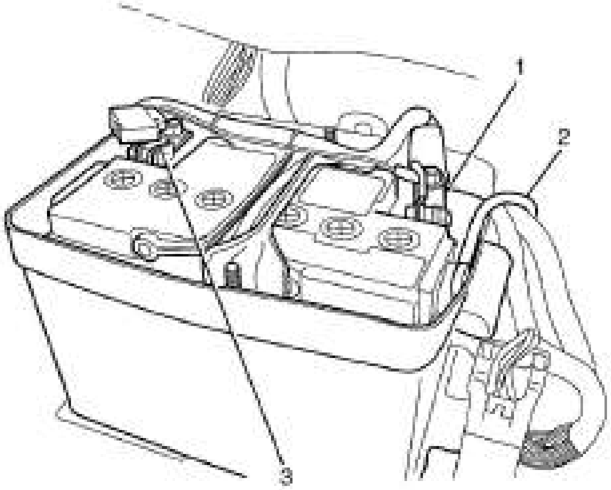
Installation Procedure



1. Install the auxiliary battery (3) into the battery box (4).
2. Install the auxiliary battery retaining bracket (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the auxiliary bracket retaining wing nuts (1).

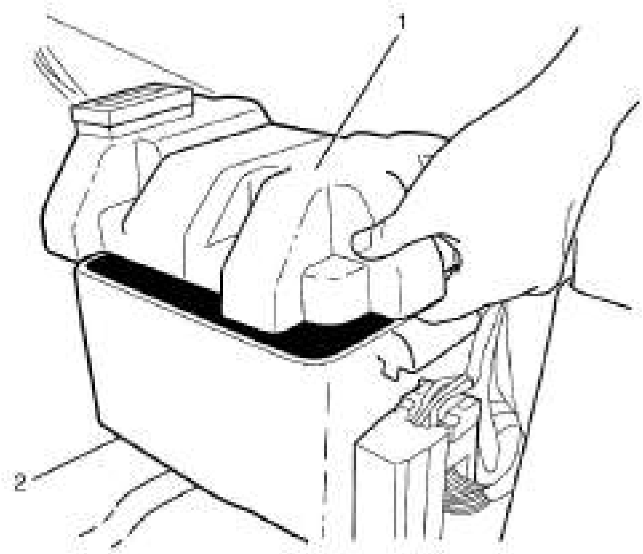


4. Connect the battery positive cable (3).

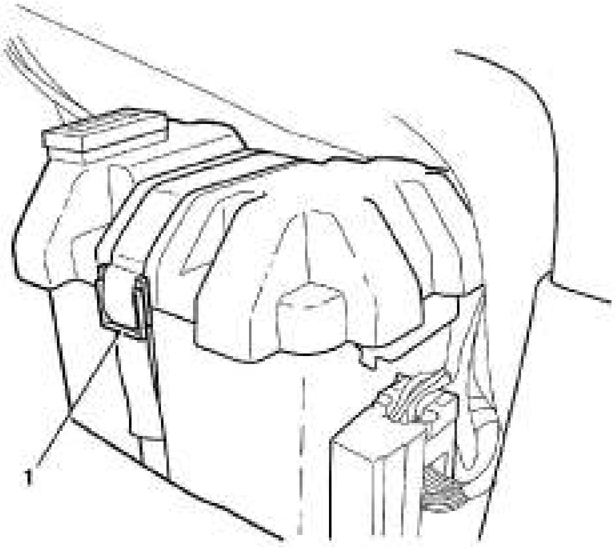
   Tighten
   Tighten the nut to 17 N·m (13 lb ft).

5. Install the auxiliary battery vent tube (2).

6. Connect the auxiliary negative battery cable (1). Refer to Battery Negative Cable Disconnection and Connection.



7. Install the auxiliary battery top cover (1) to the auxiliary battery box (2).



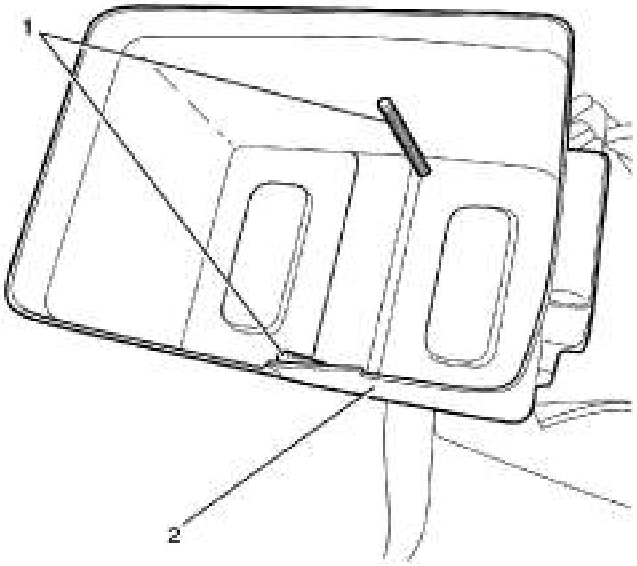
8. Attach and tighten the auxiliary battery top cover retaining strap (1).
9. Test the vehicles electrical components for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | Document ID: 2026352

Auxiliary Battery Tray Replacement

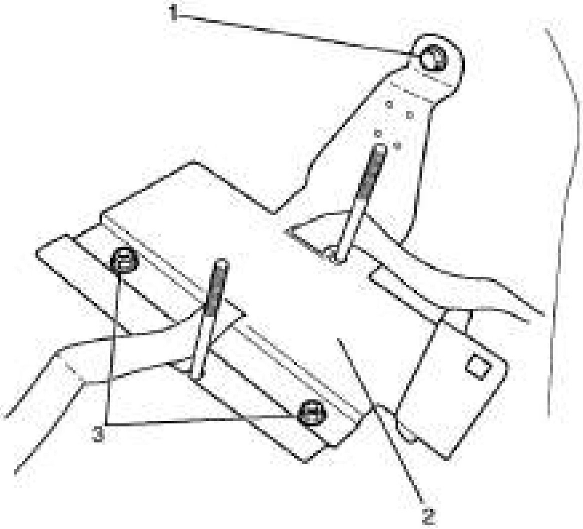
Removal Procedure

1. Remove the auxiliary battery. Refer to Auxiliary Battery Replacement.



Important: Lift the auxiliary battery box (2) upward and over the battery bracket retaining posts (1).

2. Remove the auxiliary battery box (2).

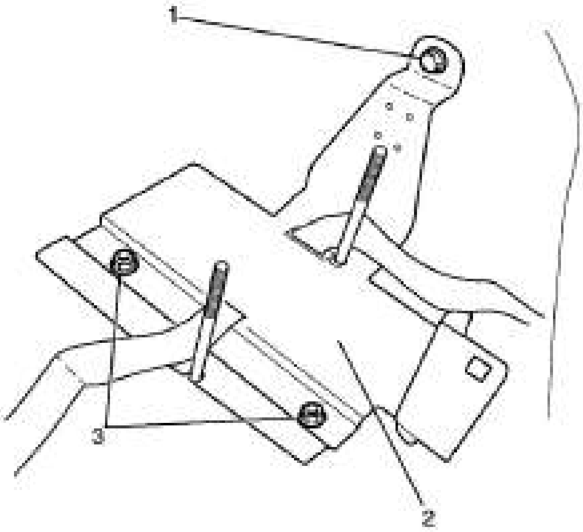


Important: The auxiliary battery tray is retained with micro-encapsulated nuts.

Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

3. Remove the auxiliary battery tray assembly retaining bolt (1).
4. Remove the auxiliary battery tray assembly retaining nut and bolts (3).
5. Remove the auxiliary battery tray assembly (2) from the vehicle.

Installation Procedure



1. Install the battery tray assembly (2) to the vehicle.

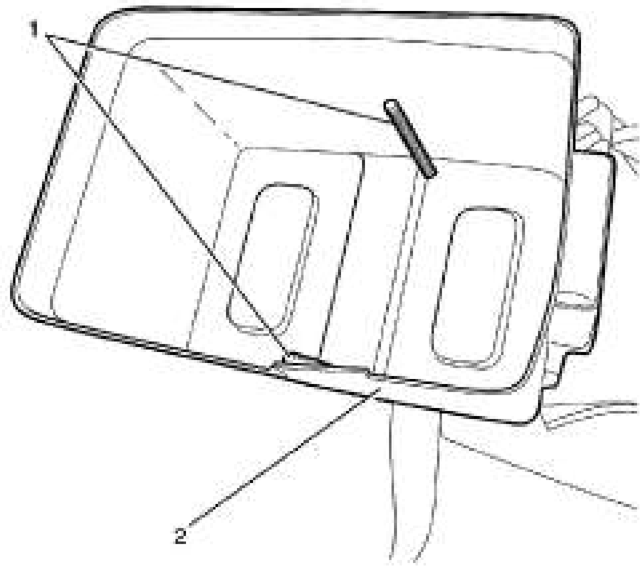
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the auxiliary battery tray assembly (2) retaining bolt (1).

   Tighten
   Tighten the bolt to 9 N·m (80 lb in).

3. Install the auxiliary battery tray assembly retaining nut and bolts (3).

   Tighten
   Tighten the nut and bolts to 9 N·m (80 lb in).



Important: Make sure the battery bracket retaining post's (1) are correctly secure under the battery tray assembly.

4. Install the auxiliary battery box (2).
5. Install the auxiliary battery. Refer to Auxiliary Battery Replacement.

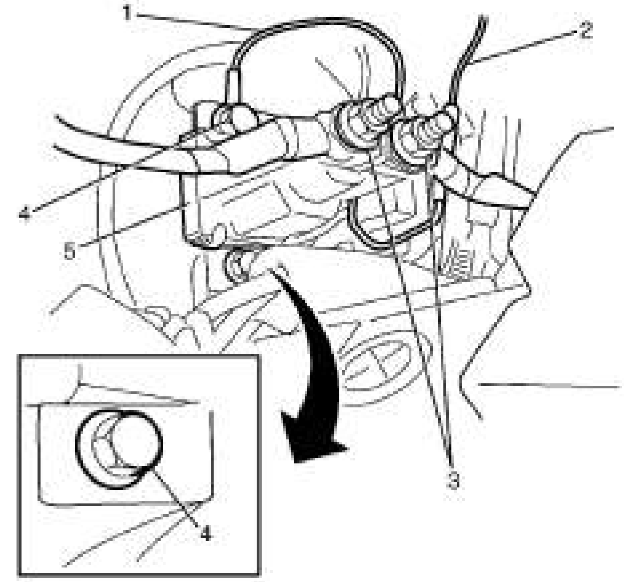
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 2026354**

Battery Isolator Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery negative cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.



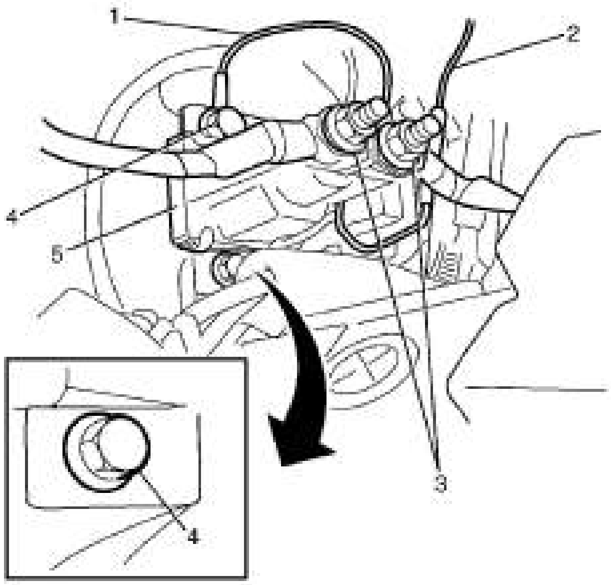
Important: The battery isolator (5) is located in the luggage compartment in the LHS rear quarter panel.

2. Remove the primary and secondary battery cable retaining nuts (3).
3. Disconnect the primary and secondary battery cables from the battery isolator (5).
4. Disconnect the battery isolator (5) input connector (2).

Important: The battery isolator negative cable (1) is secure with the battery isolator retaining bolts, make sure the ground cable is removed when removing the retaining bolts (7).

5. Remove the battery isolator retaining bolts (4).
6. Remove the battery isolator (5).

Installation Procedure



1. Install the battery isolator (5).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the battery isolator retaining bolts (4).

   Tighten
   Tighten the bolts to 11 N·m (97 lb in).

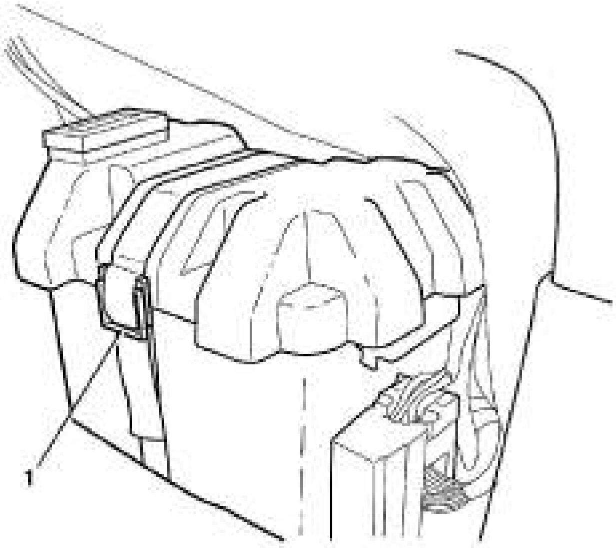
3. Connect the battery isolator input connector (2).
4. Connect the primary and secondary battery cables to the battery isolator (5).
5. Install the primary and secondary battery isolator retaining nuts (3).

   Tighten
   Tighten the nuts to xx N·m (xx lb in).

6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

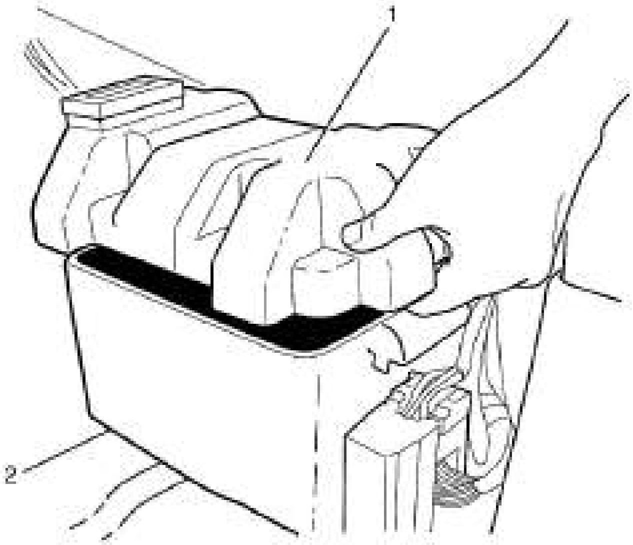
Battery Negative Cable Disconnection and Connection (Auxiliary)

Removal Procedure



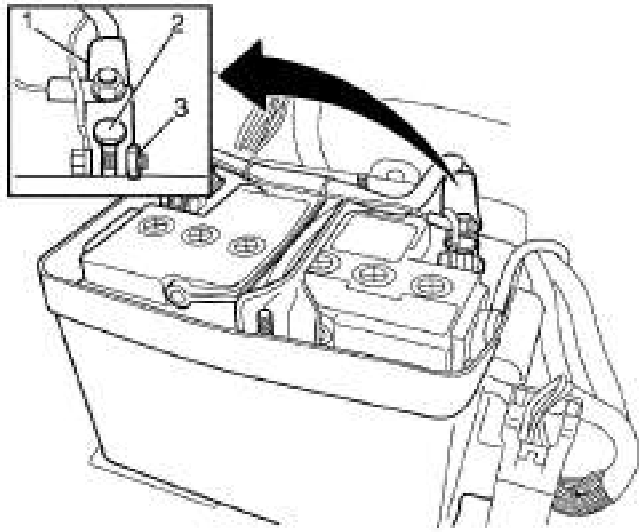
Important: The auxiliary battery is located in the luggage compartment in the RHS rear quarter panel cavity.

1. Loosen and detach the auxiliary battery top cover retaining strap (1).



2. Remove the auxiliary battery top cover (1) from the auxiliary battery box (2).

   Caution: Refer to Battery Disconnect Caution in the Preface section.

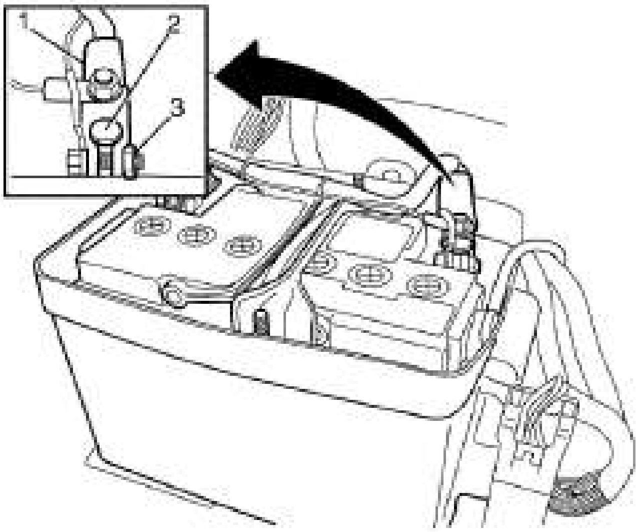


3. Remove the battery negative cable to battery terminal retaining nut (3).

   Important: Clean any existing corrosion from the battery negative terminal (2) and the battery negative cable (1).

4. Remove the battery negative cable (1) from the battery negative terminal (2).

Installation Procedure

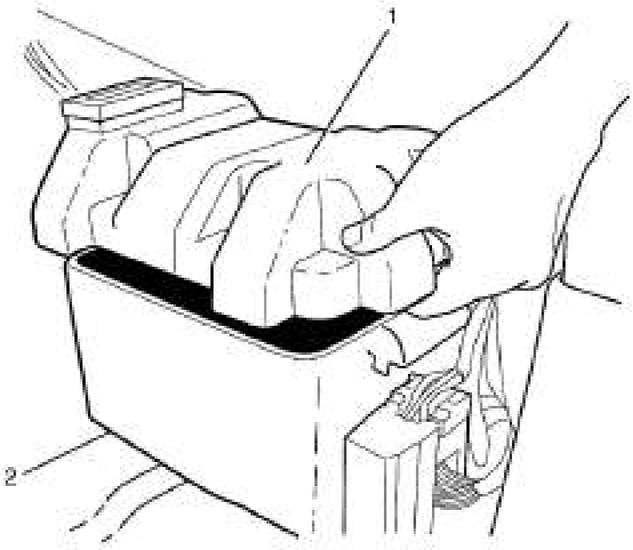


1. Install the battery negative cable (1) to the battery negative terminal (2).

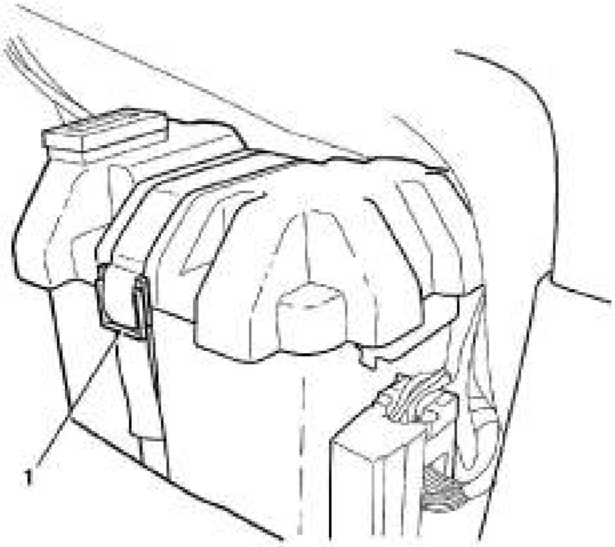
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the battery negative cable to battery negative terminal retaining nut (3).

   Tighten
   Tighten the nut to 17 N·m (13 lb ft).



3. Install the auxiliary battery top cover (1) to the auxiliary battery box (2).

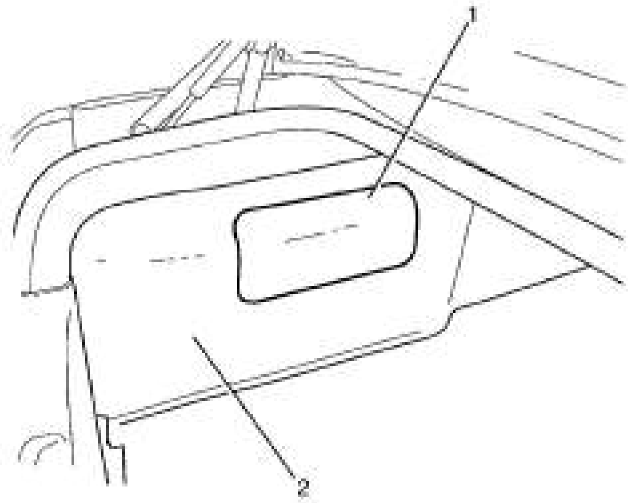


4. Attach and tighten the auxiliary battery top cover retaining strap (1).
5. Test the vehicles electrical components for correct operation.

Battery Negative Cable Disconnection and Connection (Except Auxiliary)

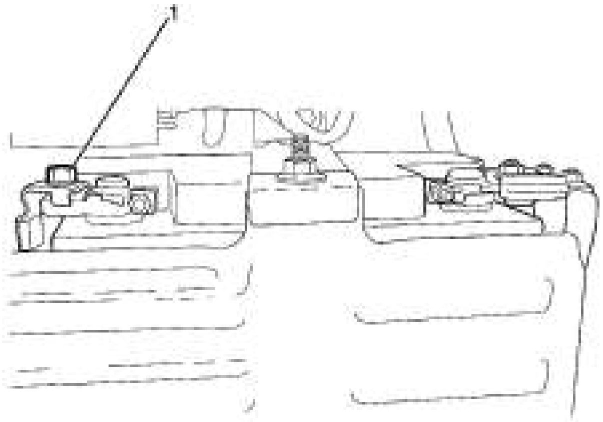
Disconnection Procedure

1. Open the rear compartment lid.



2. Remove the left-hand cargo area carpet side access panel (1) from the left-hand cargo area carpet side (2).

Caution: Refer to Battery Disconnect Caution in the Preface section.

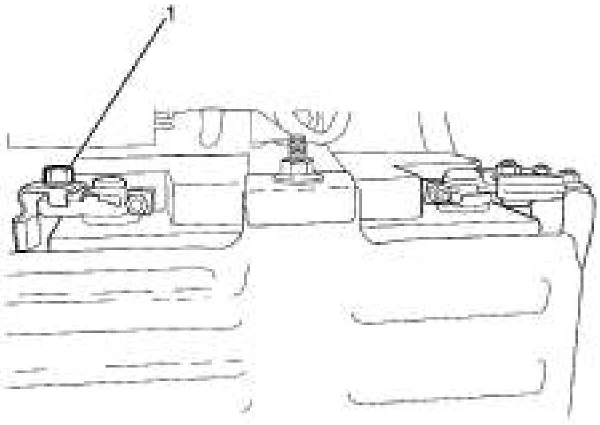


Important: Clean any existing corrosion from the battery terminal and the battery negative cable end.

3. Remove the battery negative cable to battery terminal retaining nut (1).

Connect Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.



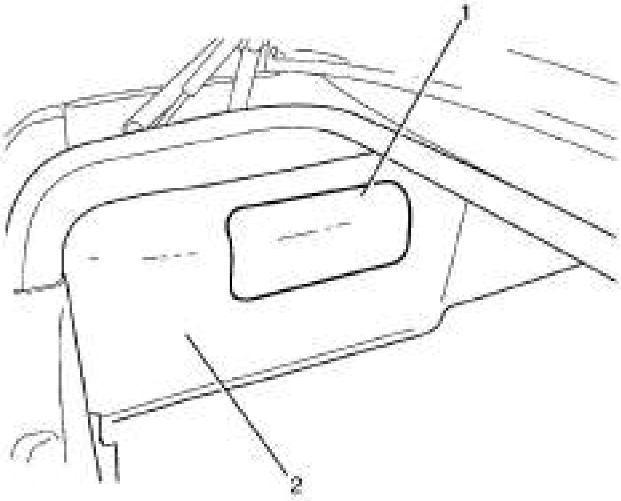
Important: Clean any existing corrosion from the battery terminal and the battery negative cable end.

1. Connect the battery negative cable to the battery.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the battery negative cable to battery terminal retaining nut (1), Tighten the battery negative cable nut.

   Tighten
   Tighten the nut to 17 N·m (13 lb ft).



3. Install the left-hand cargo area carpet side access panel (1) in the left-hand cargo area carpet side (2).
4. Close the rear compartment lid.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | Document ID: 2080792

Battery Positive Cable Replacement (Sedan)

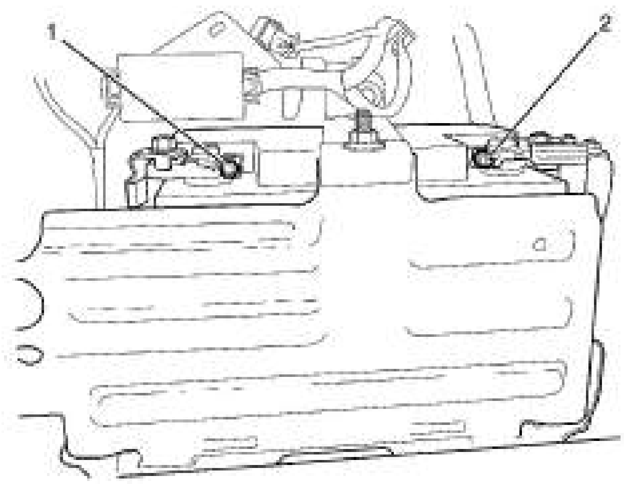
Removal Procedure - Rear

Important:

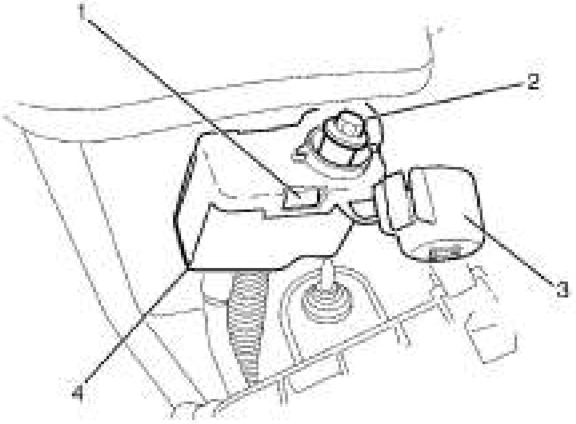
- Always use replacement cables that are of the same type, diameter and length of the cables that you are replacing.
- Always route the replacement cable the same as the original cable.

1. Remove the front seat. Refer to Front Seat Replacement - Bucket.
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
3. Remove the rear seat back. Refer to Rear Seat Back Replacement.
4. Remove the left front floor panel carpet. Refer to Front Floor Panel Carpet Replacement.
5. Remove the rear quarter trim panel. Refer to Quarter Lower Rear Trim Panel Replacement.
6. Remove the cargo area centre carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
7. Remove the left-hand cargo area carpet side. Refer to Rear Compartment Side Trim Panel Replacement

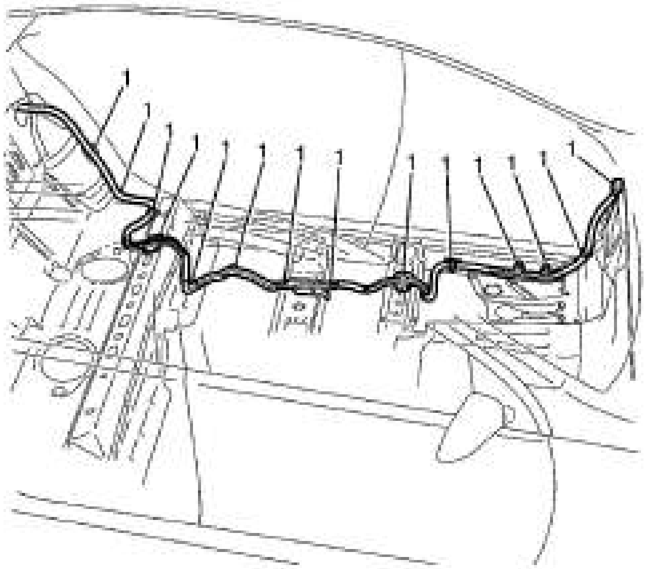
Caution: Refer to Battery Disconnect Caution in the Preface section.



8. Disconnect the battery negative cable (1). Refer to Battery Negative Cable Disconnection and Connection.
9. Disconnect the battery positive cable (2) from the battery.

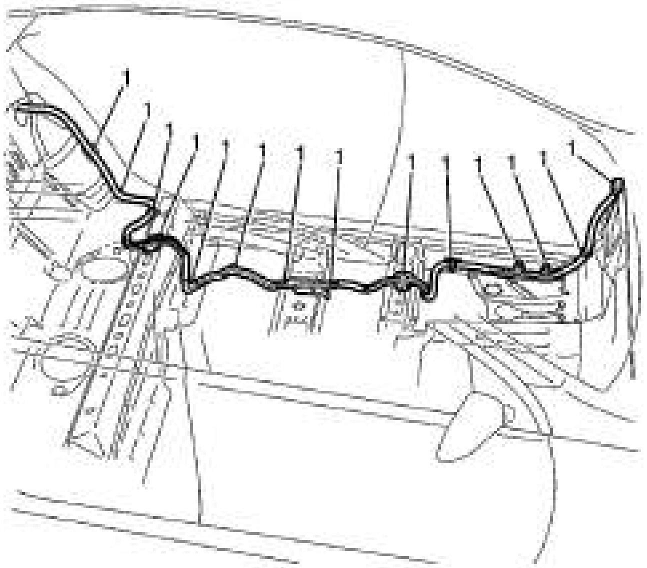


10. Detach the battery post cover (3)..
11. Press the retaining clip (1) to remove battery post protective cover (4).
12. Remove the battery post retaining bolt (2).



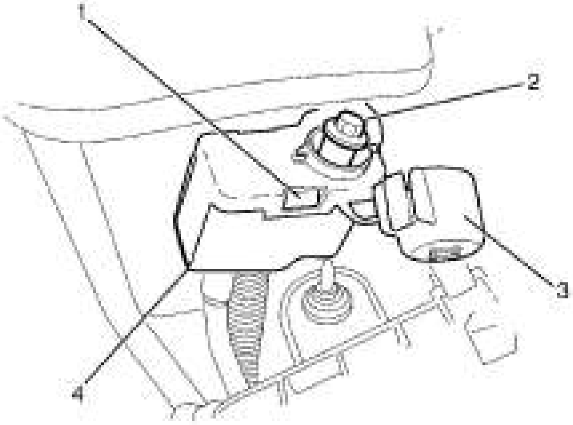
13. Remove the battery positive cable to chassis retaining clips (1).
14. Remove the battery positive cable from the vehicle.

Installation Procedure - Rear



1. Install the battery positive cable to the vehicle.
2. Install the battery positive cable to chassis retaining clips (1).

   Notice: Refer to Fastener Notice in the Preface section.

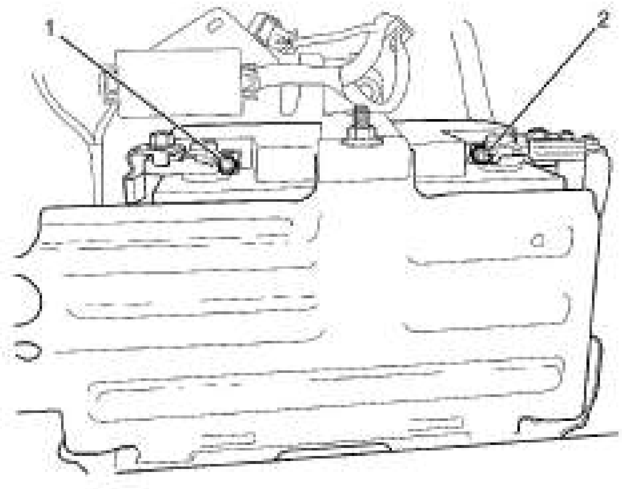


3. Install the battery post retaining bolt (2)

   Tighten
   Tighten the post retaining bolt to 15 N·m (11 lb ft).

4. Install the battery post protective cover (4).
5. Attach the battery post cover (3).

Caution: Refer to Battery Disconnect Caution in the Preface section.

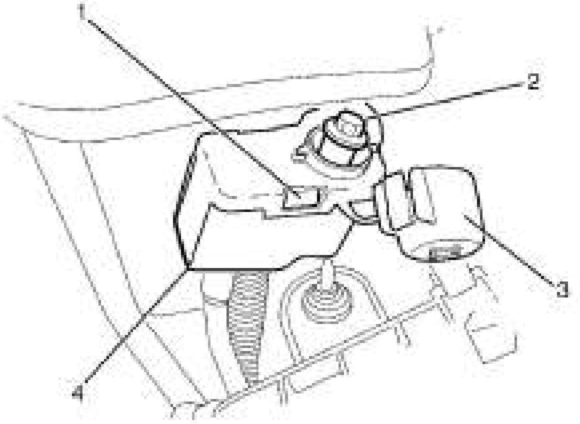


6. Connect the battery positive cable (2) to the battery.
7. Connect the battery negative cable (1). Refer to Battery Negative Cable Disconnection and Connection.
8. Install the rear floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
9. Install the rear quarter trim panel. Refer to Quarter Lower Rear Trim Panel Replacement.
10. Install the left front floor panel carpet. Refer to Front Floor Panel Carpet Replacement.
11. Install the rear seat back. Refer to Rear Seat Back Replacement.
12. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.
13. Install the front seat. Refer to Front Seat Replacement - Bucket.
14. Install the left-hand cargo area carpet side. Refer to Rear Compartment Side Trim Panel Replacement
15. Install the cargo area centre carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
16. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

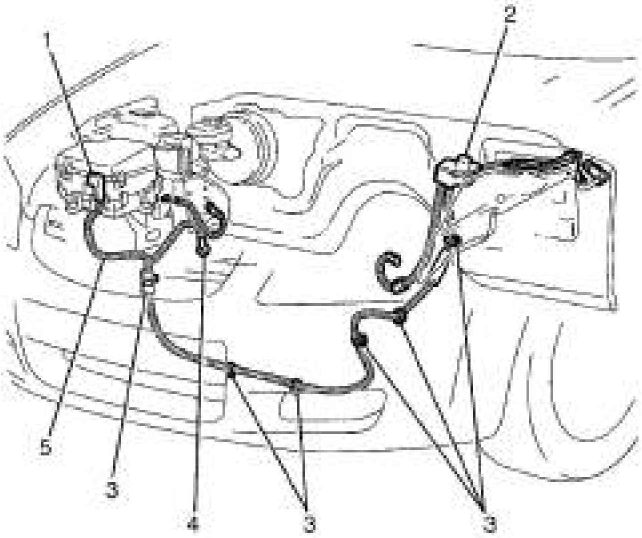
Removal Procedure - Front (3.6L Engines)

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.

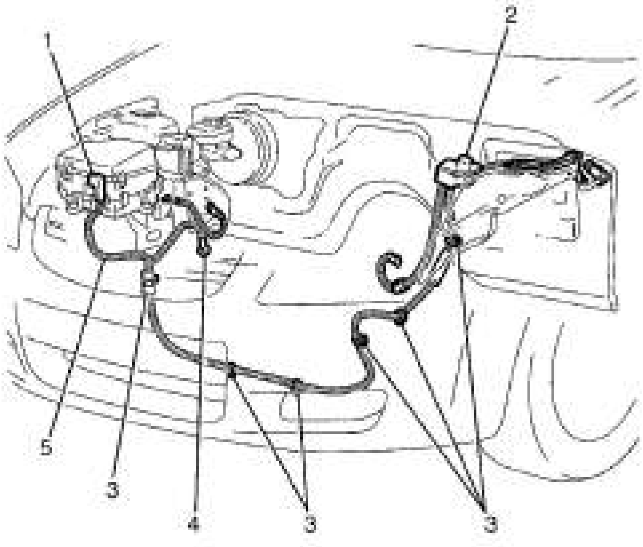


3. Detach the battery post cover (3).
4. Press the retaining clip (1) to remove battery post protective cover (4).
5. Remove the battery post retaining bolt (2).



6. Remove the front battery positive cable from battery post (2).
7. Remove the front battery positive cable to underhood body electrical centre retaining bolt (1).
8. Remove the front battery positive cable to alternator retaining nut (4).
9. Remove the front battery positive cable to chassis retaining clips (3).
10. Remove the front battery positive cable (5) from the engine compartment.

Installation Procedure - Front (3.6L Engines)



1. Install the front battery positive cable (5) to the engine compartment.
2. Install the front battery positive cable to chassis retaining clips (3).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the front battery positive cable to battery post (2).

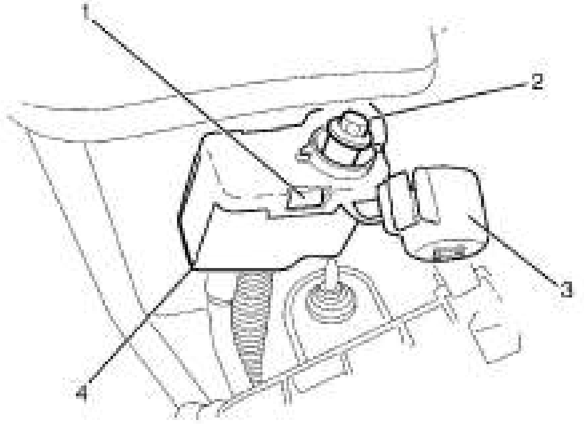
   Tighten
   Tighten the post retaining bolt to 15 N·m (11 lb ft).

4. Install the battery positive cable to underhood body electrical centre retaining nut (1).

   Tighten
   Tighten the retaining nut to 10 N·m(89 lb in).

5. Install the battery positive cable to alternator battery output terminal, install the retaining nut (4).

   Tighten
   Tighten the retaining nut to 13 N·m (115 lb in).

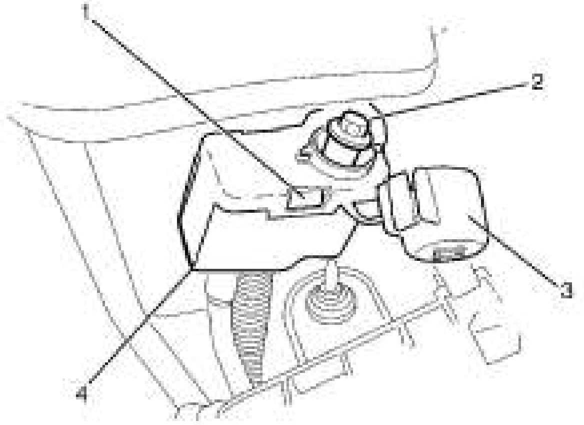


6. Install the battery post protective cover (4).
7. Attach the battery post cover (3).
8. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
9. Install the front air deflector. Refer to Front Air Deflector Replacement.

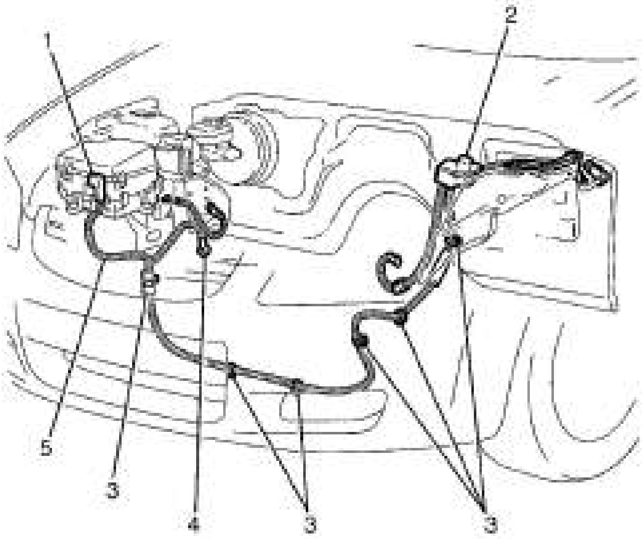
Removal Procedure - Front (6.0L Engines)

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.

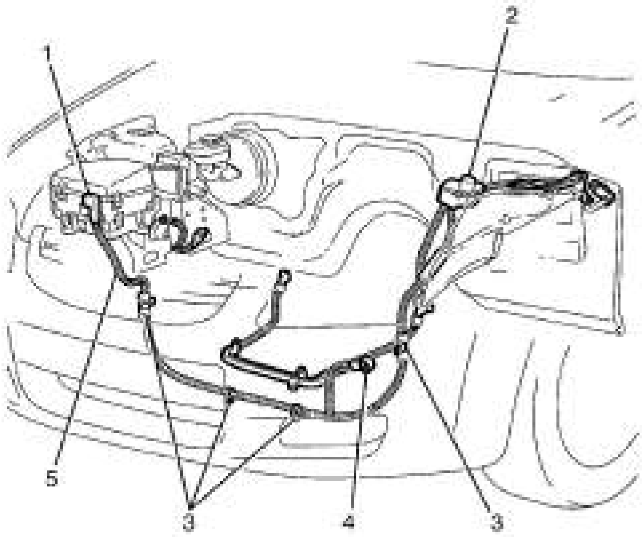


3. Detach the battery post cover (3).
4. Press the retaining clip (1) to remove battery post protective cover (4).
5. Remove the battery post retaining bolt (2).



6. Remove the front battery positive cable from battery post (2).
7. Remove the front battery positive cable to underhood body electrical centre retaining bolt (1).
8. Remove the front battery positive cable to alternator retaining nut (4).
9. Remove the front battery positive cable to chassis retaining clips (3).
10. Remove the front battery positive cable (5) from the engine compartment.

Installation Procedure - Front 6.0L Engines)



1. Install the front battery positive cable (5) to the engine compartment.
2. Install the front battery positive cable to chassis retaining clips (3).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the front battery positive cable to battery post (2).

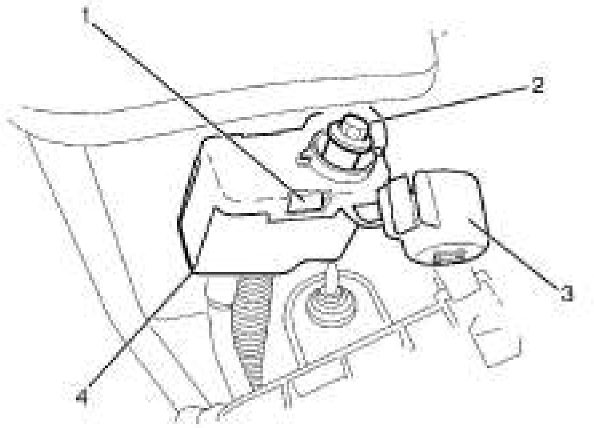
Tighten
Tighten the post retaining bolt to 15 N·m (11 lb ft).

4. Install the battery positive cable to underhood body electrical centre retaining nut (1).

Tighten
Tighten the retaining nut to 10 N·m(89 lb in).

5. Install the battery positive cable to alternator retaining nut (4).

Tighten
Tighten the retaining nut to 13 N·m (115 lb in).



6. Install the battery post protective cover (4).
7. Attach the battery post cover (3).
8. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
9. Install the front air deflector. Refer to Front Air Deflector Replacement.

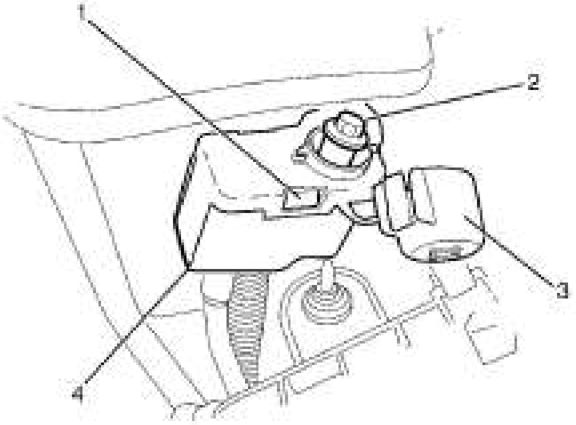
Removal Procedure - Starter (3.6L Engines)

Caution: Refer to Battery Disconnect Caution in the Preface section.

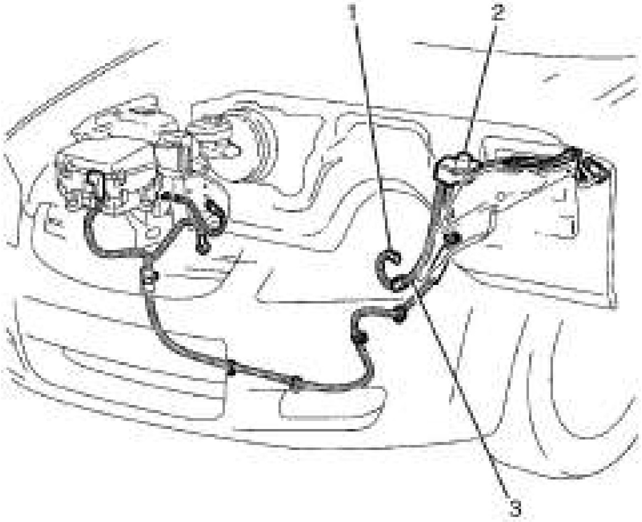
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and

Connection.

2. Remove the front air deflector. Refer to Front Air Deflector Replacement.

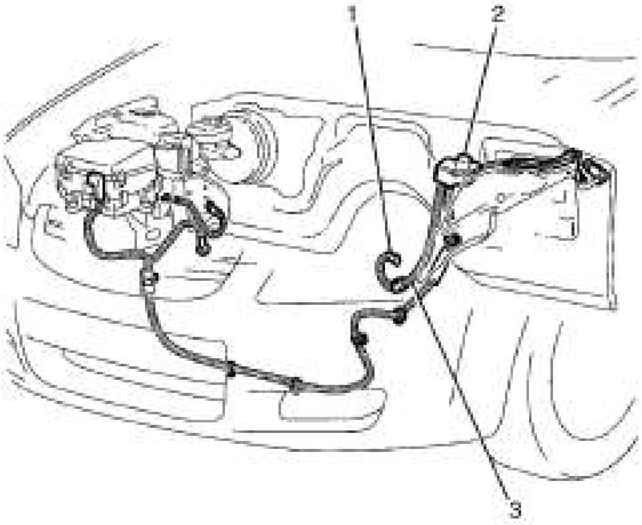


3. Detach the battery post cover (3).
4. Press the retaining clip (1) to remove battery post protective cover (4).
5. Remove the battery post retaining bolt (2).



6. Remove the starter battery positive cable from battery post (2).
7. Remove the starter battery positive cable (3) to starter motor retaining bolt (1).
8. Remove the front battery positive cable to chassis retaining clips.
9. Remove the starter battery positive cable (3) from the engine compartment.

Installation Procedure - Starter (3.6L Engines)



1. Install the starter battery positive cable (3) to the engine compartment.

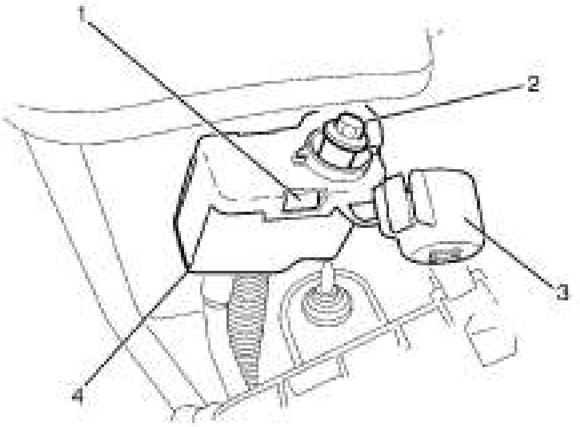
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the starter battery positive cable to battery post (2).

   Tighten
   Tighten the post retaining bolt to 15 N·m (11 lb ft).

3. Install the starter battery positive cable to starter motor and install the retaining nut (1).

   Tighten
   Tighten the retaining nut to 20 N·m (14 lb ft).

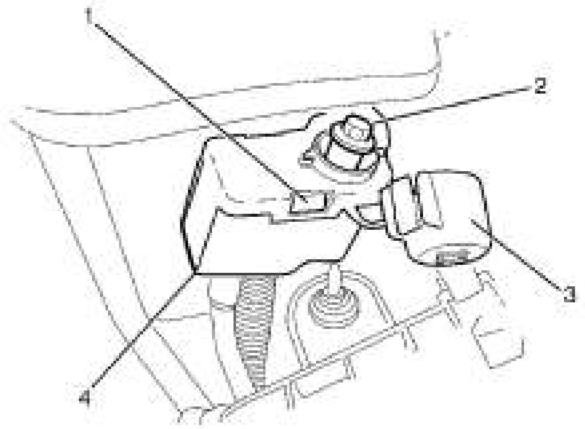


4. Install the battery post protective cover (4).
5. Attach the battery post cover (3).

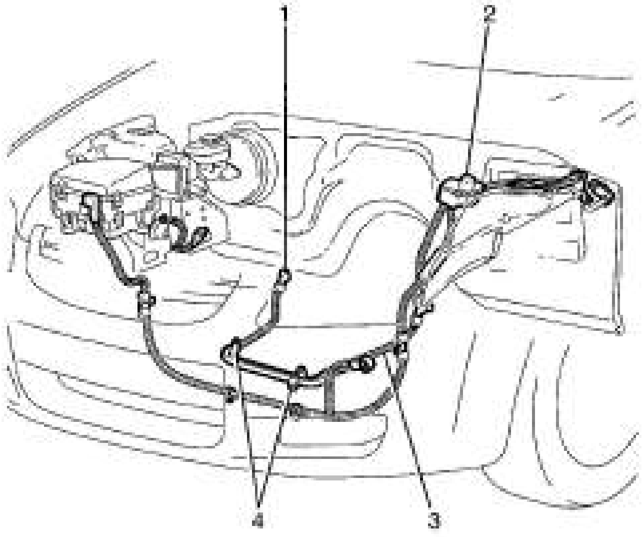
Removal Procedure - Starter (6.0L Engines)

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.

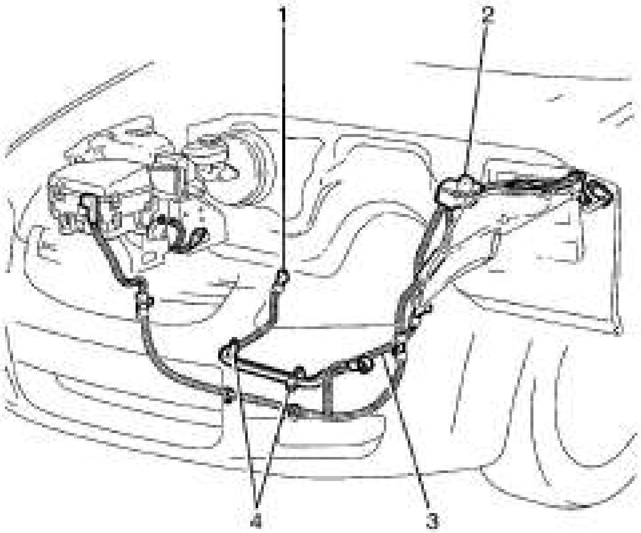


3. Detach the battery post cover (3).
4. Press the retaining clip (1) to remove battery post protective cover (4).
5. Remove the battery post retaining bolt (2).



6. Remove the starter battery positive cable from the battery post (2).
7. Remove the starter battery positive cable (3) to starter motor retaining bolt (1).
8. Remove the starter battery positive cable to chassis retaining clips (4).
9. Remove the starter battery positive cable (3) from the engine compartment.

Installation Procedure - Starter (6.0L Engines)



1. Install the starter battery positive cable (3) to the engine compartment.
2. Install the starter battery positive cable to chassis retaining clips (4).

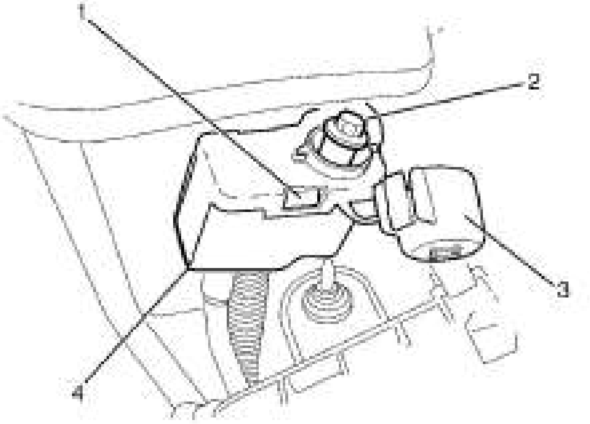
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the starter battery positive cable to battery post (2).

   Tighten
   Tighten the post retaining bolt to 15 N·m (11 lb ft).

4. Install the starter battery positive cable to starter motor and install retaining nut (1).

   Tighten
   Tighten the retaining nut to 20 N·m (14 lb ft).



5. Install the battery post protective cover (4).
6. Attach the battery post cover (3).
7. Install the front air deflector. Refer to Front Air Deflector Replacement.
8. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 2079432**

Battery Positive Cable Replacement (Sportwagon)

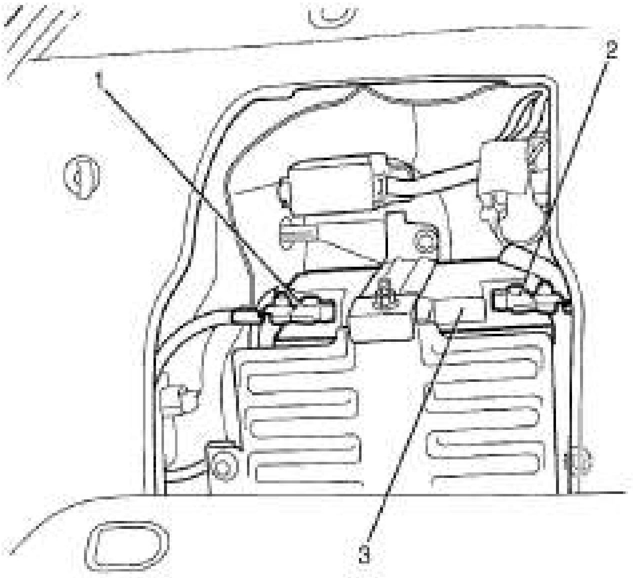
Removal Procedure - Rear

Important:

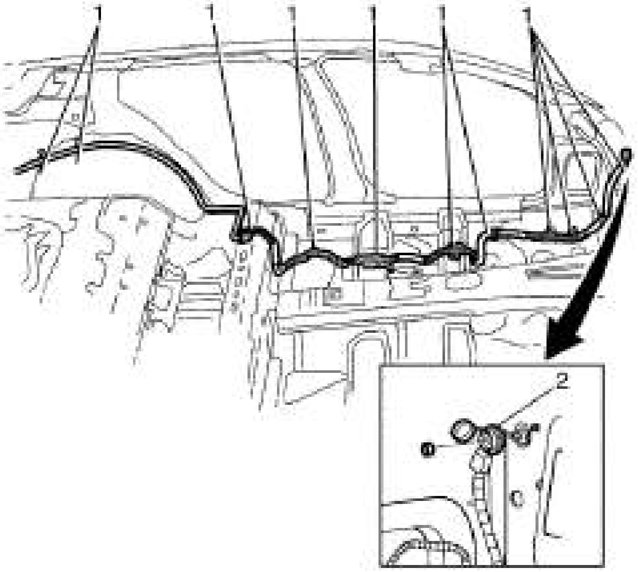
- Always use replacement cables that are of the same type, diameter and length of the cables that you are replacing.
- Always route the replacement cable the same as the original cable.

1. Remove the front seat. Refer to Front Seat Replacement - Bucket.
2. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement.
3. Remove the rear seat back. Refer to Rear Seat Back Replacement.
4. Remove the left front floor panel carpet. Refer to Front Floor Panel Carpet Replacement.
5. Remove the body lock pillar lower trim panel. Refer to Body Lock Pillar Lower Trim Panel Replacement.
6. Remove the rear end trim finish panel. Refer to Rear End Trim Finish Panel Replacement.
7. Remove the luggage shade. Refer to Luggage Shade Replacement.
8. Remove the rear compartment floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement.
9. Remove the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.
10. Remove the load floor stationary panel carpet. Refer to Load Floor Stationary Panel Carpet Replacement.
11. Remove the load floor front panel carpet. Refer to Load Floor Front Panel Carpet Replacement.
12. Remove the quarter inner trim finish panel. Refer to Quarter Inner Trim Finish Panel Replacement.

Caution: Refer to Battery Disconnect Caution in the Preface section.

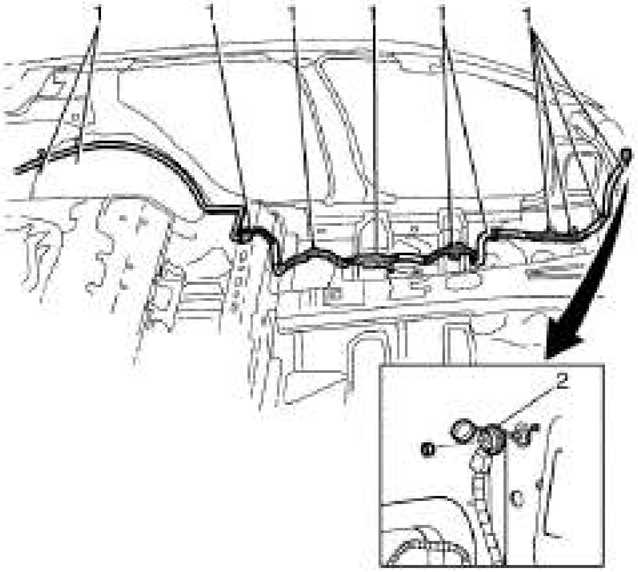


13. Disconnect the battery negative cable (1) from the battery (3). Refer to Battery Negative Cable Disconnection and Connection.
14. Disconnect the battery positive cable (2) from the battery (3).

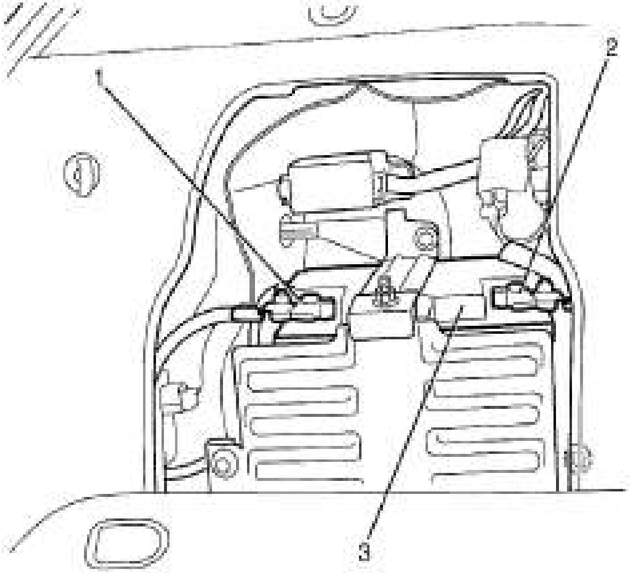


15. Detach the positive cable from the firewall.
16. Remove the battery positive cable to chassis retaining clips (1).
17. Remove the battery positive cable to firewall retaining stud (2).
18. Remove the battery positive cable from the vehicle.

Installation Procedure - Rear



1. Install the battery positive cable to the vehicle.
2. Install the battery positive cable to firewall retaining stud (2).
3. Install the battery positive cable to chassis retaining clips (1).
4. Install the battery positive cable to the firewall.



5. Connect the battery positive cable (2) to the battery (3).

   Tighten
   Tighten the nut to 6 N·m (53 lb in).

6. Connect the battery negative cable (1) to the battery (3). Refer to Battery Negative Cable Disconnection and Connection.

   Tighten
   Tighten the nut to 6 N·m (53 lb in).

7. Install the quarter inner trim finish panel. Refer to Quarter Inner Trim Finish Panel Replacement.
8. Install the load floor front panel carpet. Refer to Load Floor Front Panel Carpet Replacement.
9. Install the load floor stationary panel carpet. Refer to Load Floor Stationary Panel Carpet Replacement.
10. Install the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.
11. Install the rear compartment floor panel carpet. Refer to Rear Compartment Floor Panel Carpet Replacement.
12. Install the luggage shade. Refer to Luggage Shade Replacement.
13. Install the rear end trim finish panel. Refer to Rear End Trim Finish Panel Replacement.
14. Install the body lock pillar lower trim panel. Refer to Body Lock Pillar Lower Trim Panel Replacement.
15. Install the left front floor panel carpet. Refer to Front Floor Panel Carpet Replacement.
16. Install the rear seat back. Refer to Rear Seat Back Replacement.
17. Install the rear seat cushion. Refer to Rear Seat Cushion Replacement.

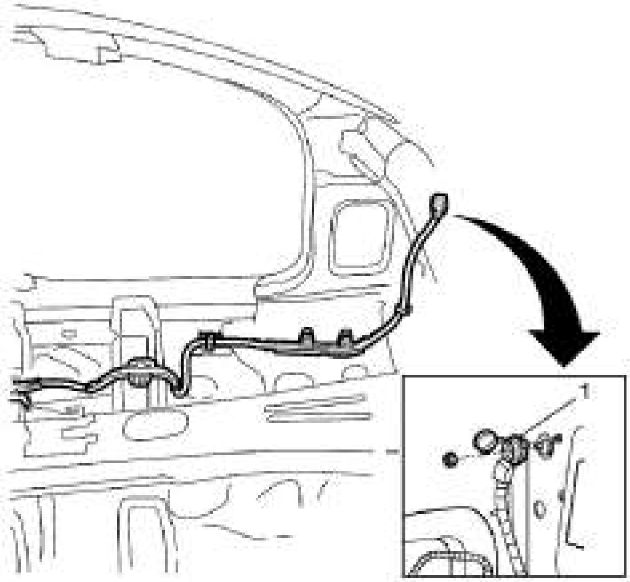
18. Install the front seat. Refer to Front Seat Replacement - Bucket.

Removal Procedure - Intermediate

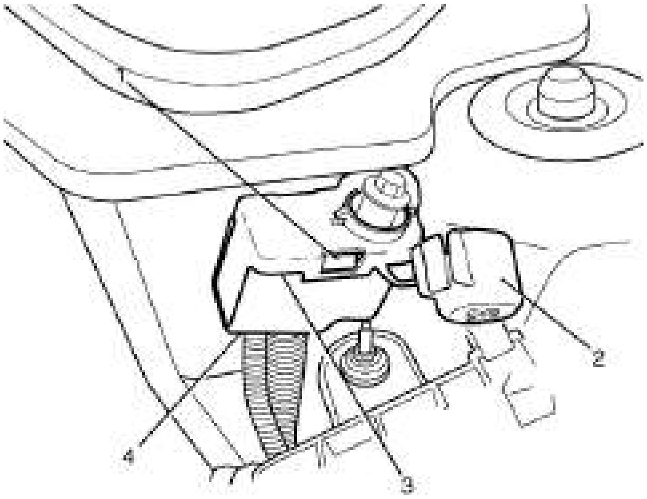
Important:

- Always use replacement cables that are of the same type, diameter and length of the cables that you are replacing.
- Always route the replacement cable the same as the original cable.

1. Remove the instrument panel insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
2. Remove the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
3. Remove the instrument panel compartment. Refer to Instrument Panel Compartment Replacement.



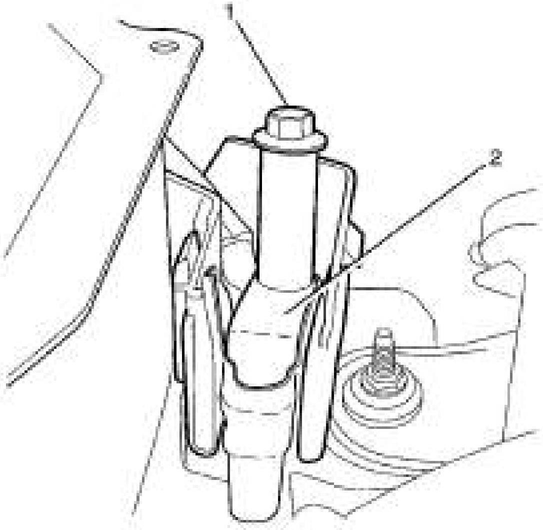
4. Remove the battery positive cable to firewall retaining stud (1).
5. Remove the windshield wiper arm. Refer to Windshield Wiper Arm Replacement.
6. Remove the hood rear seal. Refer to Hood Rear Seal Replacement.
7. Remove the air inlet grille. Refer to Air Inlet Grille Panel Replacement.



8. Detach the remote battery positive post cover (2) from the remote battery positive cable upper protective cover (3).

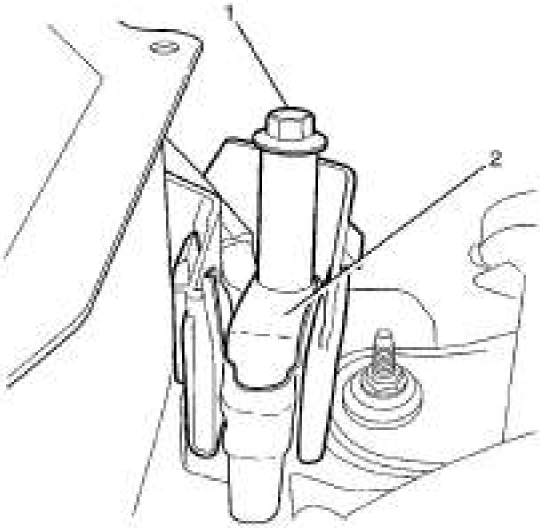
   Important: Remove the remote battery positive cable upper protective cover (3) by pressing the retaining clips (1) and lifting the remote battery positive cable upper protective cover (3) upwards.

9. Remove the remote battery positive cable upper protective cover (3) from the remote battery positive cable lower protective cover (4).



10. Remove the remote battery positive post to battery positive cable retaining bolt (1).
11. Remove the battery positive cable (2).

Installation Procedure - Intermediate

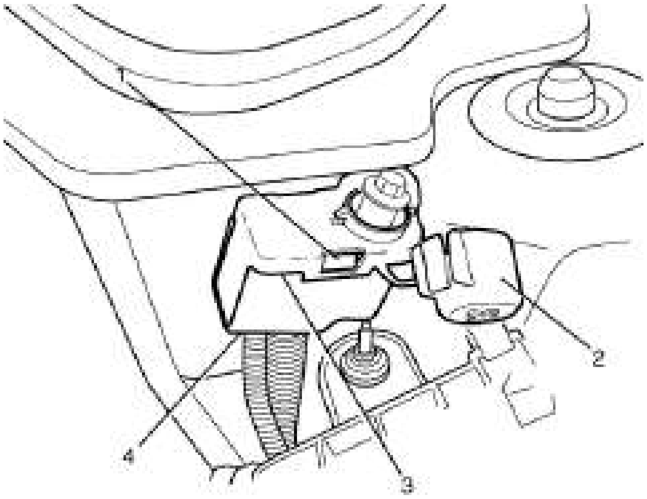


1. Install the battery positive cable (2) to the remote battery post.

   Notice: Refer to Fastener Notice in the Preface section.

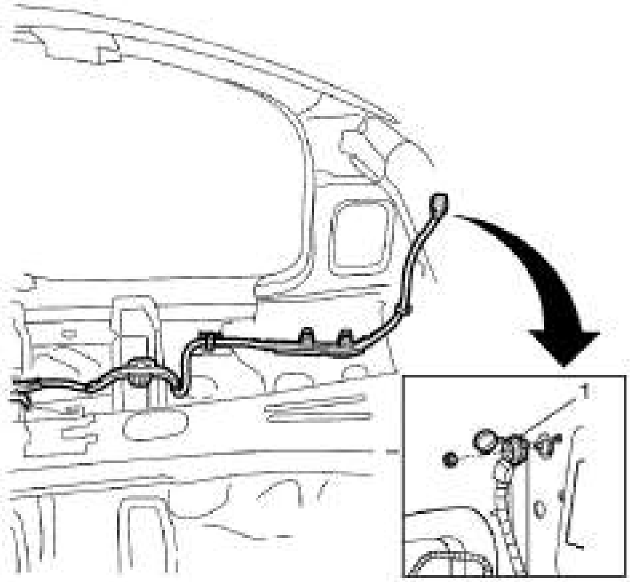
2. Install the remote battery positive post to battery positive cable retaining bolt (1).

   Tighten
   Tighten the bolt to 15 N·m (11 lb ft).



Important: Listen for an audible click from the retaining clip (1) to confirm correct fitting of the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).

3. Install the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).
4. Attach the battery post cover (2) to the remote battery positive cable upper protective cover (3).
5. Install the air inlet grille. Refer to Air Inlet Grille Panel Replacement.
6. Install the hood rear seal. Refer to Hood Rear Seal Replacement.
7. Install the windshield wiper arm. Refer to Windshield Wiper Arm Replacement.

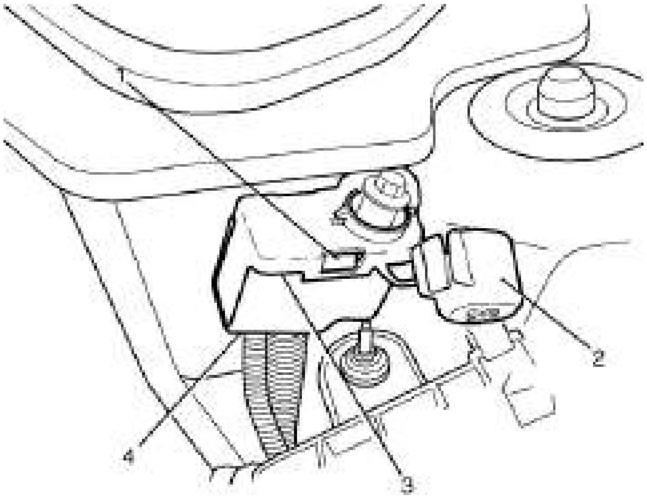


8. Install the battery positive cable to firewall retaining stud (1).
9. Install the instrument panel compartment. Refer to Instrument Panel Compartment Replacement.
10. Install the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
11. Install the instrument panel insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Left Side.

Removal Procedure - Front (3.6L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

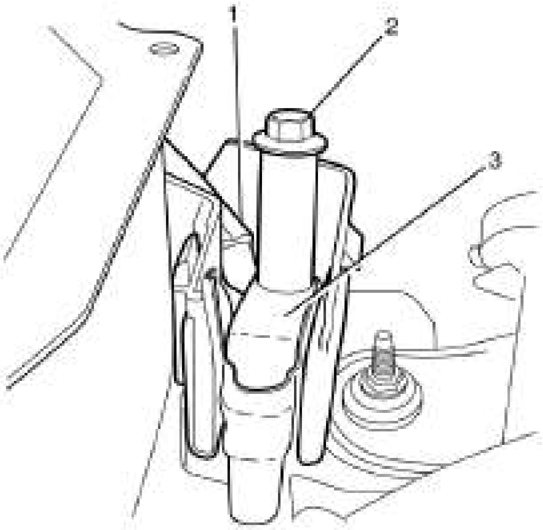
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.



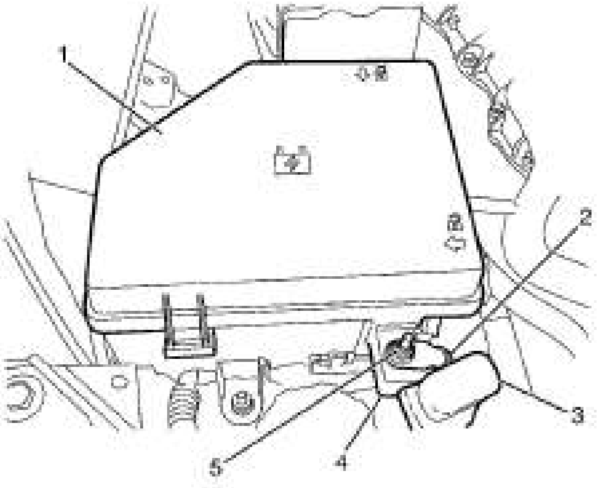
3. Detach the remote battery positive post cover (2) from the remote battery positive cable upper protective cover (3).

   Important: Remove the remote battery positive cable upper protective cover (3) by pressing the retaining clip (1) and lifting the remote battery positive cable upper protective cover (3) upwards.

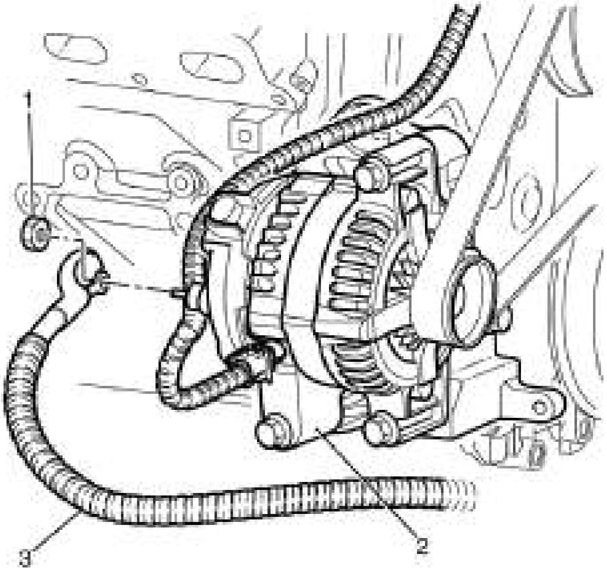
4. Remove the remote battery positive cable upper protective cover (3) from the remote battery positive cable lower protective cover (4).



5. Remove the remote battery positive post to battery positive cable retaining bolt (2).
6. Disconnect the front battery positive cable (3) from the battery post.
7. Disconnect the rear battery positive cable (1) from the battery post.

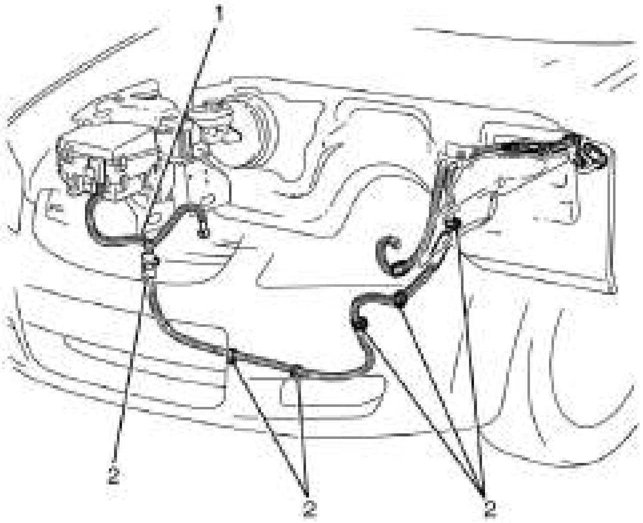


8. Remove the underhood body electrical centre (UBEC) cover (1).
9. Remove the front battery positive cable protective cover (3).
10. Remove the front battery positive cable to UBEC plate retaining nut (5).
11. Disconnect the front battery positive cable (2) from the UBEC plate (4).



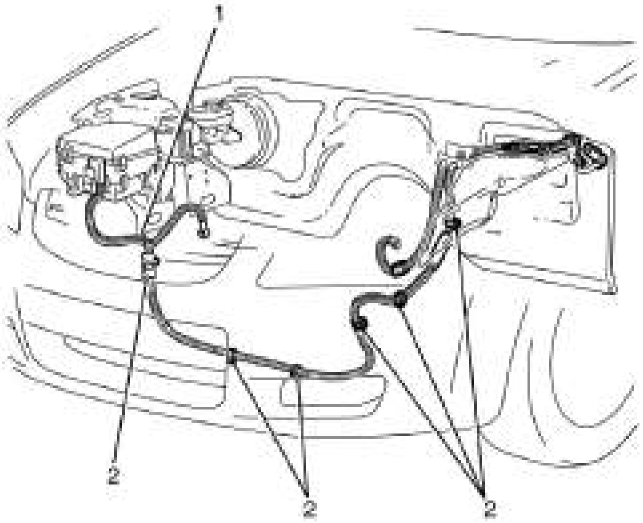
Important: Reposition the protective boot on the front battery positive cable (3) to gain access to the front battery positive cable to alternator retaining nut (1).

12. Remove the front battery positive cable to alternator retaining nut (1).
13. Disconnect the front battery positive cable (3) from the alternator (2).

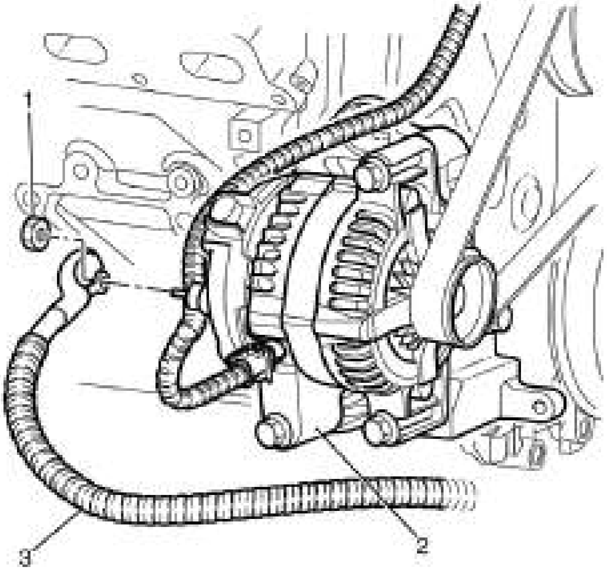


14. Remove the front battery positive cable to chassis retaining clips (2).
15. Remove the front battery positive cable (1) from the engine compartment.

Installation Procedure - Front (3.6L Engine)



1. Install the front battery positive cable (1) to the engine compartment.
2. Install the front battery positive cable to chassis retaining clips (2).

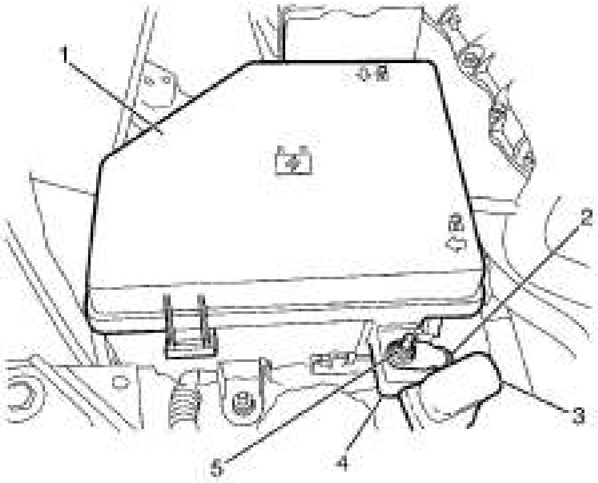


3. Connect the front battery positive cable (2) to the alternator (3).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the front battery positive cable to alternator retaining nut (1).

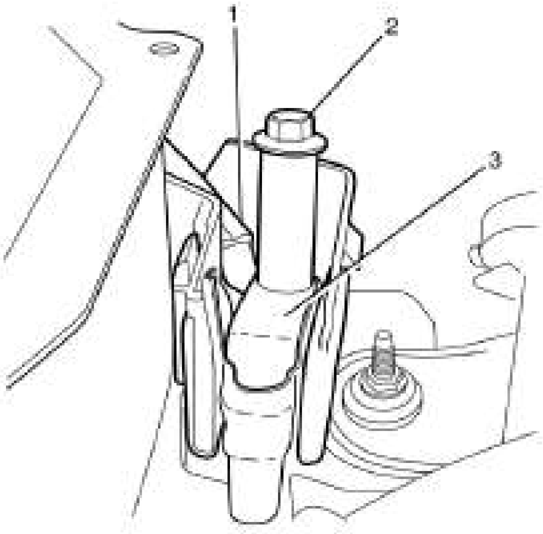
   Tighten
   Tighten the nut to 13 N·m (115 lb in).



5. Connect the front battery positive cable (2) to the UBEC plate (4).
6. Install the front battery positive cable to the UBEC plate retaining nut (5).

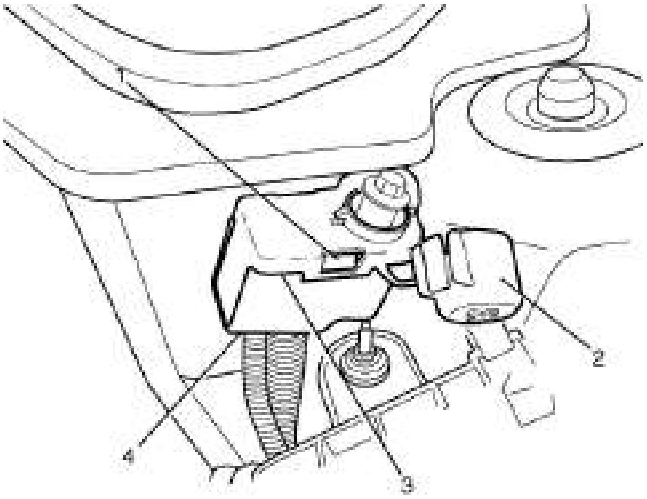
Tighten
Tighten the nut to 10 N·m (89 lb in).

7. Install the front battery positive cable protective cover (3) to the positive cable.
8. Install the UBEC cover (1).



9. Connect the rear battery positive cable (1) to the battery post.
10. Connect the front battery positive cable (3) to the battery post.
11. Install the remote battery positive post to the battery positive cable retaining bolt (2).

Tighten
Tighten the bolt to 15 N·m (13 lb ft).



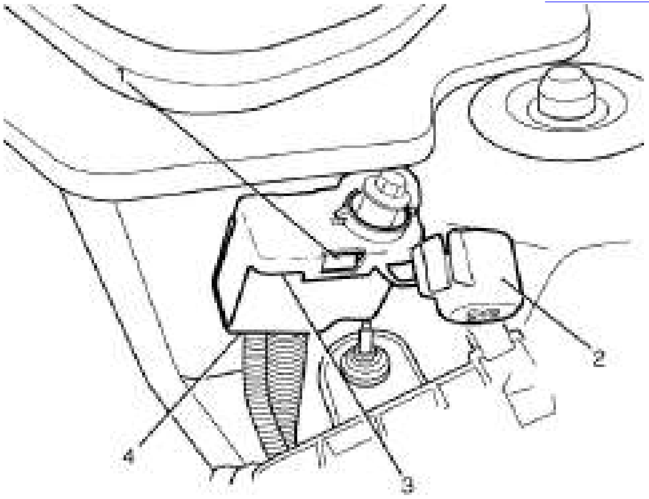
Important: Listen for an audible click from the retaining clip (1) to confirm correct fitting of the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).

12. Install the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).
13. Attach the remote battery positive post cover (2) to the remote battery positive cable upper protective cover (3).
14. Install the front air deflector. Refer to Front Air Deflector Replacement.
15. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Removal Procedure - Front (6.0L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

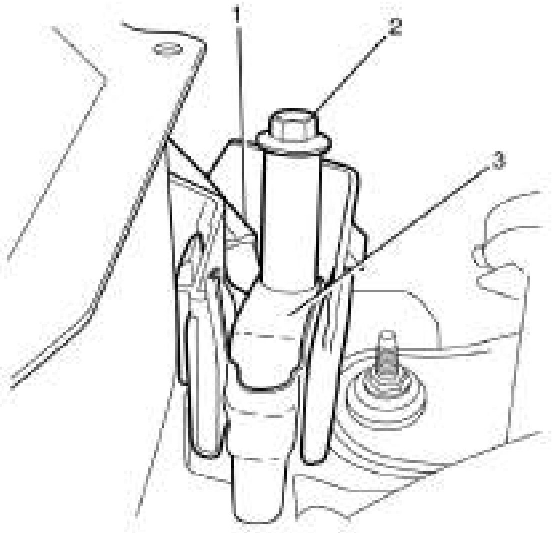
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.



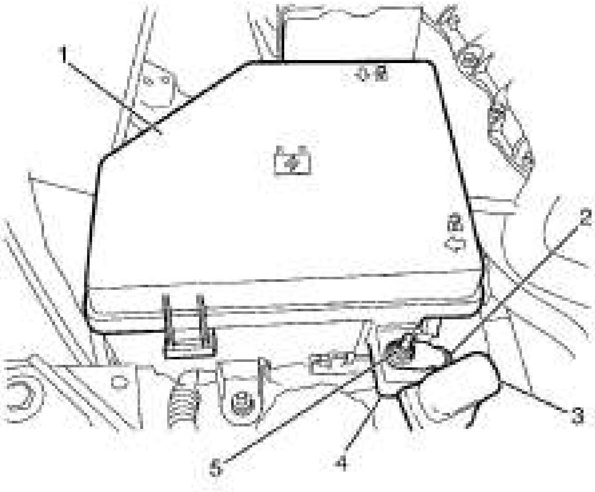
3. Detach the remote battery positive post cover (2) from the remote battery positive cable upper protective cover (3).

Important: Remove the remote battery positive cable upper protective cover (3) by pressing the retaining clip (1) and lifting the remote battery positive cable upper protective cover (3) upwards.

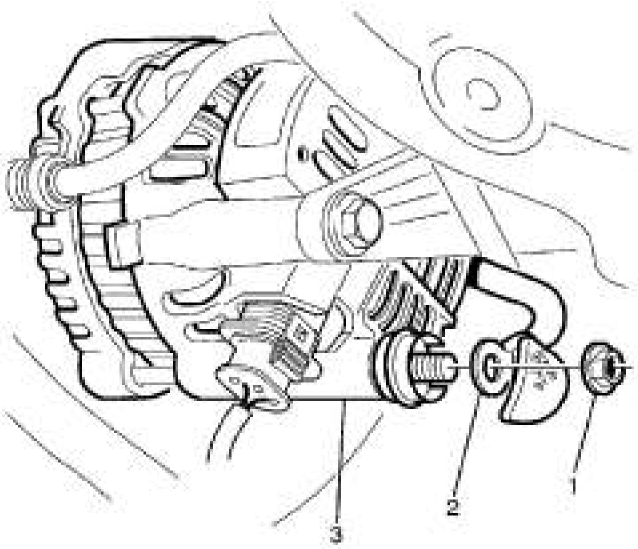
4. Remove the remote battery positive cable upper protective cover (3) from the remote battery positive cable lower protective cover (4).



5. Remove the remote battery positive post to battery positive cable retaining bolt (2).
6. Disconnect the front battery positive cable (3) from the remote battery positive post.
7. Disconnect the rear battery positive cable (1) from the remote battery positive post.

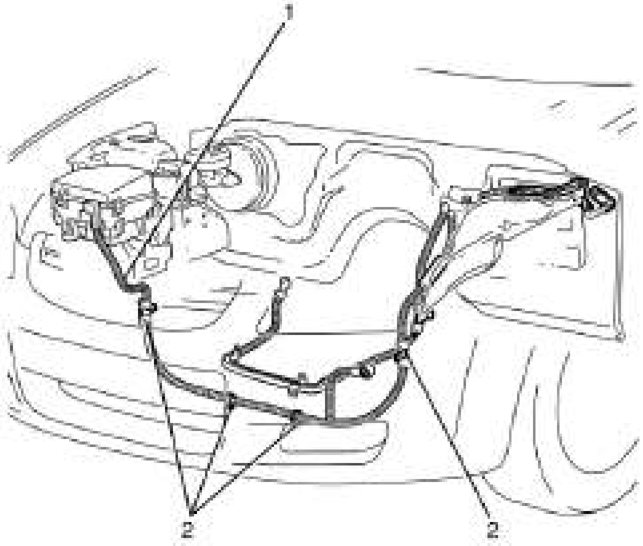


8. Remove the underhood body electrical centre (UBEC) cover (1).
9. Remove the front battery positive cable protective cover (3).
10. Remove the front battery positive cable to UBEC plate retaining bolt (5).
11. Disconnect the front battery positive cable (2) from the UBEC plate (4).



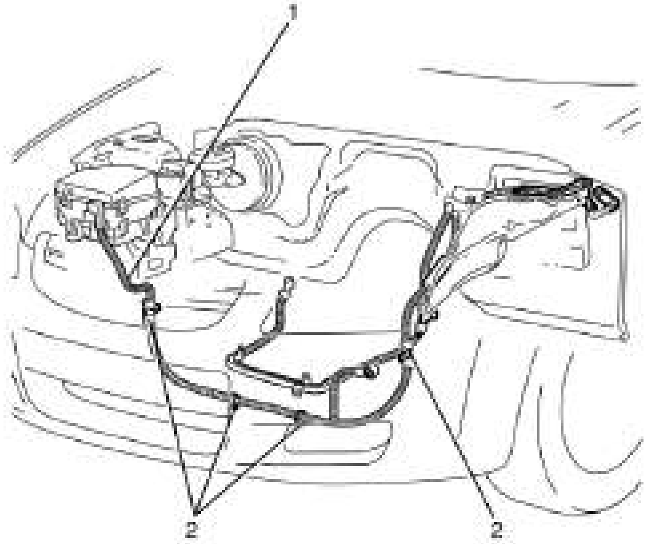
Important: Reposition the protective boot on the front battery positive cable (2) to gain access to the front battery positive cable to alternator retaining nut (1).

12. Remove the front battery positive cable to alternator retaining nut (1).
13. Remove the front battery positive cable (2) from the alternator (3).

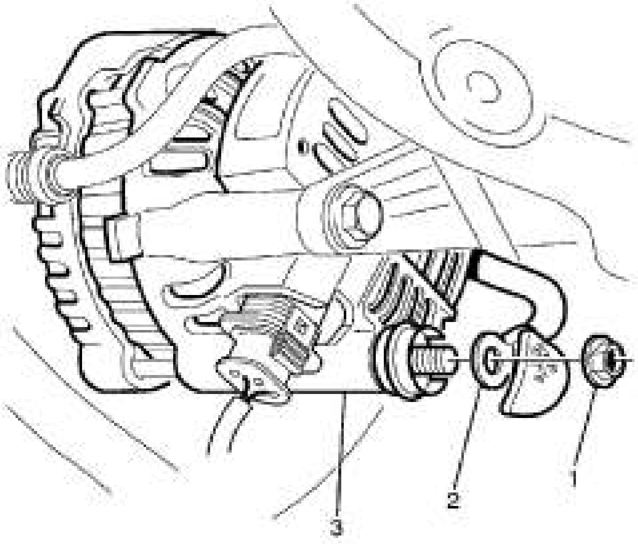


14. Remove the front battery positive cable to chassis retaining clips (2).
15. Remove the front battery positive cable (1) from the engine compartment.

Installation Procedure - Front (6.0L Engine)



1. Install the front battery positive cable (1) to the engine compartment.
2. Install the front battery positive cable to chassis retaining clips (2).

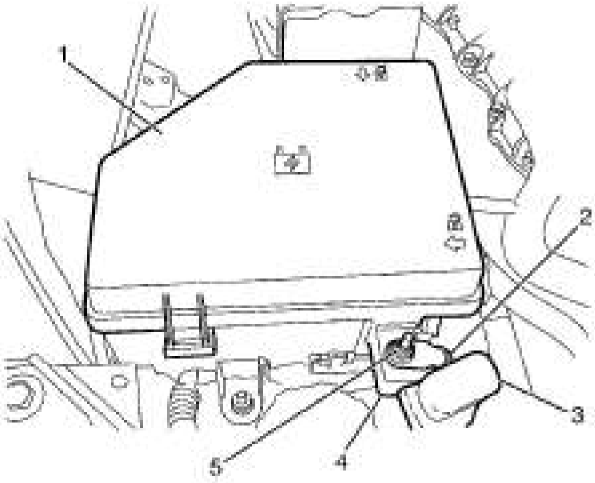


3. Connect the front battery positive cable (2) to the alternator (3).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the front battery positive cable to alternator retaining nut (1).

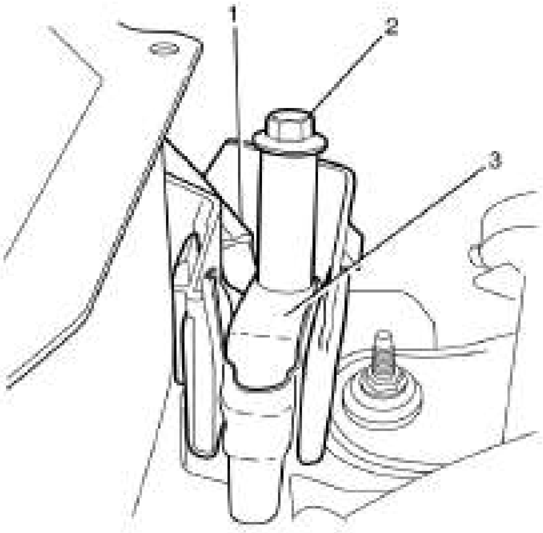
   Tighten
   Tighten the nut to 13 N·m (115 lb in).



5. Connect the front battery positive cable (2) to the UBEC plate (4).
6. Install the front battery positive cable to UBEC plate retaining bolt (5).

Tighten
Tighten the bolt to 10 N·m (89 lb in).

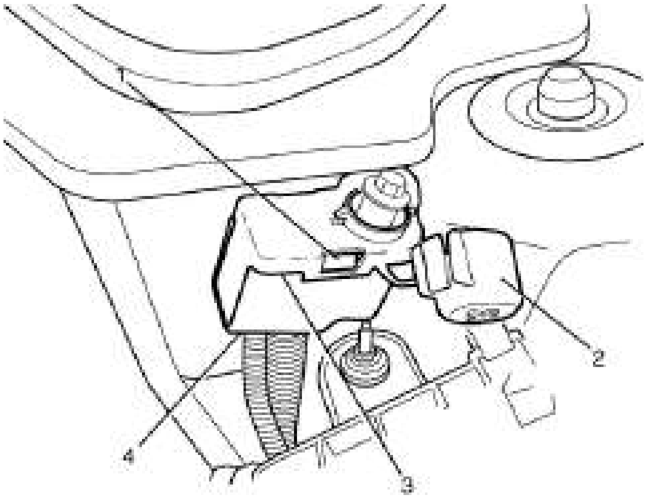
7. Install the front battery positive cable protective cover (3) to the positive cable.
8. Install the UBEC cover (1).



9. Connect the rear battery positive cable (1) to the remote battery positive post.
10. Connect the front battery positive cable (3) to the remote battery positive post.
11. Install the remote battery positive post to battery positive cable retaining bolt (2).

Tighten

Tighten the bolt to 15 N·m (11 lb ft).



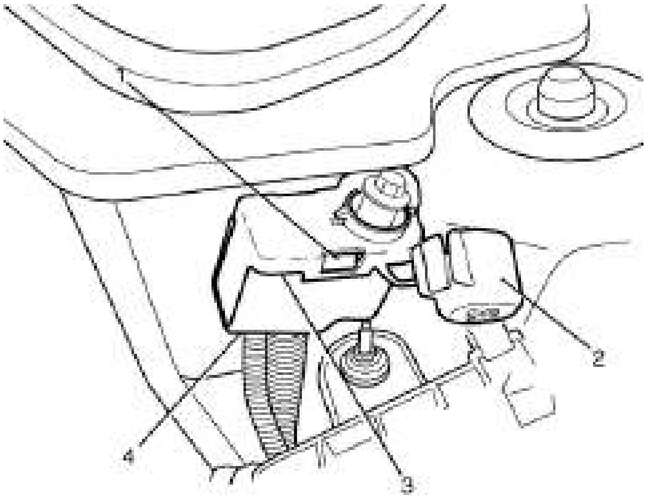
Important: Listen for an audible click from the retaining clip (1) to confirm correct fitting of the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).

12. Install the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).
13. Attach the remote battery positive post cover (2) to the remote battery positive cable upper protective cover (3).
14. Install the front air deflector. Refer to Front Air Deflector Replacement.
15. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Removal Procedure - Starter (3.6L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

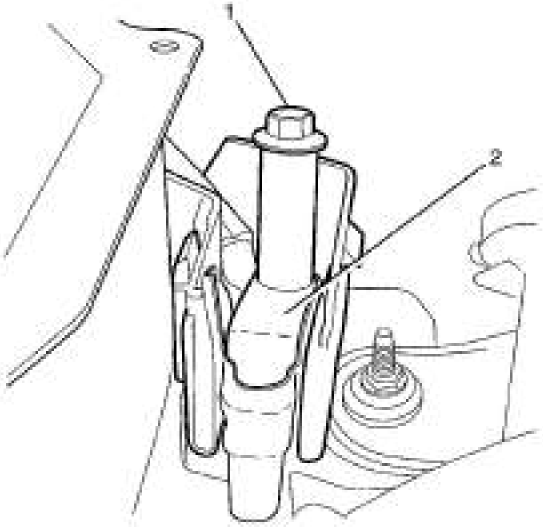
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.



3. Detach the remote battery positive post cover (2) from the remote battery positive cable upper protective cover (3).

   Important: Remove the remote battery positive cable upper protective cover (3) by pressing the retaining clip (1) and lifting the remote battery positive cable upper protective cover (3) upwards.

4. Remove the remote battery positive cable upper protective cover (3) from the remote battery positive cable lower protective cover (4).

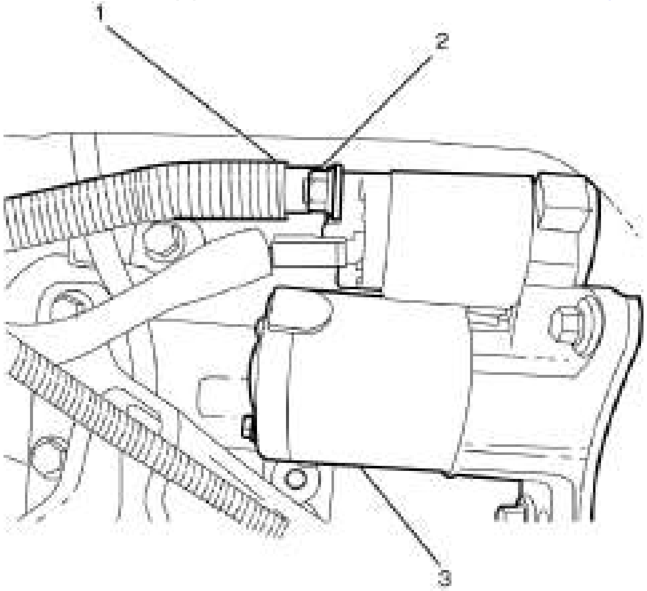


5. Remove the remote positive battery post to battery positive cable retaining bolt (1).
6. Disconnect the starter battery positive cable (2) from the remote positive battery post.

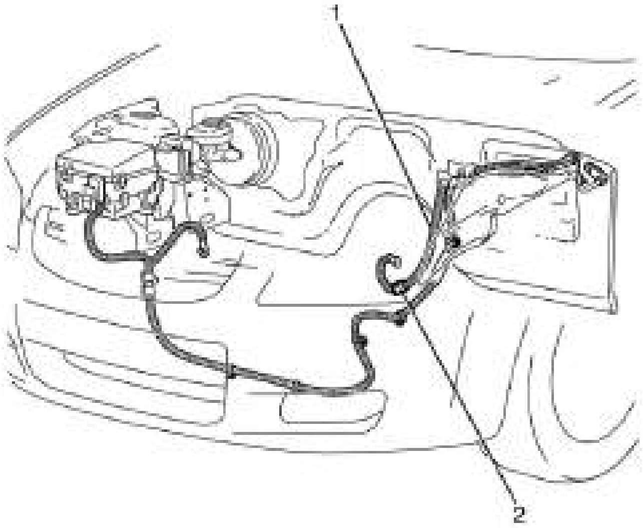
   Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

7. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

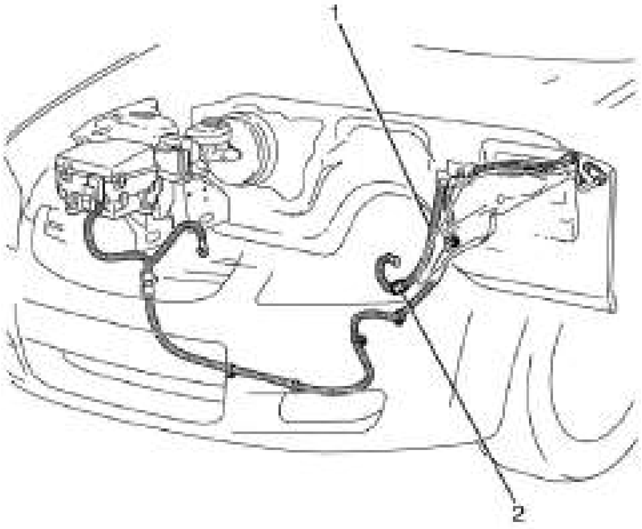


8. Remove the starter battery positive cable to starter motor retaining nut (2).
9. Disconnect the starter battery positive cable (1) from the starter motor (3).
10. Lower the vehicle.

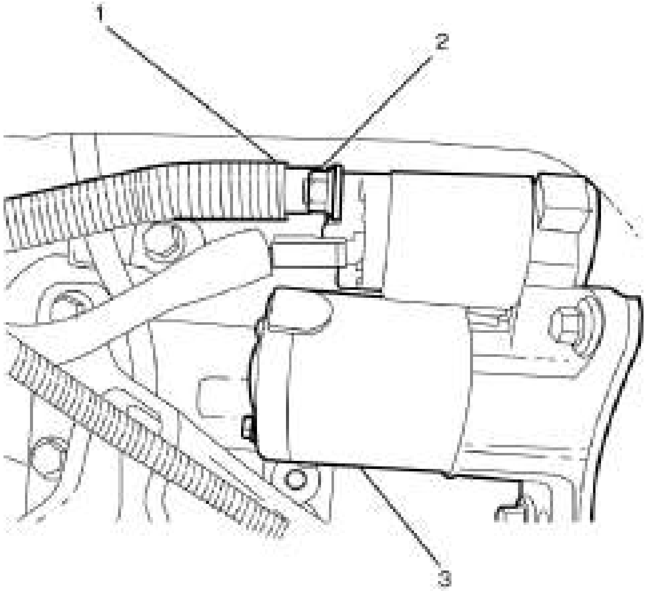


11. Detach the starter battery positive cable (1) from the starter battery positive cable retaining clip (2).
12. Remove the starter battery positive cable (1) from the engine compartment.

Installation Procedure - Starter (3.6L Engine)



1. Install the starter battery positive cable (1) to the engine compartment.
2. Attach the starter battery positive cable (1) to the starter battery positive cable retaining clip (2).
3. Raise the vehicle.



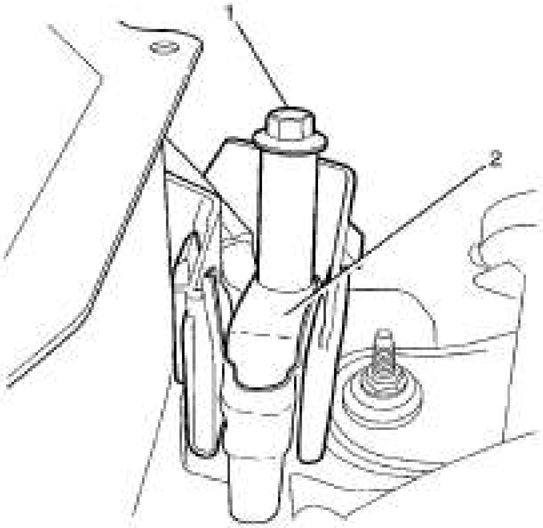
4. Connect the starter battery positive cable (1) to the starter motor (3).

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the starter battery positive cable to starter motor retaining nut (2).

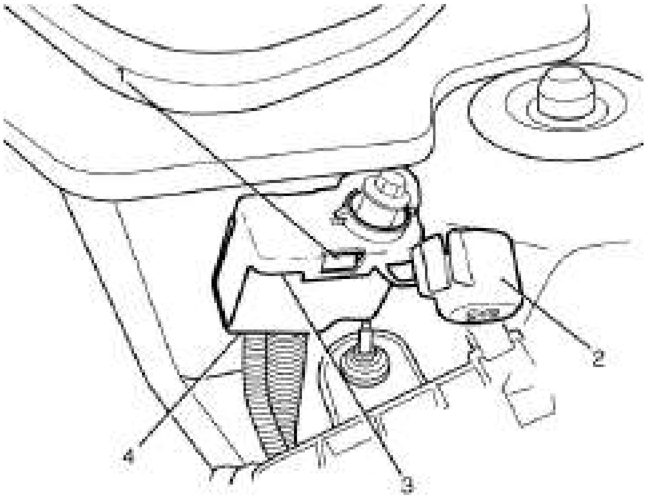
   Tighten
   Tighten the nut to 11 N·m (97 lb in).

6. Lower the vehicle.



7. Connect the starter battery positive cable (2) to the remote battery positive post.
8. Install the remote battery positive post to battery positive cable retaining bolt (1).

   Tighten
   Tighten the bolt to 15 N·m (11 lb ft).



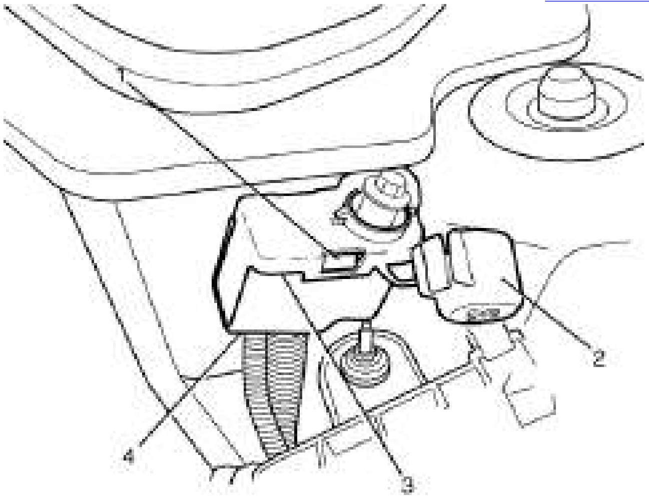
Important: Listen for an audible click from the retaining clip (1) to confirm correct fitting of the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).

9. Install the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).
10. Attach the remote battery positive post cover (2) to the remote battery positive cable upper protective cover (3).
11. Install the front air deflector. Refer to Front Air Deflector Replacement.
12. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Removal Procedure - Starter (6.0L Engine)

Caution: Refer to Battery Disconnect Caution in the Preface section.

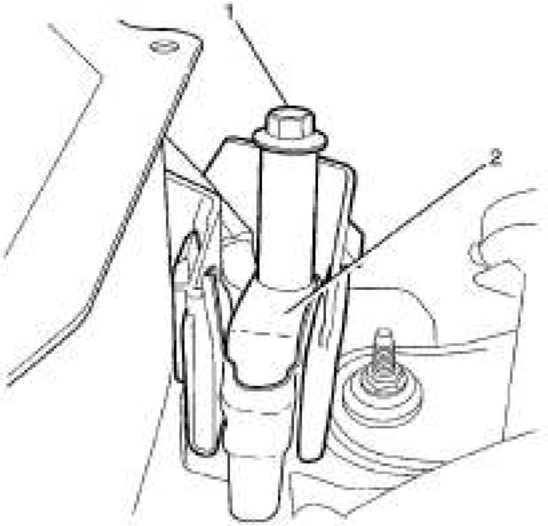
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front air deflector. Refer to Front Air Deflector Replacement.



3. Detach the remote battery positive post cover (2) from the remote battery positive cable upper protective cover (3).

Important: Remove the remote battery positive cable upper protective cover (3) by pressing the retaining clip (1) and lifting the remote battery positive cable upper protective cover (3) upwards.

4. Remove the remote battery positive cable upper protective cover (3) from the remote battery positive cable lower protective cover (4).

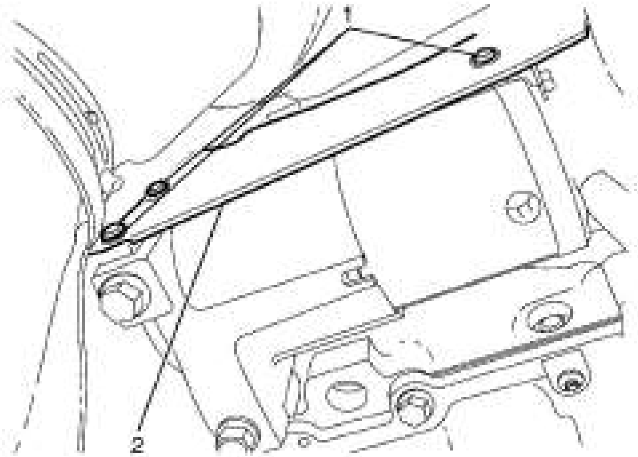


5. Remove the remote battery positive post to battery positive cable retaining bolt (1).
6. Disconnect the starter battery positive cable (2) to the remote battery positive post.

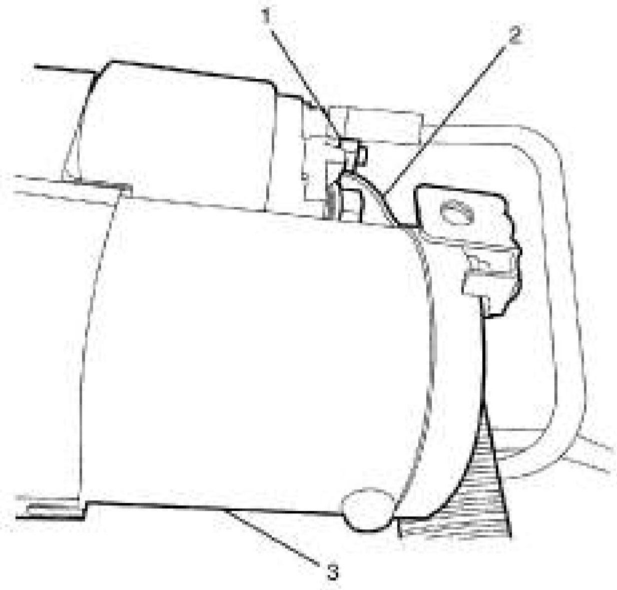
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

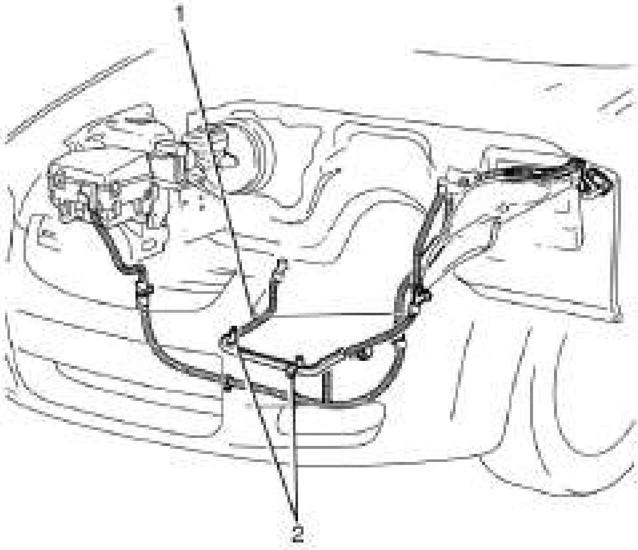
7. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
8. Remove the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.



9. Remove the starter motor heat shield to starter motor retaining bolts (1).
10. Remove the starter motor heat shield (2) from the starter motor.

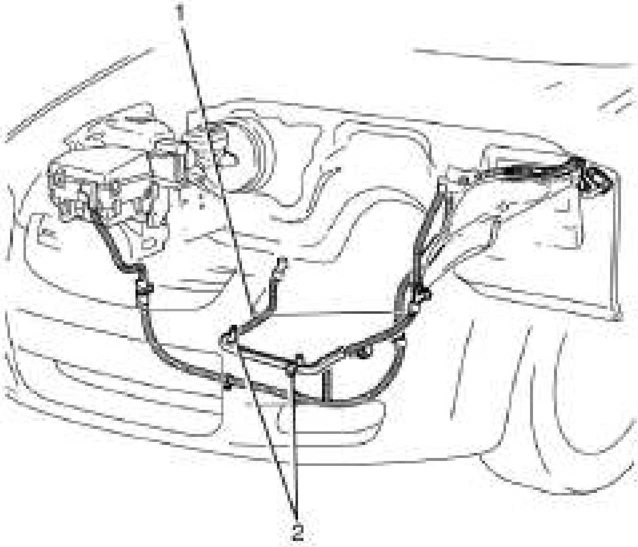


11. Remove the starter battery positive cable to starter motor retaining nut (1).
12. Disconnect the starter battery positive cable (2) from the starter motor (3).
13. Lower the vehicle.

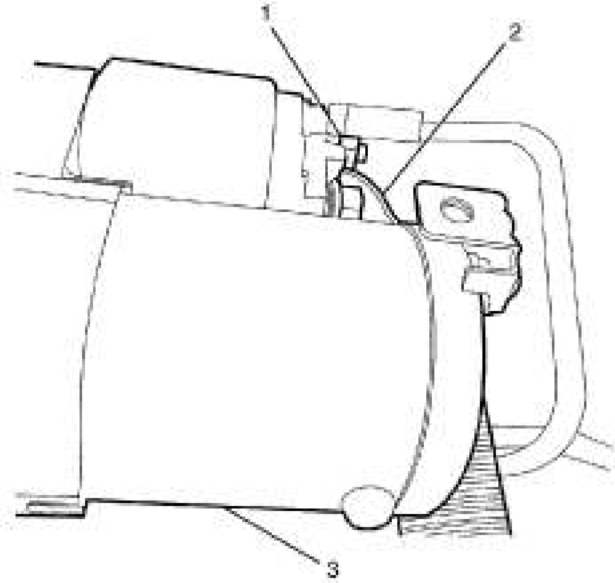


14. Detach the starter battery positive cable from the chassis retaining clips (2).
15. Remove the starter battery positive cable (1) from the engine compartment.

Installation Procedure - Starter (6.0L Engine)



1. Install the starter battery positive cable (1) to the engine compartment.
2. Attach the starter battery positive cable to the chassis retaining clips (2).
3. Raise the vehicle.

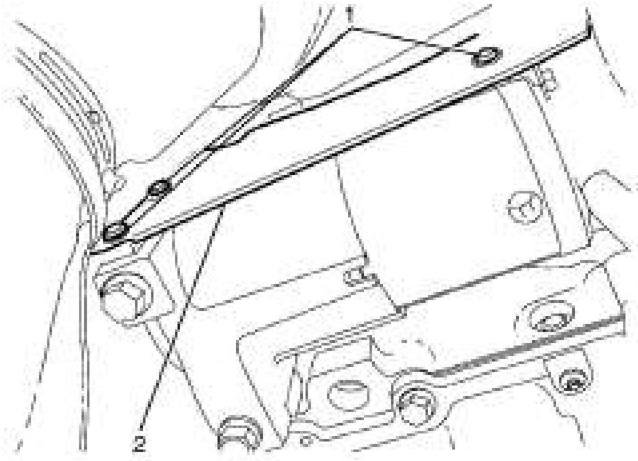


4. Connect the starter battery positive cable (2) to the starter motor (3).

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the starter battery positive cable to starter motor retaining nut (1).

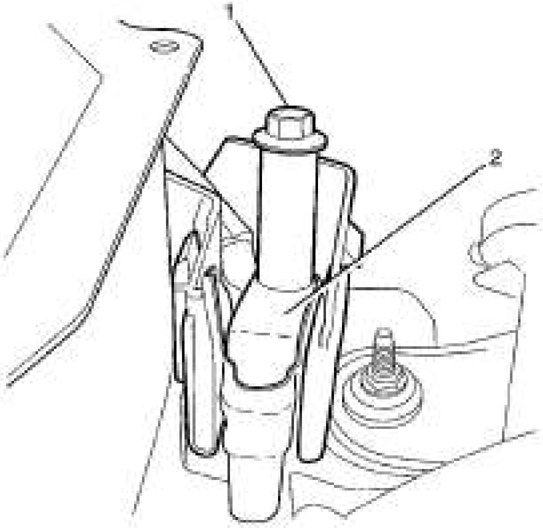
   Tighten
   Tighten the nut to 10 N·m (89 lb in).



6. Install the starter motor heat shield to the starter motor (2).
7. Install the starter motor heat shield to starter motor retaining bolts (1).

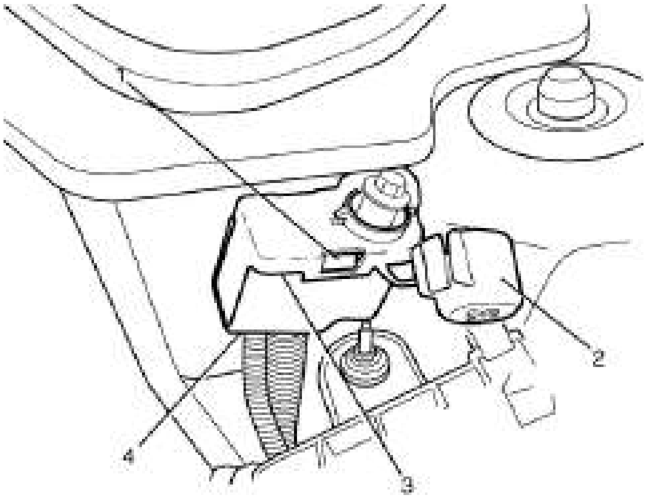
Tighten
Tighten the bolts to 5 N·m (44 lb in).

8. Install the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.
9. Lower the vehicle.



10. Connect the starter battery positive cable (2) to the remote battery positive post.
11. Install the remote battery positive post to battery positive cable retaining bolt (2).

Tighten
Tighten the bolts to 15 N·m (11 lb ft).



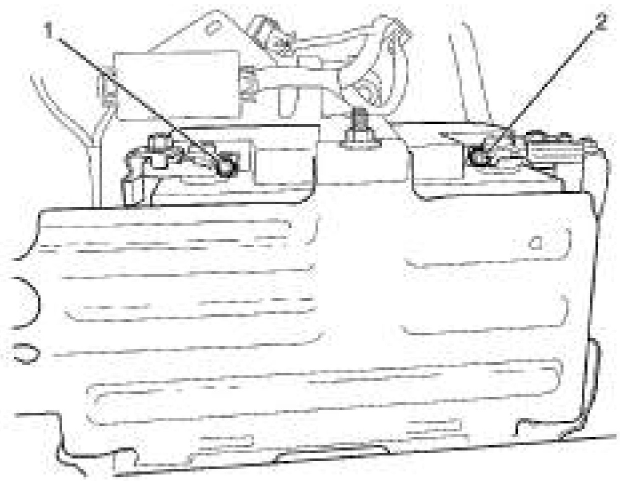
Important: Listen for an audible click from the retaining clip (1) to confirm correct fitting of the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).

12. Install the remote battery positive cable upper protective cover (3) to the remote battery positive cable lower protective cover (4).
13. Attach the remote battery positive post cover (2) to the remote battery positive cable upper protective cover (3).
14. Install the front air deflector. Refer to Front Air Deflector Replacement.
15. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

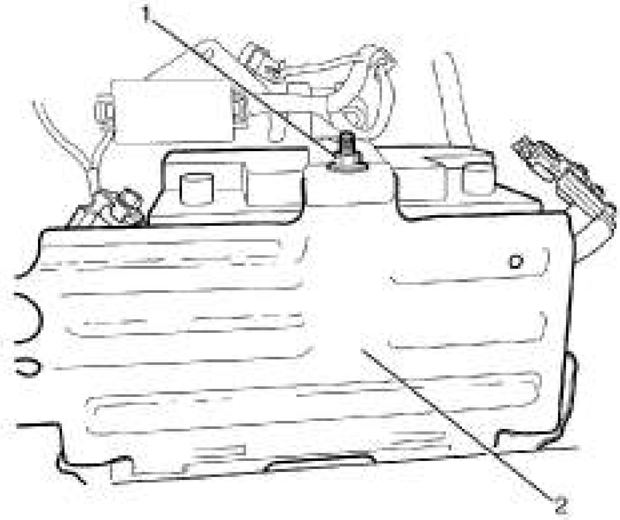
Battery Replacement (Sedan)

Removal Procedure

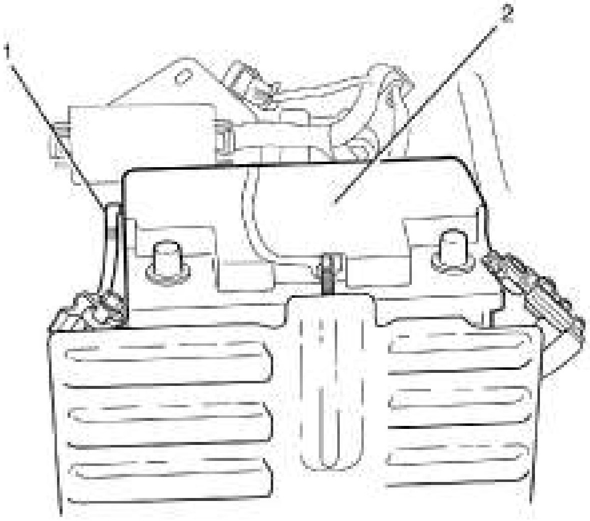
1. Remove the cargo area centre carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
2. Remove the left-hand side cargo area trim. Refer to Rear Compartment Side Trim Panel Replacement



3. Disconnect the battery negative cable (1) from the battery. Refer to Battery Negative Cable Disconnection and Connection.
4. Disconnect the battery positive cable (2) from the battery.

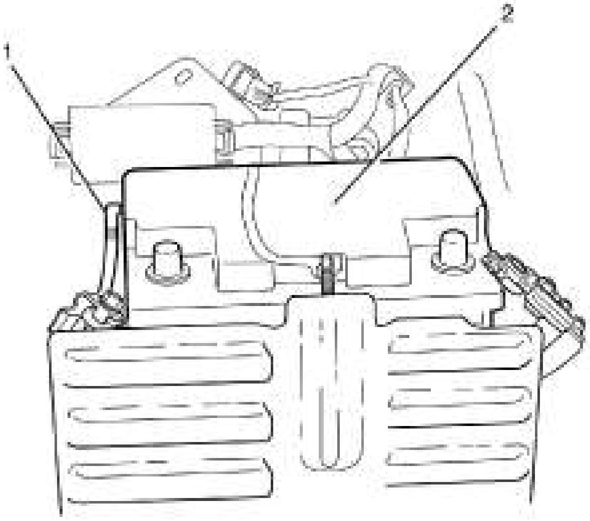


5. Remove the battery retainer strap nut (1) from the battery retainer.
6. Remove the battery retainer plate (2) from the vehicle.



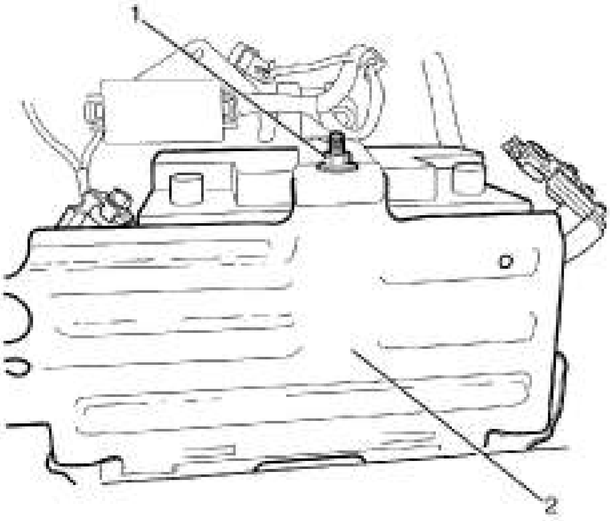
7. Detach the battery vent hose (1) from the battery (2).
8. Remove the battery (2) from the vehicle.

Installation Procedure



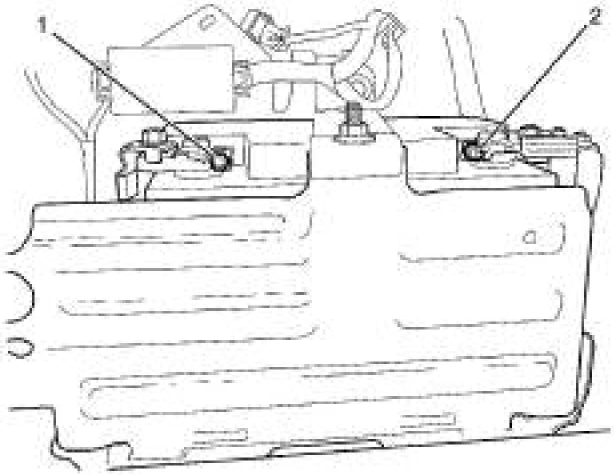
1. Install the battery (2) to the vehicle.
2. Attach the battery vent hose (1) to the battery (2).

Notice: Refer to Fastener Notice in the Preface section.



3. Install the battery retainer plate (2), locate the retainer strap to the retainer plate and install the battery retainer strap nut (1).

   Tighten
   Tighten the nut to 18 N·m (13 lb ft).



4. Connect the battery positive cable (2) to the battery.

   Tighten

Tighten the nut to 17 N·m (13 lb ft).

5. Connect the battery negative cable (1). Refer to Battery Negative Cable Disconnection and Connection.

   Tighten
   Tighten the nut to 17 N·m (13 lb ft).

6. Install the cargo area centre carpet. Refer to Rear Compartment Side Trim Panel Replacement
7. Instal the left-hand side cargo area trim. Refer to Rear Compartment Floor Panel Carpet Replacement
8. Close rear compartment lid.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 2079434**

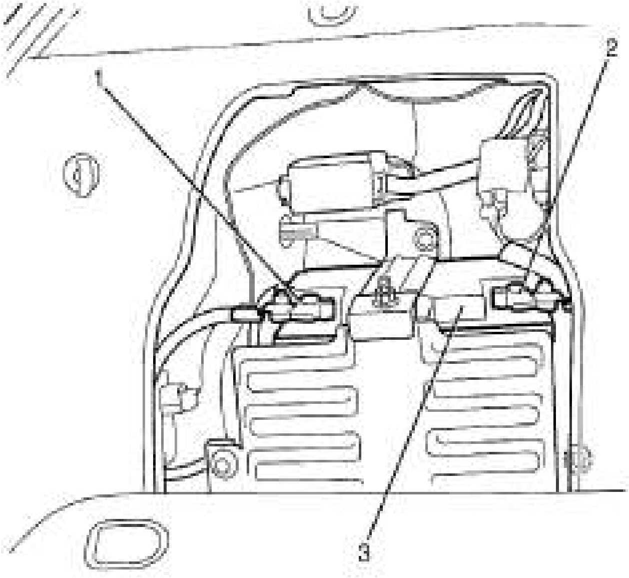
Battery Replacement (Sportwagon)

Removal Procedure

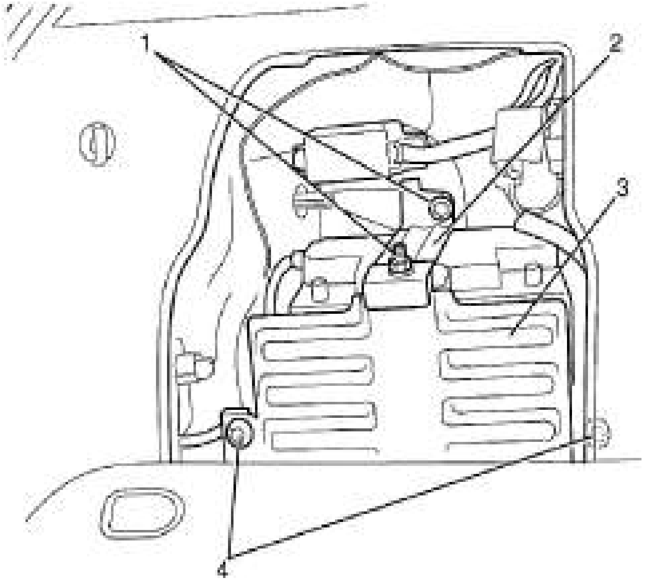
1. Open the liftgate.

   Important: When a suitable hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

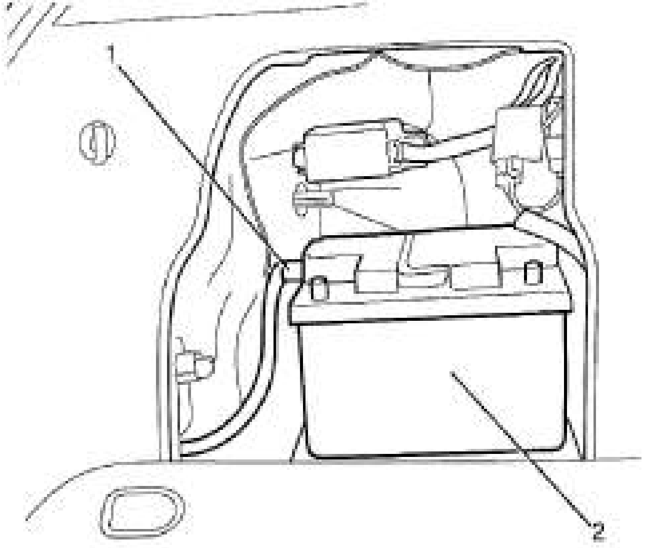
2. Install a suitable liftgate brace to the vehicle.
3. Remove the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.



4. Disconnect the battery negative cable (1) from the battery (3). Refer to Battery Negative Cable Disconnection and Connection.
5. Disconnect the battery positive cable (2) from the battery (3).

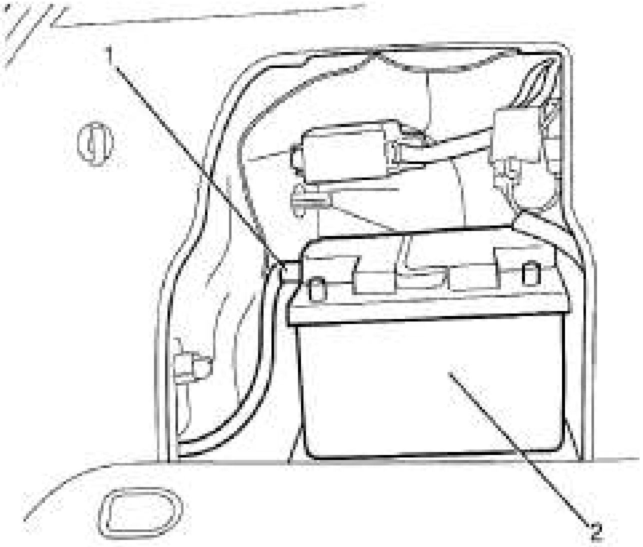


6. Remove the battery retainer strap nuts (1) from the battery retainer strap (2).
7. Remove the battery retainer strap (2).
8. Remove the battery retainer plate to battery tray retaining bolts (4).
9. Remove the battery retainer plate (3) from the vehicle.

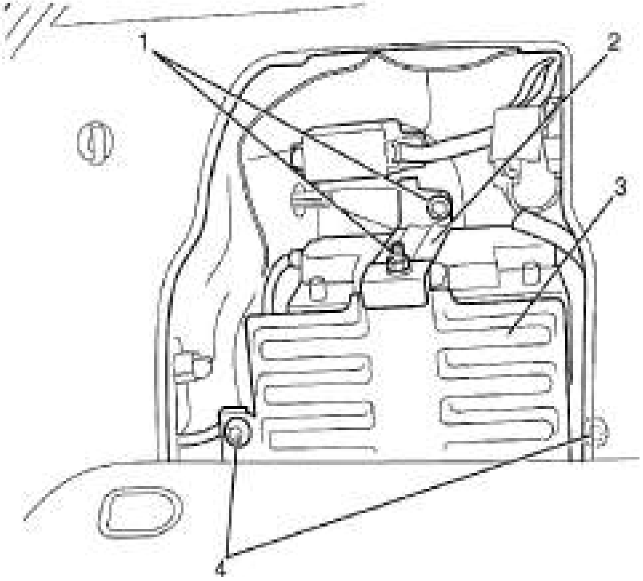


10. Pull out the battery vent hose (1) from the battery (2).
11. Remove the battery (2) from the vehicle.

Installation Procedure



1. Install the battery (2) to the vehicle.
2. Push in the battery vent hose (1) to the battery (2).



3. Install the battery retainer plate (3) to the vehicle.

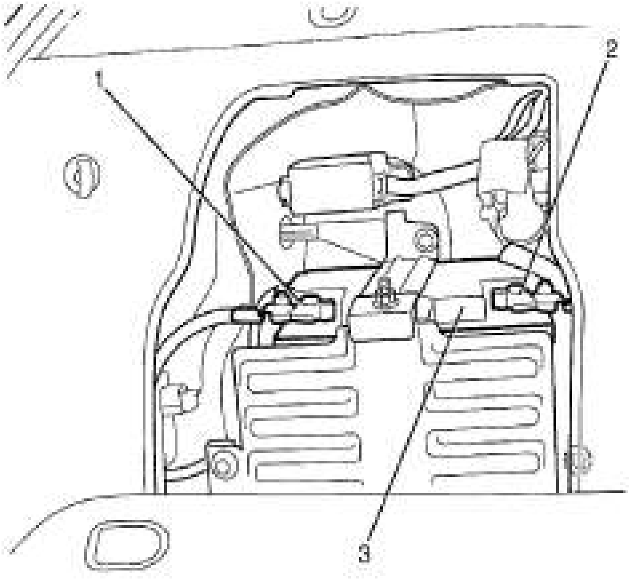
   Notice: Refer to Fastener Notice in the Preface section.

4. Install the battery retainer plate to battery tray retaining bolts (4).

   Tighten
   Tighten the bolts to 6 N·m (53 lb in).

5. Install the battery retainer strap (2).
6. Install the battery retainer strap nuts (1) to the battery retainer strap (2).

Tighten
Tighten the nuts to 6 N·m (53 lb in).



7. Connect the battery positive cable (2) to the battery (3).

   Tighten
   Tighten the nut to 5 N·m (44 lb in).

8. Connect the battery negative cable (1) to the battery (3). Refer to Battery Negative Cable Disconnection and Connection.

   Tighten
   Tighten the nut to 5 N·m (44 lb in).

9. Install the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.

   Important: When a suitable hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

10. Remove the suitable liftgate brace from the vehicle.
11. Close the liftgate.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 2080794**

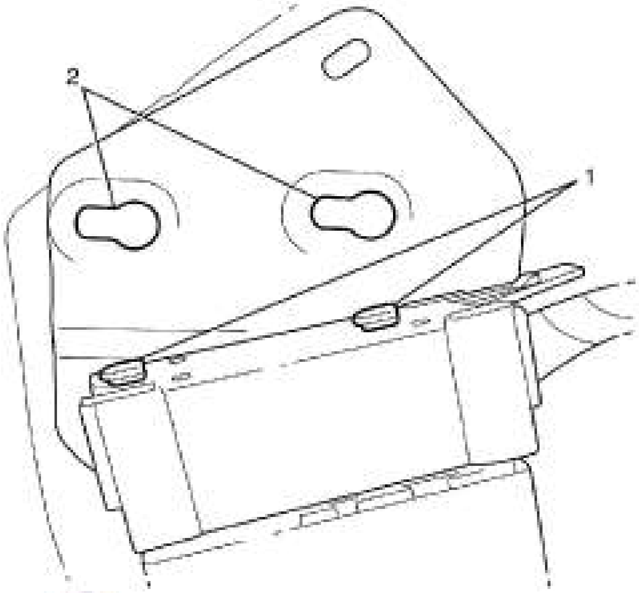
Battery Tray Replacement (Sedan)

Removal Procedure

1. Remove the cargo area centre carpet. Refer to Rear Compartment Floor Panel Carpet Replacement
2. Remove the left-hand side cargo area trim. Refer to Rear Compartment Side Trim Panel Replacement

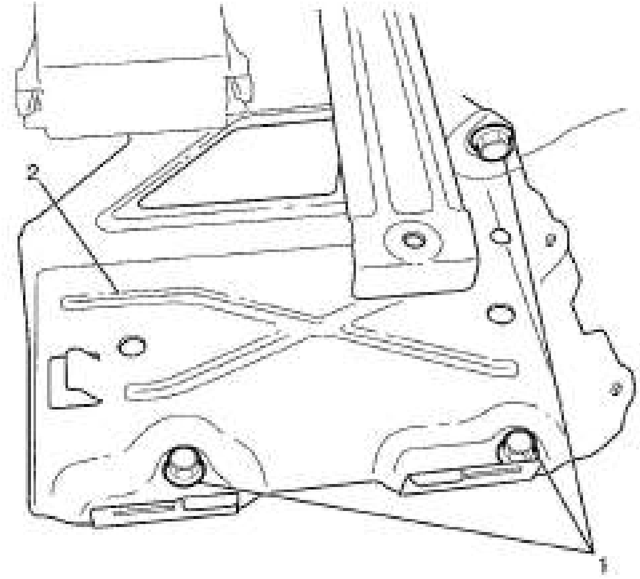
Caution: Refer to Battery Disconnect Caution in the Preface section.

3. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
4. Remove the battery refer to Battery Replacement.



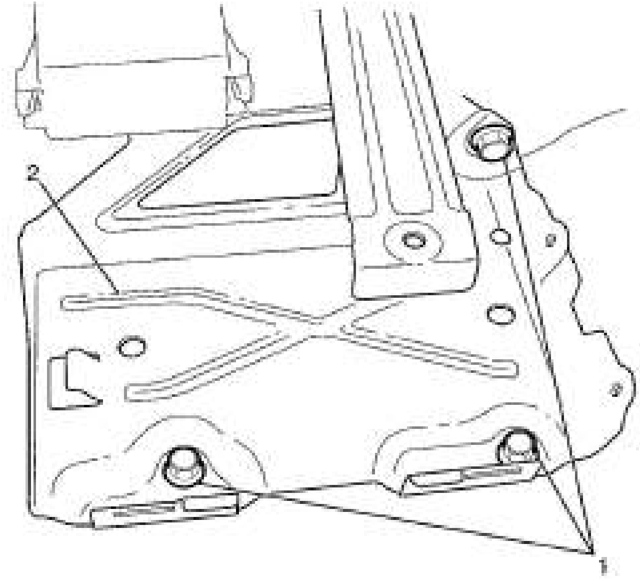
Important: To remove the fuse box, the locking tabs (1) must be released, push the fuse box towards the front of the vehicle to allow the fuse box to be released from the battery tray (2).

5. Remove the fuse box from the battery tray to allow access to the retaining bolts.



6. Remove the battery tray to chassis mounting bolts (1).
7. Remove the battery tray from the vehicle (2).

Installation Procedure

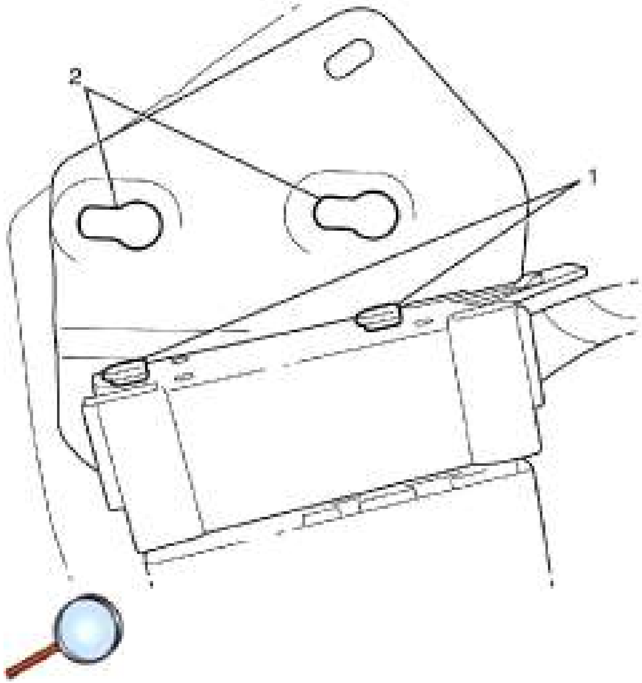


1. Fit the battery tray to the vehicle (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Fit the battery tray to chassis retaining bolts (1).

Tighten
Tighten the bolts to 25 N·m (18 lb ft).



Important: The fuse box locking tabs (1) must be located correctly into the battery tray (2), push the fuse box towards the rear of the vehicle to lock the fuse box into place.

3. Install the fuse box to the battery tray.

Caution: Refer to Battery Disconnect Caution in the Preface section.

4. Install the battery refer to Battery Replacement.
5. Install the left-hand side cargo area trim. Refer to Rear Compartment Side Trim Panel Replacement
6. Install the cargo area centre carpet.. Refer to Rear Compartment Floor Panel Carpet Replacement

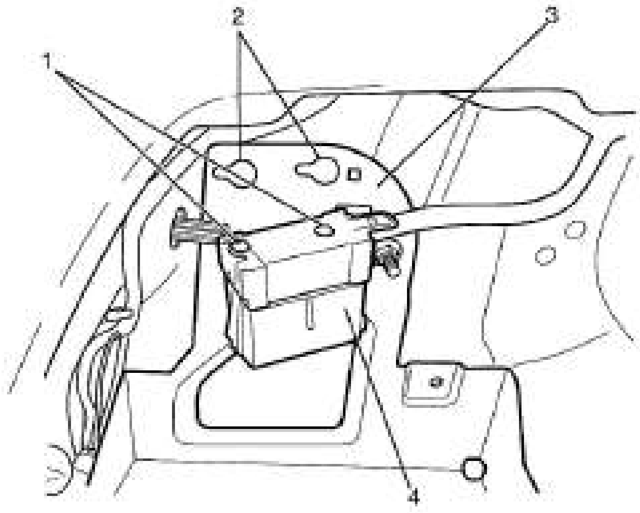
Battery Tray Replacement (Sportwagon)

Removal Procedure

1. Open the liftgate.

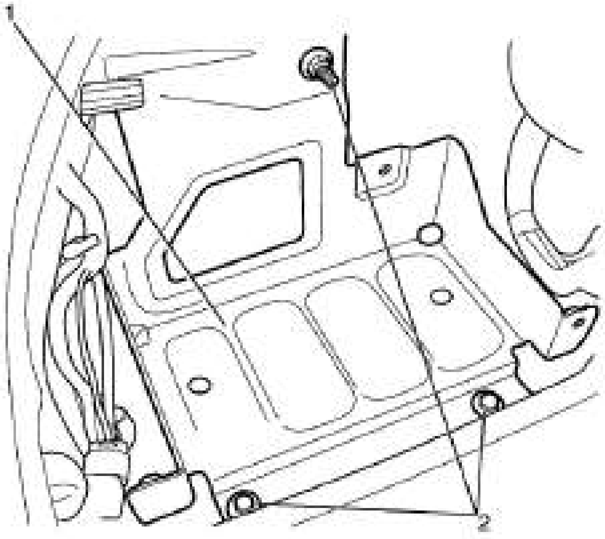
   Important: When a suitable hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

2. Install a suitable liftgate brace to the vehicle.
3. Remove the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.
4. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
5. Remove the battery. Refer to Battery Replacement.



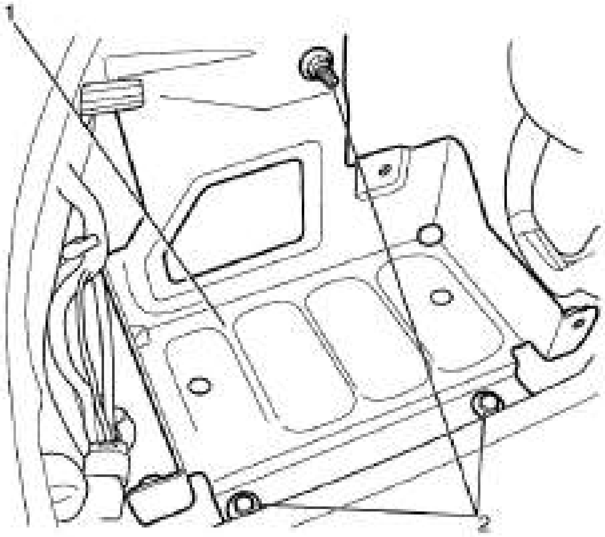
Important: To detach the fuse box, the locking tabs (1) must be released, push the fuse box (4) towards the front of the vehicle to detach from the battery tray (3).

6. Detach the fuse box (4) from the battery tray (3).



7. Remove the battery tray to chassis retaining bolts (2).
8. Remove the battery tray (1) from the vehicle.

Installation Procedure

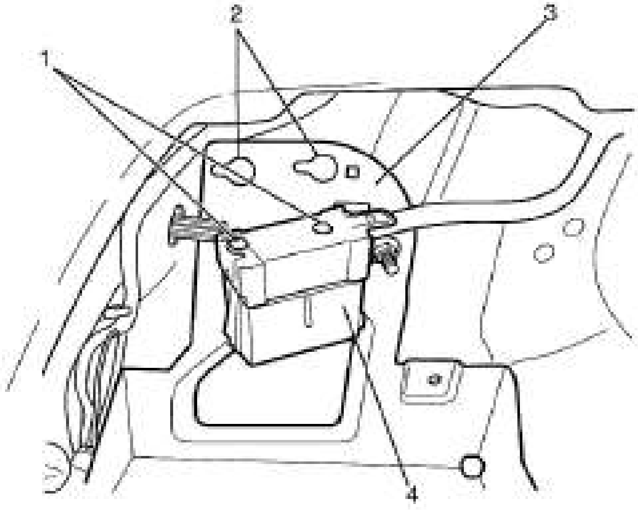


1. Install the battery tray (1) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the battery tray to chassis retaining bolts (2).

Tighten
Tighten the nut to 25 N·m (18 lb ft).



Important: The fuse box locking tabs (1) must be located correctly into the battery tray (3), push the fuse box towards the rear of the vehicle to lock the fuse box (4) into place.

3. Attach the fuse box (4) to the battery tray (3).
4. Install the battery. Refer to Battery Replacement.
5. Install the rear compartment side trim panel access hole cover. Refer to Rear Compartment Side Trim Panel Access Hole Cover Replacement.

Important: When a suitable hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

6. Remove the suitable liftgate brace to the vehicle.
7. Close the liftgate.

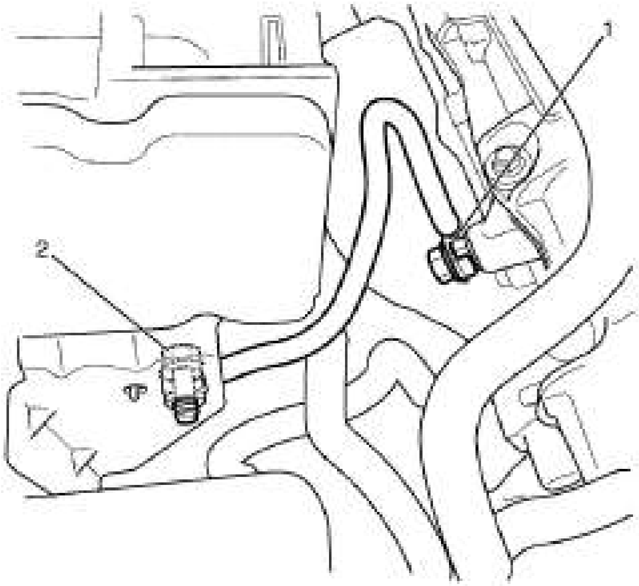
Engine Ground Strap Replacement (3.6L Engine)

Removal Procedure

1. Ignition OFF.

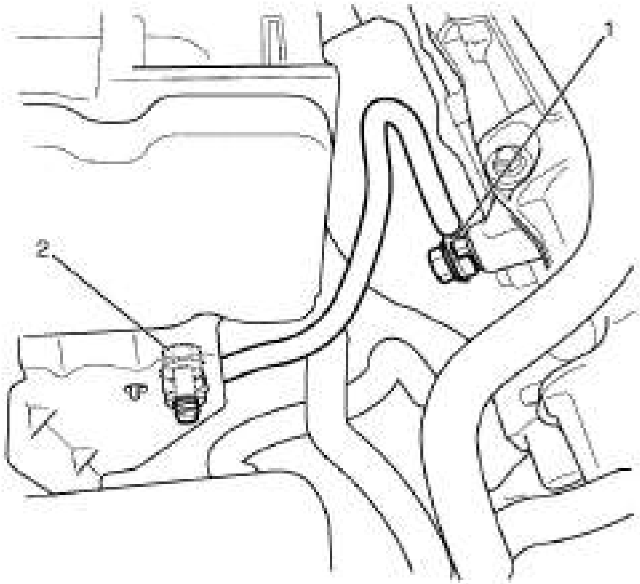
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.



3. Remove the engine ground strap to the right side engine cylinder head retaining nut (1).
4. Remove the engine ground strap to ABS module mounting bracket retaining bolt (2).
5. Remove the engine ground strap from the vehicle.

Installation Procedure



1. Position the engine ground strap to the correct position.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the engine ground strap to ABS module mounting bracket retaining bolt (2).

   Tighten
   Tighten the bolt to 15 N·m(11 lb ft).

3. Install the engine ground strap to the right side engine cylinder head retaining nut (1).

   Tighten
   Tighten the nut to 25 N·m(18 lb ft).

   Caution: Refer to Battery Disconnect Caution in the Preface section.

4. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 2181562**

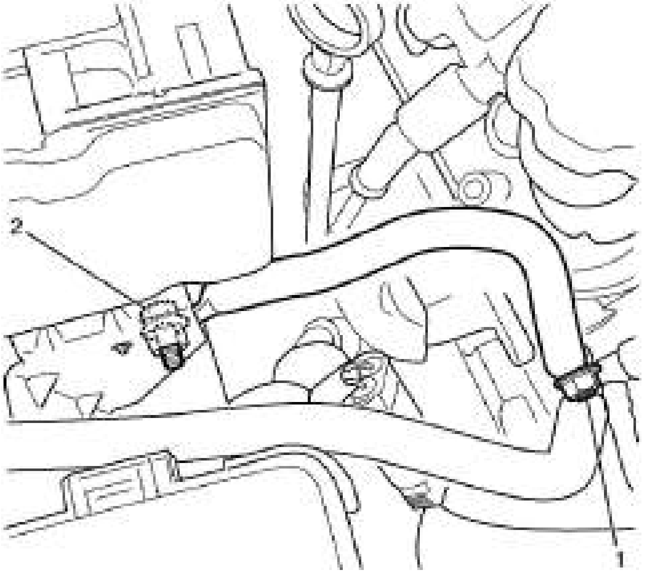
Engine Ground Strap Replacement (6.0L Engine)

Removal Procedure

1. Ignition OFF.

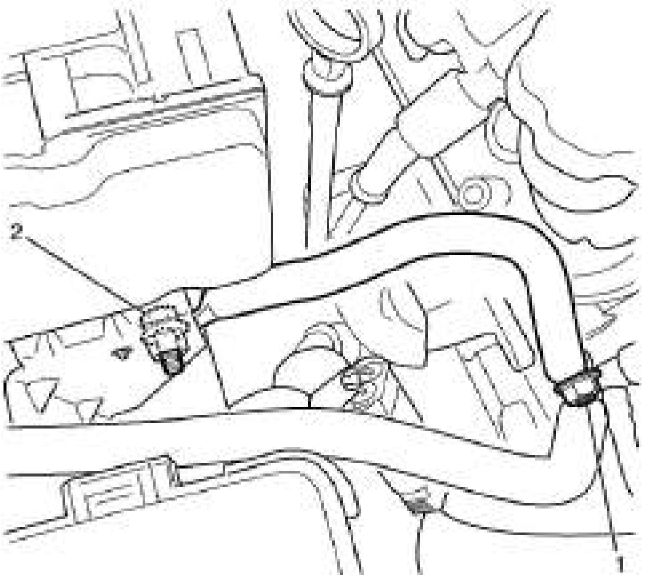
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.



3. Remove the engine ground strap to the right side engine cylinder head retaining nut (1).
4. Remove the engine ground strap to ABS module mounting bracket retaining bolt (2).
5. Remove the engine ground strap from the vehicle.

Installation Procedure



1. Position the engine ground strap to the correct position.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the engine ground strap to ABS module mounting bracket retaining bolt (2).

   Tighten
   Tighten the bolt to 15 N·m(11 lb ft).

3. Install the engine ground strap to the right side engine cylinder head retaining nut (1).

   Tighten
   Tighten the nut to 25 N·m(18 lb ft).

   Caution: Refer to Battery Disconnect Caution in the Preface section.

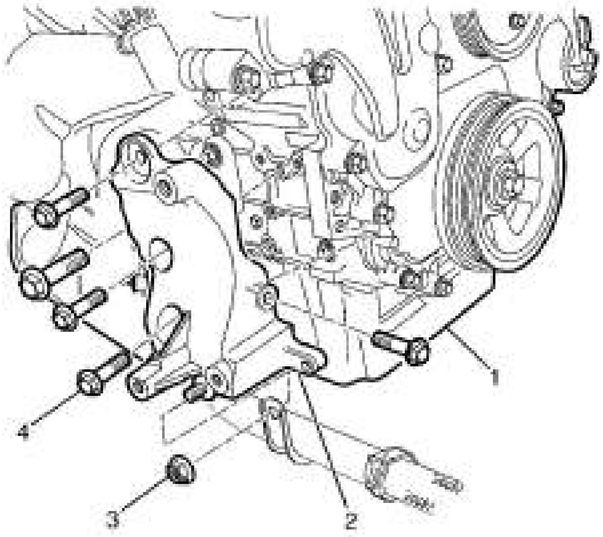
4. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 1977444**

Generator Bracket Replacement (3.6L Engine)

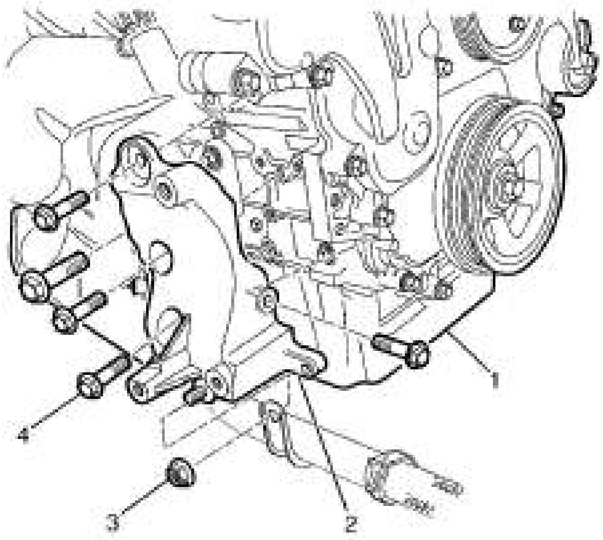
Removal Procedure

1. Remove the alternator. Refer to Generator Replacement.



2. Remove the coolant inlet pipe to alternator mounting bracket retaining nut (3).
3. Remove the alternator mounting bracket to cylinder block retaining bolts (4).
4. Remove the alternator mounting bracket (2) from the cylinder block (1).

Installation Procedure



1. Install the alternator bracket (2) to the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the alternator bracket to engine block retaining bolts.

   Tighten
   Tighten the bolts to 50 N·m (37 lb ft).

3. Install the coolant inlet pipe to alternator mounting bracket retaining nut (3).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).

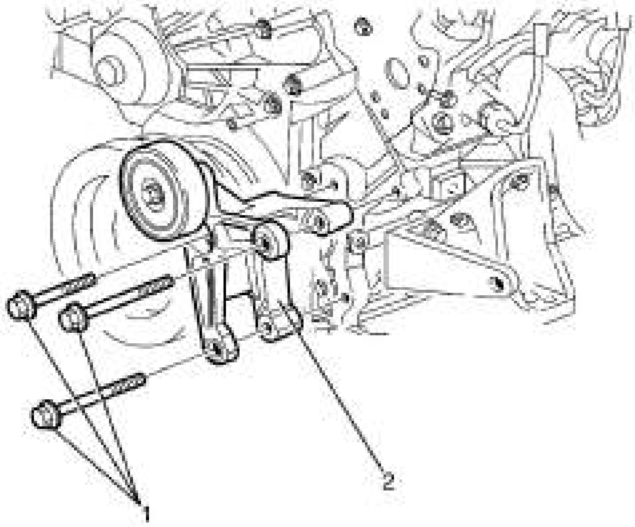
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | Document ID: 1977440

Generator Bracket Replacement (6.0L Engine)

Removal Procedure

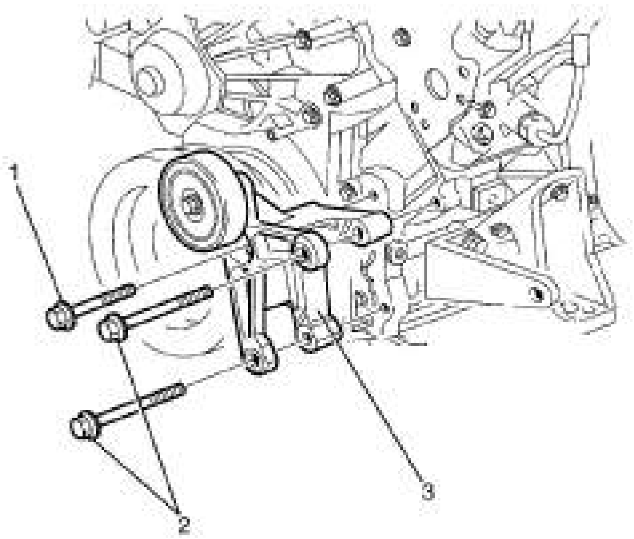
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Ignition OFF.
2. Remove the alternator. Refer to Generator Replacement .



3. Remove the alternator bracket to engine block mounting bolts (1).
4. Remove the alternator bracket (2) from the vehicle.

Installation Procedure



1. Install the alternator bracket (3) to the engine block.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the alternator bracket to engine block mounting bolts (1).

   Tighten
   Tighten the bolts in the sequence shown.

   Tighten
   Tighten the bolts 1 to 27 N·m (20 lb ft).

   Tighten
   Tighten the bolt 2 to 50 N·m (37 lb ft).

3. Install the alternator. Refer to Generator Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 1977438**

Generator Replacement (3.6L Engine)

Removal Procedure

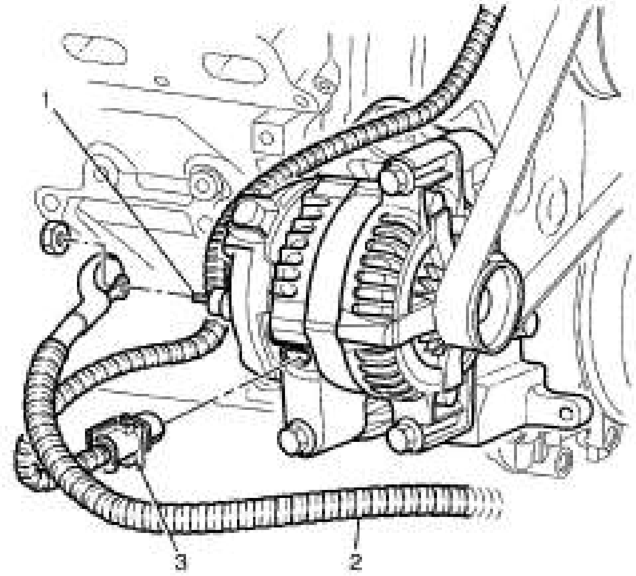
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

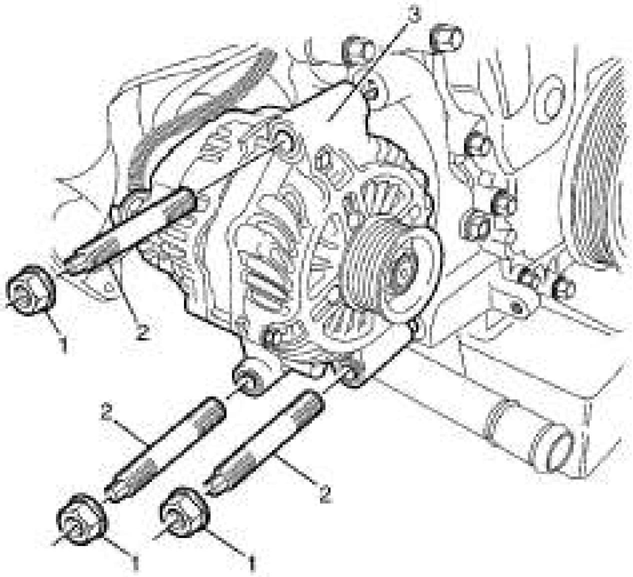
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the drive belt from the alternator. Refer to Drive Belt Replacement.

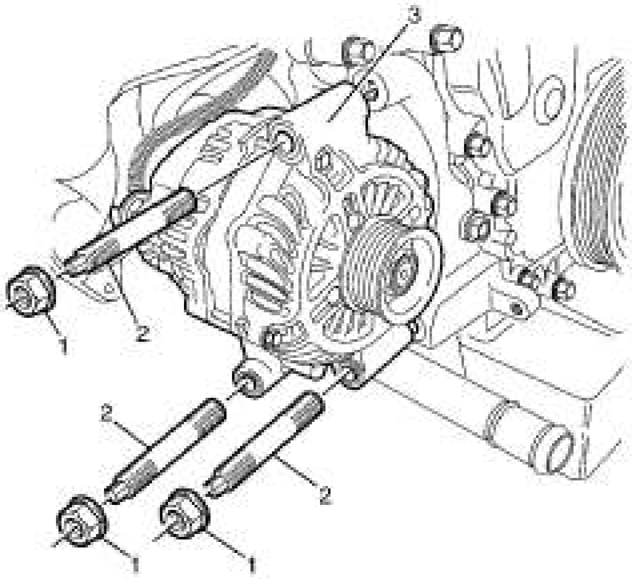


4. Disconnect the electrical connector (3) from the alternator.
5. Reposition the protective boot from the alternator output terminal for access.
6. Remove the alternator output terminal nut (1) and disconnect the battery positive lead from the alternator.



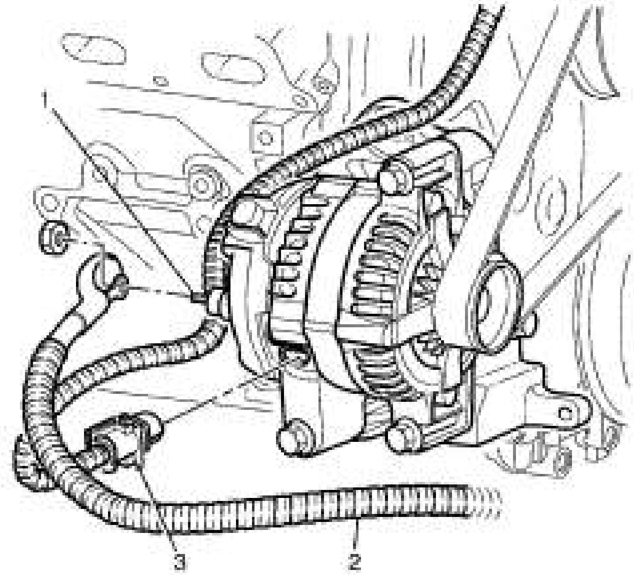
7. Remove the alternator to alternator retaining nuts (1).
8. Remove the alternator to alternator bracket retaining studs (2).
9. Remove the alternator from the vehicle (3).

Installation Procedure



1. Install the alternator (3) to the alternator mounting bracket.
2. Install the alternator to alternator bracket retaining studs (2).
3. Instal the alternator to alternator bracket retaining nuts (1).

Tighten
Tighten the nut to xx N·m (xx lb in).



4. Install the battery positive lead and the alternator terminal nut (1) to the alternator.

   Tighten
   Tighten the nut to 13 N·m (115 lb in).

5. Install the terminal boot.
6. Connect the electrical connector (3) to the alternator.
7. Lower the vehicle.
8. Install the drive belt to the alternator. Refer to Drive Belt Replacement.
9. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

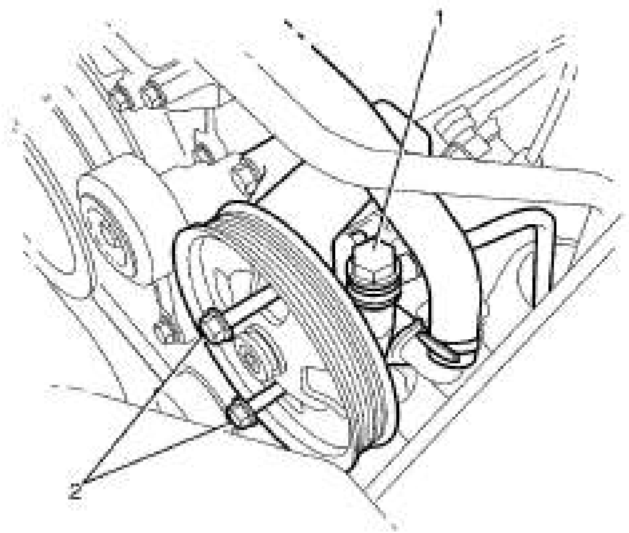
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | Document ID: 2042177

Generator Replacement (6.0L Engine)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

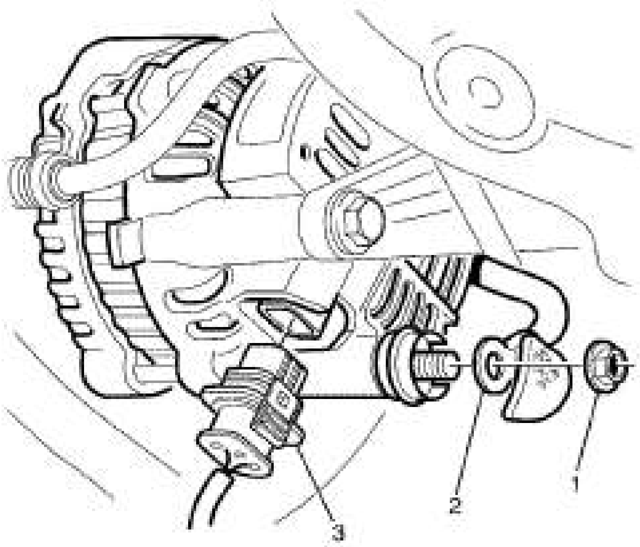
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine cover. Refer to Engine Cover Replacement.
3. Remove air filter assembly. Refer to Air Cleaner Assembly Replacement.
4. Remove the induction tube from throttle body. Refer to Air Cleaner Inlet Duct Replacement.
5. Remove the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement.
6. Remove the drive belt. Refer to Drive Belt Replacement - Accessory.



7. Remove the power steering pump to power steering hose banjo bolt (1)

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

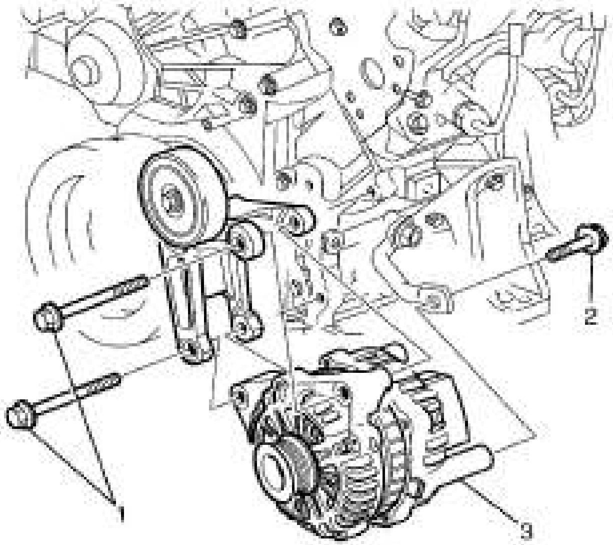
8. Remove the power steering pump to power steering pump bracket retaining bolts (2).
   - Discard the bolts.
   - Place the power steering pump to allow access to the alternator



9. Remove the alternator battery positive cable nut (1) from the alternator.
10. Remove the alternator battery positive cable (2) from the alternator stud.

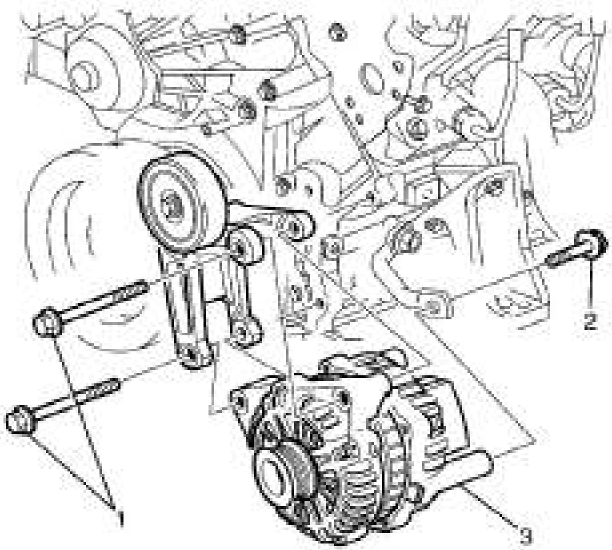
Important: Press the retainer tabs to remove electrical connector.

11. Remove the electrical connector (3) from the alternator.



12. Remove the alternator retaining bolts (1&2).
13. Remove the alternator (3) from the vehicle.

Installation Procedure

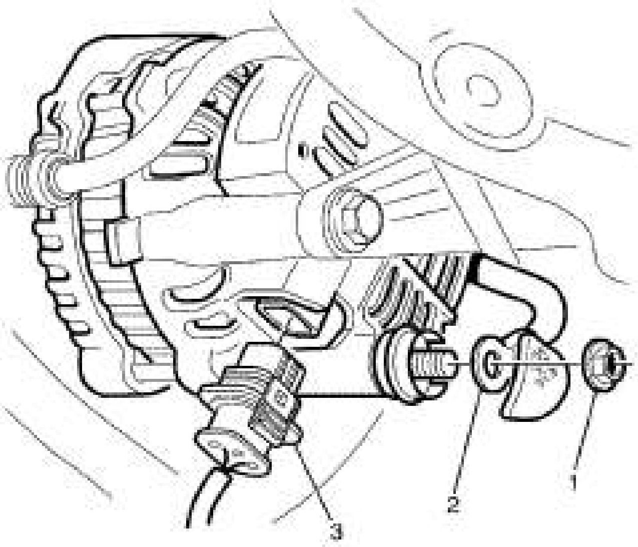


1. Install the alternator to the alternator mounting bracket.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install alternator retaining bolts (1 and 2).

   Tighten
   Tighten the bolts to 34 N·m (25 lb in).

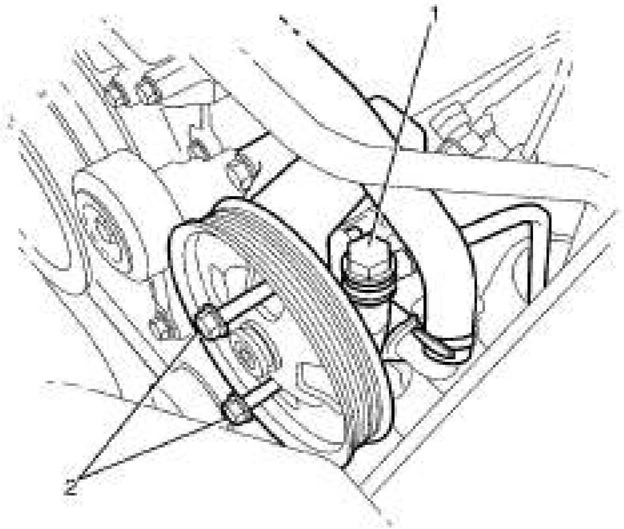


3. Install the alternator battery positive cable (2) to the alternator stud.
4. Install the alternator battery cable nut (1) to the alternator.

Tighten
Tighten the bolts to 13 N·m (115 lb in).

Important: Ensure locking tabs are located into the correct position.

5. Install the electrical connector (3).



6. Install the power steering pump to the power steering pump bracket.
7. Install the power steering pump to power steering pump bracket retaining bolts (2).

Tighten
Tighten the bolts to 30 N·m (23 lb ft).

8. Install the power steering pump to power steering hose banjo fitting bolt (1). Refer to Power Steering System Bleeding.
9. Install the drive belt. Refer to Drive Belt Replacement - Accessory.
10. Install the induction tube to the throttle body. Refer to Air Cleaner Inlet Duct Replacement.
11. Install the mass air flow (MAF) sensor. Refer to Mass Airflow Sensor/Intake Air Temperature Sensor Replacement.
12. Install the air box. Refer to Air Cleaner Assembly Replacement.
13. Install the engine dress cover. Refer to Engine Cover Replacement.
14. Reconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Starter Replacement (3.6L Engine)

Removal Procedure

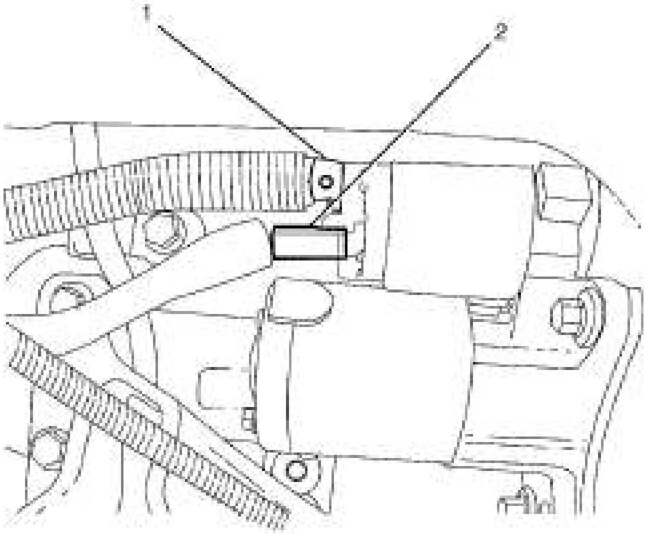
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

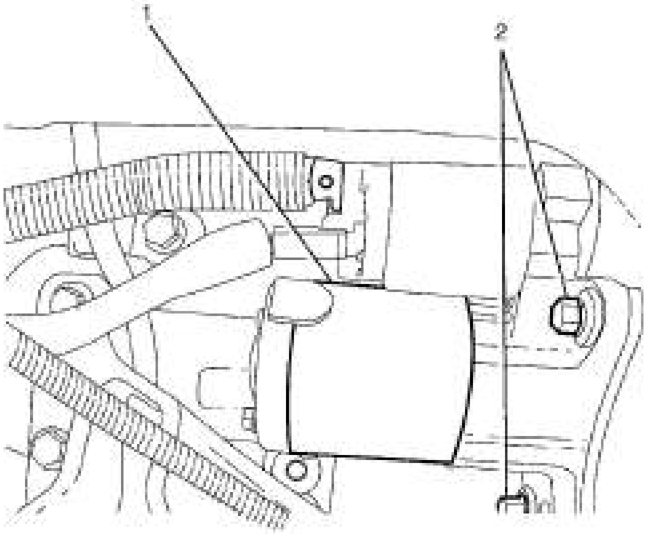
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Ignition OFF.

Caution: Refer to Battery Disconnect Caution in the Preface section.

3. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.



4. Remove the starter motor solenoid electrical connector (2) from the starter motor.
5. Remove the battery positive cable retaining nut (1) from the starter motor solenoid .



6. Remove the starter motor to bell housing retaining bolts (2).
7. Remove the starter motor (1) from the vehicle.

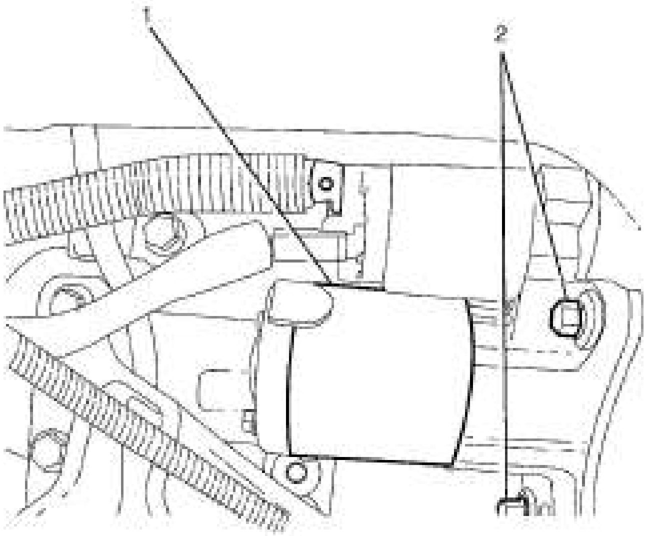
Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

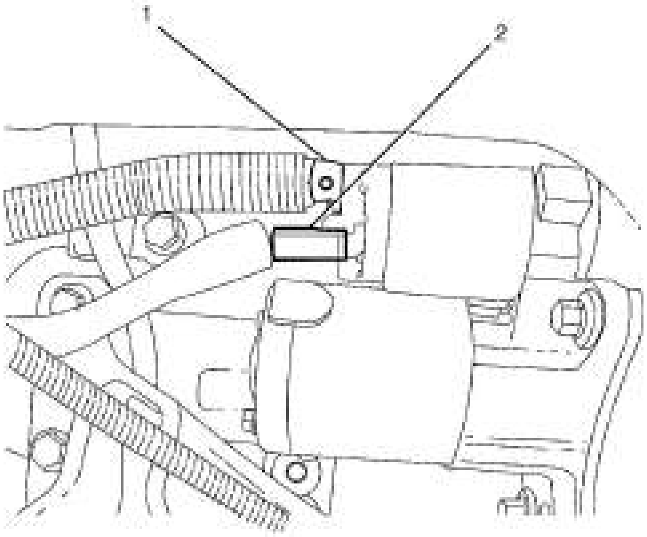
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Manoeuvre the starter motor into place, locating into the correct position on the bell housing.

Notice: Refer to Fastener Notice in the Preface section.



3. Install the starter motor to bell housing (2) retaining bolt.

   Tighten
   Tighten the bolts to 50 N·m (37 lb ft).



4. Install the battery positive cable to the battery solenoid.
5. Install the starter motor solenoid cable to the starter motor retaining nut (1).

   Tighten
   Tighten the nut to 20 N·m (14 lb ft).

6. Install the starter motor solenoid cable (1) to the starter motor.
7. Lower the vehicle from supports. Refer to Lifting and Jacking the Vehicle.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

8. Connect negative battery terminal. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Repair Instructions | **Document ID: 1995435**

Starter Replacement (6.0L Engine)

Removal Procedure

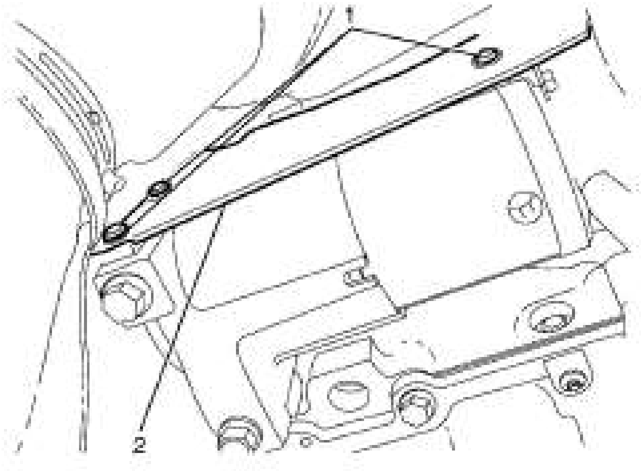
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

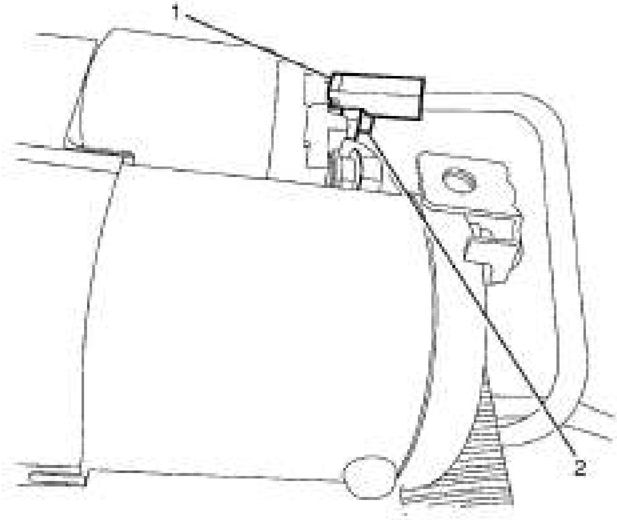
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

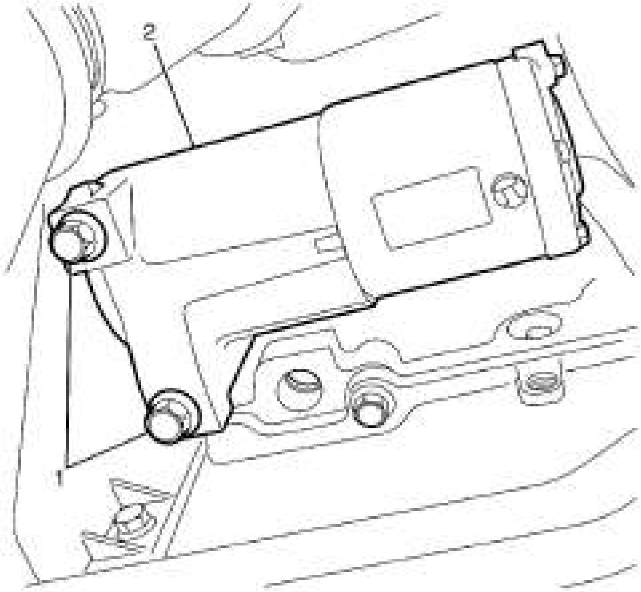
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the right catalytic converter from the vehicle. Refer to Catalytic Converter Replacement - Right Side.



4. Remove the starter motor heat shield to starter motor retaining bolts (1).
5. Remove the heat shield from the vehicle (2).



6. Remove the starter motor solenoid cable (1) from the starter motor.
7. Remove battery positive cable retaining nut (2) from the starter motor solenoid.



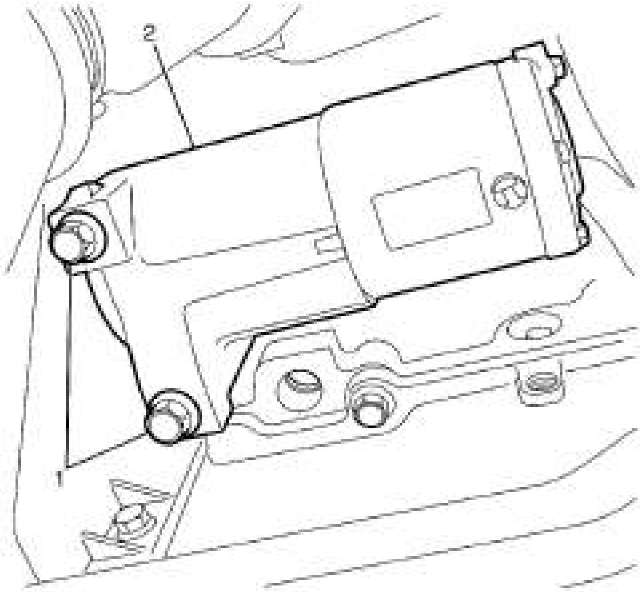
8. Remove starter motor to engine block retaining bolts (1).
9. Manoeuvre the starter motor (2) out and down between the transmission bell housing and body sub frame.

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

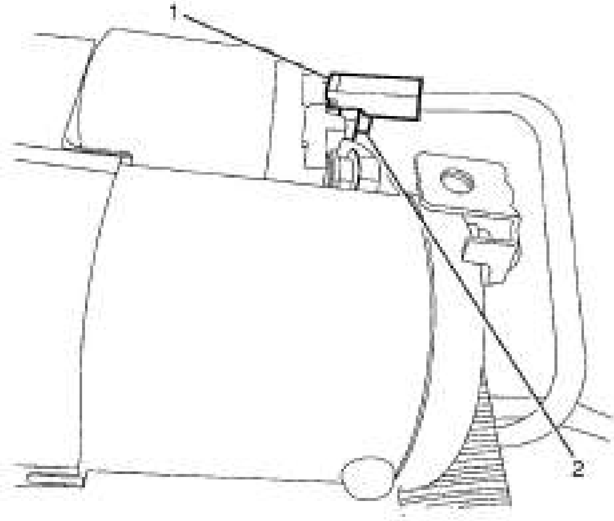


2. Manoeuvre the starter motor (2) Into position between the transmission bell housing and body sub frame.

   Notice: Refer to Fastener Notice in the Preface section.

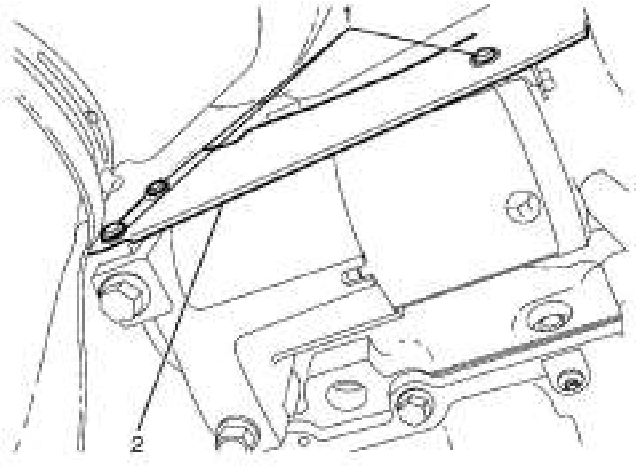
3. Install starter motor to bell housing retaining bolts (1).

   Tighten
   Tighten the bolts to xx N·m (xx lb ft).



4. Install the starter motor solenoid cable (2), to the starter motor solenoid terminal.
5. Install battery positive cable retaining nut (1) to the starter motor battery positive terminal.

Tighten
Tighten the solenoid cable nut to 10 N·m (7 lb ft).



6. Install the heat shield to the vehicle (2).
7. Install the heat shield to starter motor retaining bolts (1).

   Tighten
   Tighten the bolts to (5) N·m (44) lb in).

8. Install the right catalytic converter to the vehicle. Refer to Catalytic Converter Replacement - Right Side.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

9. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
10. Remove the safety stands.
11. Lower the vehicle to the ground.

Starter Shield Replacement

Removal Procedure

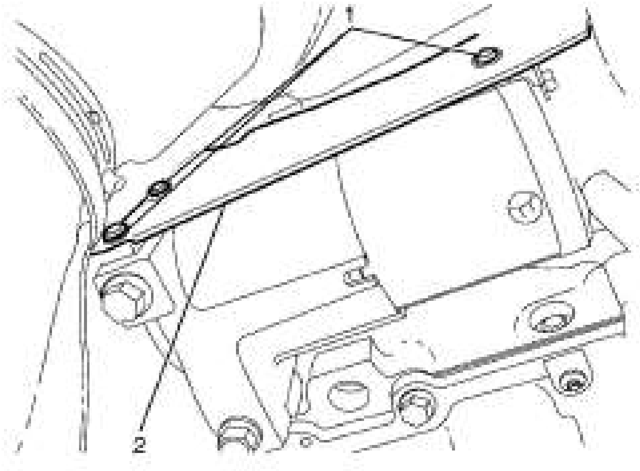
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to Safety Glasses Caution in the Preface section.

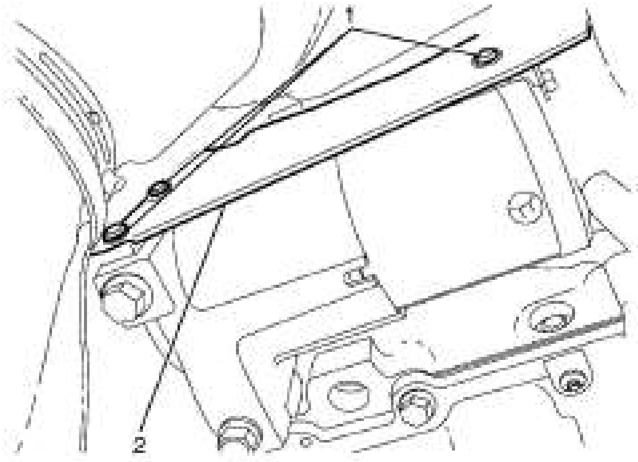
Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the right catalytic converter from the vehicle. Refer to Catalytic Converter Replacement - Right Side .



4. Remove the heat shield to starter motor retaining bolts (1).
5. Remove the heat shield (2) from the vehicle.

Installation Procedure



1. Install the heat shield (2) to the vehicle.
2. Install the heat shield to starter motor retaining bolts (1).

   Tighten
   Tighten the bolts to 30 N·m (22 lb ft).

3. Install the right catalytic converter to the vehicle. Refer to Catalytic Converter Replacement - Right Side .
4. Connect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Electrical | Description and Operation | **Document ID: 1990449**

Battery Description and Operation

SULFURIC ACID CAN CAUSE BLINDNESS OR SEVERE BURNS
L'ACIDE SULFURIQUE PEUT RENDRE AVEUGLE OU PROVOQUER DES BRÛLURES GRAVES
FLUSH EYES IMMEDIATELY WITH WATER GET MEDICAL HELP FAST
RINCER LES YEUX IMMÉDIATEMENT À L'EAU CONSULTER IMMÉDIATEMENT UN MÉDECIN
KEEP OUT OF REACH OF CHILDREN. DO NOT TIP. DO NOT OPEN BATTERY.
TENIR HORS DE LA PORTÉE DES ENFANTS. NE PAS INCLINER. NE PAS OUVRIR LA BATTERIE.
PROPOSITION 65 WARNING
BATTERY POSTS, TERMINALS, AND RELATED ACCESSORIES CONTAIN LEAD AND LEAD COMPOUNDS, CHEMICALS KNOWN TO THE STATE OF CALIFORNIA TO CAUSE CANCER AND REPRODUCTIVE HARM. WASH HANDS AFTER HANDLING.
Pb

Caution: Batteries produce explosive gases. Batteries contain corrosive acid. Batteries supply levels of electrical current high enough to cause burns. Therefore, in order to reduce the risk of personal injury while working near a battery, observe the following guidelines:

- Always shield your eyes.
- Avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow battery acid to contact the eyes or the skin.
  - Flush any contacted areas with water immediately and thoroughly.
  - Get medical help.

Important: Because of the materials used in the manufacture of automotive lead-acid batteries, dealers and service shops that handle them are subject to regulations issued by various state or local agencies. Other regulations may also apply in other locations. Always know and follow these regulations when handling batteries.

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the rubbish or sent to a land-fill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

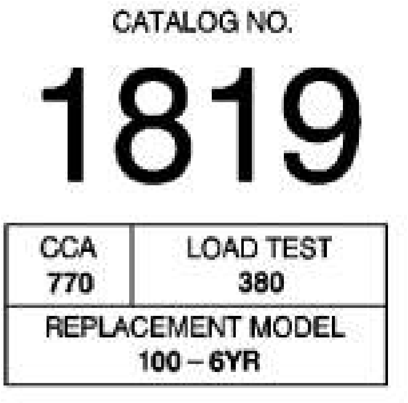
The maintenance-free battery has no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

The battery has 3 functions as a major source of energy:

- Engine cranking
- Voltage stabilizer
- Alternate source of energy with alternator overload

The battery specification label, example below, contains information about the following:

- The test ratings
- The original equipment catalogue number
- The recommended replacement model number



CATALOG NO.

1819

CCA	LOAD TEST
770	380

REPLACEMENT MODEL
100 – 6YR

Battery Ratings

A battery may have 3 ratings:

- Amp Hour (AH)
- Reserve Capacity (RC)
- Cold Cranking Amperage (CCA)

When a battery is replaced, use a battery with the same ratings. Refer to the battery specification label on the original battery or refer to Battery Usage .

Amp Hour (AH)

The amp hour rating of a battery is the amount of time it takes a fully charged battery, being discharged at a constant rate of 1 amperes and a constant temperature of 27°C (80°F), to reach a terminal voltage of 10.5 volts. Refer to Battery Usage for the amp hour rating of the original equipment battery.

Reserve Capacity (RC)

Reserve capacity is the amount of time in minutes it takes a fully charged battery, being discharged at a constant rate of 25 amperes and a constant temperature of 27°C (80°F), to reach a terminal voltage of 10.5 volts. Refer to Battery Usage for the reserve capacity rating of the original equipment battery.

Cold Cranking Amperage (CCA)

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 volts. Refer to Battery Usage for the cold cranking amperage rating for this vehicle.

Police Package Special Equipment Battery Options

Important: GM cannot be held responsible for any changes made to the vehicle. All electrical and body modifications must be preformed by experience and qualified technicians.

- Be sure that any modified or added wiring will not impact the function of the vehicles factory wiring system.
- See that all wiring is correctly protected by fuses, and not causing a overload to connectors and components.
- Do not route wiring in areas of the vehicle where temperatures can be high or where wiring may be cut, pinched or rubbed.
- See that all wiring is of the same or smaller gauge to that of the wire it is being attached to for correct fuse protection.
- Be sure that all holes drilled in the body are correctly sealed and corrosion protected. See that the vehicles wiring harnesses, piping, and other components have not been displaced or damaged during customer installation of equipment and wiring.
- See that the vehicles wiring harnesses, piping, and other components have not been displaced or damaged during customer installation of equipment and wiring.

Electrical Connections

Overloading the vehicles electrical system may damage the vehicles accessories. Do not overload the vehicles system by having unnecessary accessories at the same time.

Auxiliary Battery

The auxiliary battery is located in the rear compartment in the right hand side quarter panel cavity. The auxiliary battery has a secondary fuse box attached to the right hand side of the battery tray. The function of the auxiliary battery is to supply power to all of the after market components fitted to the vehicle:

- Sirens.
- Flashing lights (Front, rear and roof).

- Two way radio.
- Speed detector.

Battery Isolator

The electrical system has a battery isolator located in the rear compartment mounted on the left hand side quarter panel, the isolator should be mounted as close as possible to the Start Battery with the coil terminal facing up or horizontal. The battery isolator is designed to protect the Start Battery from excessive discharge whist allowing the auxiliary battery to supply non-essential loads. The battery isolator detects the Start Battery voltage when it drops below 12.7 Volts on a 12V system (25.4 volts on a 24V system) the solenoid will open, separating the Start Battery from the auxiliary battery. Once the engine has been started the battery isolator monitors the Start Battery and the charging system. When the charging system reaches 13.6V (27.2 Volts on a 24V system) indicating a fully charge Start Battery, the battery isolator will close the solenoid connecting the auxiliary battery to the Start Battery and the charging system.

Charging System Description and Operation

Electrical Power Management (EPM) Overview

The Electrical Power Management (EPM) system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of a possible fault with the battery and/or alternator. This EPM system primarily utilizes existing on-board computer capability to maximize the effectiveness of the alternator, to manage the load, improve battery State Of Charge (SOC) and minimize the system's impact on fuel economy. The EPM system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by boosting idle speeds and adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during ignition-off and during ignition-on. During ignition-off the State Of Charge (SOC) of the battery is determined by measuring the open circuit voltage. The SOC is a function of the acid concentration and the internal resistance of the battery and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The SOC can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. Throughout ignition-on, the algorithm continuously estimates SOC based on adjusted net amp hours, battery capacity, initial SOC, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the EPM function is designed to perform Regulated Voltage Control (RVC) to improve battery SOC, battery life and fuel economy. This is accomplished by using knowledge of the battery SOC and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

The Charging System Description and Operation is divided into 3 sections. The first section describes the charging system components and their integration into the EPM. The second section describes charging system operation. The third section describes the Instrument Panel Cluster (IPC) operation of the charge indicator, Driver Information Centre (DIC) messages and voltmeter operation if equipped.

Charging System Components

Alternator

The alternator is not a serviceable component. If there is a diagnosed failure of the alternator it must be replaced as an assembly. The engine drive belt drives the alternator. When the rotor is spun it induces an alternating current (AC) into the stator windings. This AC current then passes through a series of diodes and is converted to a direct current (DC) for use by the vehicle electrical systems. This DC voltage also charges the battery when the engine is running. The alternator output is monitored and controlled by the BCM.

Body Control Module (BCM)

The Body Control Module (BCM) is a LAN device. It communicates with the engine control module (ECM) and the instrument panel cluster (IPC) for electrical power management (EPM) operation. The BCM determines the output of the alternator and sends the information to the ECM for control of the alternator field control circuit. It monitors the alternator field duty cycle signal circuit information sent from the ECM for control of the alternator. It also monitors the battery current sensor, the battery positive voltage circuit and estimated battery temperature to determine the battery state of charge (SOC).

Battery Current Sensor

The battery current sensor is a serviceable component that is located on the negative battery cable. The battery current sensor is a 3-wire Hall effect current sensor and monitors the battery current. It directly inputs to the BCM. It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Engine Control Module (ECM)

The ECM directly controls the alternator field control circuit input to the alternator. The ECM receives control decisions based on messages from the BCM. It monitors the alternators alternator field duty cycle signal circuit and sends the information to the BCM.

Instrument Panel Cluster (IPC)

The IPC provides a means of customer notification in case of a failure and a voltmeter if equipped. There are 2 means of notification, a charge indicator and a driver information centre (DIC) message of SERVICE BATTERY CHARGING SYSTEM.

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode
- Charge Mode
- Fuel Economy Mode
- Headlamp Mode
- Start Up Mode
- Voltage Reduction Mode

The engine control module (ECM) controls the alternator through the alternator field control circuit. It monitors the alternator performance though the alternator field duty cycle signal circuit. The ECM controls the alternator through the alternator field control circuit. The signal is a 5 volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes. The following table shows the commanded duty cycle and output voltage of the alternator:

Commanded Duty Cycle	alternator Output Voltage

10%	11 V
20%	11.56 V
30%	12.12 V
40%	12.68 V
50%	13.25 V
60%	13.81 V
70%	14.37 V
80%	14.94 V
90%	15.5 V

The alternator provides a feedback signal of the alternator voltage output through the alternator field duty cycle signal circuit to the ECM. This information is sent to the body control module (BCM). The signal is a 5-volt PWM signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-99 percent. Between 0-5 percent and 100 percent are for diagnostic purposes.

Battery Sulfation Mode

The BCM will enter this mode when the interpreted alternator output voltage is less than 13.2 volts for 45 minutes. When this condition exists the BCM will enter Charge Mode for 2-3 minutes. The BCM will then determine which mode to enter depending on voltage requirements.

Charge Mode

The BCM will enter Charge Mode when ever one of the following conditions are met.

- The wipers are ON for than 3 seconds.
- GMLAN (Climate Control Voltage Boost Mode Request) is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0°C (32°F).
- Battery State of Charge is less than 80 percent.
- Vehicle Speed is greater than 145 kph (90 mph)
- Current Sensor Fault Exists
- System Voltage was determined to be below 12.56 volts

When any one of these conditions is met, the system will set targeted alternator output voltage to a charging voltage between 13.9-15.5 volts, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the estimated battery temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is less than 15 amps and greater than -8 amps, and the battery state of charge (SOC) is greater than or equal to 80 percent. Its targeted alternator output voltage is the open circuit voltage of the battery and can be between 12.5-13.1 volts. The BCM will exit this mode and enter Charge Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode when ever the headlamps are ON (high or low beams). Voltage will be regulated between 13.9-14.5 volts

Start Up Mode

When the engine is started the BCM sets a targeted alternator output voltage of 14.5 volts for 30 seconds.

Voltage Reduction Mode

The BCM will enter voltage reduction mode when the calculated ambient air temperature is above 0°C (32°F). The calculated battery current is less than 1 amp and greater than -7 amps, and the alternator field duty cycle is less than 99 percent. Its targeted alternator output voltage is 12.9 volts. The BCM will exit this mode once the criteria are met for Charge Mode.

Instrument Panel Cluster (IPC) Operation

Charge Indicator Operation

The instrument panel cluster (IPC) illuminates the charge indicator and displays a warning message in the driver information centre (DIC) when the one or more of the following occurs:

- The engine control module (ECM) detects that the alternator output is less than 11 volts or greater than 16 volts. The IPC receives a GMLAN message from the ECM requesting illumination.
- The IPC determines that the system voltage is less than 11 volts or greater than 16 volts for more than 30 seconds. The IPC receives a GMLAN message from the body control module (BCM) indicating there is a system voltage range concern.
- The IPC performs the displays test at the start of each ignition cycle. The indicator illuminates for approximately 3 seconds.
- The ignition is ON, with the engine OFF.

Battery Voltage

The IPC displays the system voltage as received from the BCM over the GMLAN serial data circuit. If there is no communication with the BCM then the display will read all dashes until communication is restored.

SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the DIC for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is commanded ON when a charging system DTC is a current DTC. The message is turned OFF when the conditions for clearing the DTC have been met.

Starting System Description and Operation

The starter motor is a non-repairable unit. the starter motor has pole pieces that are arranged around the armature. Both solenoid windings are energized. The pull-in winding circuit is completed to the ground through the starter motor. The windings work together magnetically to pull and hold in the plunger. The plunger moves the shift lever. This action causes the starter drive assembly to rotate on the armature shaft spline as it engages with the flywheel ring gear/flex plate on the engine. Moving at the same time, the plunger also closes the solenoid switch contacts in the starter solenoid. Full battery voltage is applied directly to the starter motor and it cranks the engine.

As soon as the solenoid switch contacts close, current stops flowing thorough the pull-in winding because battery voltage is applied to both ends of the windings. The hold-in winding remains energized. Its magnetic field is strong enough to hold the plunger, shift lever, starter drive assembly, and solenoid switch contacts in place to continue cranking the engine. When the engine starts, pinion overrun protects the armature from over run until the switch is opened.

When the ignition switch is released from the START position, the START relay opens and battery voltage is removed from the starter solenoid terminal. Current flows from the motor contacts through both windings to the ground at the end of the hold-in winding. However, the direction of the current flow through the pull-in winding is now opposite the direction of the current flow when the winding was first energized.

The magnetic fields of the pull-in and hold-in windings now oppose one another. This action of the windings, along with the help of the return spring, causes the starter drive assembly to disengage and the solenoid switch contacts to open simultaneously. As soon as the contacts open, the starter circuit is turned off.

Circuit Description (Key Start)

When the ignition switch is placed in the Start position, a discrete 12 volt signal is supplied to the body control module (BCM) notifying it that the ignition is in the Start position. The BCM then sends a message to the engine control module (ECM) notifying it that CRANK has been requested. The ECM verifies that the transmission is in Park or Neutral. If it is the ECM then supplies 12 volts to the control circuit of the crank relay. When this occurs, battery positive voltage is supplied through the switch side of the crank relay to starter solenoid.

Special Tools

Rear Insulator Hanger Bracket to Body Retaining Bolts	26 N·m	19 lb ft
Rear Muffler to Intermediate Exhaust Assembly Retaining Nuts	45 N·m	33 lb ft

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Diagnostic Information and Procedures | **Document ID: 1978443**

Diagnostic Starting Point - Engine Exhaust

Begin the system diagnosis by reviewing the exhaust system description and operation. Reviewing the information will help you determine the correct symptom diagnostic procedure when a malfunction exists. It will also help you determine if the condition described by the customer is normal operation. To identify the correct procedure for diagnosing the system, refer to Symptoms - Engine Exhaust.

Symptoms - Engine Exhaust

- Review the exhaust system description and operation in order to familiarise yourself with the system functions. Refer to Exhaust System Description.
- All diagnostics on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow is the place to start when repairs are necessary and may always be used in order to resolve a system problem. For a detailed explanation, refer to Strategy Based Diagnosis.

Visual / Physical Inspection

- Inspect for aftermarket or non-OEM devices. These could affect the operation and performance of the exhaust system.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, engine temperature, engine load, and frequency of concern.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause any symptom.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating as designed.

Symptom List

For the following symptoms, refer to Restricted Exhaust

- Loss of Power
- Poor fuel economy
- Poor acceleration

For the following symptoms, refer to Exhaust Leakage.

- Exhaust hissing
- Exhaust popping

For the following symptoms, refer to Exhaust Noise.

- Exhaust rattle
- Loud exhaust
- Exhaust buzz, groan or hum

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Diagnostic Information and Procedures | **Document ID: 2035203**

Restricted Exhaust

Tools Required

J 35314-A Exhaust Back Pressure Gauge

Diagnostic Aids

Caution: Refer to Hot Exhaust System Caution in the Preface section.

For dual exhaust systems a quick check of exhaust flow will help determine which side of the exhaust system is restricted. The side that has less exhaust flow is the side that will be suspect, and diagnosis should begin there.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. The exhaust system has very low back pressure under normal conditions. If the exhaust system is restricted, a significant increase in the exhaust pressure is noticed on the J 35314-A .

   Removing the heated oxygen sensor may set a DTC. When finishing this diagnostic table all codes must be cleared.

4. This step will isolate the catalytic converter from the remainder of the exhaust system.

7. Confirming that the condition has been fixed is essential. If the symptom still exists and the vehicle has a dual exhaust system, proceed to Step 2 and repeat diagnostic procedure on the opposite exhaust pipe.

Step	Action	Value(s)	Yes	No
1	Did you verify the customers complaint?	--	Go to Step 2	--
2	Did you review the exhaust symptoms diagnostic information and perform the necessary inspections?	--	Go to Step 3	Go to Symptoms - Engine Exhaust.
	1. Remove the pre-catalytic converter heated oxygen sensor (HO2S) that is in front of and closest to the catalytic converter. Refer to the appropriate procedure. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 for 3.6L engine. • Heated Oxygen Sensor Replacement -			

3	• Bank 1 Sensor 1 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 for 6.0L engine. 2. Install the J 35314-A in place of the pre-catalytic converter heated oxygen sensor (HO2S). 3. Start the engine. 4. Increase and monitor the engine speed at 2,500 RPM. 5. Observe the exhaust system back pressure reading on the gauge. Does the reading exceed the specified value?	9 kPa (1.25 psi)	Go to Step 4	Go to Step 7
4	1. Turn the engine off and place the ignition in the OFF position. 2. Remove the J 35314-A . 3. Re-install the pre-catalytic converter heated oxygen sensor (HO2S). Refer to the appropriate procedure. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 for 3.6L engine. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 for 6.0L engine. 4. Remove the post-catalytic converter heated oxygen sensor (HO2S). Refer to the appropriate procedure. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 3.6L engine. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 6.0L engine. 5. Install the J 35314-A in place of the pre-catalytic converter heated oxygen sensor (HO2S). 6. Start the engine. 7. Increase and monitor the engine speed at 2,500 RPM. 8. Observe the exhaust system back pressure reading on the gauge. Does the reading exceed the specified value?	9 kPa (1.25 psi)	Go to Step 5	Go to Step 6
	Inspect the exhaust system for the following conditions: • Damage in the exhaust pipe			

5	• Debris in the exhaust pipe • Muffler or resonator internal failure • Two-layer exhaust pipe separation Did you find and correct the condition?	--	Go to Step 7	--
6	Replace the catalytic converter. Refer to Catalytic Converter Replacement - Left Side, Catalytic Converter Replacement - Right Side. Did you find and correct the condition?	--	Go to Step 7	--
7	1. Remove the J 35314-A . 2. Re-install the applicable heated oxygen sensor (HO2S). Refer to the appropriate procedure. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 3.6L engine. • Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 6.0L engine. 3. If re-programming is required. Refer to Control Module References. 4. Clear any codes. 5. Road test the vehicle in order to verify the repair. Did you correct the condition?	--	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Diagnostic Information and Procedures | Document ID: 1978464

Exhaust Leakage

Problem	Action
Caution: Refer to Hot Exhaust System Caution in the Preface section. DEFINITION: An exhaust leak may show stains at the area of the leak. The leak may be felt by holding a hand close to the suspected areas or using a smoke pencil. The leak may make a popping or hissing noise. Refer to Symptoms - Engine Exhaust, prior to beginning this table.	
Misaligned or incorrectly installed exhaust system components	• Align and tighten the exhaust system components to the required specifications. Refer to Fastener Tightening Specifications. • Make sure the exhaust hangers are in the proper locations and not loose. Refer to Exhaust System Insulator, Hanger, Bracket Replacement or Exhaust Hanger Mounting Bracket Replacement.
Exhaust leaks at the following connections: • Exhaust manifold to pipe • Flanges	Tighten the affected components to the required specifications. Refer to Fastener Tightening Specifications.
Seals or gaskets leaking • Exhaust manifold to cylinder head • Exhaust pipes to exhaust manifold • Catalytic converter connection	Replace the leaking seal or gasket. Refer to the affected components repair procedure for service.
Irregularities at the mating surfaces on the flange connections	Repair as required or replace the affected component. Refer to the affected components repair procedure for service.
Exhaust manifold cracked or broken	Replace the exhaust manifold. Refer to Exhaust Manifold Replacement - Left Side, Exhaust Manifold Replacement - Right Side, Exhaust Manifold Replacement - Left Side or Exhaust Manifold Replacement - Right Side.
Exhaust system component connection welds leaking	Replace the leaking component. Refer to the affected component's procedure for service.
Muffler or resonator, if equipped, damaged or leaking at the seams	Replace the affected muffler. Refer to Exhaust Muffler Replacement - Left Side or Exhaust Muffler Replacement - Right Side.

Exhaust Noise

Condition	Action
Caution: Refer to Hot Exhaust System Caution in the Preface section. DEFINITION: An audible or physical noise due to a faulty component or damaged components causing a loose or misaligned exhaust system resulting in a rattle or vibration noise, i.e. buzz, groan, hum. Refer to Symptoms - Engine Exhaust , prior to beginning this table.	
Popping or hissing noise	Exhaust leak. Refer to Exhaust Leakage .
Loud exhaust	1. Compare to a known good vehicle. 2. Inspect for a damaged or failed muffler. 3. Replace the faulty muffler. Refer to Exhaust Muffler Replacement - Left Side or Exhaust Muffler Replacement - Right Side
External rattle or vibration noise	1. Inspect for a bent or loose hanger, loose heat shield, or loose clamp. 2. Inspect for an exhaust pipe causing interference. 3. Repair or replace the affected component. Refer to the affected component's service procedure.
Internal rattle	1. Test the components by tapping with a rubber mallet to confirm a rattle. 2. Replace the faulty catalytic converter, or muffler. Refer to one of the following procedures: • Catalytic Converter Replacement - Left Side . • Catalytic Converter Replacement - Right Side . • Exhaust Muffler Replacement - Left Side . • Exhaust Muffler Replacement - Right Side .

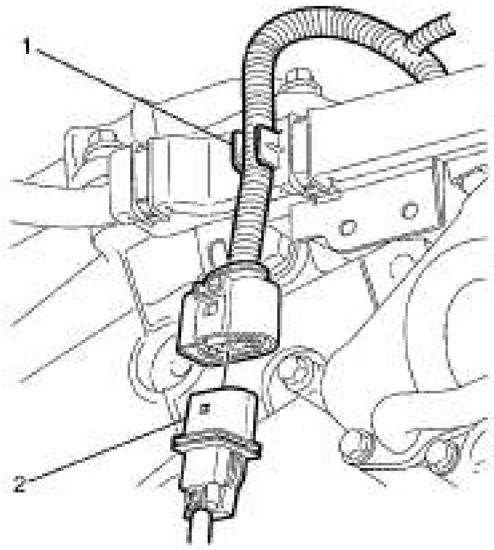
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | Document ID: 1994554

Catalytic Converter Replacement - Left Side (3.6L Engine)

Removal Procedure

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine dress cover. Refer to Engine Cover Replacement .

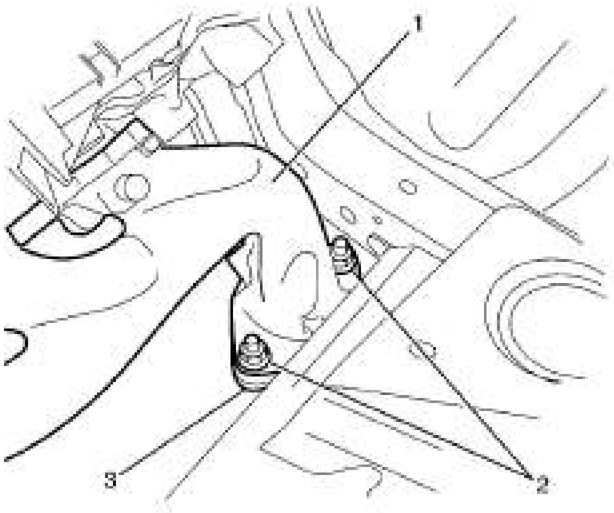
Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



3. Remove the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the engine wiring loom retaining clip (1).
4. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) from the main wiring harness.

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



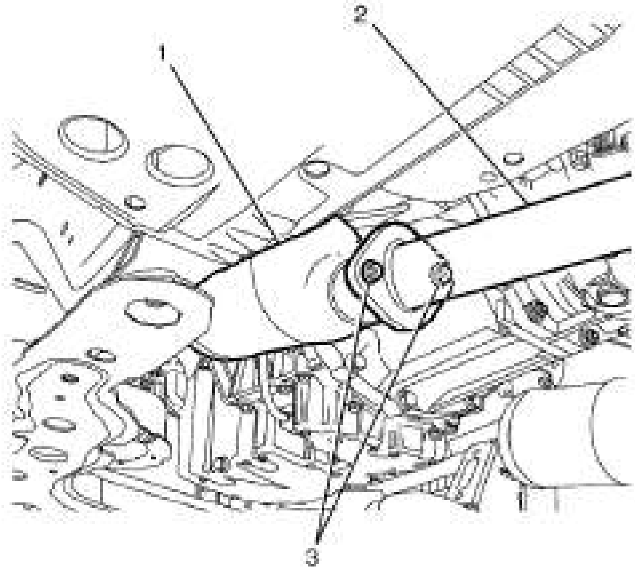
Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

5. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

   Discard the nuts.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
7. Pull down and back on the left catalytic converter (3) to disconnect from the exhaust manifold (1).

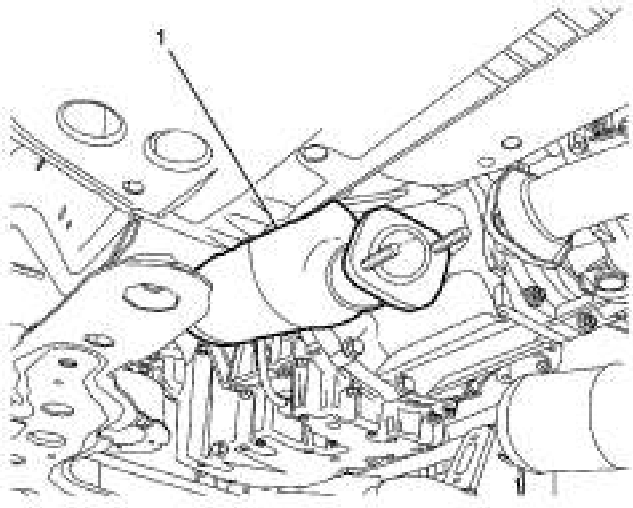


Important: The intermediate exhaust assembly to left catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

8. Remove the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

   Discard the nuts.

9. Disconnect the intermediate exhaust assembly (2) from the left catalytic converter (1).

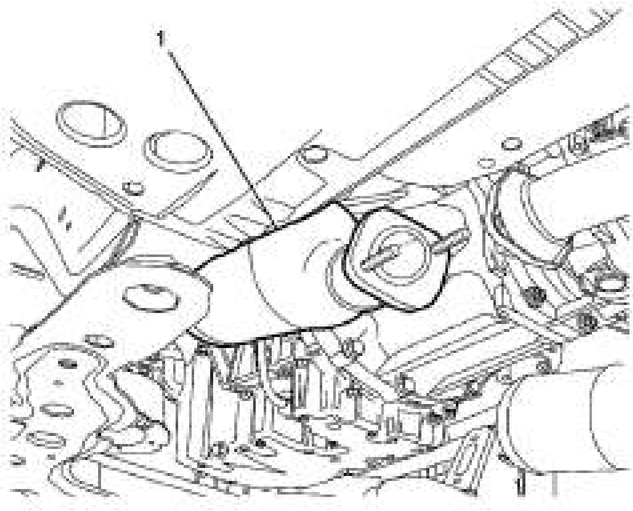


10. Remove the left catalytic converter (1) from the vehicle.
11. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .

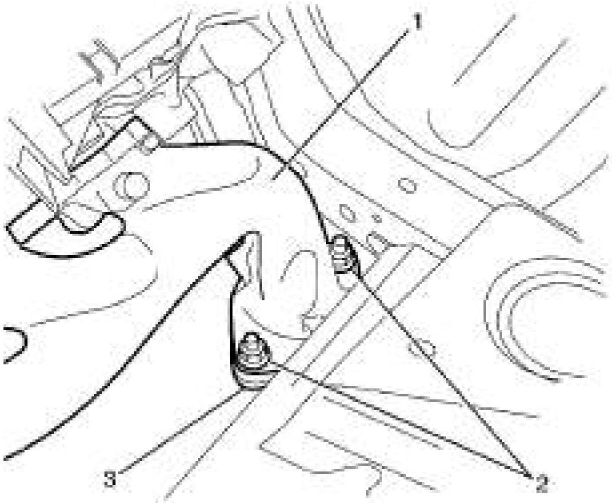
Installation Procedure

Notice: Refer to Exhaust Service Caution in the Preface section.

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .



2. Install the left catalytic converter (1) to the vehicle.



Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

3. Lift the left catalytic converter (3) up and forward to connect to the exhaust manifold (1).
4. Lower the vehicle.

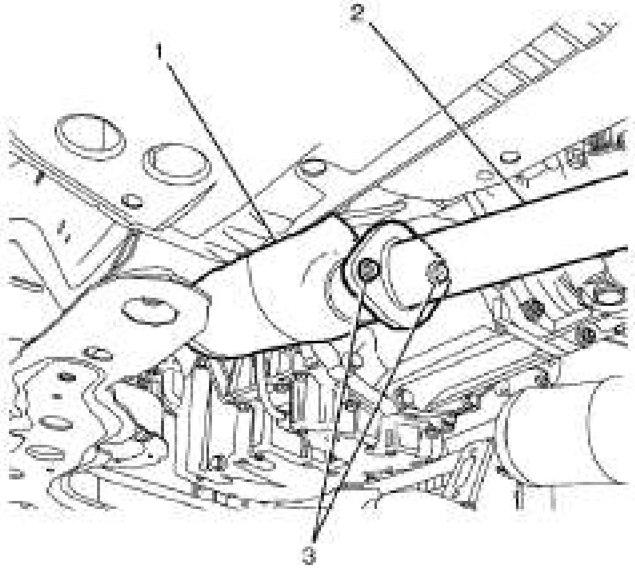
Important: Do not fully tighten the left catalytic converter to exhaust manifold retaining nuts (2) at this stage.

5. Install the left catalytic converter to exhaust manifold retaining nuts (2).

Do not fully tighten at this stage.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



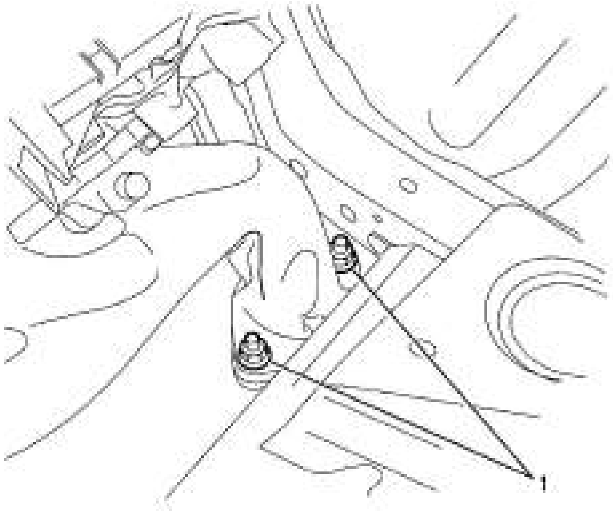
7. Align the intermediate exhaust assembly (2) to the left catalytic converter (1).

Notice: Refer to Fastener Notice in the Preface section.

8. Tighten the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

Tighten
Tighten the nuts to 40 N·m (30 lb ft).

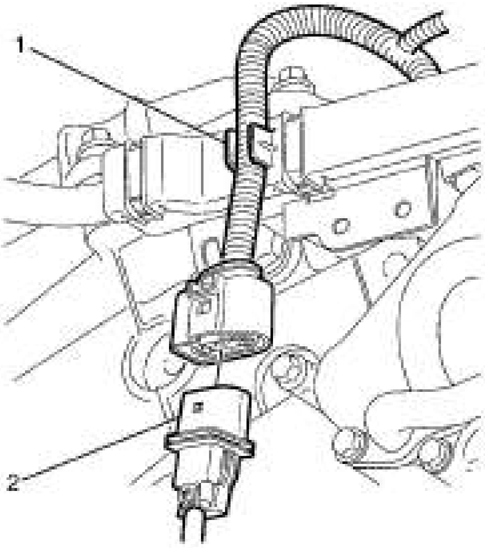
9. Lower the vehicle.



10. Tighten the left catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

11. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
12. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



13. Connect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) to the main wiring harness.
14. Install the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom to the engine wiring loom retaining clip (1).
15. Lower the vehicle.
16. Install the engine dress cover. Refer to Engine Cover Replacement .
17. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
18. If re-programming is required. Refer to Control Module References .
19. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

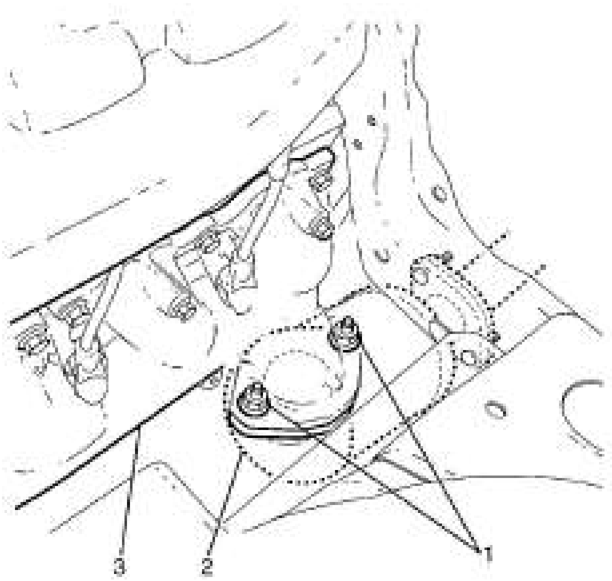
Catalytic Converter Replacement - Left Side (6.0L Engine)

Removal Procedure

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



Important: The left catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

2. Remove the left catalytic converter to exhaust manifold retaining nuts (1).

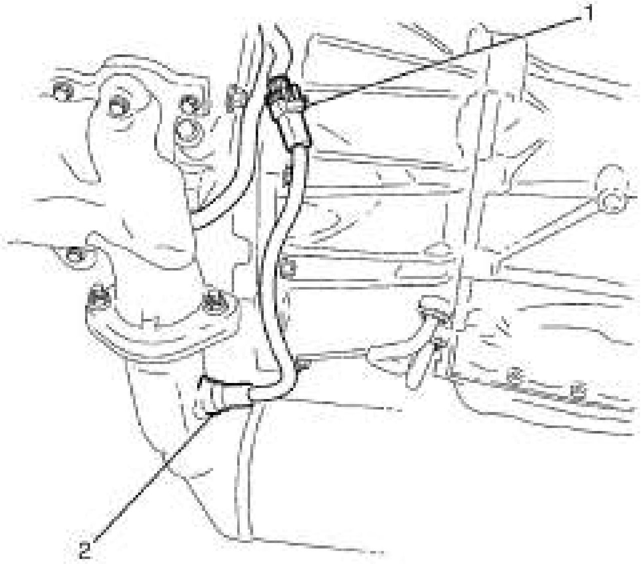
   Discard the nuts.

3. Disconnect the left catalytic converter (2) from the exhaust manifold (3).

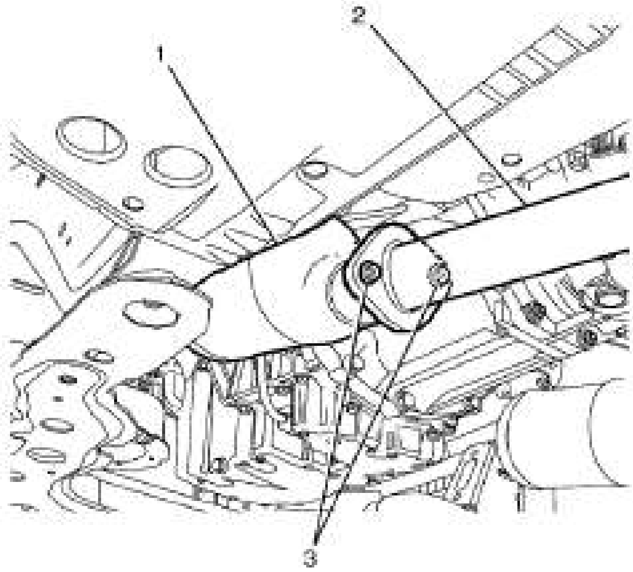
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



5. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (1).

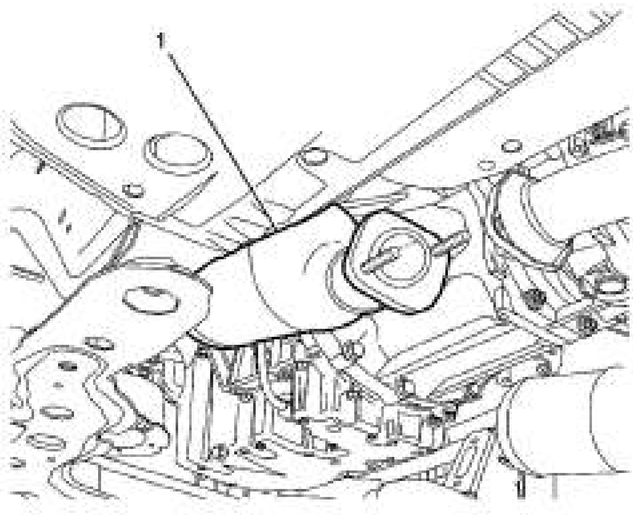


Important: The intermediate exhaust assembly to left catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

6. Remove the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

   Discard the nuts.

7. Disconnect the intermediate exhaust assembly (2) from the left catalytic converter (1).

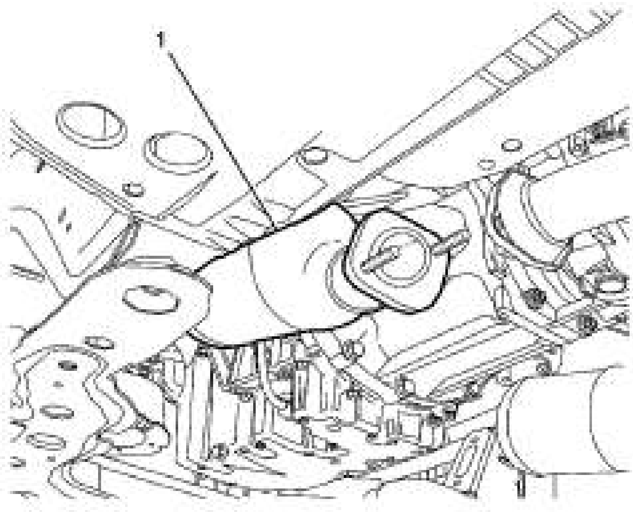


8. Remove the left catalytic converter (1) from the vehicle.
9. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.

Installation Procedure

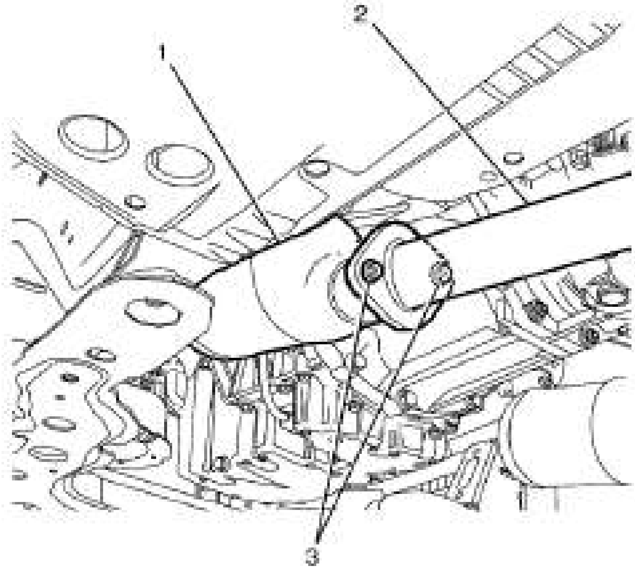
1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.

   Caution: Refer to Exhaust Service Caution in the Preface section.

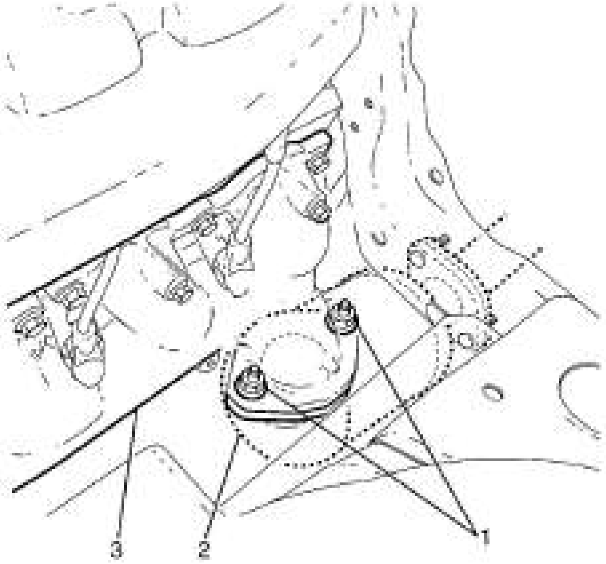


Important: Make sure that a new sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

2. Install the left catalytic converter (1) to the vehicle.



3. Align the intermediate exhaust assembly (2) to the left catalytic converter (1) by pushing back and down on the intermediate exhaust assembly (2).



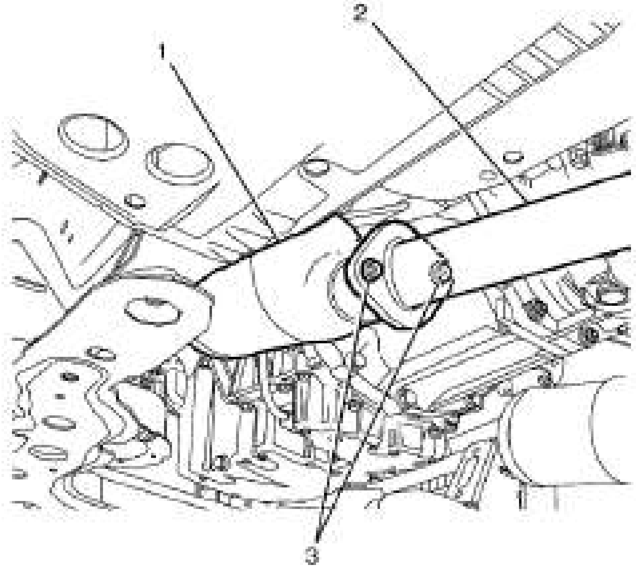
4. Push up and forward on the left catalytic converter (2) to connect to the exhaust manifold (3).
5. Lower the vehicle.
6. Install the left catalytic converter to exhaust manifold retaining nuts (1).
7. Tighten the left catalytic converter to exhaust manifold retaining nuts (1).

Tighten

Tighten the nuts to 45 N·m (33 lb ft).

Caution: Refer to Vehicle Lifting Caution in the Preface section.

8. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

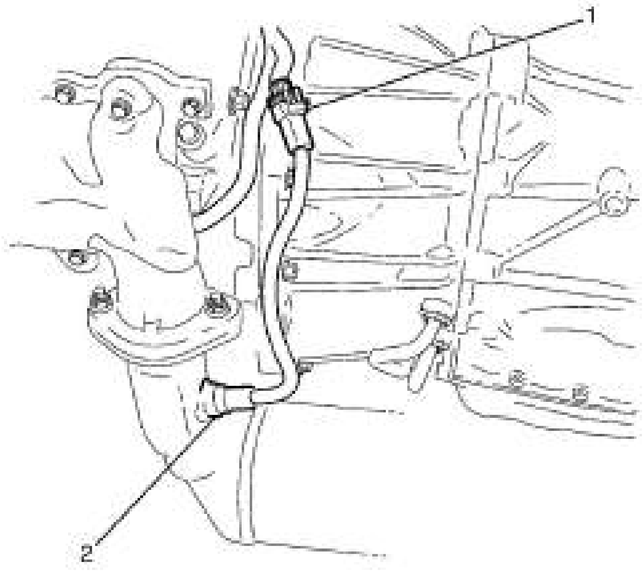


9. Install the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

Notice: Refer to Fastener Notice in the Preface section.

10. Tighten the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

Tighten
Tighten the nuts to 40 N·m (30 lb ft).



11. Connect the left pre-catalytic converter HO2S electrical connector (1).
12. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
13. Lower the vehicle to the ground.
14. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
15. If re-programming is required. Refer to Control Module References .
16. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

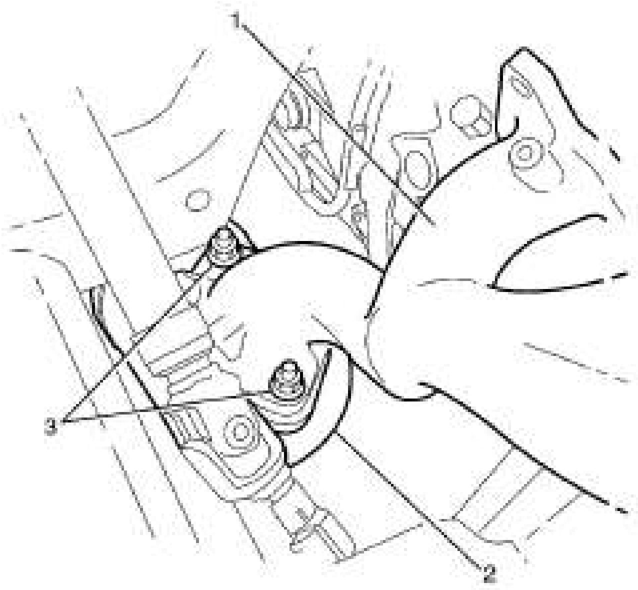
Catalytic Converter Replacement - Right Side (3.6L Engine)

Removal Procedure

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine dress cover. Refer to Engine Cover Replacement .

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



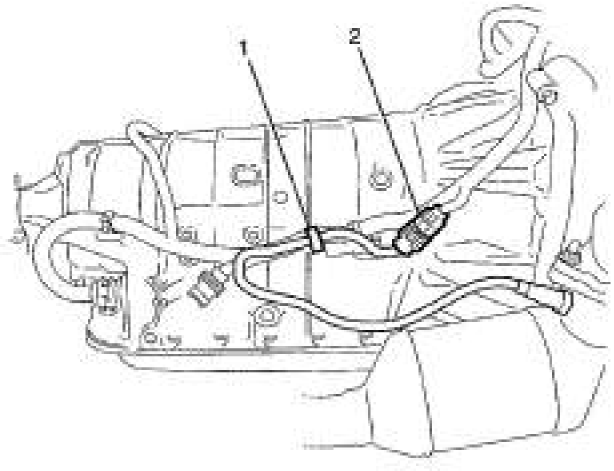
Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

3. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

Discard the nuts.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

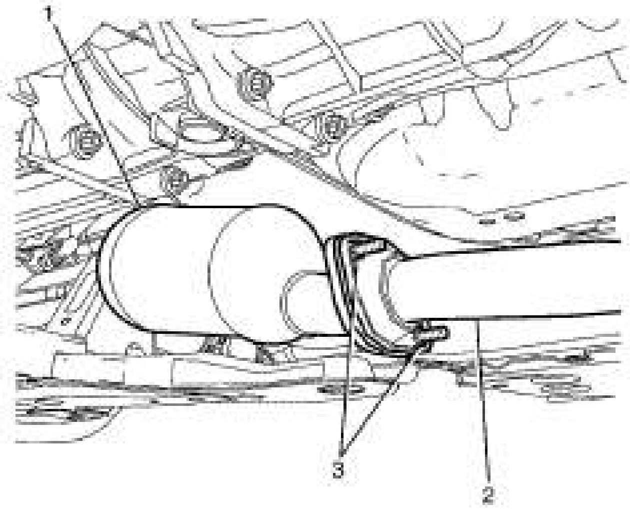
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



5. Remove the right pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the transmission wiring loom retraining clip (1).

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

6. Disconnect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).



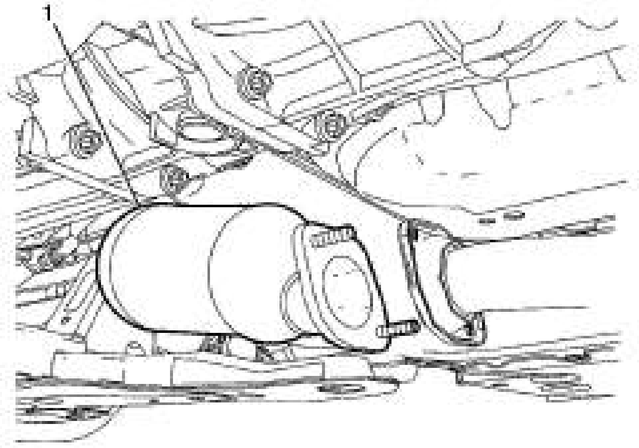
7. Pull down and back on the right catalytic converter (1) to disconnect from the exhaust manifold.

   Important: The intermediate exhaust assembly to right catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

8. Remove the intermediate exhaust assembly to right catalytic converter retaining nuts (3).

   Discard the nuts.

9. Disconnect the intermediate exhaust assembly (2) from the right catalytic converter (1).

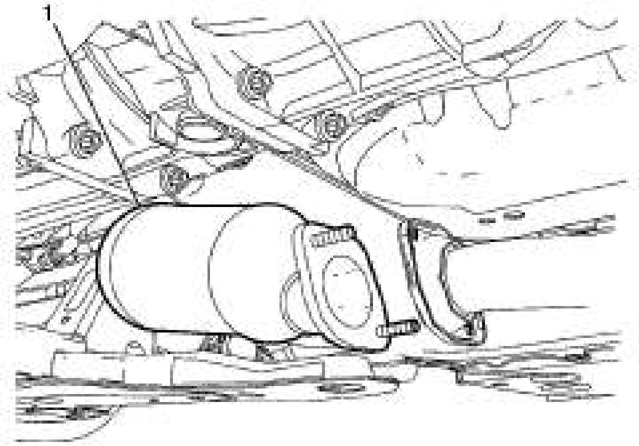


10. Remove the right catalytic converter (1) from the vehicle.
11. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .

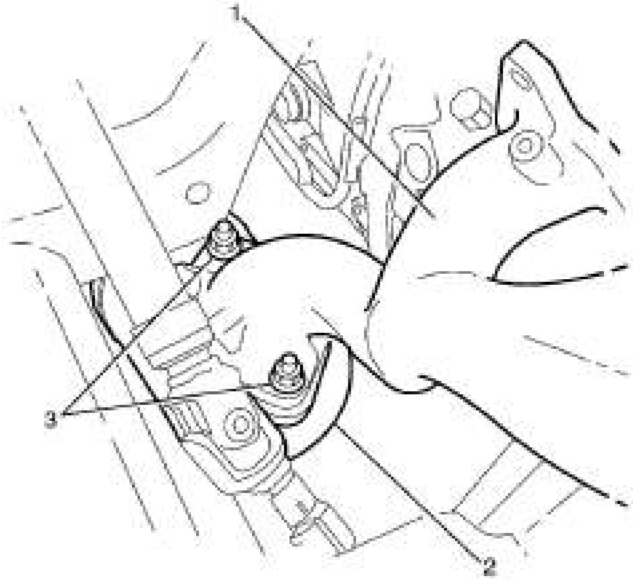
Installation Procedure

Caution: Refer to Exhaust Service Caution in the Preface section.

1. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .



2. Install the right catalytic converter (1) to the vehicle.



Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

3. Lift the right catalytic converter (2) up and forward to connect to the exhaust manifold (1).
4. Lower the vehicle.

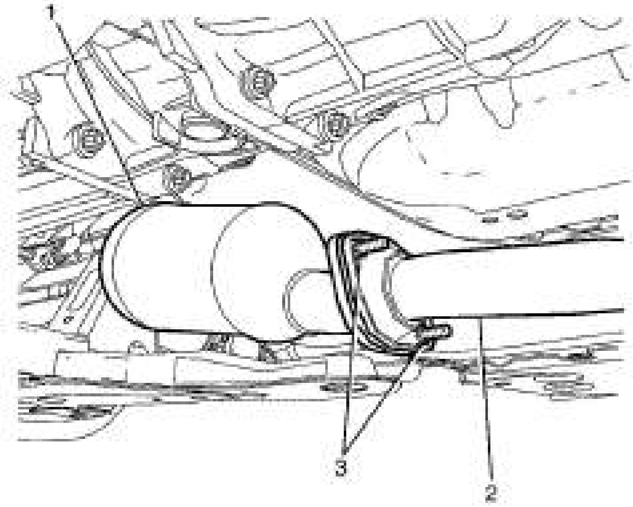
Important: Do not fully tighten the right catalytic converter to exhaust manifold retaining nuts (3) at this stage.

5. Install the right catalytic converter to exhaust manifold retaining nuts (3).

Do not fully tighten at this stage.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

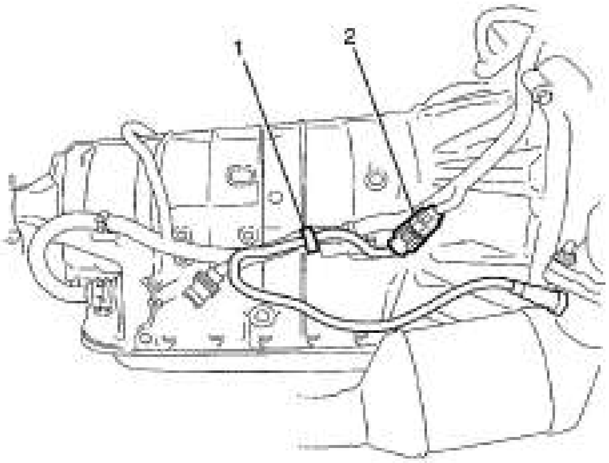


7. Align the intermediate exhaust assembly (2) to the right catalytic converter (1).

   Notice: Refer to Fastener Notice in the Preface section.

8. Tighten the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

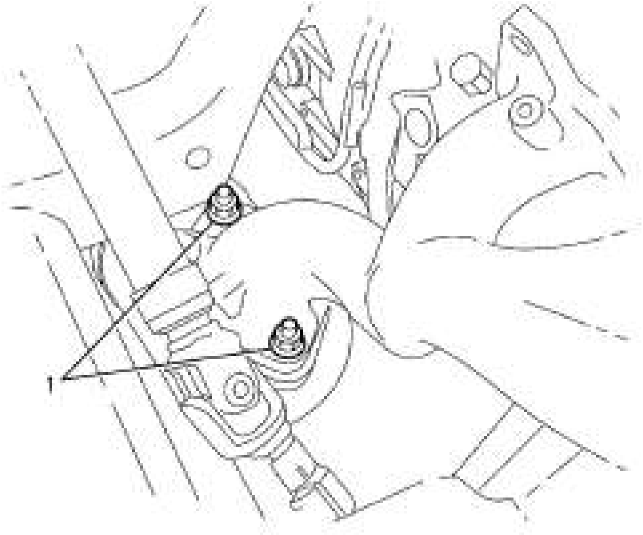
   Tighten
   Tighten the nuts to 40 N·m (30 lb ft).



9. Connect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) to the main wiring harness.
10. Install the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the

engine wiring loom retaining clip (1).

11. Lower the vehicle.



12. Tighten the right catalytic converter to exhaust manifold retaining nuts (2).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

13. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
14. Install the engine dress cover. Refer to Engine Cover Replacement .
15. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
16. If re-programming is required. Refer to Control Module References .
17. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

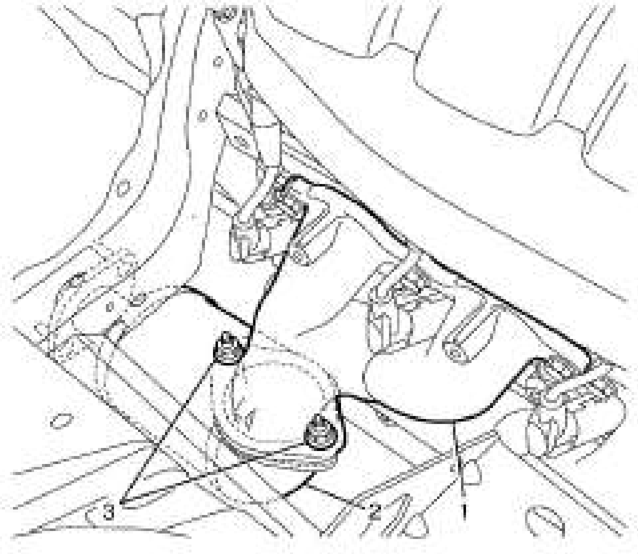
Catalytic Converter Replacement - Right Side (6.0L Engine)

Removal Procedure

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



Important: The right catalytic converter to exhaust manifold retaining (3) are single use parts. They must be discarded after removal.

2. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

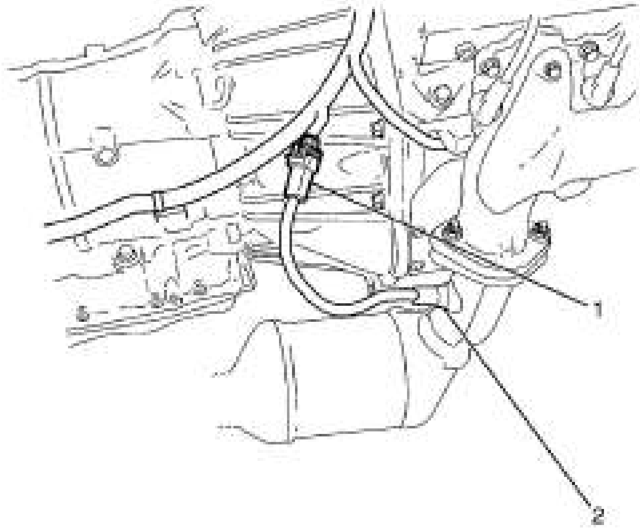
   Discard the nuts.

3. Disconnect the right catalytic converter (2) from the exhaust manifold (1).

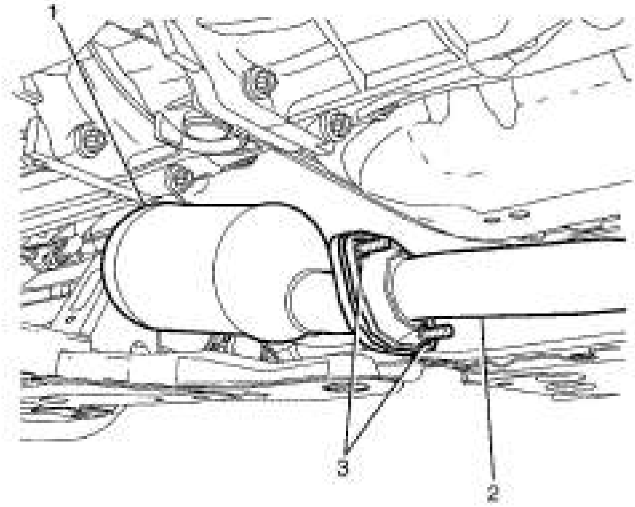
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



5. Disconnect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (1).

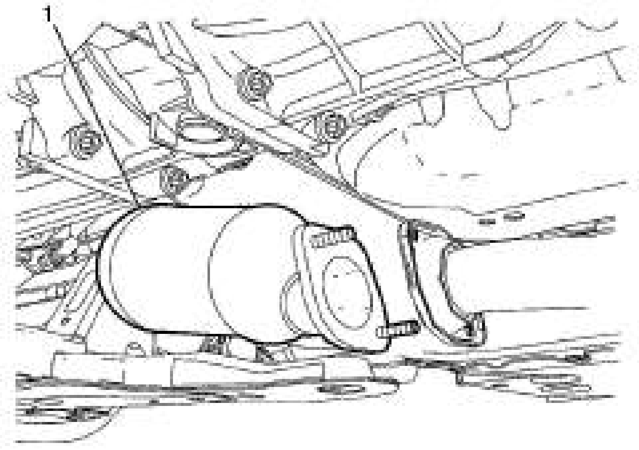


Important: The intermediate exhaust assembly to right catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

6. Remove the intermediate exhaust assembly to right catalytic converter retaining nuts (3).

   Discard the nuts.

7. Disconnect the intermediate exhaust assembly (2) from the right catalytic converter (1).

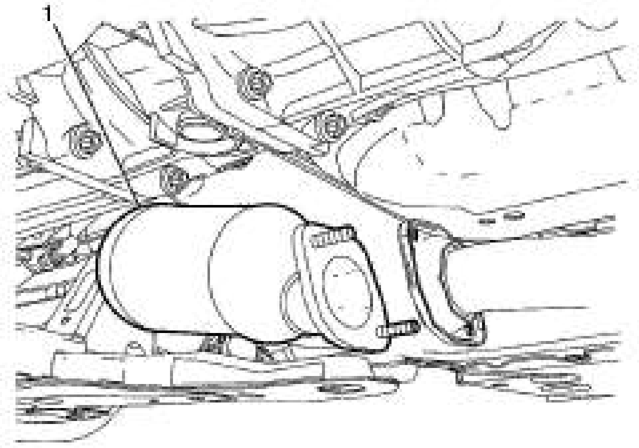


8. Remove the right catalytic converter (1) from the vehicle.
9. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.

Installation Procedure

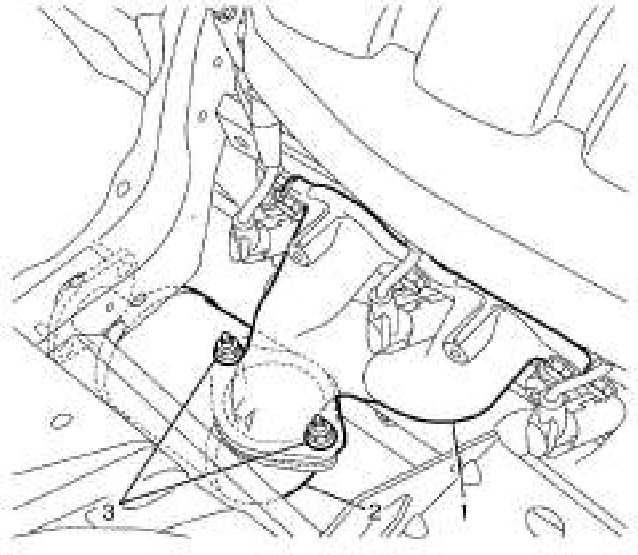
Caution: Refer to Exhaust Service Caution in the Preface section.

1. Install the right pre-catalytic converter heated oxygen sensor (HO2S) to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.



Important: Make sure that a new sealing ring if fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

2. Install the right catalytic converter (1) to the vehicle.



3. Push up and forward on the right catalytic converter (2) to connect the exhaust manifold (1).
4. Lower the vehicle.

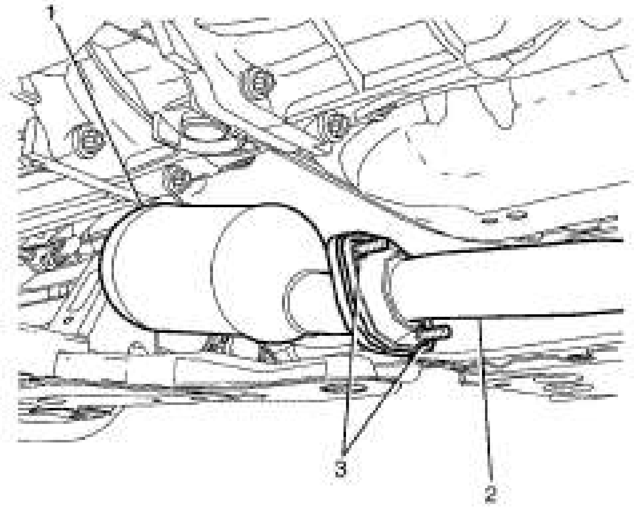
Important: Do not fully tighten the right catalytic converter to exhaust manifold retaining nuts (3) at this stage.

5. Install the right catalytic converter to exhaust manifold retaining nuts (3).

Do not fully tighten at this stage.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

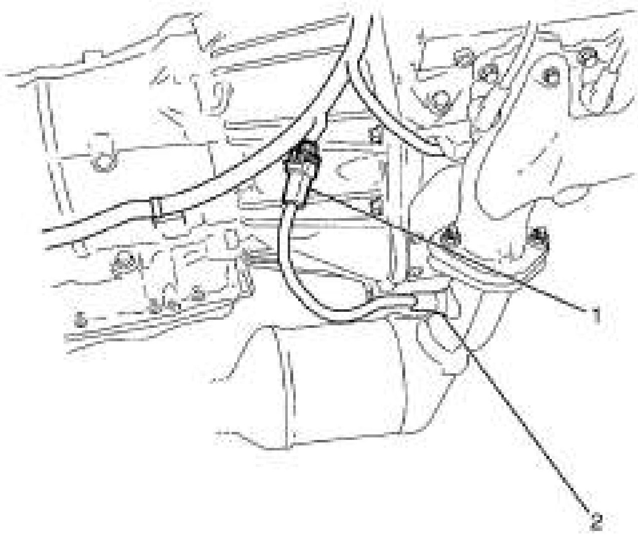


7. Align the intermediate exhaust assembly (2) to the right catalytic converter (1).

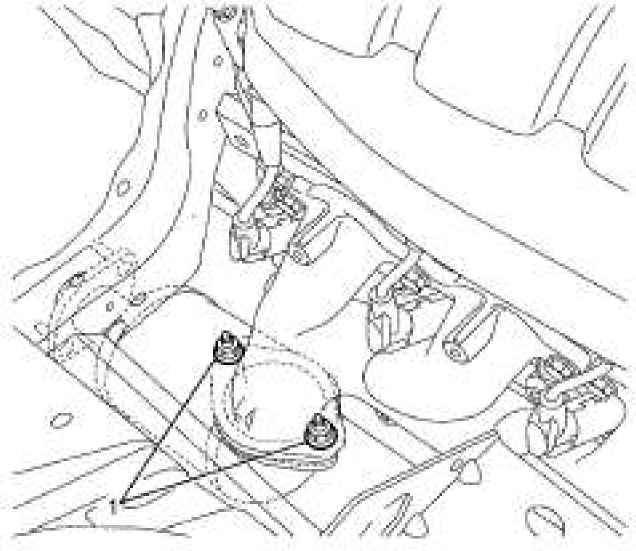
Notice: Refer to Fastener Notice in the Preface section.

8. Tighten the intermediate exhaust assembly to right catalytic converter retaining nuts (3).

Tighten
Tighten the nuts to 40 N·m (30 lb ft).



9. Connect the right pre-catalytic converter HO2S electrical connector (1).
10. Lower the vehicle.



11. Tighten the right catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

12. Make sure the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
13. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
14. If re-programming is required. Refer to Control Module References .
15. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect system for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2035206**

Exhaust Crossover Pipe Replacement

Removal Procedure

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

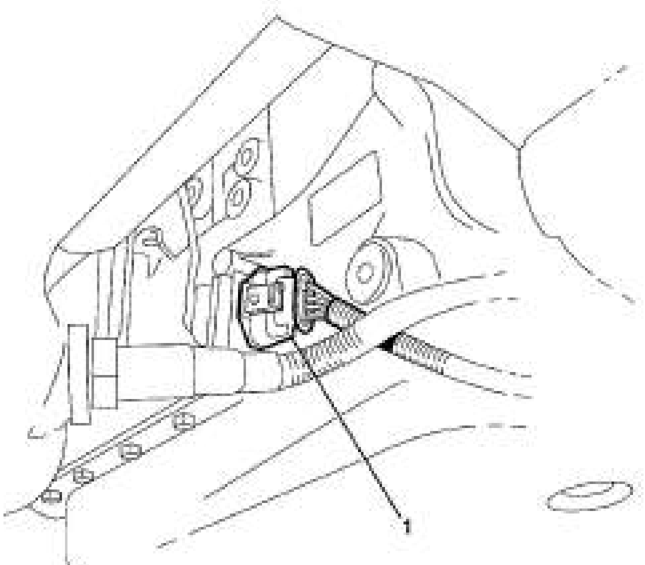
   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

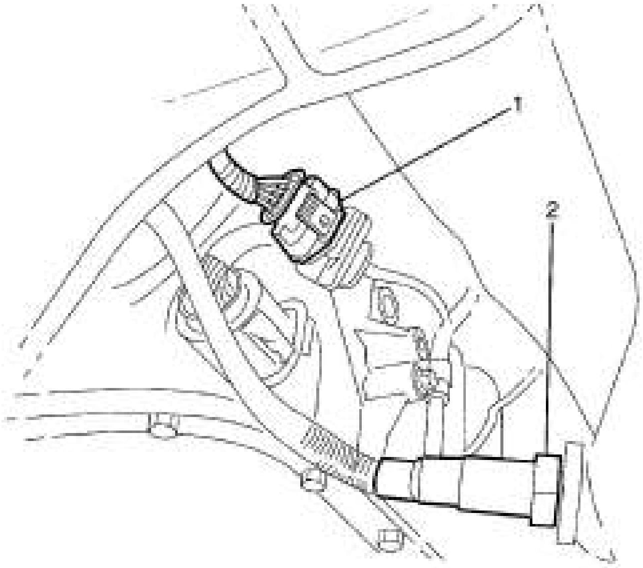
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Support the exhaust system using a suitable jack.
4. Remove the rear exhaust muffler assemblies. Refer to Exhaust Muffler Replacement - Left Side and Exhaust Muffler Replacement - Right Side .

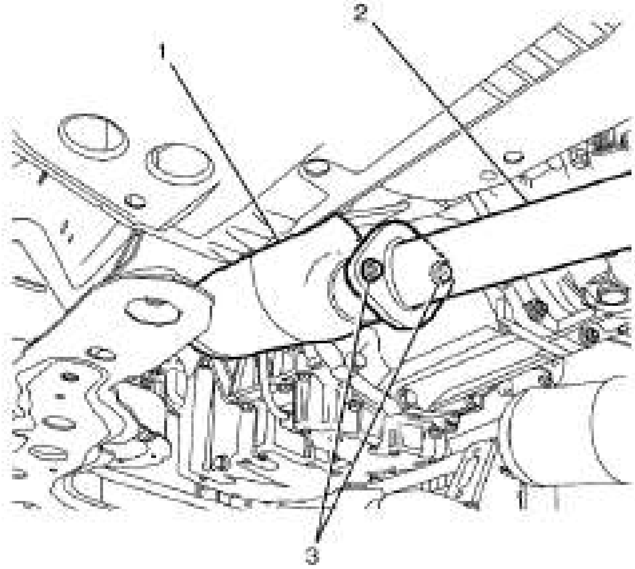
   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



5. Disconnect the left post-catalytic converter heated oxygen sensor (HO2S) electrical connector (1).



6. Disconnect the right post-catalytic converter HO2S electrical connector (1).

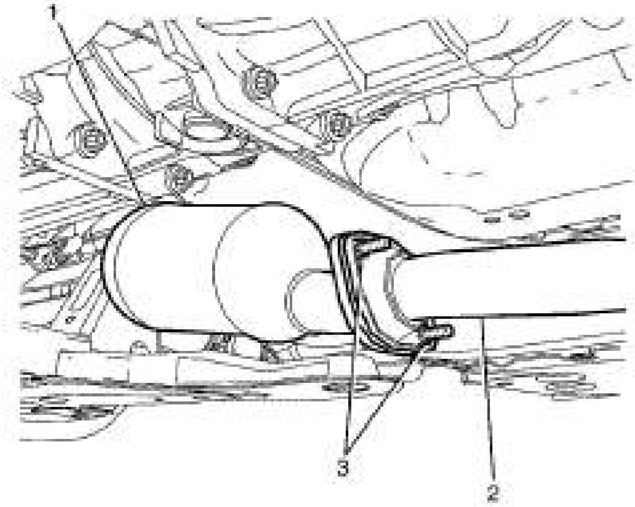


Important: The intermediate exhaust assembly to left catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

7. Remove the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

   Discard the nuts.

8. Disconnect the intermediate exhaust assembly (2) from the left catalytic converter (1).

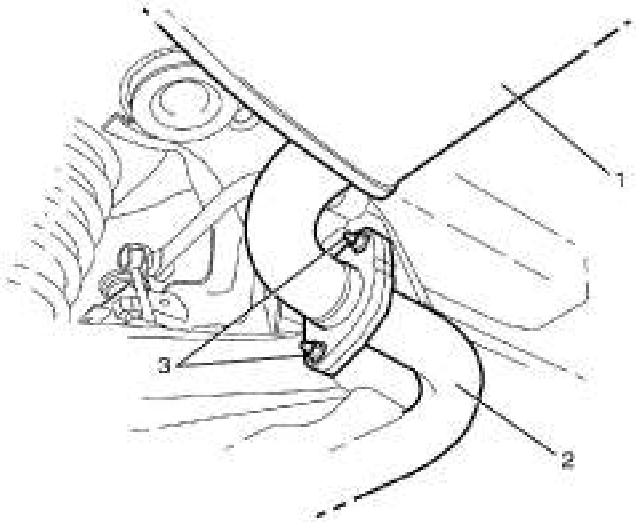


Important: The intermediate exhaust assembly to right catalytic converter retaining nuts (3) are single use parts. They must be discarded after removal.

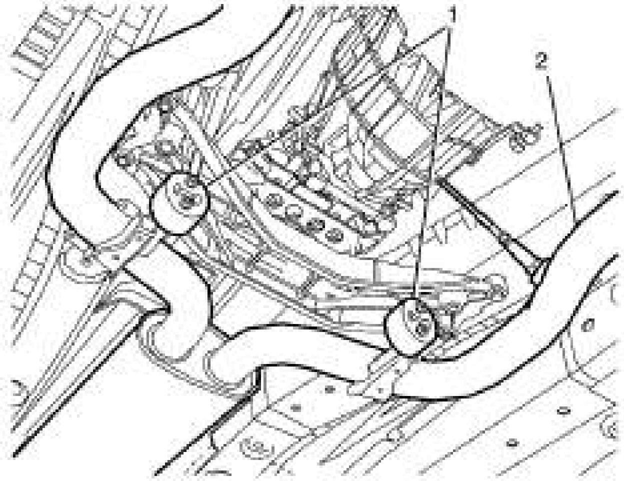
9. Remove the intermediate exhaust assembly to right catalytic converter retaining nuts (3).

   Discard the nuts.

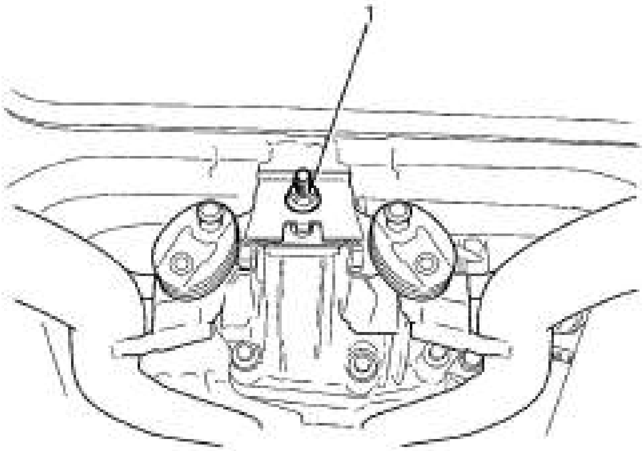
10. Disconnect the intermediate exhaust assembly (2) from the right catalytic converter (1).



11. Remove the intermediate exhaust assembly to rear muffler retaining bolts (3).



12. Detach the intermediate exhaust assembly (2) by removing the front insulator hangers (1) if fitted.



13. Detach the intermediate exhaust assembly (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).
14. Carefully lower the intermediate exhaust assembly from the vehicle.
15. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 for 3.6L engine or Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 for 6.0L engine.
16. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 3.6L engine or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 6.0L engine.

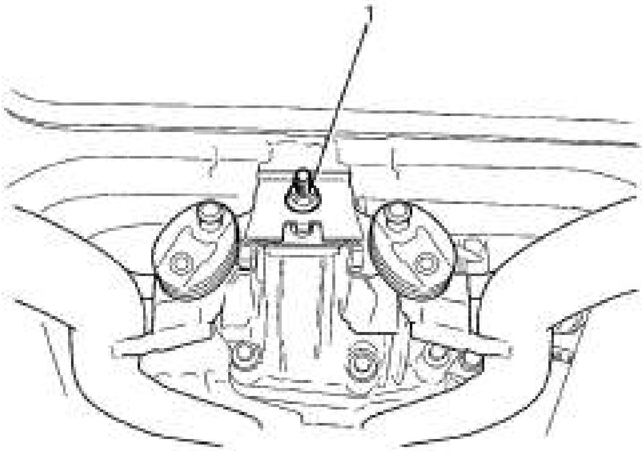
Installation Procedure

1. Clean all threads and flange faces of the intermediate exhaust system.
2. Always check the condition of the catalytic converter to intermediate pipe flange gaskets and replace as necessary.
3. Install the left post-catalytic converter HO2S to the intermediate exhaust system. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 for 3.6L engine or Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 for 6.0L engine.
4. Install the right post-catalytic converter HO2S to the intermediate exhaust system. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 3.6L engine or Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 for 6.0L engine.

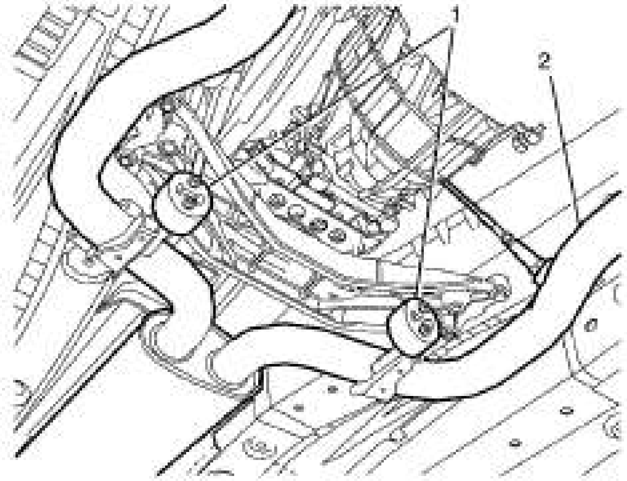
Notice: Refer to Exhaust System Inspection Notice in the Preface section.

Notice: Refer to Exhaust Service Caution in the Preface section.

5. Position the intermediate exhaust assembly to the vehicle using a suitable jack.

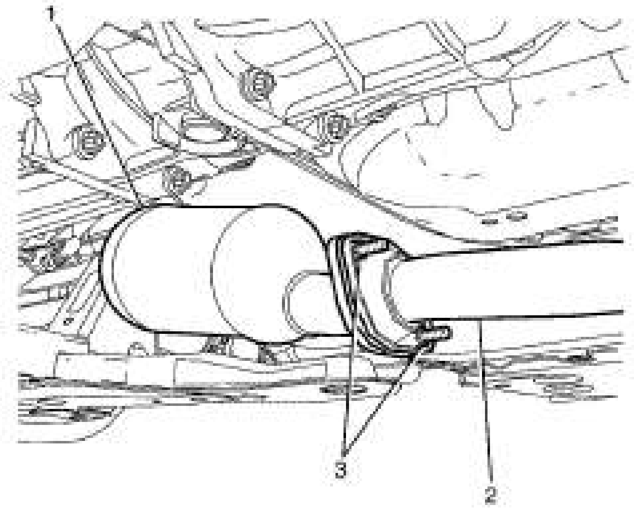


6. Attach the intermediate exhaust assembly (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).



7. Attach the intermediate exhaust assembly (2) by installing the front insulator hangers (1) if fitted.
8. Tighten the intermediate exhaust assembly to rear muffler retaining bolts.

   Tighten
   Tighten the bolts to 45 N·m (33 lb ft).

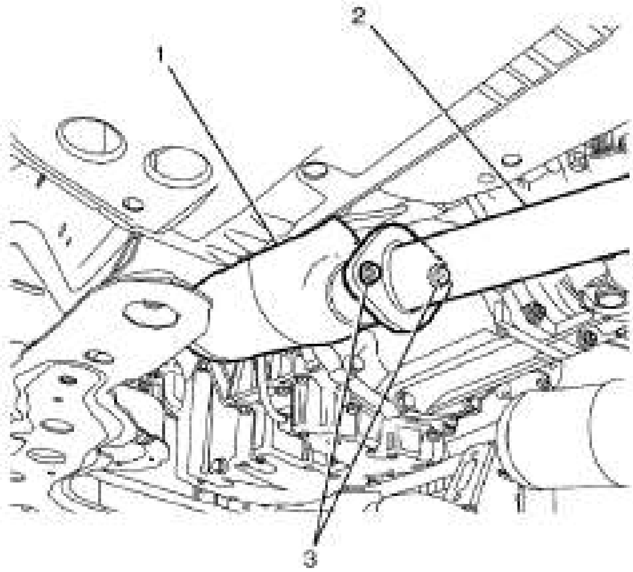


9. Align the intermediate exhaust assembly (2) to the right catalytic converter (1).

   Notice: Refer to Fastener Notice in the Preface section.

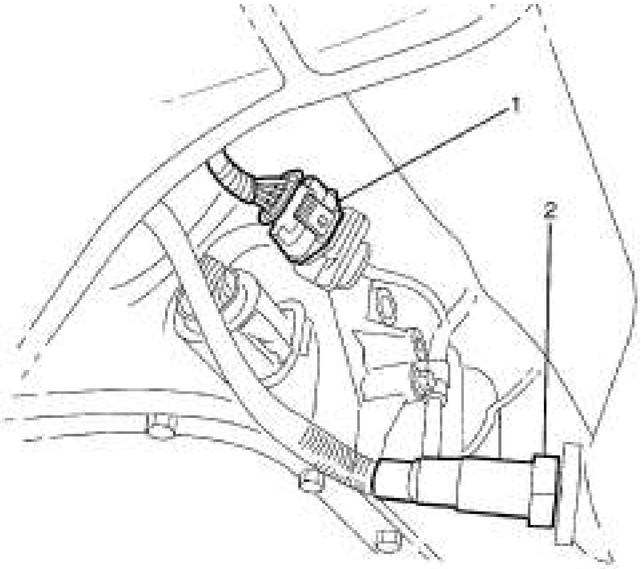
10. Tighten the intermediate exhaust assembly to right catalytic converter retaining nuts (3).

Tighten
Tighten the nuts to 40 N·m (30 lb ft).

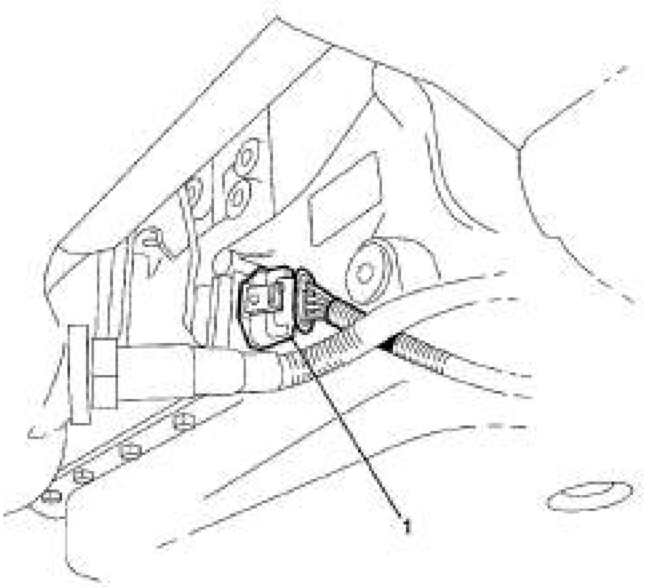


11. Align the intermediate exhaust assembly (2) to the left catalytic converter (1).
12. Tighten the intermediate exhaust assembly to left catalytic converter retaining nuts (3).

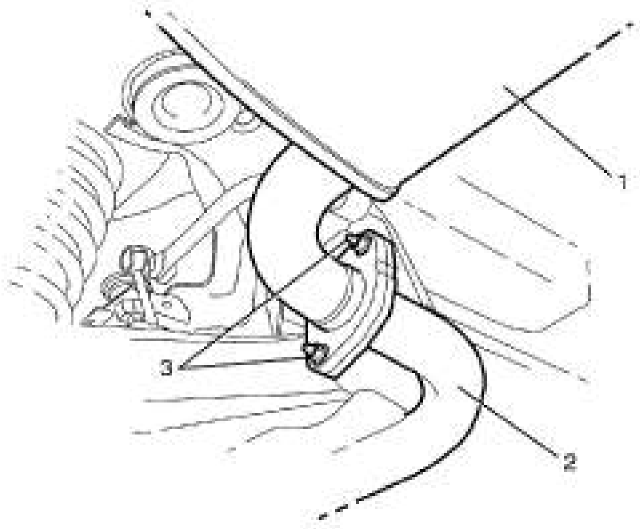
Tighten
Tighten the nuts to 40 N·m (30 lb ft).



13. Connect the right post-catalytic converter HO2S electrical connector (1).



14. Connect the left post-catalytic converter HO2S electrical connector (1).



15. Connect the left rear muffler (1) to the intermediate exhaust assembly (2).

    Notice: Refer to Fastener Notice in the Preface section.

16. Install the left rear muffler to intermediate exhaust assembly retaining bolts (3).

    Tighten
    Tighten the bolts to 45 N·m (33 lb ft).

17. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .

18. Lower the vehicle to the ground.
19. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
20. If re-programming is required. Refer to Control Module References .
21. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

Exhaust Front Heat Shield Replacement

Removal Procedure

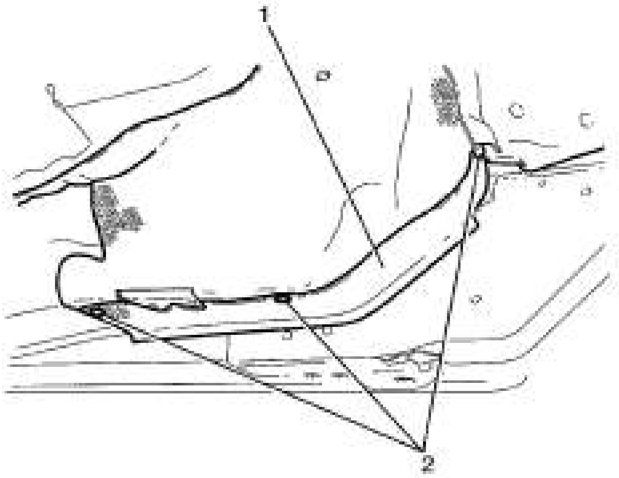
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

   Caution: Refer to Exhaust Service Caution in the Preface section.

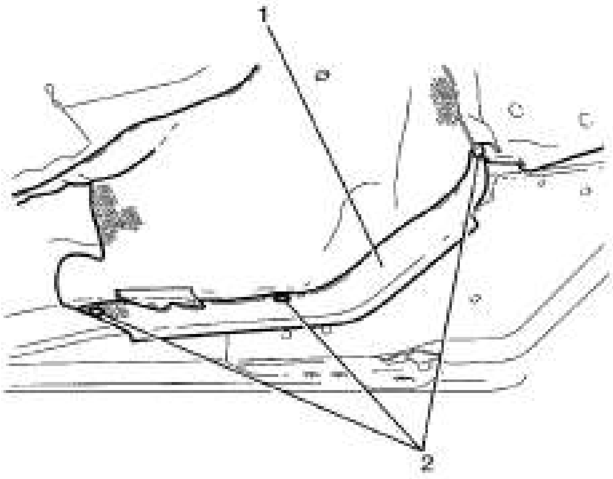
2. Remove the catalytic converter. Refer to Catalytic Converter Replacement - Left Side, Catalytic Converter Replacement - Right Side.



3. Remove the front exhaust foil heat shield to body retaining bolts (2).
4. Remove the front exhaust foil heat shield (1).

Installation Procedure

1. Install the front exhaust foil heat shield (1).



Notice: Refer to Fastener Notice in the Preface section.

2. Install the front exhaust foil heat shield to body retaining bolts (2).

   Tighten
   Tighten the bolts to 4 N·m (35 lb in).

3. Install the catalytic converter. Refer to Catalytic Converter Replacement - Left Side, Catalytic Converter Replacement - Right Side.
4. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1977420**

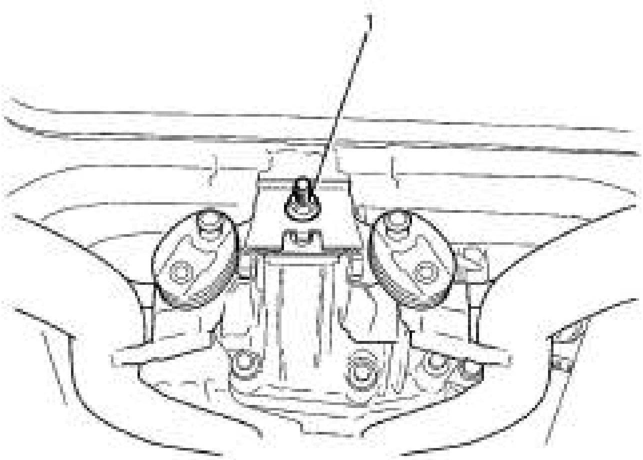
Exhaust Hanger Mounting Bracket Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

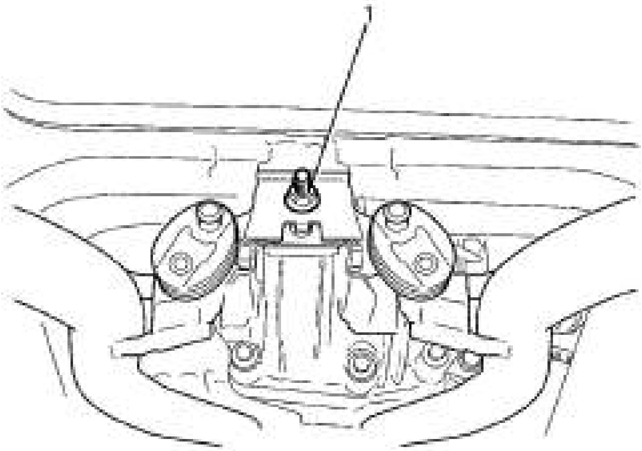
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Detach the intermediate exhaust assembly (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).
3. Remove the intermediate exhaust assembly to centre insulator hanger bracket insulators.

Installation Procedure



1. Install the intermediate exhaust assembly (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).

   Tighten
   Tighten the nuts to 45 N·m (33 lb ft).

2. Install the intermediate exhaust assembly to centre insulator hanger bracket insulators.
3. Lower the vehicle.

Exhaust Heat Shield Replacement - Center

Removal Procedure

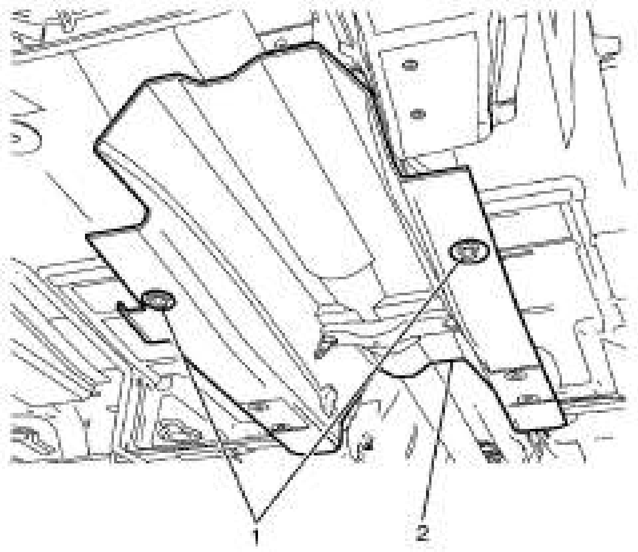
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

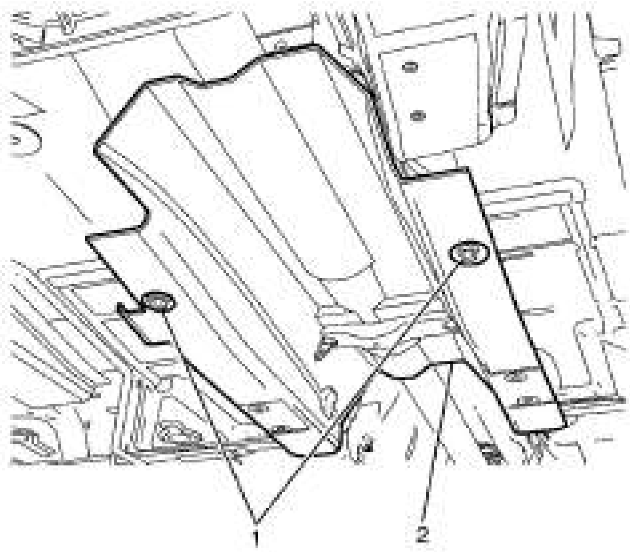
Caution: Refer to Exhaust Service Caution in the Preface section.

2. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.



3. Remove the centre exhaust heat shield to body retaining bolts (1).
4. Remove the centre exhaust heat shield (2).

Installation Procedure



1. Position the centre exhaust heat shield (2) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the centre exhaust heat shield to body retaining bolts (1).

   Tighten
   Tighten the bolts to 4 N·m (35 lb in).

3. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
4. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2195326**

Exhaust Manifold Heat Shield Replacement - Left Side (NT4)

Removal Procedure

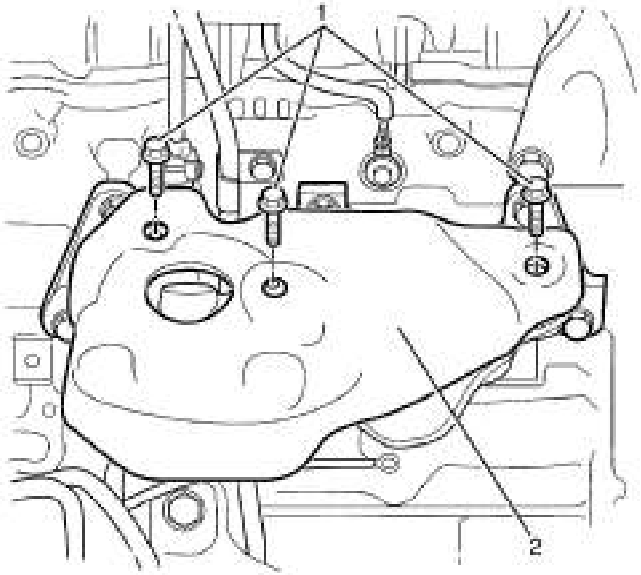
Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

1. Ignition OFF.

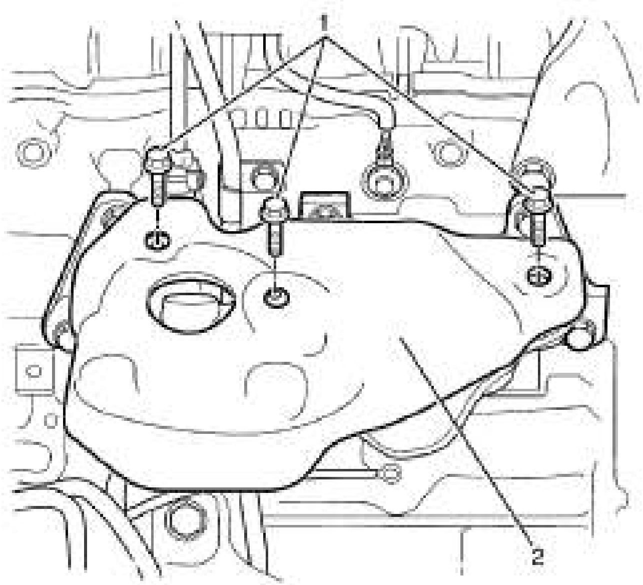
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the left pre-catalytic convertor heated oxygen sensor (HO2S). Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.



5. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
6. Remove the exhaust manifold heat shield (2).

Installation Procedure



1. Install the exhaust manifold heat shield (2).

   Caution: Refer to Fastener Caution in the Preface section.

2. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

3. Install the left pre-catylitic convertor HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
4. Install the engine cover. Refer to Engine Cover Replacement.
5. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Exhaust Manifold Heat Shield Replacement - Right Side (NT4)

Removal Procedure

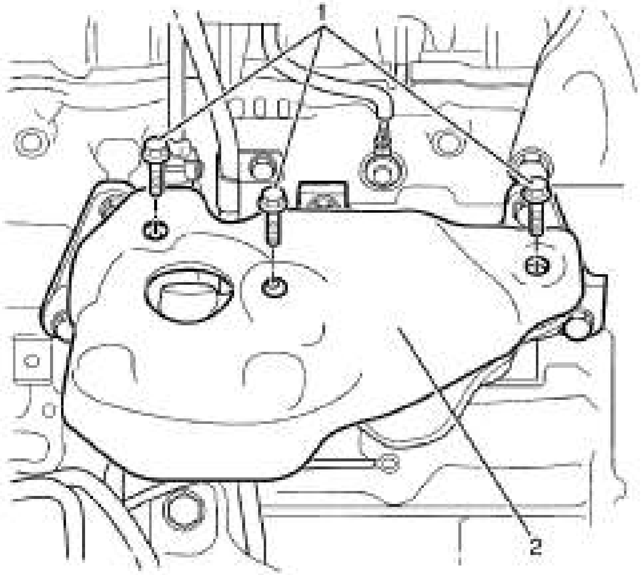
Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

1. Ignition OFF.

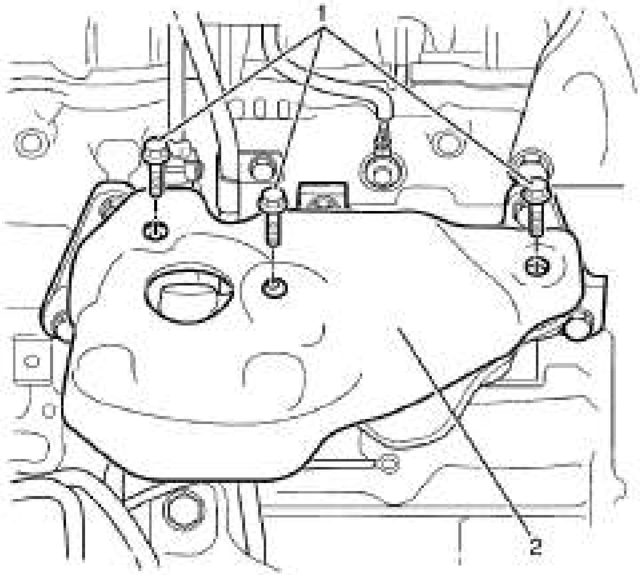
Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the right pre-catalytic convertor heated oxygen sensor (HO2S). Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.



5. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
6. Remove the exhaust manifold heat shield (2).

Installation Procedure



1. Install the exhaust manifold heat shield (2).

   Caution: Refer to Fastener Caution in the Preface section.

2. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

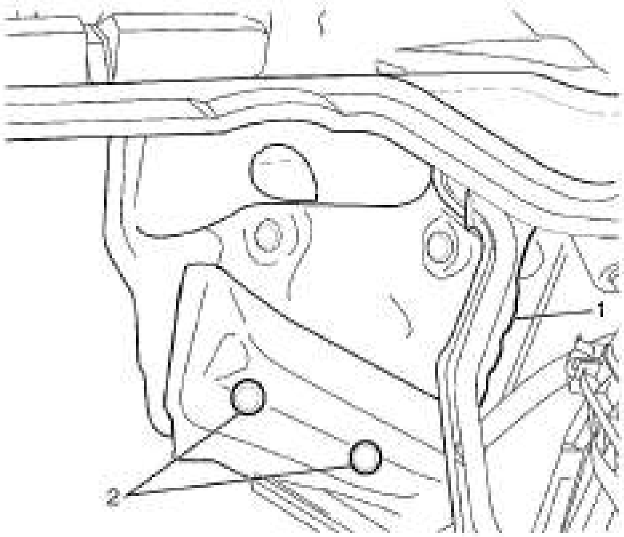
   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

3. Install the right pre-catalytic convertor HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
4. Install the engine cover. Refer to Engine Cover Replacement.
5. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1977389**

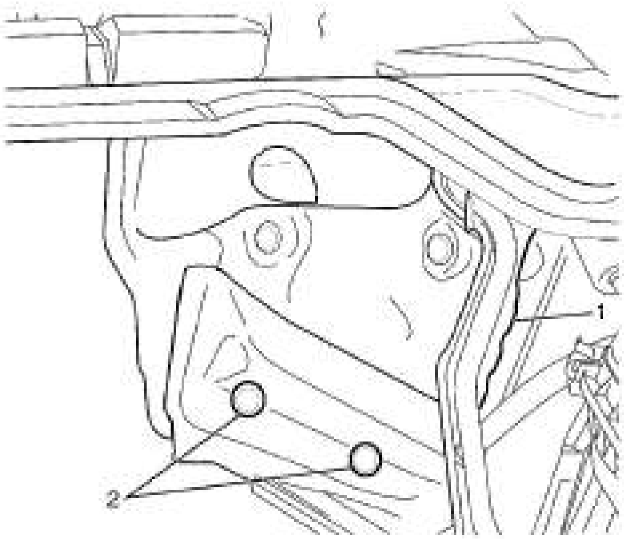
Exhaust Manifold Heat Shield Replacement

Removal Procedure



1. Remove the exhaust manifold heat shield to air box retaining clips (2).
2. Remove the exhaust manifold heat shield (1) from the vehicle.

Installation Procedure



1. Install the exhaust manifold heat shield to the vehicle (1)
2. Install the exhaust manifold heat shield to air box retaining clips (2)

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2195322**

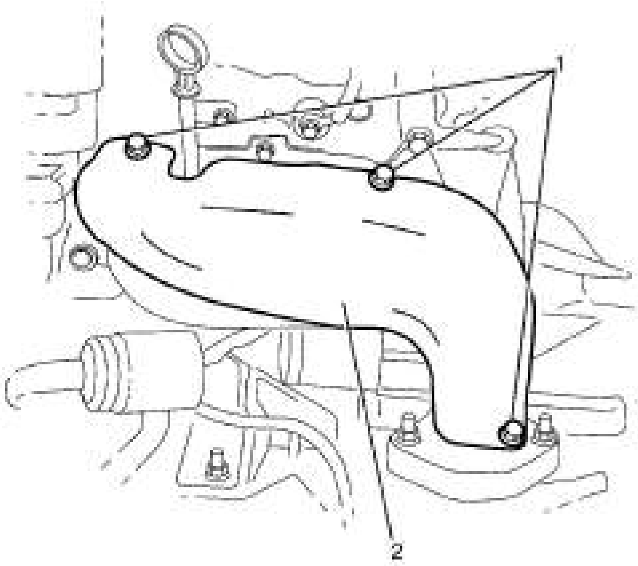
Exhaust Manifold Replacement - Left Side (3.6L Engine NT3)

Removal Procedure

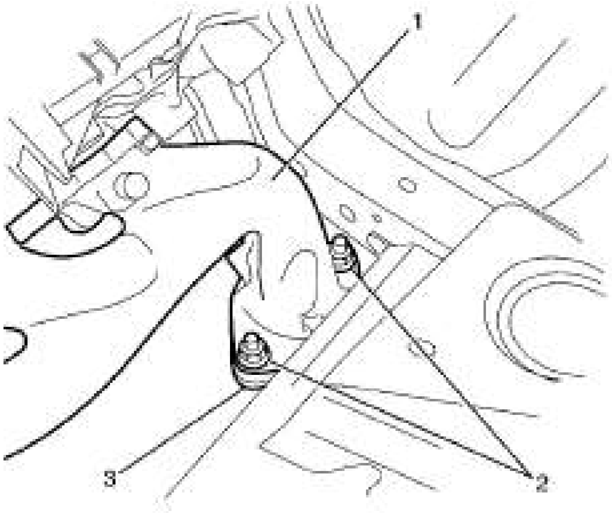
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine dress cover. Refer to Engine Cover Replacement.

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



3. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
4. Remove the exhaust manifold heat shield (2).
5. Remove the oil level indicator tube. Refer to Oil Level Indicator and Tube Removal.



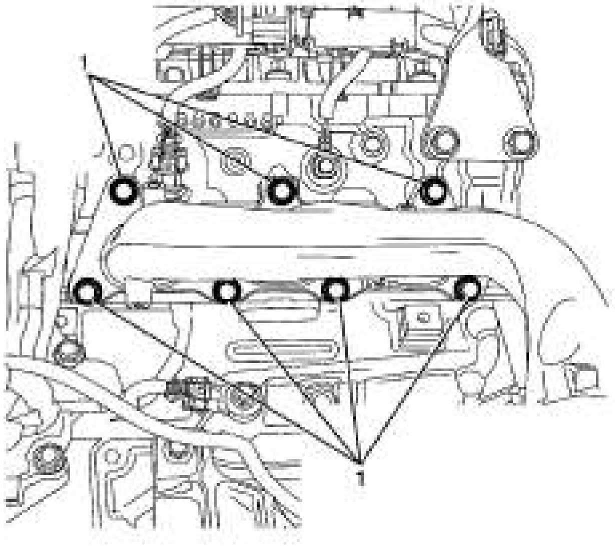
Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

6. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

   Discard the nuts.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

7. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
8. Remove the left catalytic converter. Refer to Catalytic Converter Replacement - Left Side.
9. Remove the starter motor. Refer to Starter Replacement.
10. Lower the vehicle.



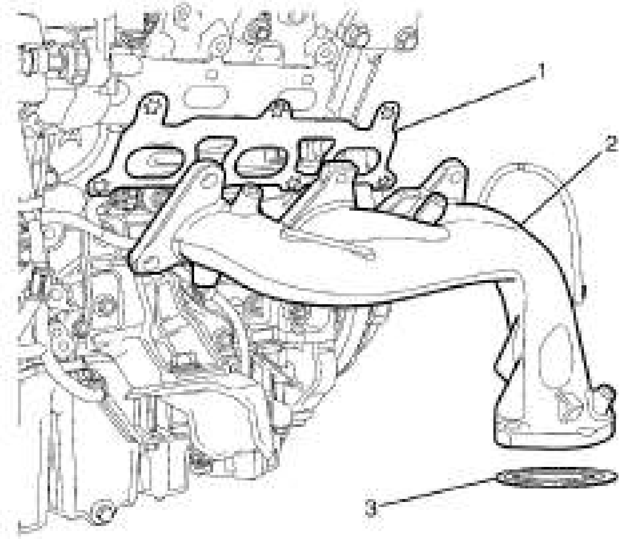
11. Loosen the exhaust manifold to cylinder head retaining bolts (1) working from the outside to the centre.

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

12. Remove the exhaust manifold to cylinder head retaining bolts (1).

    Discard the bolts.

13. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



Important: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

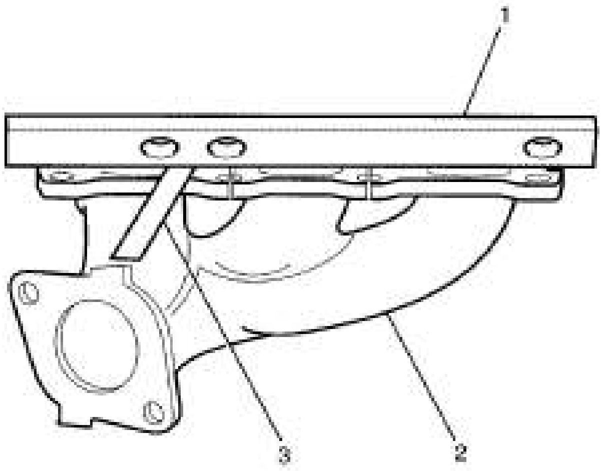
14. Remove the exhaust manifold (2).

    Discard the exhaust manifold gasket (1) and sealing ring (3).

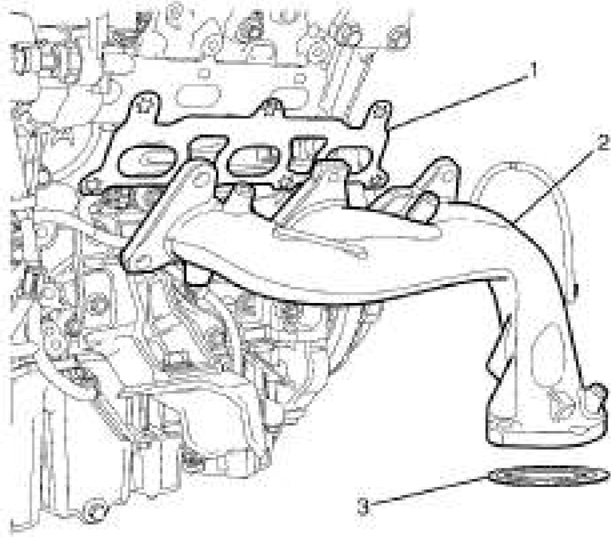
Installation Procedure

Notice: Refer to Exhaust Service Caution in the Preface section.

1. Before installation inspect for the following:
    - Damage to the gasket sealing surfaces.
    - Distortion of exhaust manifold mating surface.
    - Damage to the exhaust mounting holes.



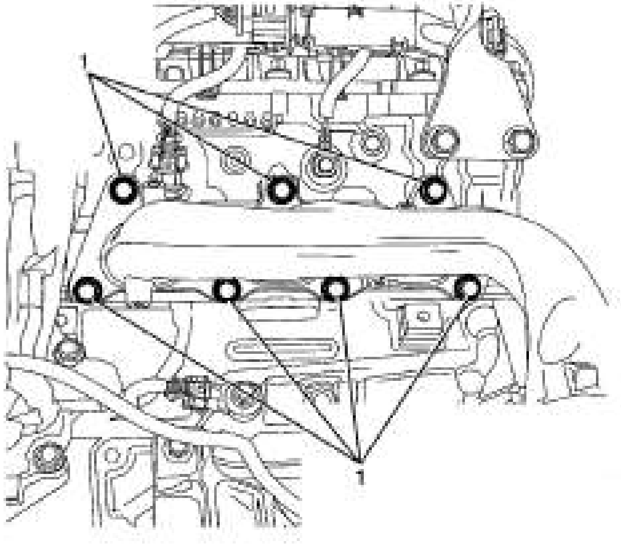
2. Check for distortion on the mating surface of the exhaust manifold (2) by using a straight edge (1) and a feeler gauge (3).
3. Clean the exhaust manifold and catalytic converter flange mating surfaces.



4. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

   Notice: Refer to Exhaust System Inspection Notice in the Preface section.

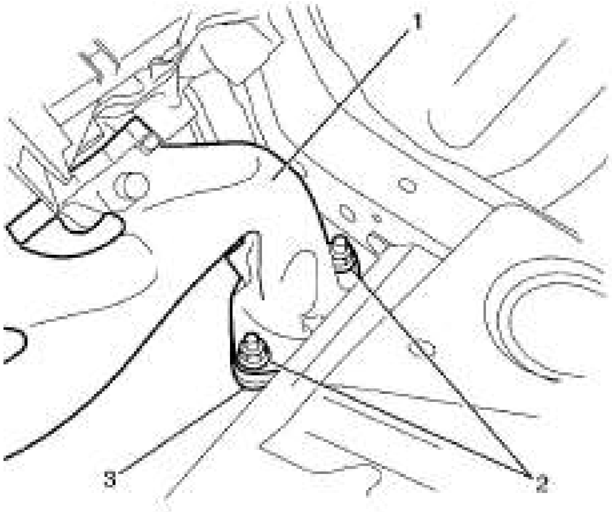
5. Install the exhaust manifold assembly to the engine.
6. Lower the vehicle.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

7. Install the NEW exhaust manifold to cylinder head retaining bolts (1).

   Do not fully tighten at this stage.



Important: Make sure the sealing ring is seated correctly.

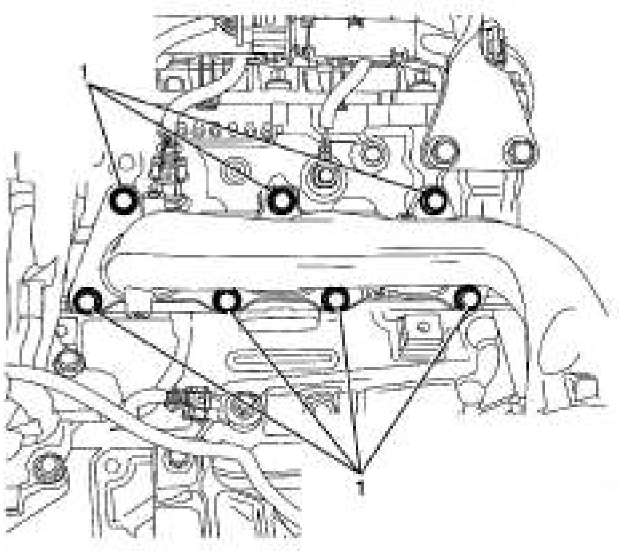
8. Install the left catalytic converter. Refer to Catalytic Converter Replacement - Left Side.

9. Install the starter motor. Refer to Starter Replacement.

   Notice: Refer to Fastener Notice in the Preface section.

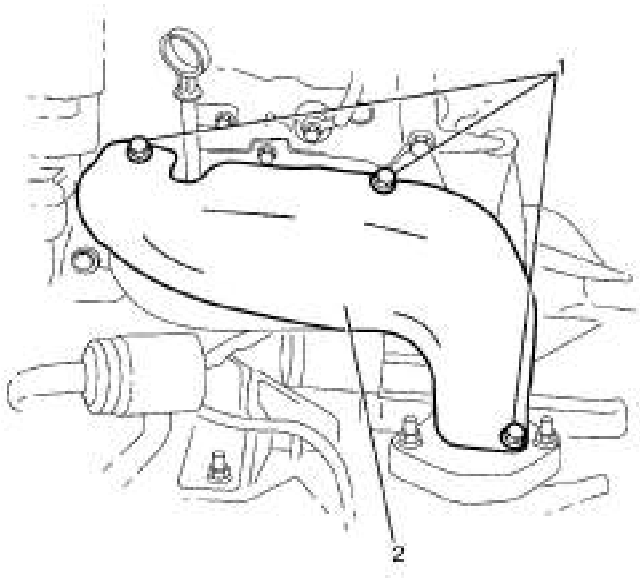
10. Install the NEW left catalytic converter to exhaust manifold retaining nuts (2).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



11. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

    Tighten
    Tighten the bolts to 20 N·m (15 lb ft).



12. Install the exhaust manifold heat shield (2).
13. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

14. Install the engine dress cover. Refer to Engine Cover Replacement.
15. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2195327**

Exhaust Manifold Replacement - Left Side (3.6L Engine NT4)

Removal Procedure

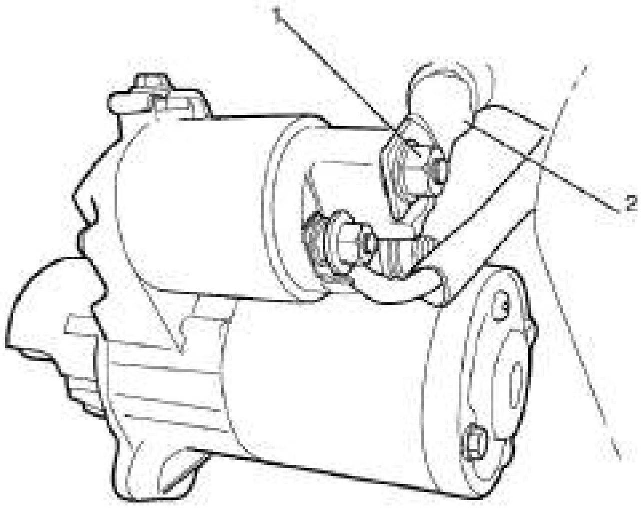
Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

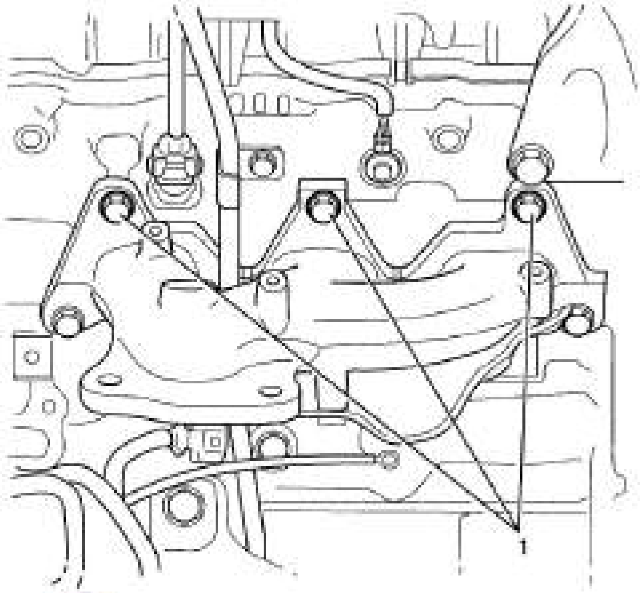
1. Ignition OFF.

Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the left pre-catalytic convertor heated oxygen sensor (HO2S). Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
5. Remove the exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Left Side .
6. Remove the oil level indicator tube. Refer to Oil Level Indicator and Tube Removal .
7. Remove the left catalytic converter. Refer to Catalytic Converter Replacement - Left Side .



8. Remove the battery positive cable retaining nut (1) from the starter motor solenoid.
9. Remove the battery positive cable (2) from the starter motor.



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

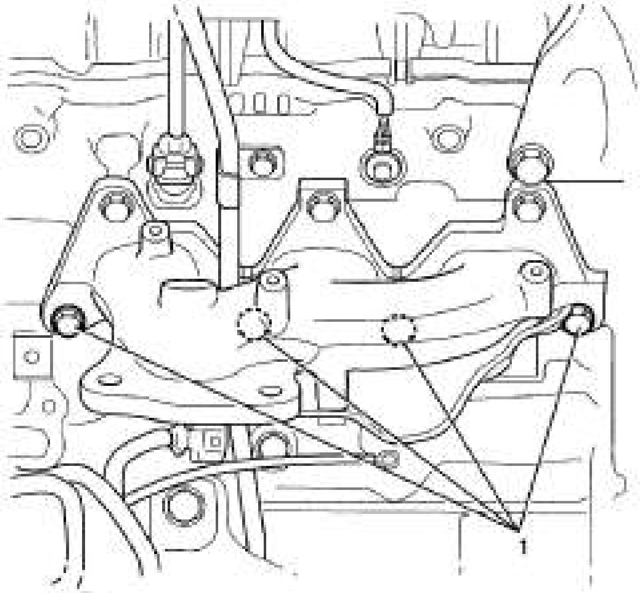
10. Remove the exhaust manifold to cylinder head retaining bolts (1).

    Discard the bolts.

    Caution: Refer to Safety Glasses Caution in the Preface section.

    Caution: Refer to Vehicle Lifting Caution in the Preface section.

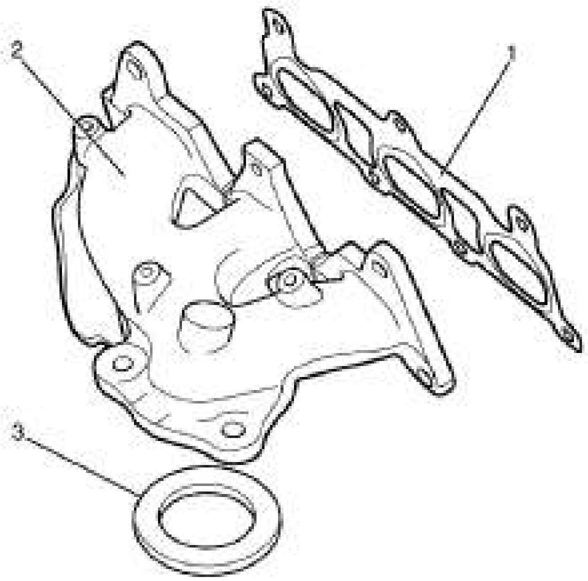
11. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

12. Remove the exhaust manifold to cylinder head retaining bolts (1).

    Discard the bolts.



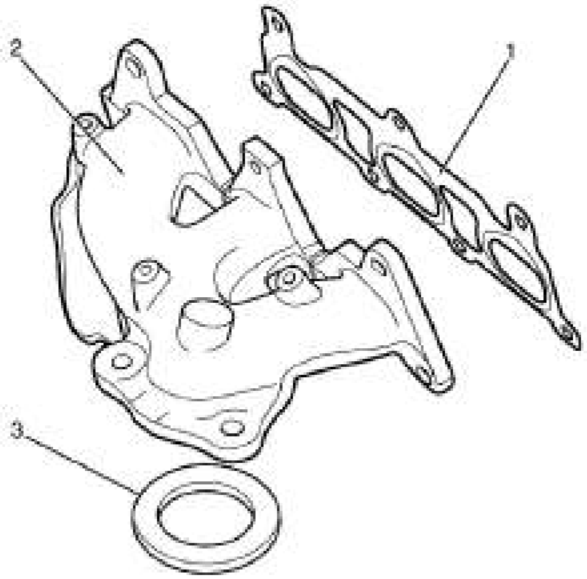
Important: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

13. Remove the exhaust manifold (2) from the engine assembly.
14. Separate the exhaust manifold (2) from the exhaust manifold gasket (1) and sealing ring (3).
15. Discard the exhaust manifold gasket (1) and sealing ring (3).

Installation Procedure

1. Inspect the exhaust manifold before installation. Refer to Exhaust Manifold Cleaning and Inspection - Left Side.



Important: Make sure the sealing ring is seated correctly.

2. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

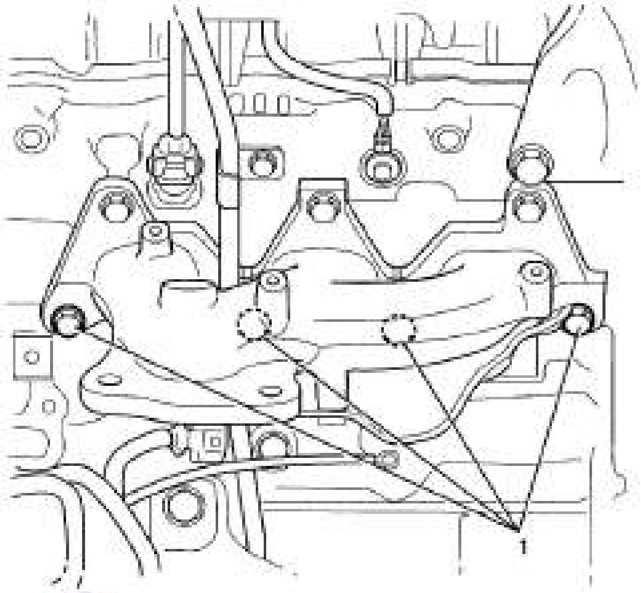
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

Important: A suitable support must be used to support the exhaust manifold while the vehicle is being lowered.

4. Install the exhaust manifold assembly (2) to the engine.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

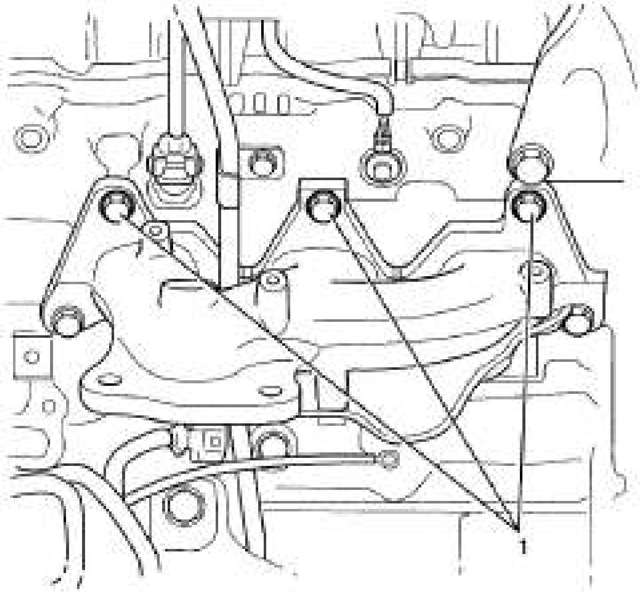
5. Install NEW exhaust manifold to cylinder head retaining bolts (1).

Caution: Refer to Fastener Caution in the Preface section.

6. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten
Tighten the bolts to 20 N·m (15 lb ft).

7. Lower the vehicle.



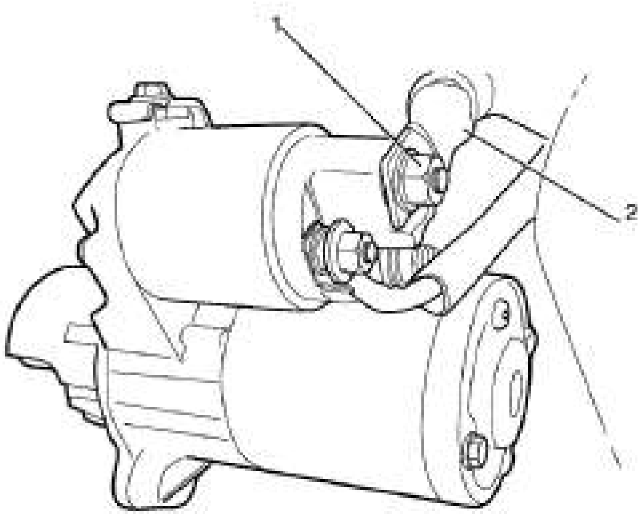
Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

8. Install NEW exhaust manifold to cylinder head retaining bolts (1).

Caution: Refer to Fastener Caution in the Preface section.

9. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten
Tighten the bolts to 20 N·m (15 lb ft).



10. Install the battery positive cable (2) to the starter motor.
11. Install the battery positive cable retaining nut (1) to the starter motor solenoid.

Tighten
Tighten the nut to 10 N·m (89 lb in).

12. Install the left catalytic converter. Refer to Catalytic Converter Replacement - Left Side .
13. Install the exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Left Side .
14. Install the left pre-catalytic convertor HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
15. Install the engine cover. Refer to Engine Cover Replacement.
16. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .

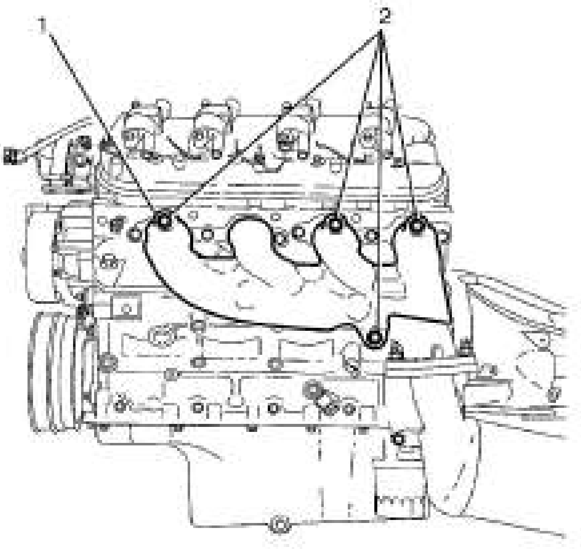
Exhaust Manifold Replacement - Left Side (6.0L Engine LWB SWB)

Removal Procedure

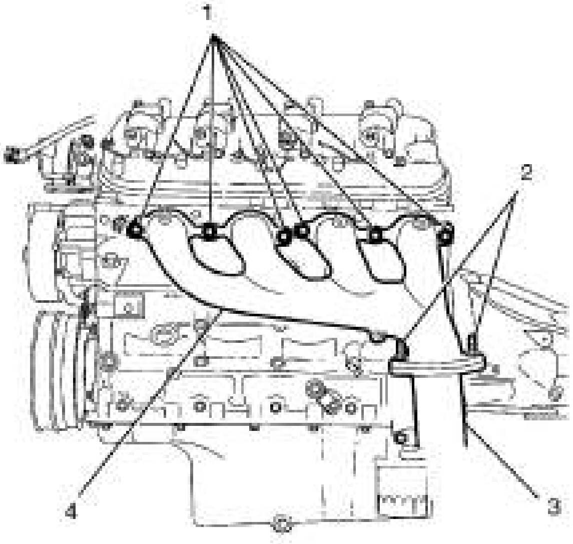
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine dress cover. Refer to Engine Cover Replacement.
3. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement.
4. Remove the left side spark plug leads. Refer to Spark Plug Wire Replacement.
5. Remove the left side spark plugs from the cylinder head. Refer to Spark Plug Replacement.

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



6. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (2).
7. Remove the exhaust manifold heat shield (1).
8. Remove the engine coolant temperature sensor. Refer to Engine Coolant Temperature Sensor Replacement.



Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

9. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

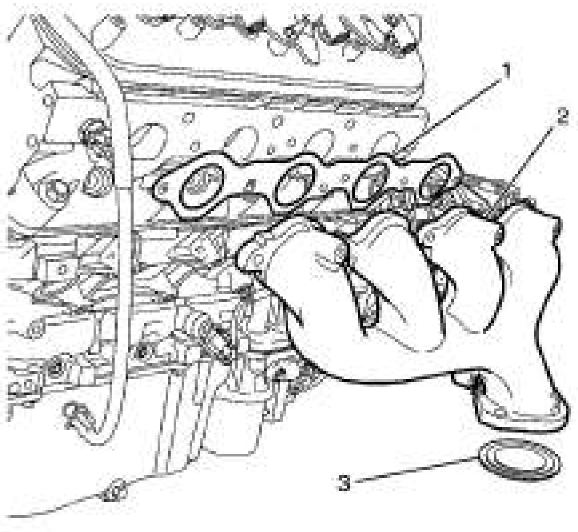
   Discard the nuts.

10. Disconnect the left catalytic converter (3) from the exhaust manifold (4).
11. Loosen the exhaust manifold to cylinder head retaining bolts (1) working from the outside to the centre.

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

12. Remove the exhaust manifold to cylinder head retaining bolts (1).

    Discard the bolts.



Important: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

13. Remove the exhaust manifold (2).

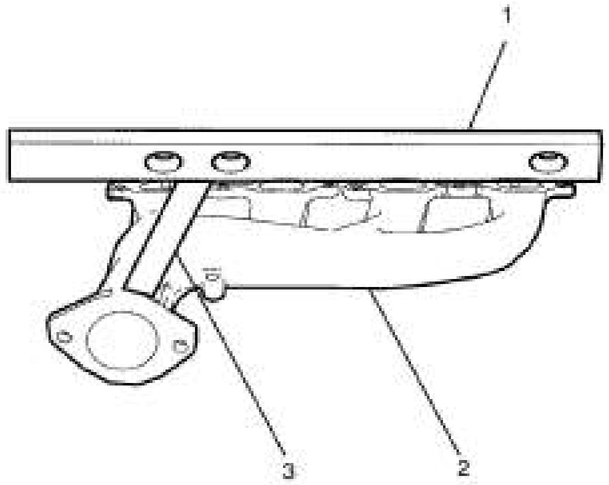
    Discard the exhaust manifold gasket (1) and sealing ring (3).

Installation Procedure

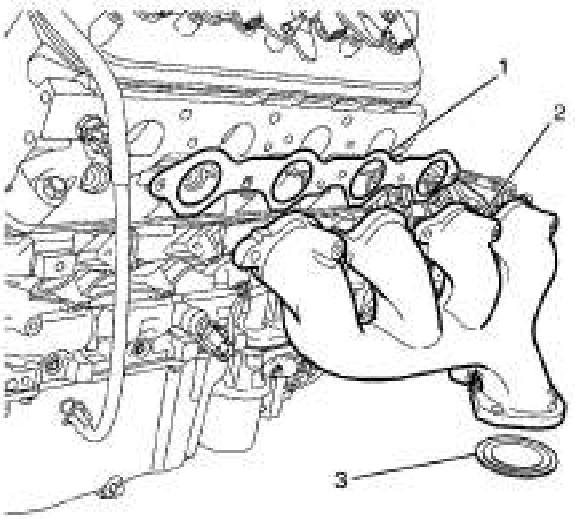
Inspect

Notice: Refer to Exhaust Service Caution in the Preface section.

1. Before installation inspect for the following:
    - Damage to the gasket sealing surfaces.
    - Distortion of exhaust manifold mating surface.
    - Damage to the exhaust mounting holes.



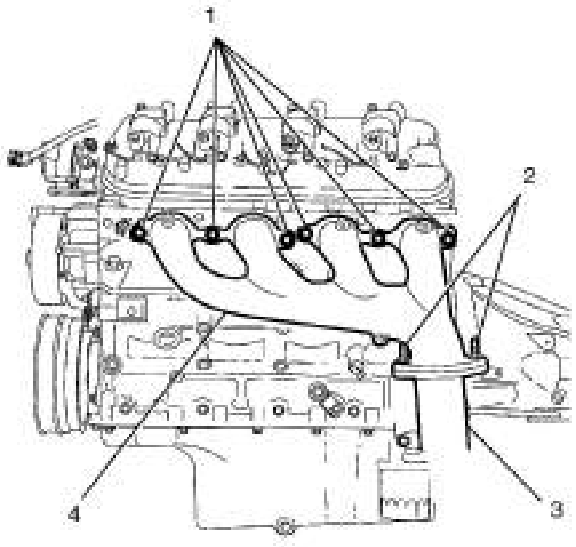
2. Check for distortion on the mating surface of the exhaust manifold (3) by using a straight edge (1) and a feeler gauge (2).
3. Clean the exhaust manifold and catalytic converter flange mating surfaces.



4. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

   Notice: Refer to Exhaust System Inspection Notice in the Preface section.

5. Install the exhaust manifold assembly to the engine.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

6. Install the NEW exhaust manifold to cylinder head retaining bolts (1).

   Do not fully tighten at this stage.

   Important: Make sure the sealing ring is seated correctly.

7. Lift the left catalytic converter (3) up and forward to connect to the exhaust manifold (4).
8. Clean the threads of the exhaust manifold to catalytic converter retaining studs with a suitable cleaning solvent.

   Notice: Refer to Fastener Notice in the Preface section.

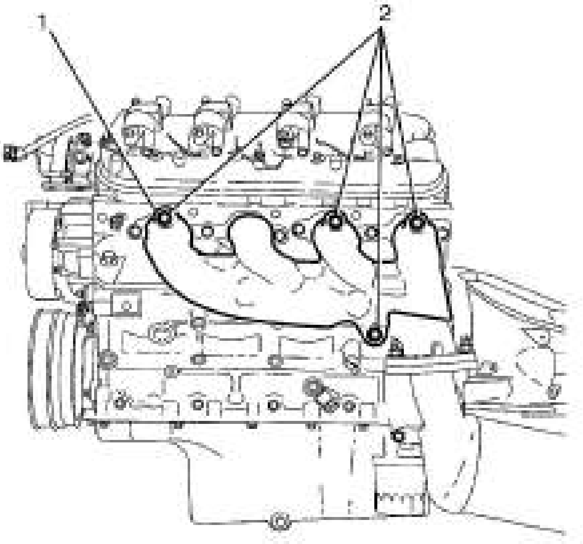
9. Install the NEW left catalytic converter to exhaust manifold retaining nuts (2).

   Tighten
   Tighten the nuts to 45 N·m (33 lb ft).

10. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

    Tighten
    Tighten the bolts to 20 N·m (15 lb ft).

11. Install the engine coolant temperature sensor. Refer to Engine Coolant Temperature Sensor Replacement .



12. Install the exhaust manifold heat shield (1).
13. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (2).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

14. Install the left side spark plugs to the cylinder head. Refer to Spark Plug Replacement.
15. Install the left side spark plug leads. Refer to Spark Plug Wire Replacement.
16. Install the air intake duct. Refer to Air Cleaner Assembly Replacement.
17. Install the engine dress cover. Refer to Engine Cover Replacement.
18. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

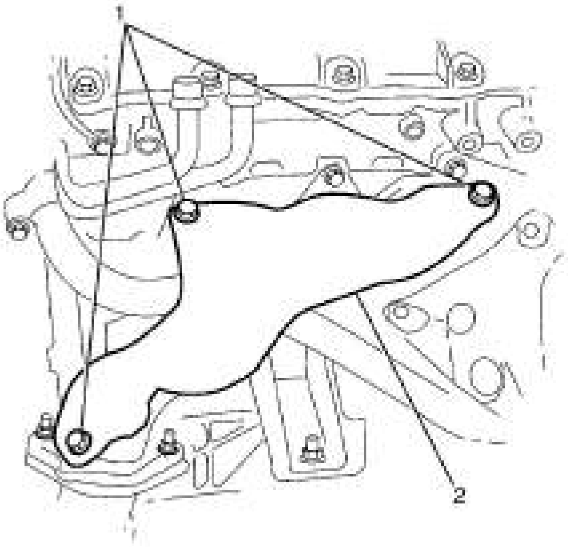
Exhaust Manifold Replacement - Right Side (3.6L Engine NT3)

Removal Procedure

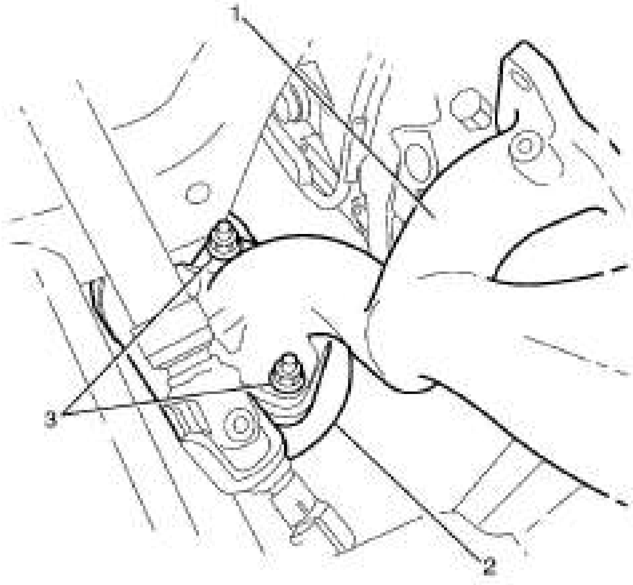
1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine dress cover. Refer to Engine Cover Replacement.

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.



3. Remove the exhaust manifold heat shield to exhaust manifold retaining bolts (1).
4. Remove the exhaust manifold heat shield (2).

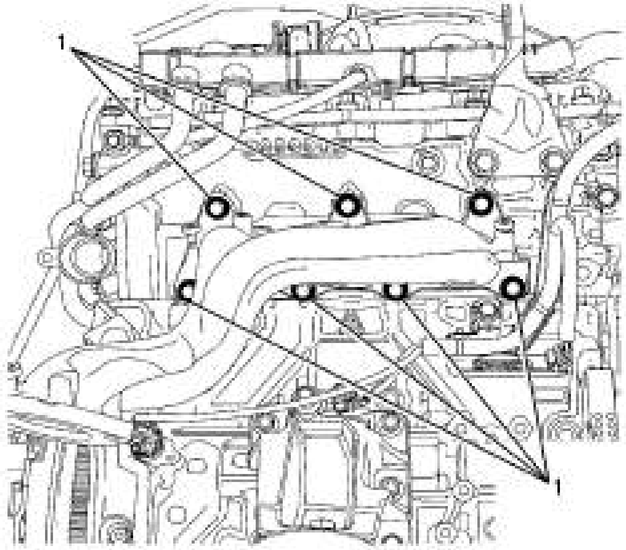


Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

5. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

   Discard the nuts.

6. Remove the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.
7. Lower the vehicle.

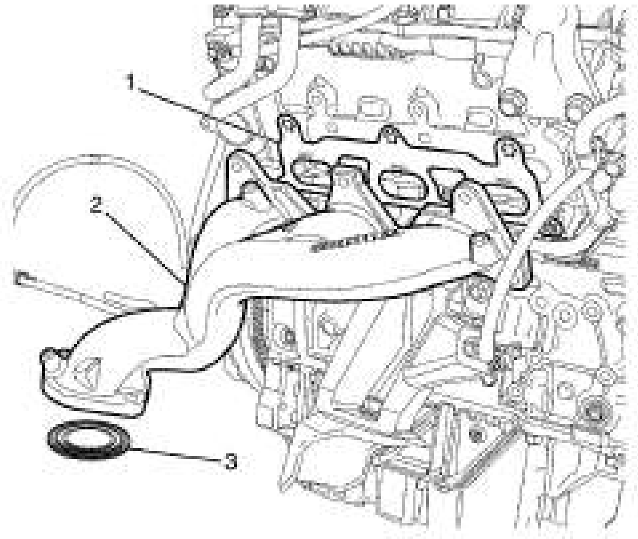


8. Loosen the exhaust manifold to cylinder head retaining bolts (1) working from the outside to the centre.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

9. Remove the exhaust manifold to cylinder head retaining bolts (1).

   Discard the bolts.



Important: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

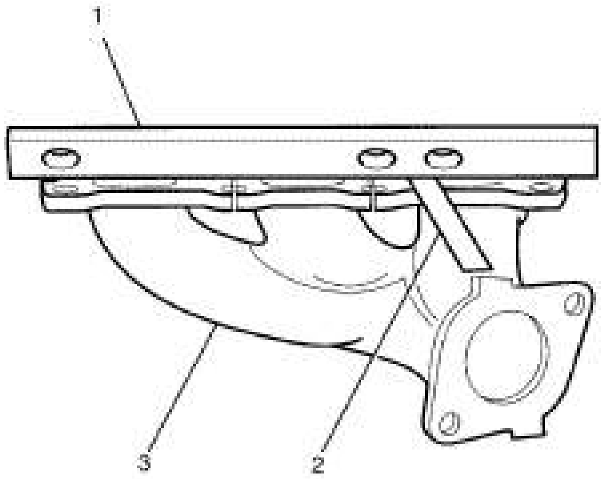
10. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
11. Remove the exhaust manifold (2).

    Discard the exhaust manifold gasket (1) and sealing ring (3).

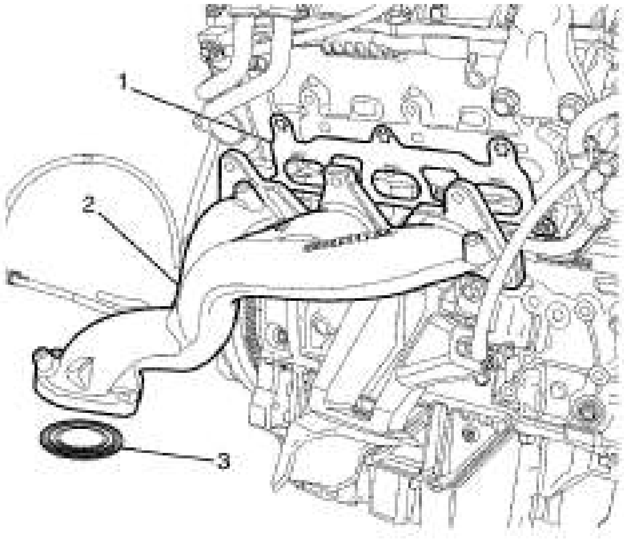
Installation Procedure

Notice: Refer to Exhaust Service Caution in the Preface section.

1. Before installation inspect for the following:
   - Damage to the gasket sealing surfaces.
   - Distortion of exhaust manifold mating surface.
   - Damage to the exhaust mounting holes.



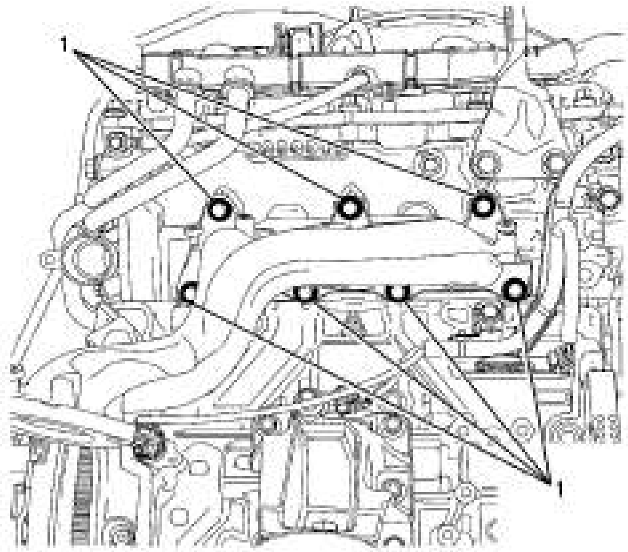
2. Check for distortion on the mating surface of the exhaust manifold (3) by using a straight edge (1) and a feeler gauge (2).
3. Clean the exhaust manifold and catalytic converter flange mating surfaces.



4. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

   Notice: Refer to Exhaust System Inspection Notice in the Preface section.

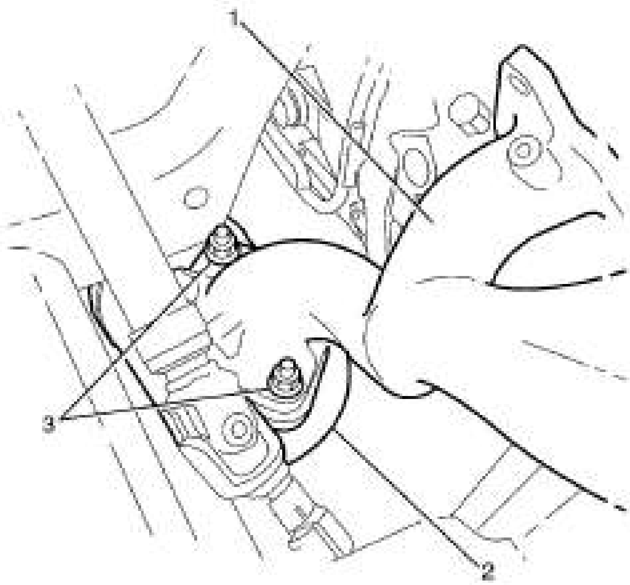
5. Install the exhaust manifold assembly to the engine.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

6. Install the NEW exhaust manifold to cylinder head retaining bolts (1).

   Do not fully tighten at this stage.



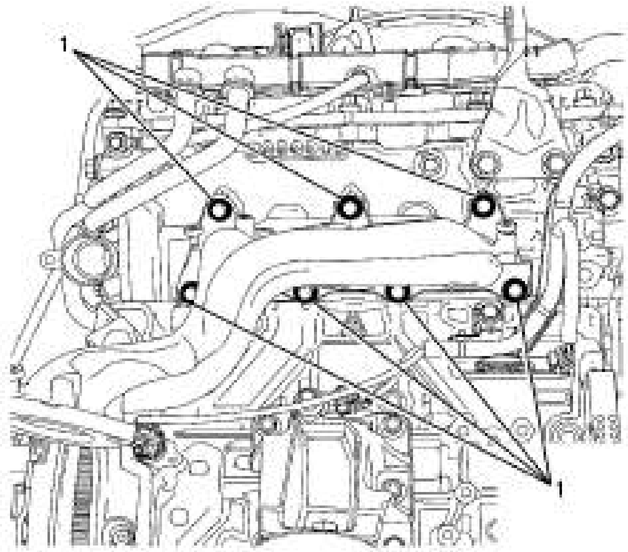
Important: Make sure the sealing ring is seated correctly.

7. Install the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.

Notice: Refer to Fastener Notice in the Preface section.

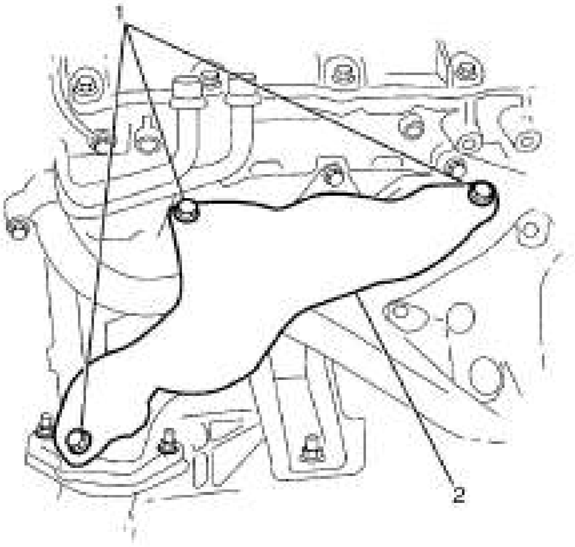
8. Install the NEW right catalytic converter to exhaust manifold retaining nuts (3).

Tighten
Tighten the nuts to 45 N·m (33 lb ft).



9. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten
Tighten the bolts to 20 N·m (15 lb ft).



10. Install the exhaust manifold heat shield (2).
11. Install the exhaust manifold heat shield to exhaust manifold retaining bolts (1).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

12. Install the engine dress cover. Refer to Engine Cover Replacement.
13. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | Document ID: 2195329

Exhaust Manifold Replacement - Right Side (3.6L Engine NT4)

Removal Procedure

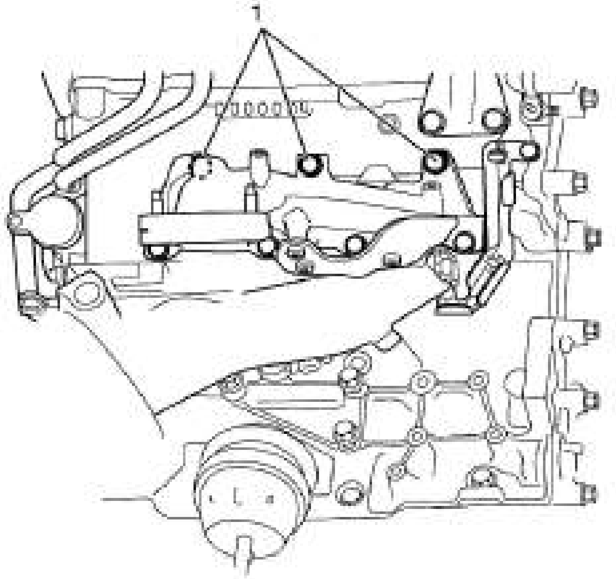
Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

1. Ignition OFF.

Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the right pre-catalytic convertor heated oxygen sensor (HO2S). Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
5. Remove the exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Right Side .
6. Remove the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side .



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

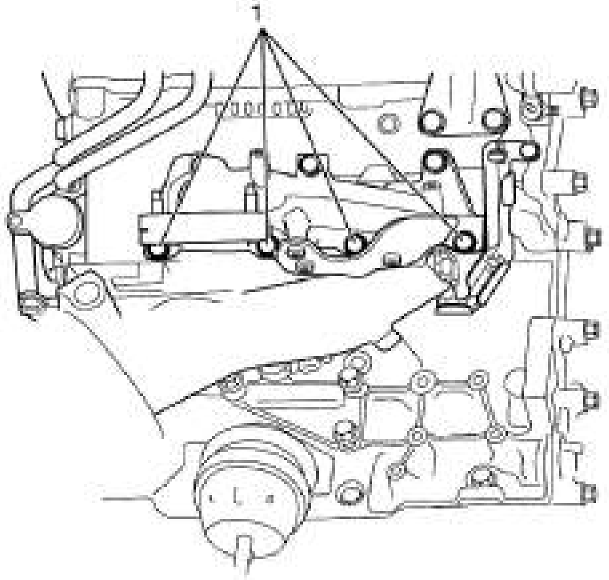
7. Remove the exhaust manifold to cylinder head retaining bolts (1).

Discard the bolts.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

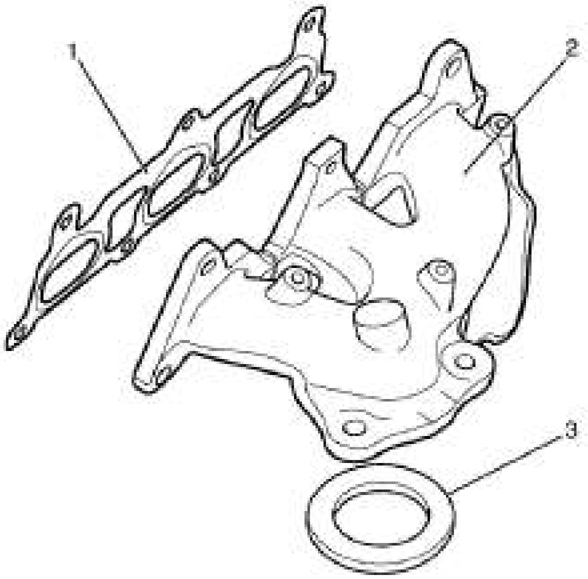
8. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

9. Remove the exhaust manifold to cylinder head retaining bolts (1).

   Discard the bolts.



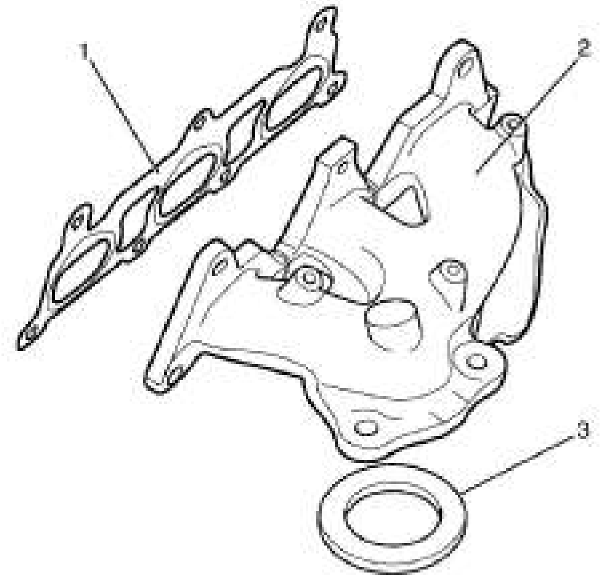
Important: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

Important: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

10. Remove the exhaust manifold (2) from the engine assembly.
11. Separate the exhaust manifold (2) from the exhaust manifold gasket (1) and sealing ring (3).
12. Discard the exhaust manifold gasket (1) and sealing ring (3).

Installation Procedure

1. Inspect the exhaust manifold before installation. Refer to Exhaust Manifold Cleaning and Inspection - Right Side.



2. Install a NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

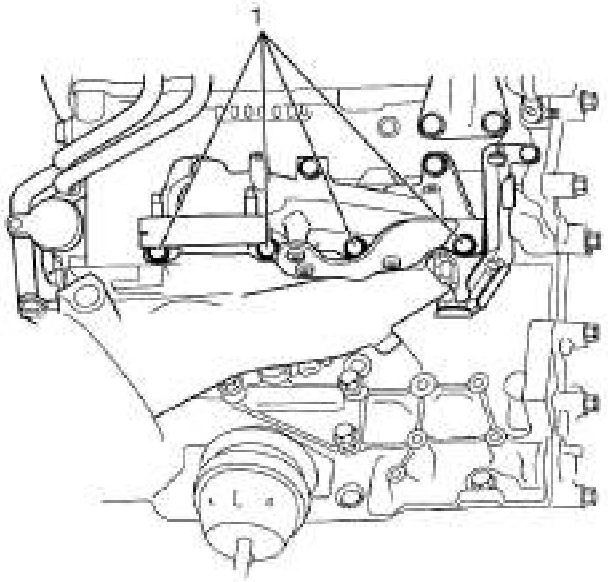
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

Important: A suitable support must be used to support the exhaust manifold while the vehicle is being lowered.

4. Install the exhaust manifold assembly (2) to the engine.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

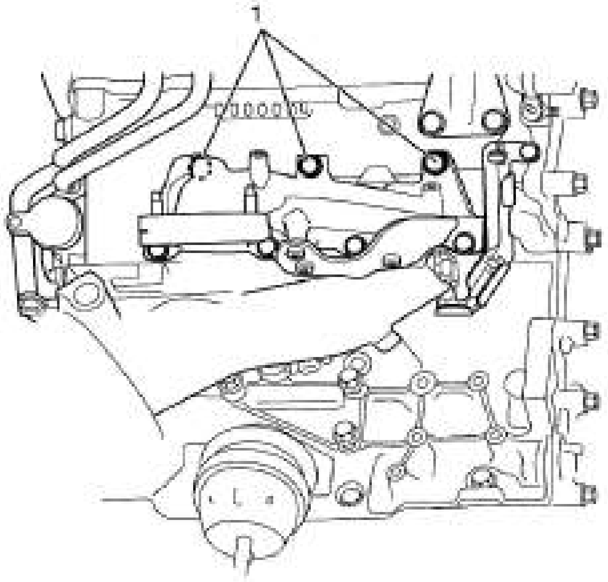
5. Install NEW exhaust manifold to cylinder head retaining bolts (1).

Caution: Refer to Fastener Caution in the Preface section.

6. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

Tighten
Tighten the bolts to 20 N·m (15 lb ft).

7. Lower the vehicle.



Important: Do not fully tighten the exhaust manifold to cylinder head retaining bolts (1) at this stage.

8. Install NEW exhaust manifold to cylinder head retaining bolts (1).

   Caution: Refer to Fastener Caution in the Preface section.

9. Tighten the exhaust manifold to cylinder head retaining bolts (1) working from the centre to the outside.

   Tighten
   Tighten the bolts to 20 N·m (15 lb ft).

10. Install the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side .
11. Install the exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Right Side .
12. Install the right pre-catalytic convertor HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
13. Install the engine cover. Refer to Engine Cover Replacement.
14. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2195332**

Exhaust Manifold Replacement - Right Side (6.0L Engine)

Removal Procedure

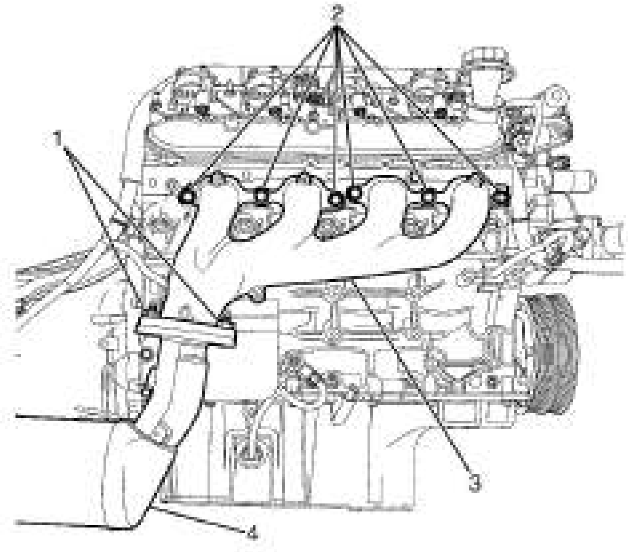
Warning: Refer to Exhaust Service Warning in the Preface section.

Warning: Refer to Protective Goggles and Glove Warning in the Preface section.

1. Ignition OFF.

Warning: Refer to Battery Disconnect Warning in the Preface section.

2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the engine cover. Refer to Engine Cover Replacement.
4. Remove the oil level indicator tube. Refer to Oil Level Indicator Tube Replacement.
5. Remove the right side spark plug leads. Refer to Spark Plug Wire Replacement.
6. Remove the right side spark plugs from the cylinder head. Refer to Spark Plug Replacement.
7. Remove the right side exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Right Side.



Note: The right catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

8. Remove the right catalytic converter to exhaust manifold retaining nuts (1).

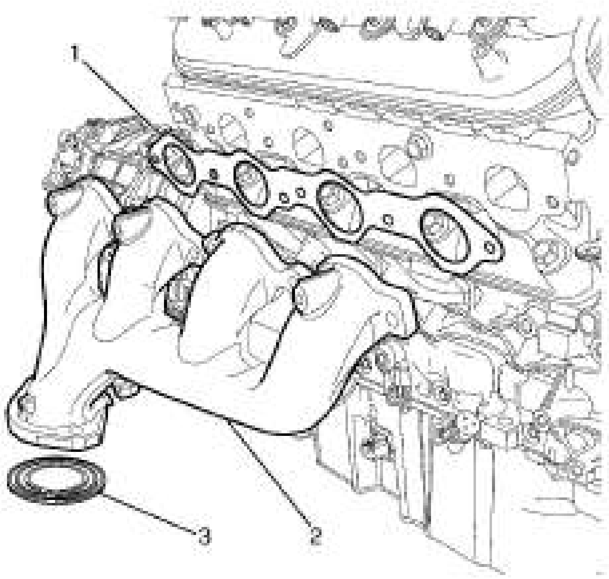
Discard the nuts.

9. Disconnect the right catalytic converter (4) from the exhaust manifold (3).
10. Loosen the exhaust manifold to cylinder head retaining bolts (2) working from the outside to the centre.

    Note: Bolts with micro-encapsulated thread sealant must be discarded after removal.

11. Remove the exhaust manifold to cylinder head retaining bolts (2).

    Discard the bolts.



Note: Make sure that the surrounding wiring harness and electrical connectors are not damaged when removing the exhaust manifold (2).

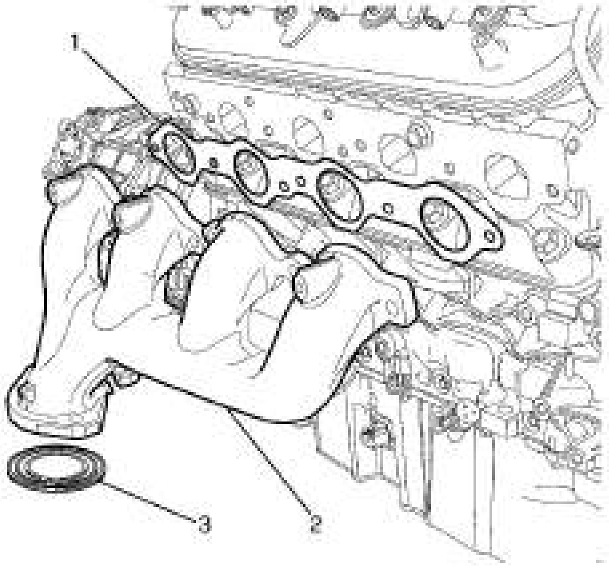
Note: The exhaust manifold gasket (1) and sealing ring (3) are single use parts. They must be discarded after removal.

12. Remove the exhaust manifold (2).

    Discard the exhaust manifold gasket (1) and sealing ring (3).

Installation Procedure

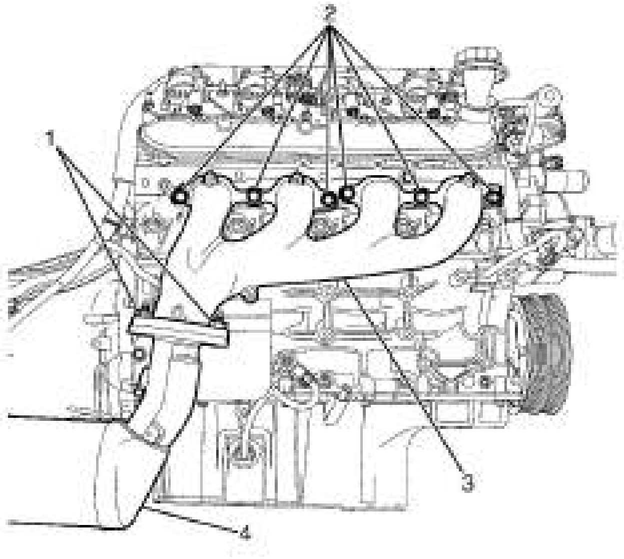
1. Clean and inspect the exhaust manifold. Refer to Exhaust Manifold Cleaning and Inspection.



2. Install NEW exhaust manifold gasket (1) and NEW sealing ring (3) to the exhaust manifold (2).

Caution: Refer to Exhaust System Inspection Caution in the Preface section.

3. Install the exhaust manifold assembly to engine.



4. Install the NEW exhaust manifold to cylinder head retaining bolts (1).
5. Tighten the exhaust manifold to cylinder head retaining bolts (2) working from the centre to the outside to **20 N·m (15 lb ft)**.

Note: Make sure the sealing ring is seated correctly.

6. Lift the right catalytic converter (4) up and forward to connect to the exhaust manifold (3).

7. Clean the threads of the exhaust manifold to catalytic converter retaining studs with a suitable cleaning solvent.

   Caution: Refer to Fastener Caution in the Preface section.

8. Install the NEW right catalytic converter to exhaust manifold retaining nuts (1) and tighten to **45 N·m (33 lb ft)**
9. Install the right side exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement - Right Side.
10. Install the right side spark plugs to the cylinder head. Refer to Spark Plug Replacement.
11. Install the right side spark plug leads. Refer to Spark Plug Wire Inspection.
12. Install the oil level indicator tube. Refer to Oil Level Indicator Tube Replacement.
13. Install the engine cover. Refer to Engine Cover Replacement.
14. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection.

Exhaust Muffler Heat Shield Replacement - Left Side

Removal Procedure

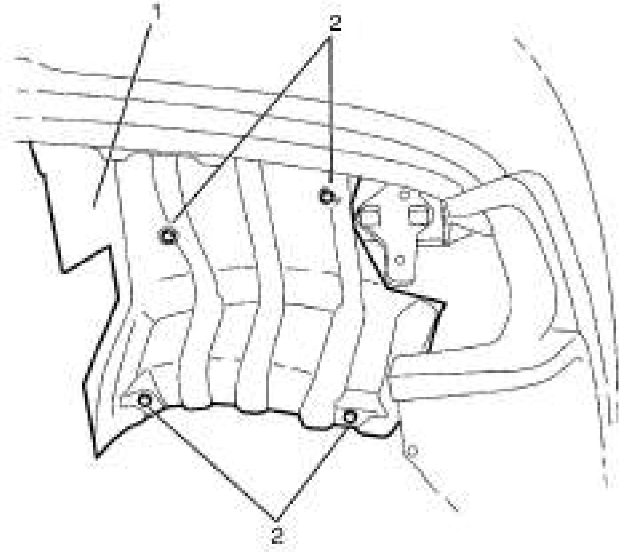
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

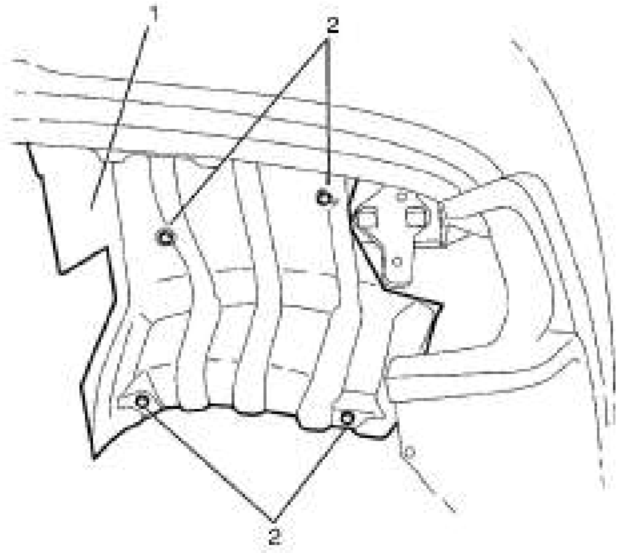
Caution: Refer to Exhaust Service Caution in the Preface section.

2. Remove the left rear muffler assembly. Refer to Exhaust Muffler Replacement - Left Side.



3. Remove the left exhaust muffler heat shield to body retaining bolts (2).
4. Remove the left exhaust muffler heat shield (1).

Installation Procedure



1. Position the left exhaust muffler heat shield (1) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the left exhaust muffler heat shield to body retaining bolts (2).

   Tighten
   Tighten the bolts to 4 N·m (35 lb in).

3. Install the left rear muffler assembly. Refer to Exhaust Muffler Replacement - Left Side.
4. Lower the vehicle to the ground.

Exhaust Muffler Heat Shield Replacement - Right Side

Removal Procedure

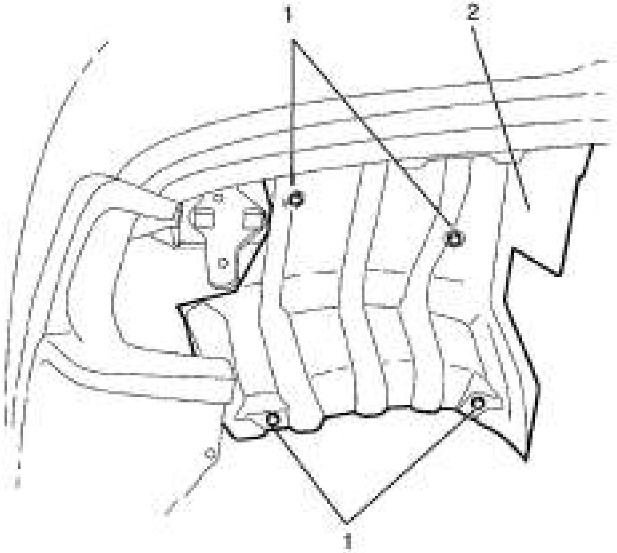
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

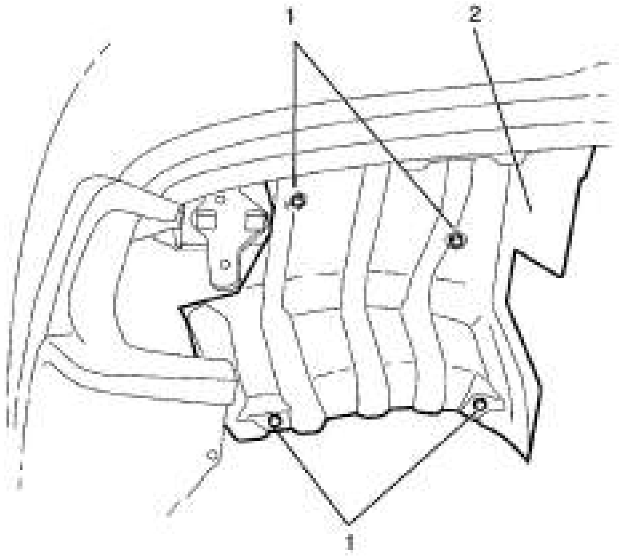
Caution: Refer to Exhaust Service Caution in the Preface section.

2. Remove the right rear muffler assembly. Refer to Exhaust Muffler Replacement - Right Side.



3. Remove the right exhaust muffler heat shield to body retaining bolts (1).
4. Remove the right exhaust muffler heat shield (2).

Installation Procedure



1. Position the right exhaust muffler heat shield (2) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the right exhaust muffler heat shield to body retaining bolts (1).

   Tighten
   Tighten the bolts to 4 N·m (35 lb in).

3. Install the right rear muffler assembly. Refer to Exhaust Muffler Replacement - Right Side.
4. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1994572**

Exhaust Muffler Replacement - Left Side

Removal Procedure

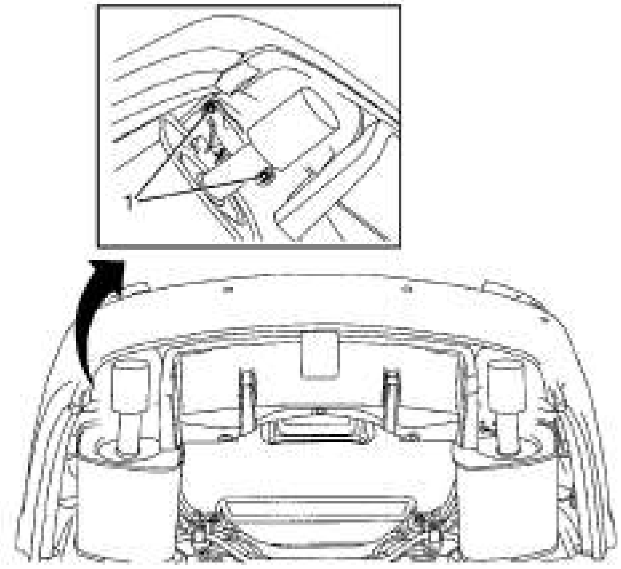
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

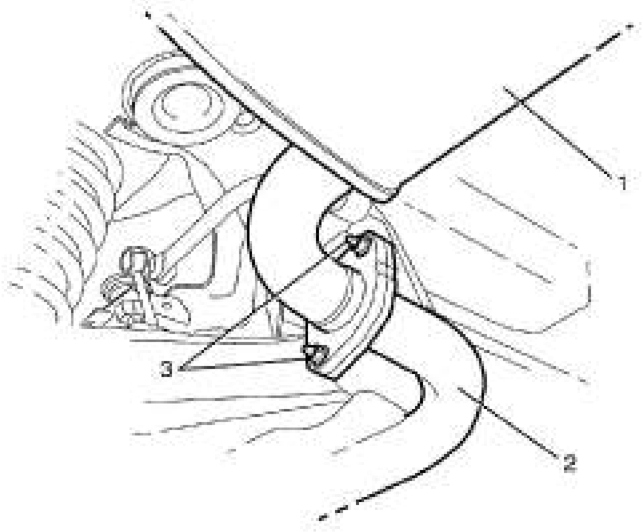
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Caution: Refer to Exhaust Service Caution in the Preface section.

2. Support the exhaust system using a suitable jack.

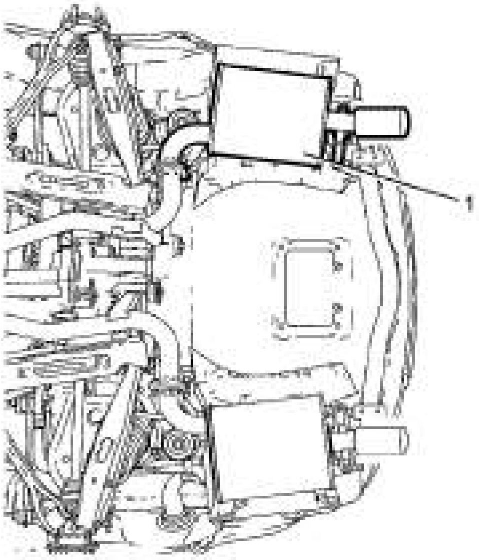


3. Remove the rear insulator hanger to body retaining bolts (1).



Important: The left rear muffler to intermediate exhaust assembly retaining nuts (3) are single use parts. They must be discarded after removal.

4. Remove the left rear muffler to intermediate exhaust assembly retaining bolts (3).
5. Disconnect the left rear muffler (1) from the intermediate exhaust assembly (2).

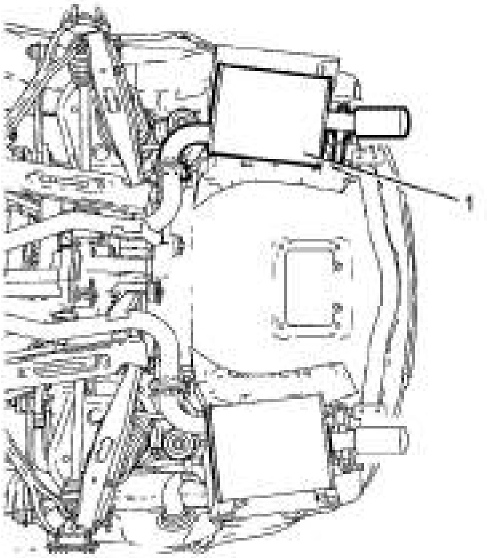


6. Remove the left rear muffler (1) from the vehicle.

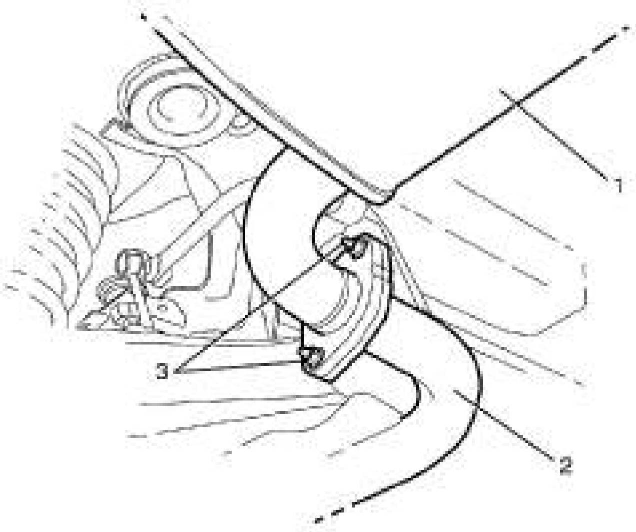
Installation Procedure

Important: The originally equipped exhaust extension pipe can be cut and reused when replacing a rear muffler. Only reuse if the extension pipe is in an acceptable condition.

1. Clean the threads of the rear exhaust assembly with a suitable cleaning solvent.



2. Install the left rear muffler (1) to the vehicle.

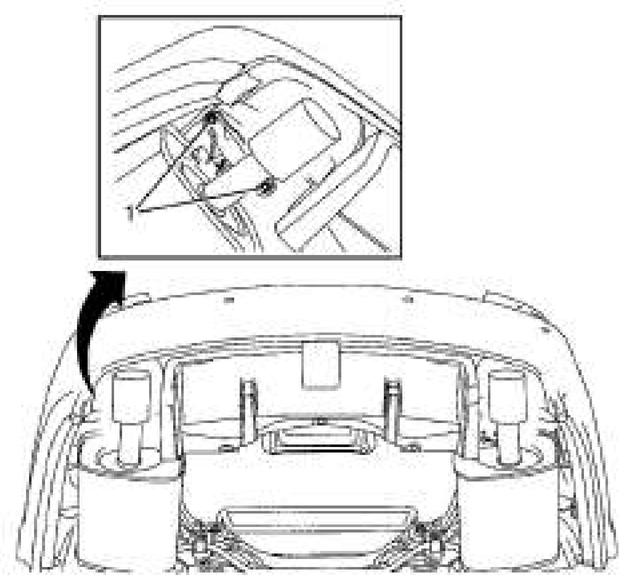


3. Connect the left rear muffler (1) to the intermediate exhaust assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the left rear muffler to intermediate exhaust assembly retaining bolts (3).

   Tighten
   Tighten the bolts to 45 N·m (33 lb ft).



5. Install the rear insulator hanger to body retaining bolts (1).

   Tighten
   Tighten the bolts to 26 N·m (19 lb ft).

6. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
7. Lower the vehicle to the ground.

Exhaust Muffler Replacement - Right Side

Removal Procedure

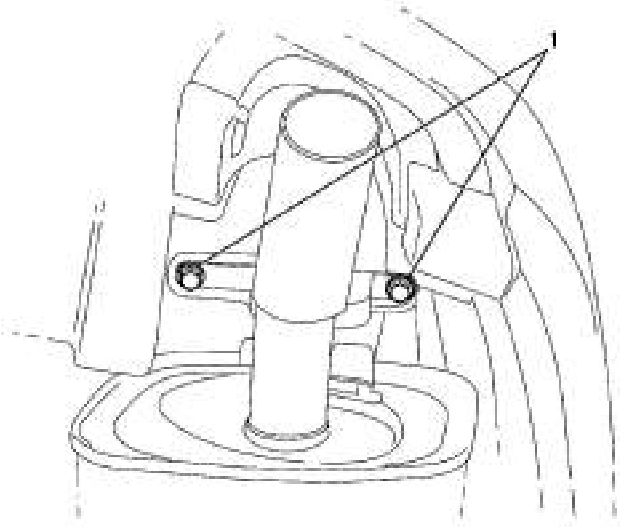
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

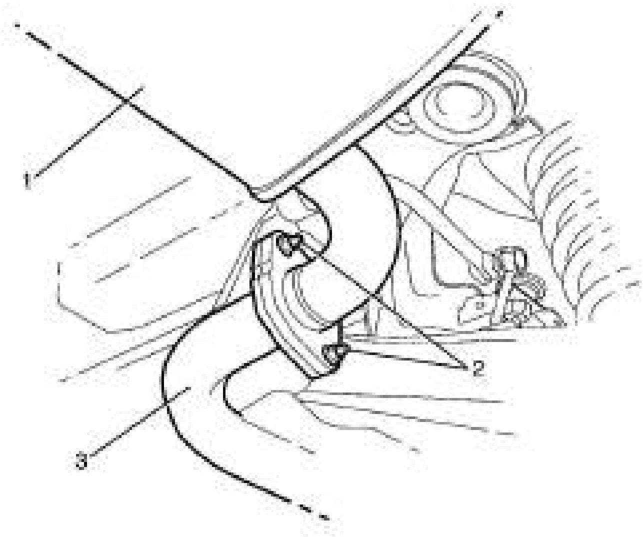
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Caution: Refer to Exhaust Service Caution in the Preface section.

2. Support the exhaust system using a suitable jack.

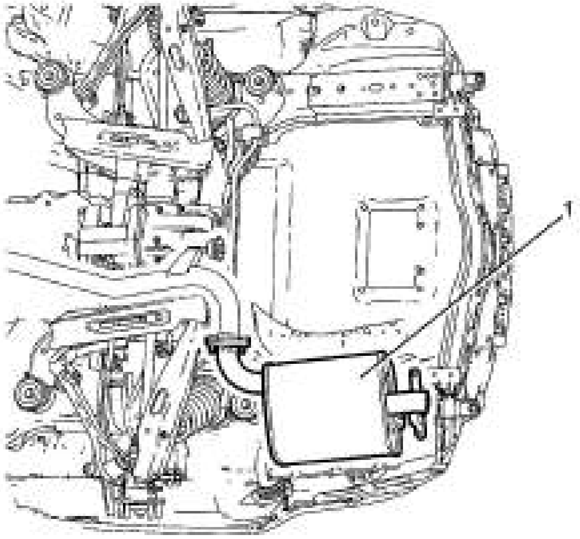


3. Remove the rear insulator hanger to body retaining bolts (1).



Important: The right rear muffler to intermediate exhaust assembly retaining nuts (2) are single use parts. They must be discarded after removal.

4. Remove the right rear muffler to intermediate exhaust assembly retaining bolts (2).
5. Disconnect the right rear muffler (1) from the intermediate exhaust assembly (3).

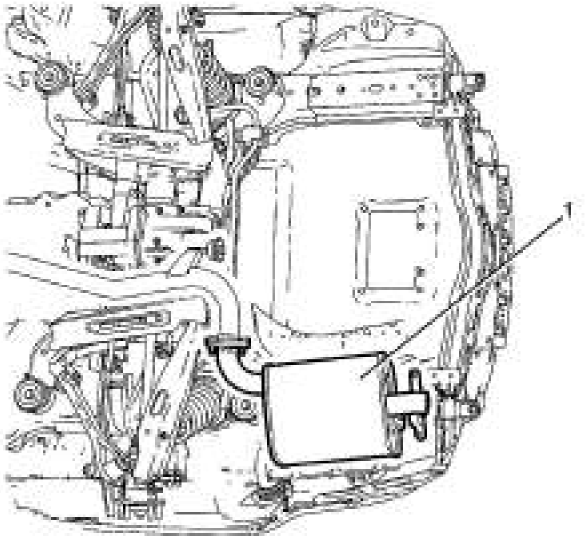


6. Remove the right rear muffler (1) from the vehicle.

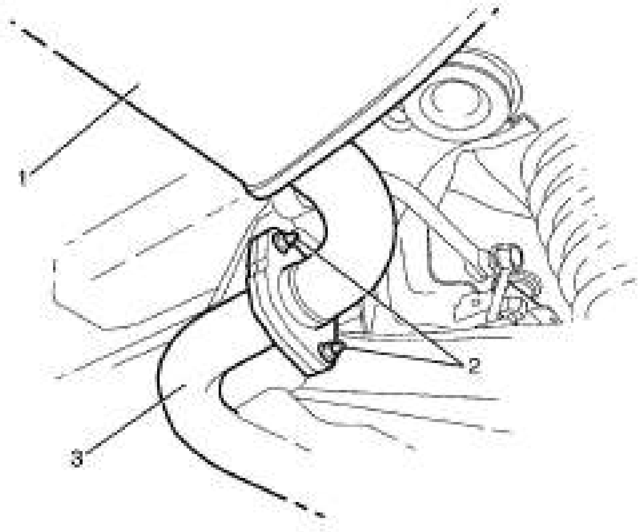
Installation Procedure

Important: The originally equipped exhaust extension pipe can be cut and reused when replacing a rear muffler. Only reuse if the extension pipe is in an acceptable condition.

1. Clean the threads of the rear exhaust assembly with a suitable cleaning solvent.



2. Install the right rear muffler (1) to the vehicle.

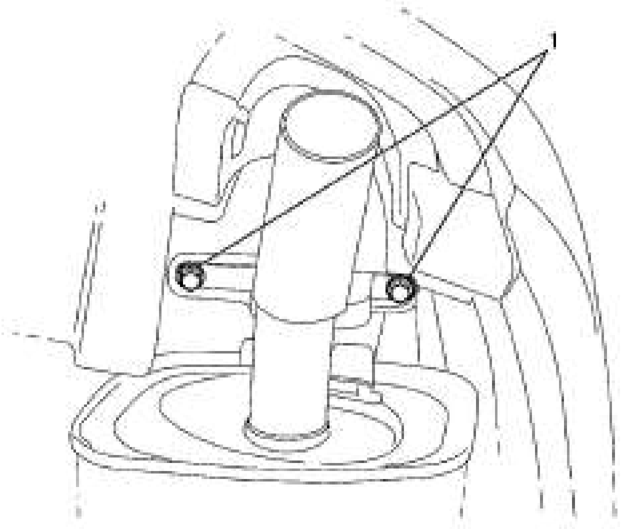


3. Align the right rear muffler (1) to the intermediate exhaust assembly (3).

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the right rear muffler to intermediate exhaust assembly retaining bolts (2).

   Tighten
   Tighten the bolts to 45 N·m (33 lb ft).



5. Install the rear insulator hanger to body retaining bolts (1).

   Tighten
   Tighten the bolts to 26 N·m (19 lb ft).

6. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
7. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1996249**

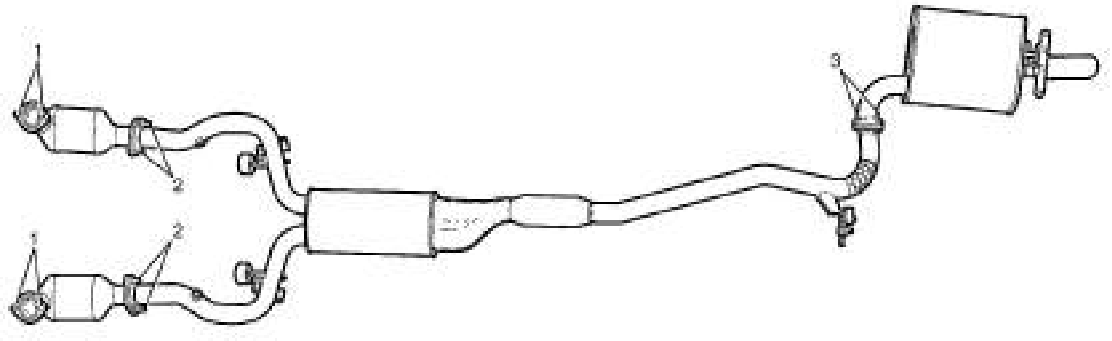
Exhaust System Alignment (LEO and LW2 Engines)

Notice: Refer to Exhaust System Inspection Notice in the Preface section.

Caution: Refer to Exhaust Service Caution in the Preface section.

Important: This procedure is only to be performed if the exhaust is incorrectly aligned or is not clear of all other components or chassis.

Important: Make sure all exhaust retaining nuts and bolts are loose before conducting this procedure.



1. Initially tighten catalytic converter to exhaust manifold retaining nuts (1).

   Tighten
   Tighten the nuts to 20 N·m (15 lb ft).

2. Tighten catalytic converter to exhaust manifold retaining nuts (1).

   Tighten
   Tighten the nuts to 45 N·m (33 lb ft).

3. Tighten exhaust crossover pipe to catalytic converter retaining nuts (2).

   Tighten
   Tighten the nuts to 40 N·m (30 lb ft).

4. Tighten muffler to exhaust crossover pipe retaining bolts (3).

   Tighten
   Tighten the nuts to 45 N·m (33 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | Document ID: 1996248

Exhaust System Alignment (LY7 and L98 Engines)

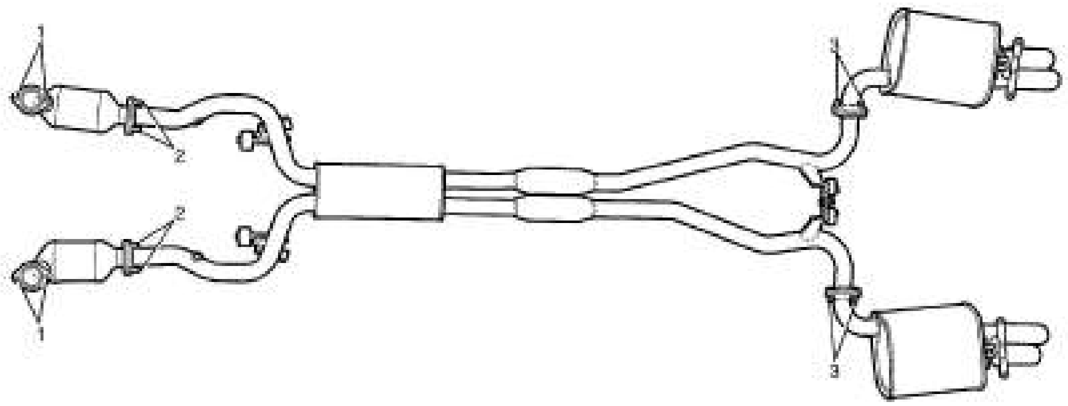
Notice: Refer to Exhaust System Inspection Notice in the Preface section.

Notice: Refer to Exhaust Service Caution in the Preface section.

Important: This procedure is only to be performed if the exhaust is incorrectly aligned or is not clear of all other components or chassis.

Important: Make sure all exhaust retaining nuts and bolts are loose before conducting this procedure.

Important: The L98 exhaust is pictured but flange bolts are in the same location on LY7.



1. Initially tighten catalytic converter to exhaust manifold retaining nuts (1).

   Tighten
   Tighten the nuts to 20 N·m (15 lb ft).

2. Tighten catalytic converter to exhaust manifold retaining nuts (1).

   Tighten
   Tighten the nuts to 45 N·m (33 lb ft).

3. Tighten exhaust crossover pipe to catalytic converter retaining nuts (2).

   Tighten
   Tighten the nuts to 40 N·m (30 lb ft).

4. Tighten muffler to exhaust crossover pipe retaining bolts (3).

   Tighten

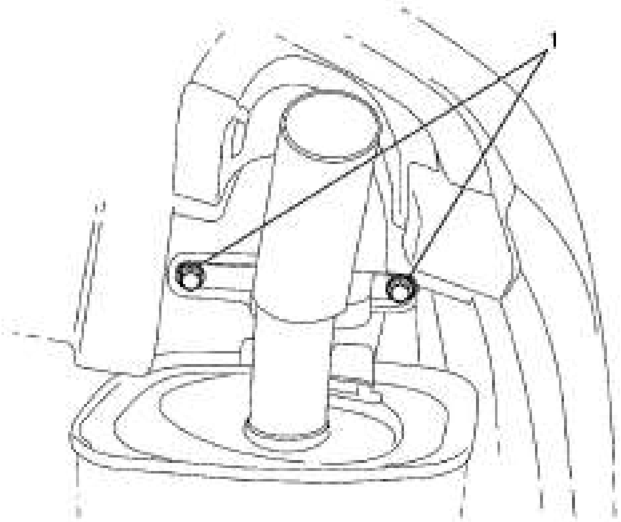
Tighten the nuts to 45 N·m (33 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1977422**

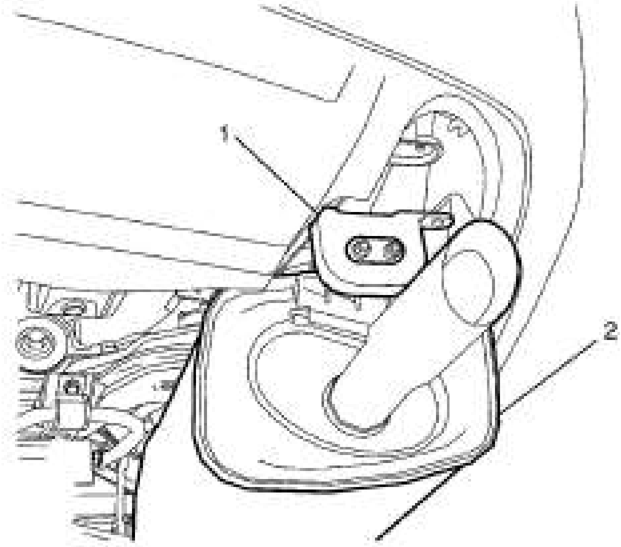
Exhaust System Insulator, Hanger, Bracket Replacement

Removal Procedure

Caution: Refer to Exhaust Service Caution in the Preface section.

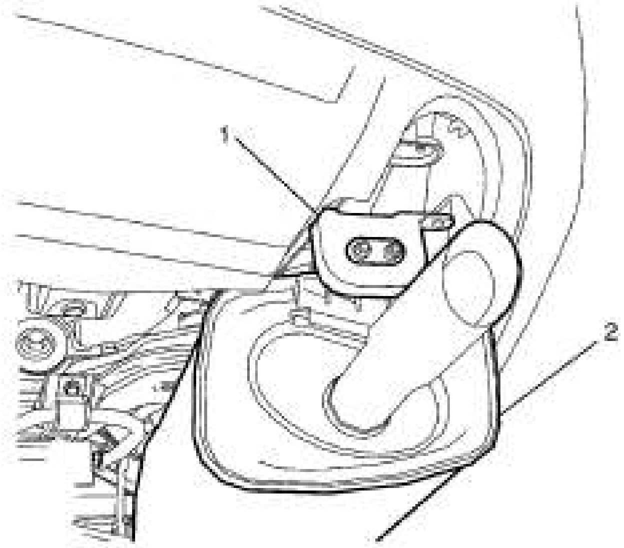


1. Remove the rear Insulator hanger to body retaining bolts (1).

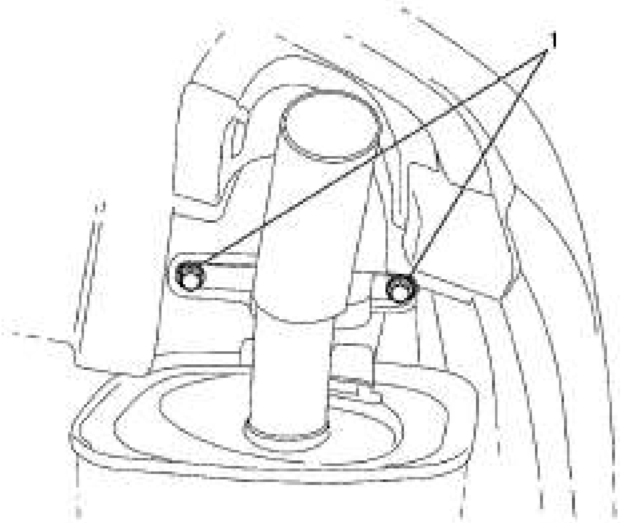


2. Remove the rear insulator hanger (1) from the rear muffler (2).

Installation Procedure



1. Install the rear insulator hanger (1) to the rear muffler (2).



2. Install the rear insulator hanger to body retaining bolts (1).

Tighten
Tighten the bolts to 26 N·m (19 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 2077308**

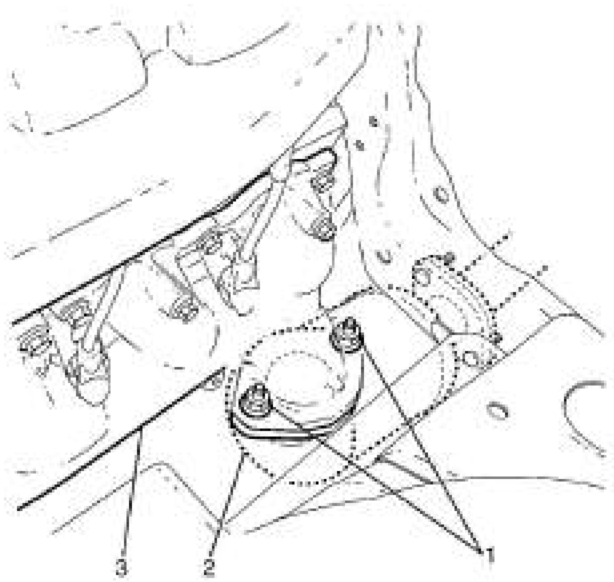
Exhaust System Replacement (L98)

Removal Procedure - Up to 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

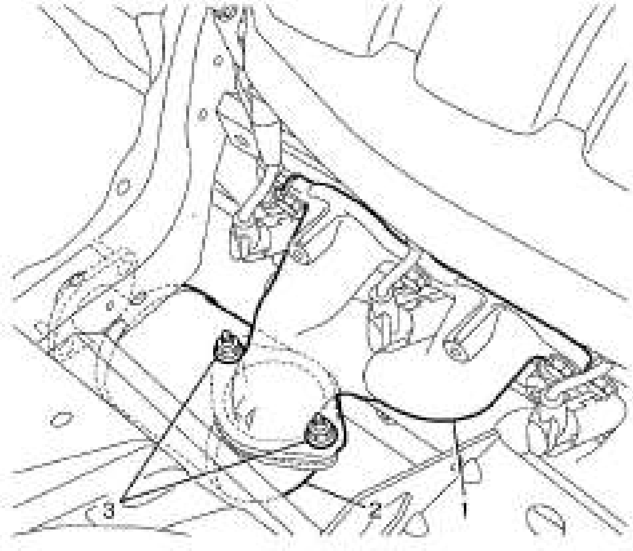


Important: The left catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

2. Remove the left catalytic converter to exhaust manifold retaining nuts (1).

   Discard the nuts.

3. Disconnect the left catalytic converter (2) from the exhaust manifold (3).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

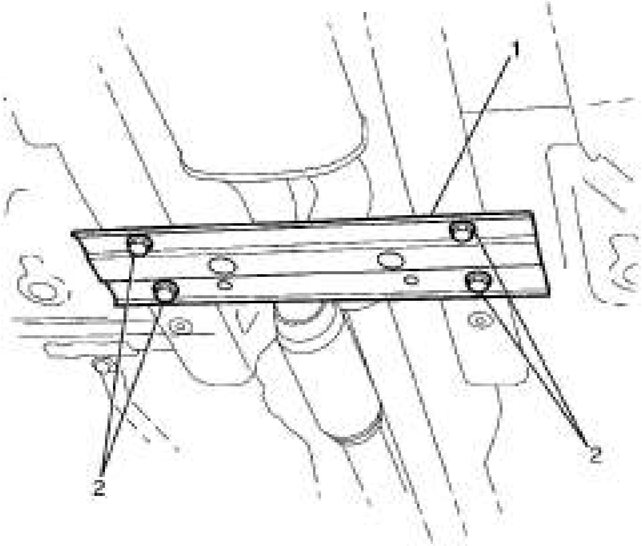
4. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

   Discard the nuts.

5. Disconnect the right catalytic converter (2) from the exhaust manifold (1).

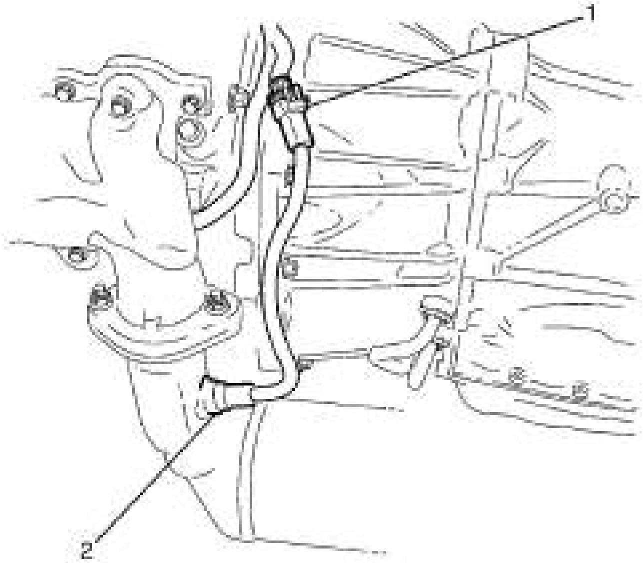
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

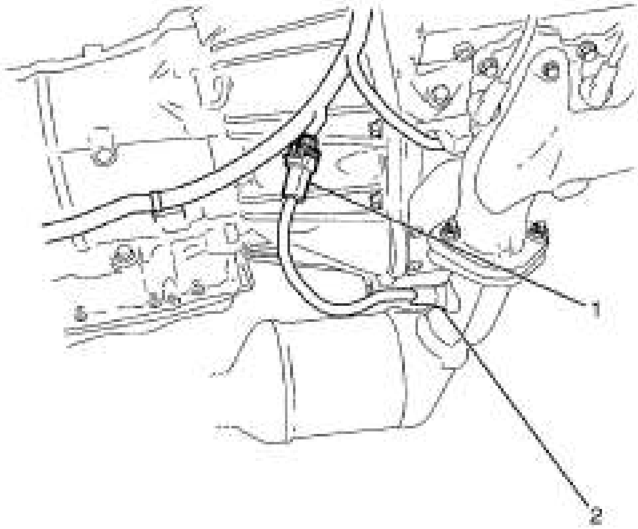


7. Remove the transmission tunnel cross-brace to body retaining bolts (2).
8. Remove the transmission tunnel cross-brace (1).
9. Support the exhaust system using a suitable jack.

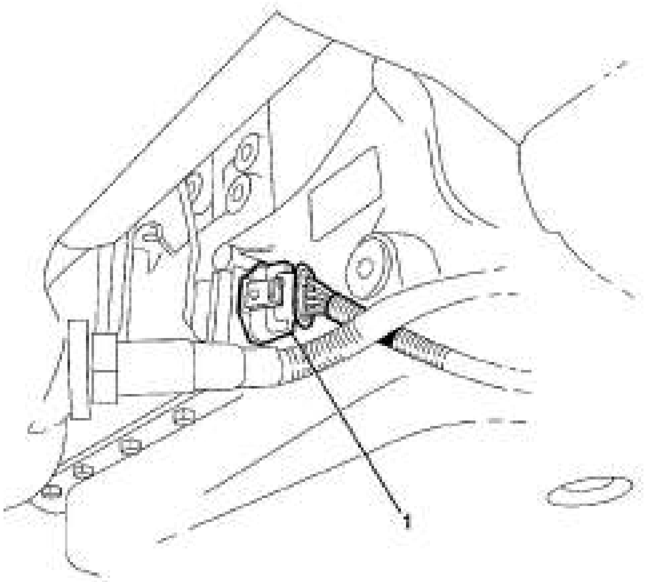
Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



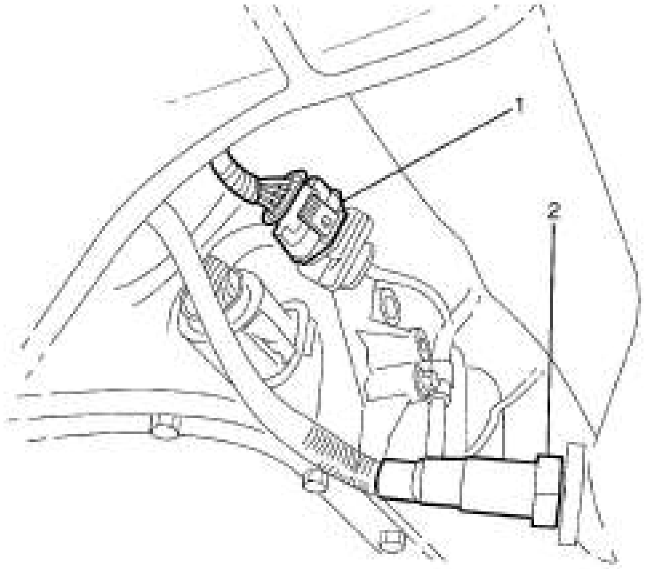
10. Disconnect the left pre-catalytic converter HO2S electrical connector (1).



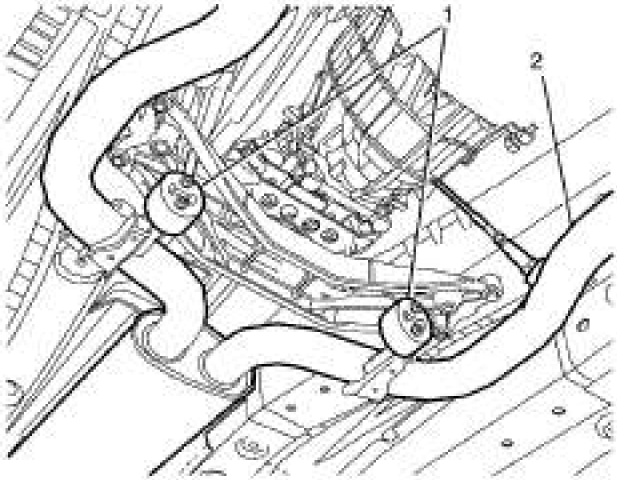
11. Disconnect the right pre-catalytic converter HO2S electrical connector (2).



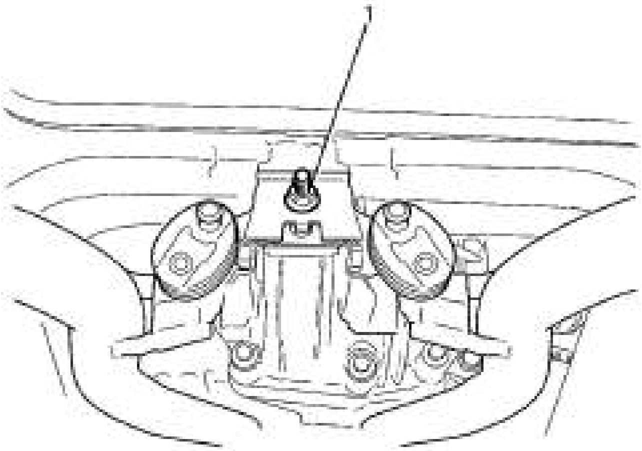
12. Disconnect the left post-catalytic converter HO2S electrical connector (1).



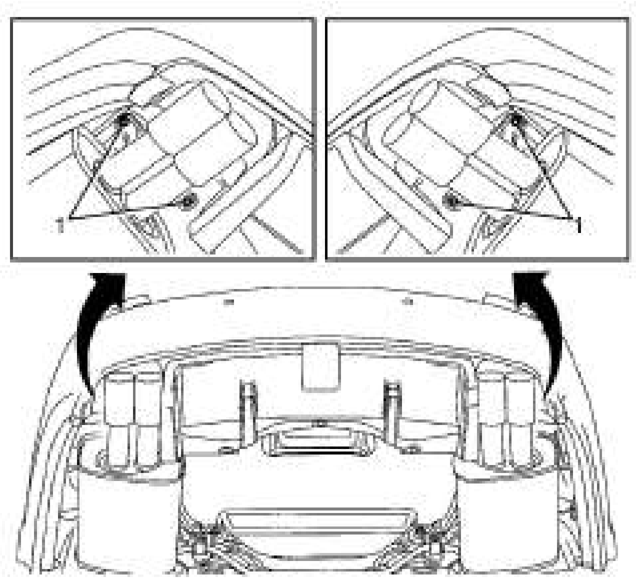
13. Disconnect the right post-catalytic converter HO2S electrical connector (1).



14. Detach the exhaust system (2) by removing the front insulator hangers (1).



15. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



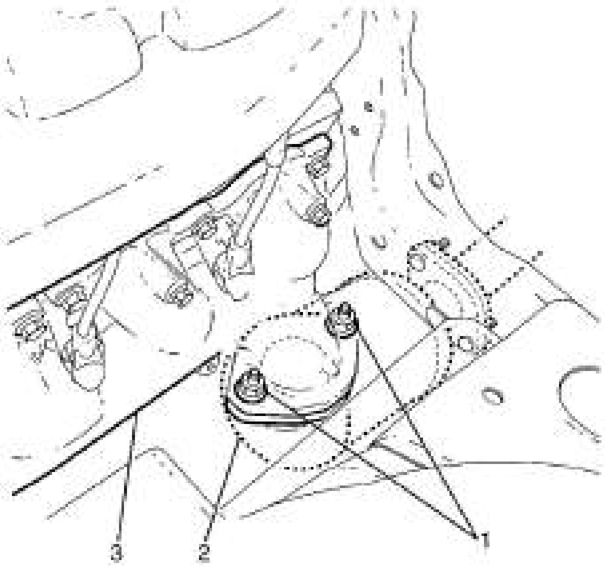
16. Remove the rear insulator hanger to body retaining bolts (1).
17. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
18. Carefully lower the exhaust system from the vehicle.
19. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
20. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
21. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
22. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

Installation Procedure - Up to 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

   Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.



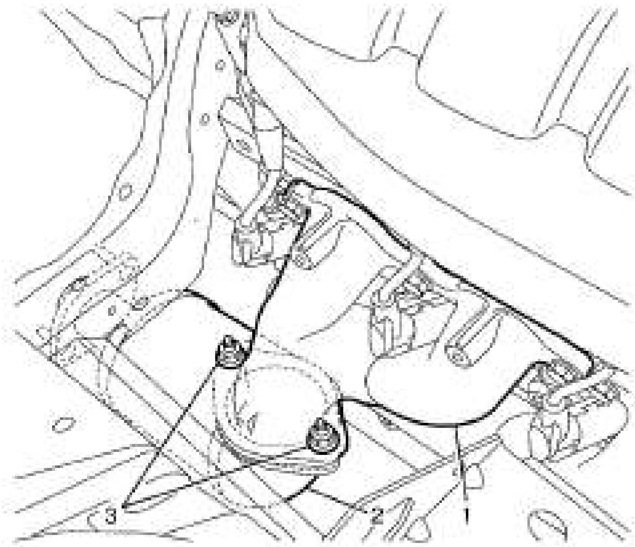
Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (2) to connect to the exhaust manifold (3).

   Important: Do not fully tighten the left catalytic converter to exhaust manifold retaining nuts (1) at this stage.

7. Install the NEW left catalytic converter to exhaust manifold retaining nuts (2).

   Do not fully tighten at this stage.

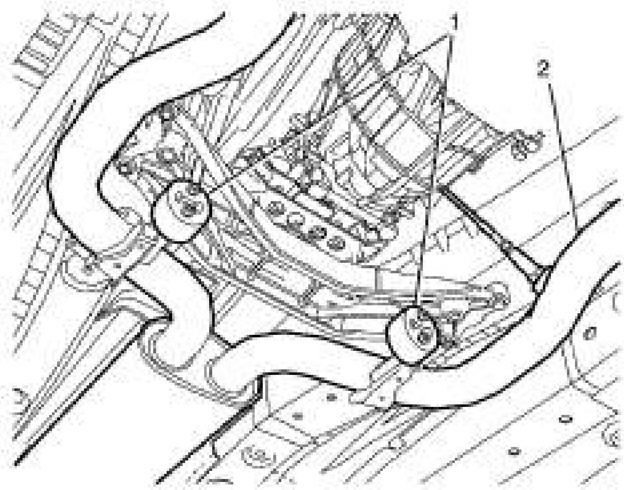


8. Push up and forward on the right catalytic converter (2) to connect to the exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to exhaust manifold retaining nuts (3) at this stage.

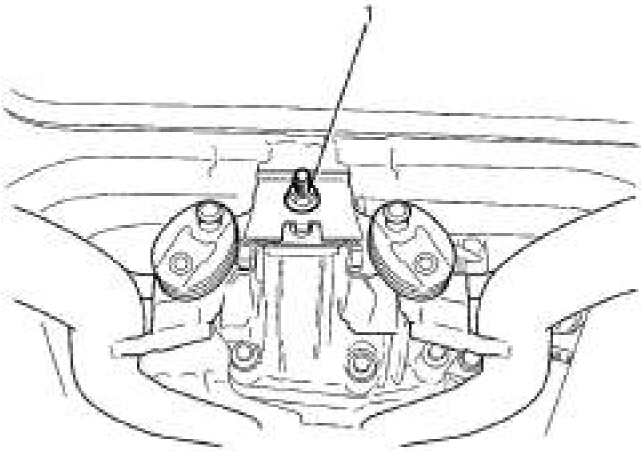
9. Install the NEW right catalytic converter to exhaust manifold retaining nuts (3).

   Do not fully tighten at this stage.



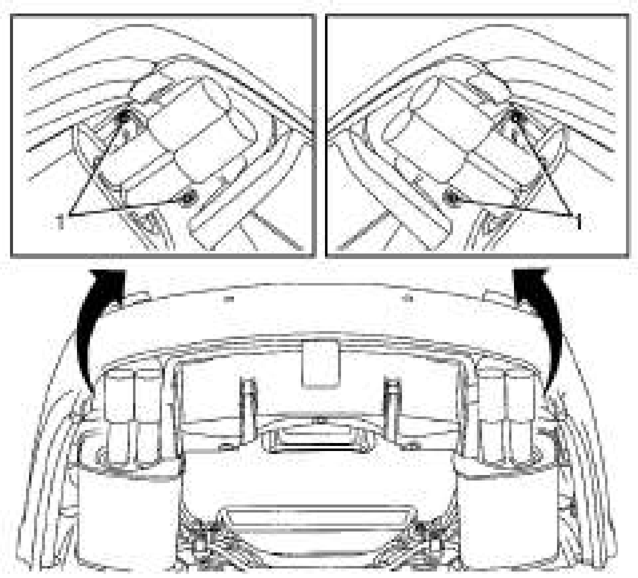
10. Attach the exhaust system (2) by installing the front insulator hangers (1).

    Notice: Refer to Fastener Notice in the Preface section.



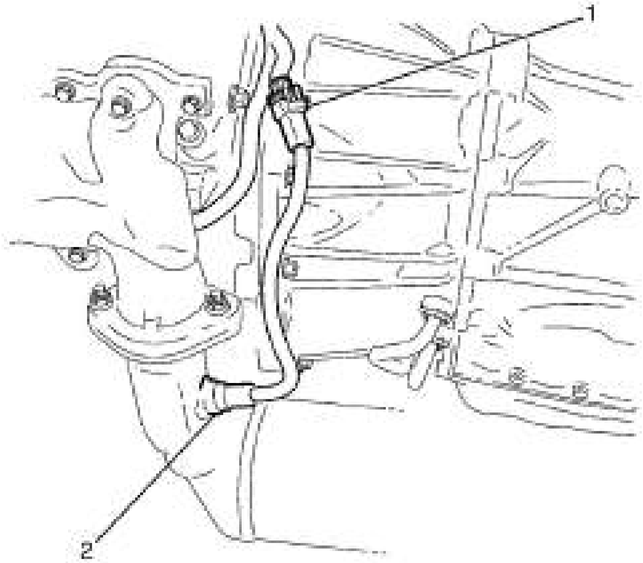
11. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

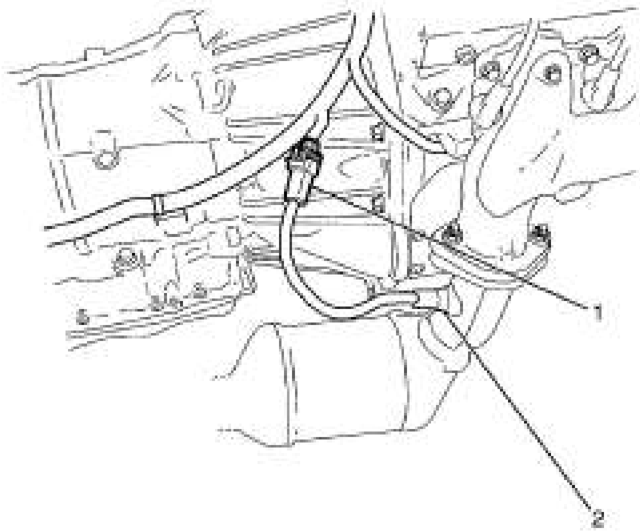


12. Install the rear insulator hanger to body retaining bolts (1).

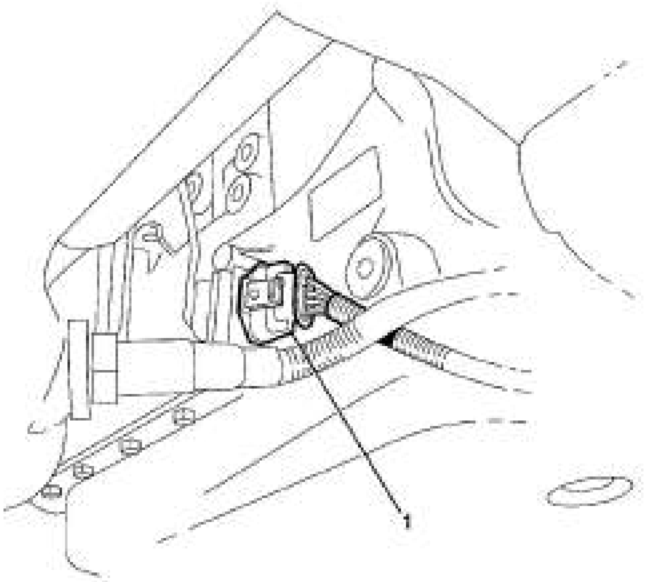
    Tighten
    Tighten the bolts to 26 N·m (19 lb ft).



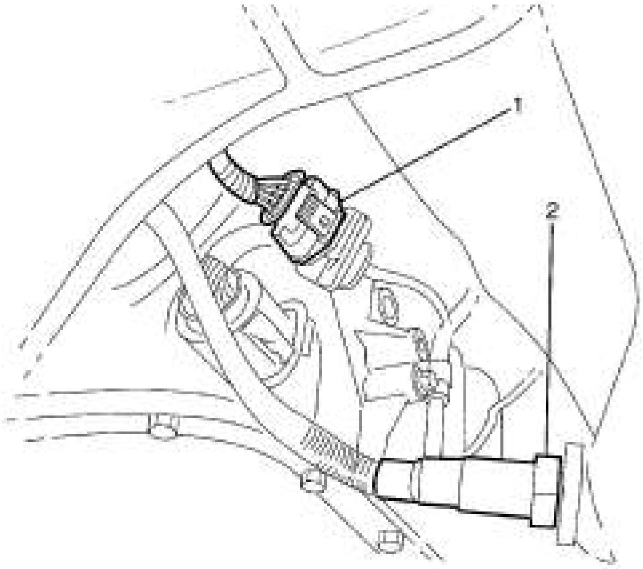
13. Connect the left pre-catalytic converter HO2S electrical connector (1).



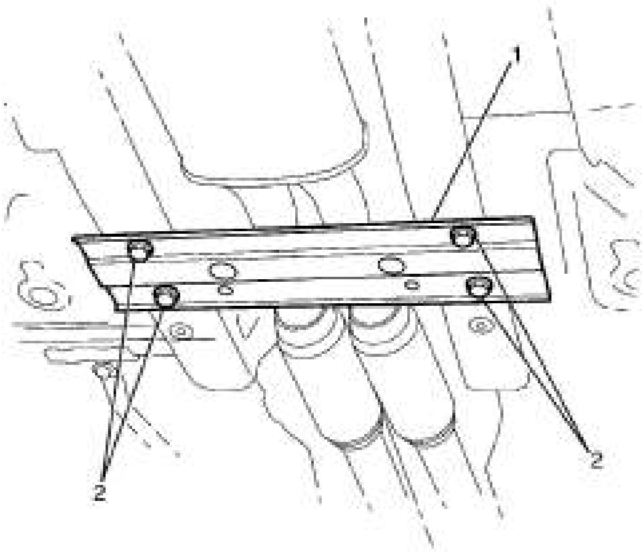
14. Connect the right pre-catalytic converter HO2S electrical connector (2).



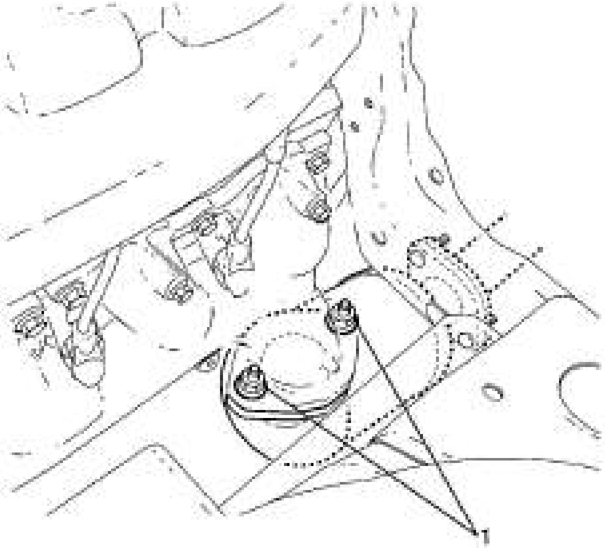
15. Connect the left post-catalytic converter HO2S electrical connector (1).



16. Connect the right post-catalytic converter HO2S electrical connector (1).

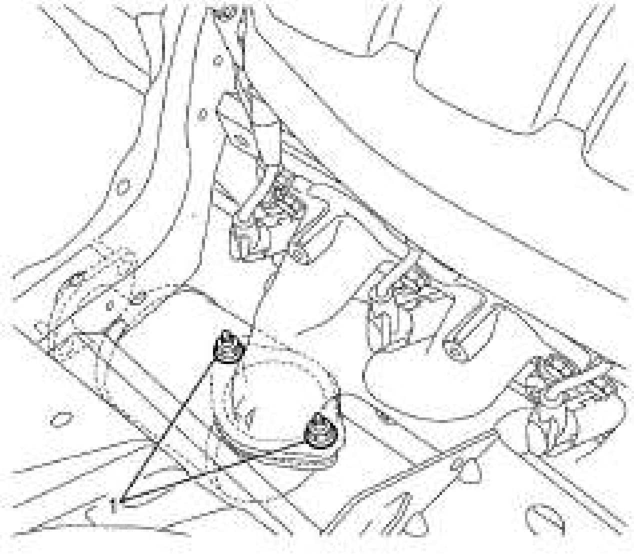


17. Install the transmission tunnel cross-brace (1).
18. Install the transmission tunnel cross-brace to body retaining bolts (2).
19. Remove the jack supporting the exhaust system.
20. Lower vehicle.



21. Tighten the left catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



22. Tighten the right catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

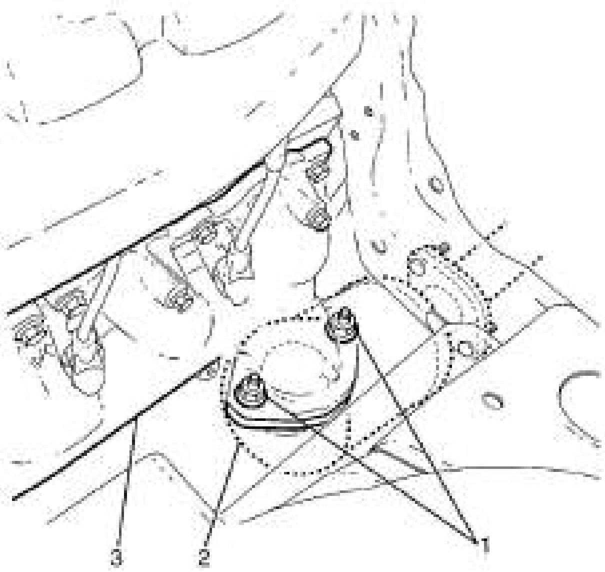
23. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment.
24. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
25. If re-programming is required. Refer to Control Module References.
26. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

Removal Procedure - From 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

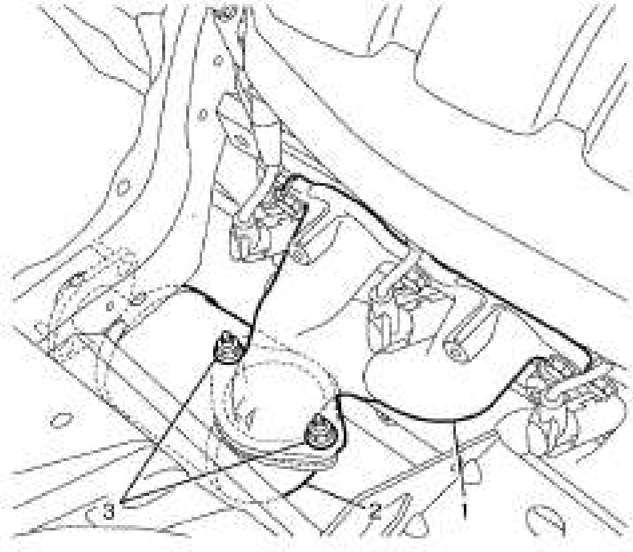


Important: The left catalytic converter to exhaust manifold retaining nuts (1) are single use parts. They must be discarded after removal.

2. Remove the left catalytic converter to exhaust manifold retaining nuts (1).

   Discard the nuts.

3. Disconnect the left catalytic converter (2) from the exhaust manifold (3).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

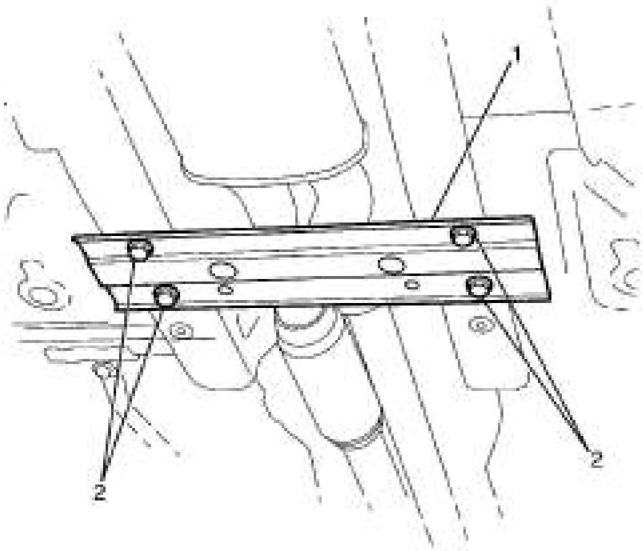
4. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

   Discard the nuts.

5. Disconnect the right catalytic converter (2) from the exhaust manifold (1).

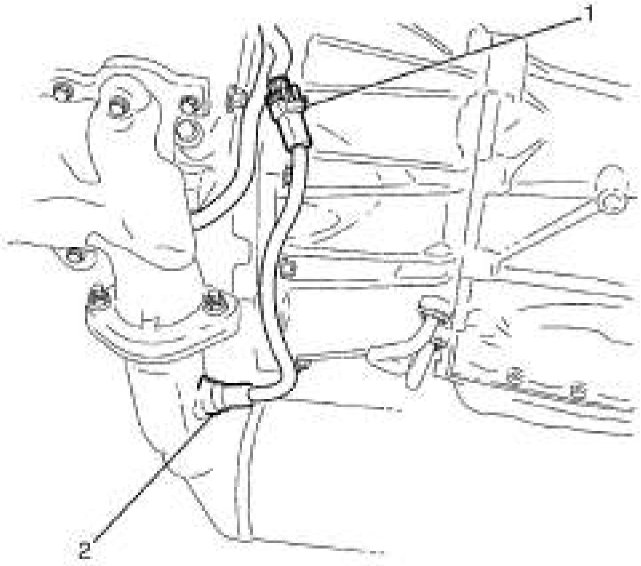
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

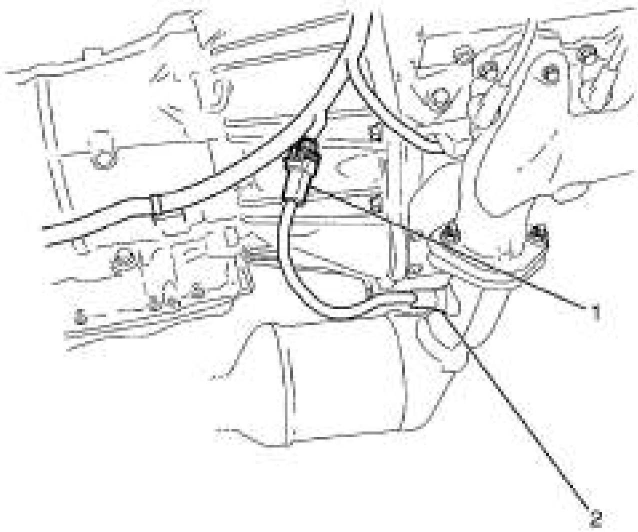


7. Remove the transmission tunnel cross-brace to body retaining bolts (2).
8. Remove the transmission tunnel cross-brace (1).
9. Support the exhaust system using a suitable jack.

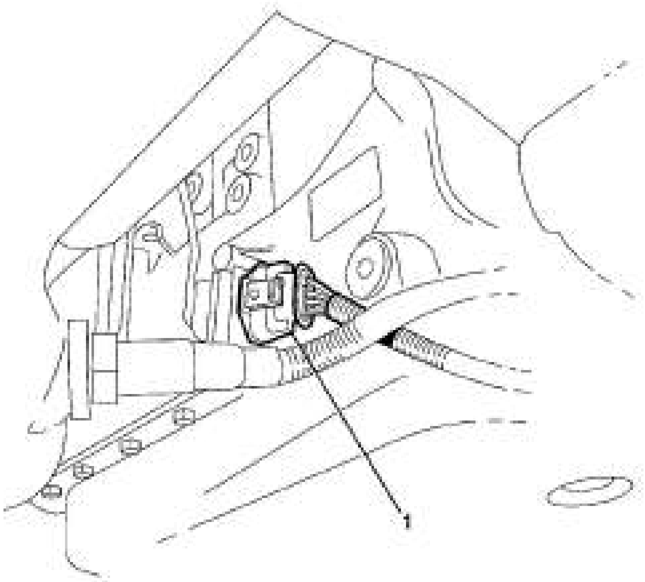
   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



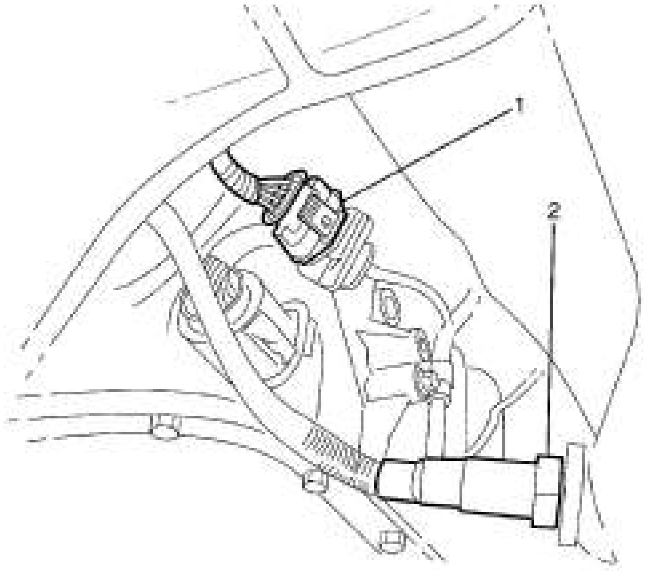
10. Disconnect the left pre-catalytic converter HO2S electrical connector (1).



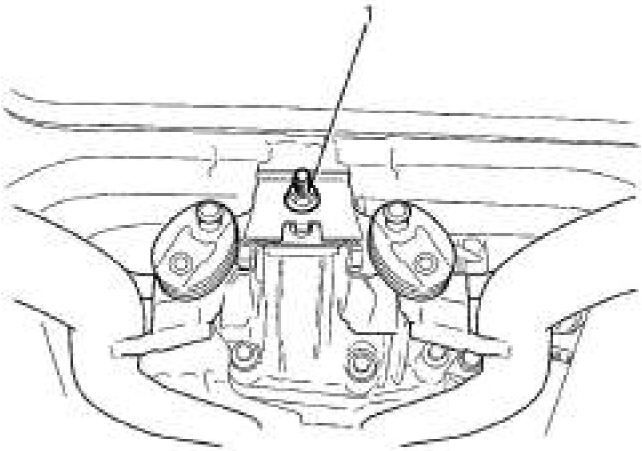
11. Disconnect the right pre-catalytic converter HO2S electrical connector (2).



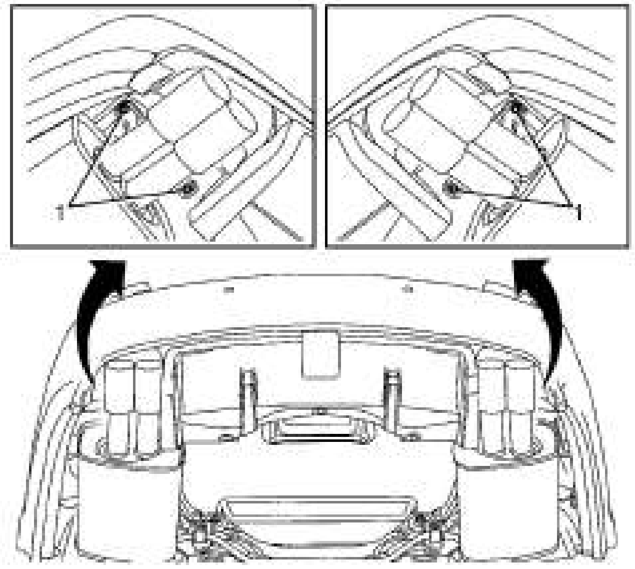
12. Disconnect the left post-catalytic converter HO2S electrical connector (1).



13. Disconnect the right post-catalytic converter HO2S electrical connector (1).



14. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



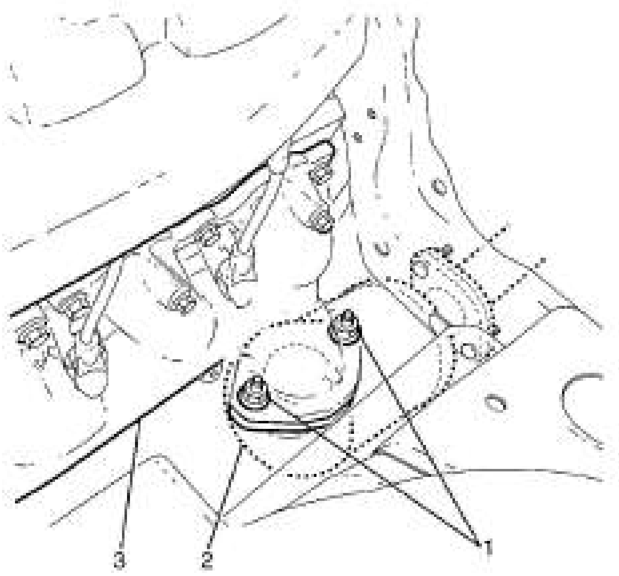
15. Remove the rear insulator hanger to body retaining bolts (1).
16. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
17. Carefully lower the exhaust system from the vehicle.
18. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
19. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
20. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
21. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

Installation Procedure - From 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.



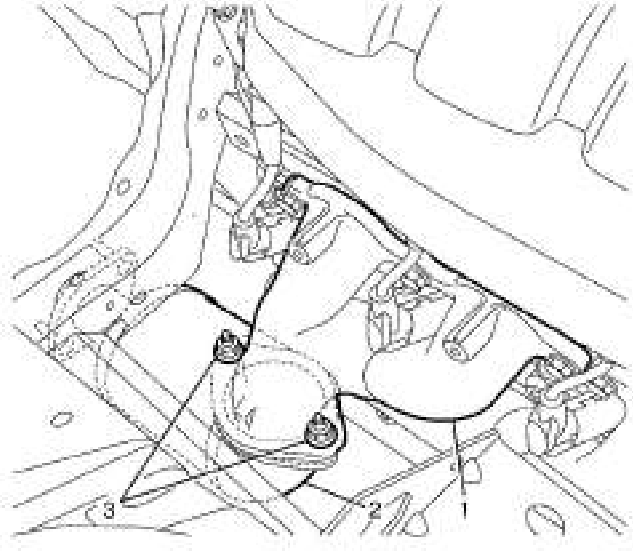
Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (2) to connect to the exhaust manifold (3).

Important: Do not fully tighten the left catalytic converter to exhaust manifold retaining nuts (1) at this stage.

7. Install the NEW left catalytic converter to exhaust manifold retaining nuts (2).

Do not fully tighten at this stage.



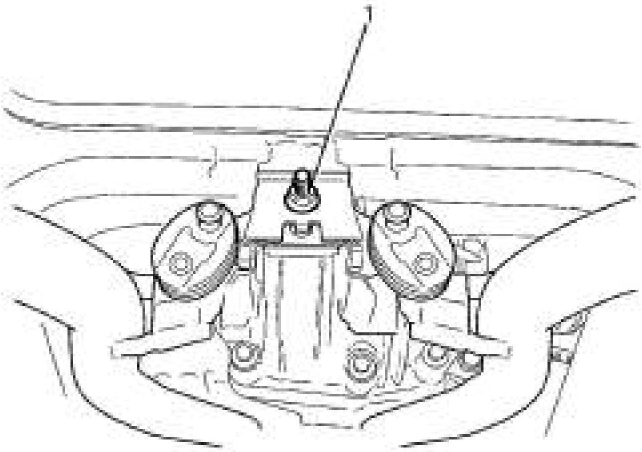
8. Push up and forward on the right catalytic converter (2) to connect to the exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to exhaust manifold retaining nuts (3) at this stage.

9. Install the NEW right catalytic converter to exhaust manifold retaining nuts (3).

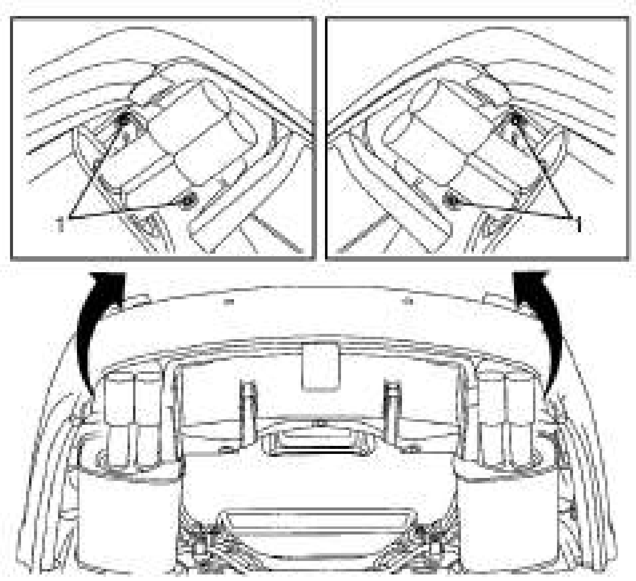
   Do not fully tighten at this stage.

   Notice: Refer to Fastener Notice in the Preface section.



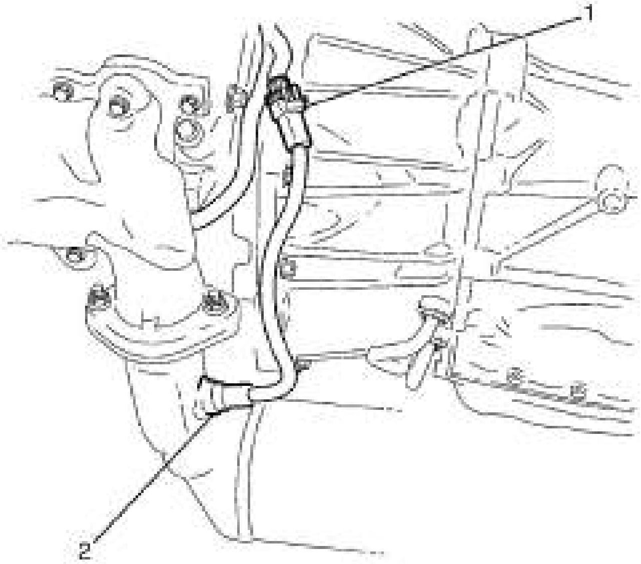
10. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

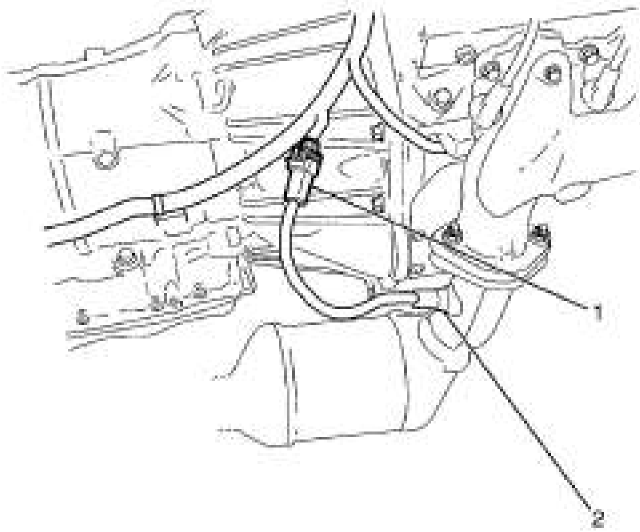


11. Install the rear insulator hanger to body retaining bolts (1).

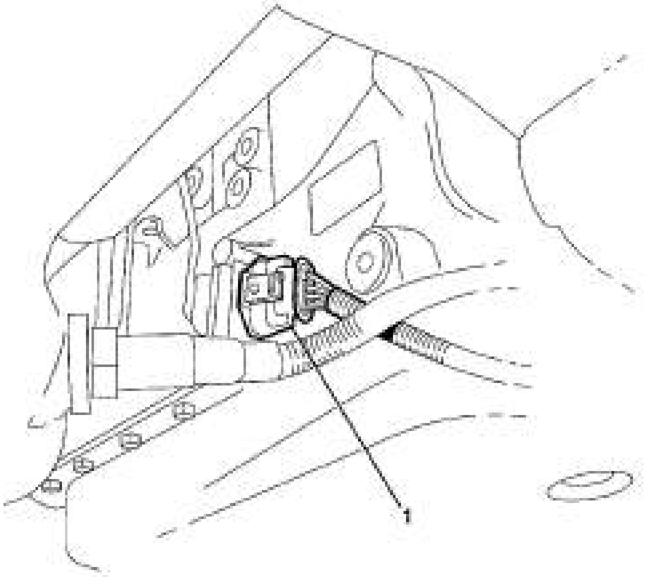
    Tighten
    Tighten the bolts to 26 N·m (19 lb ft).



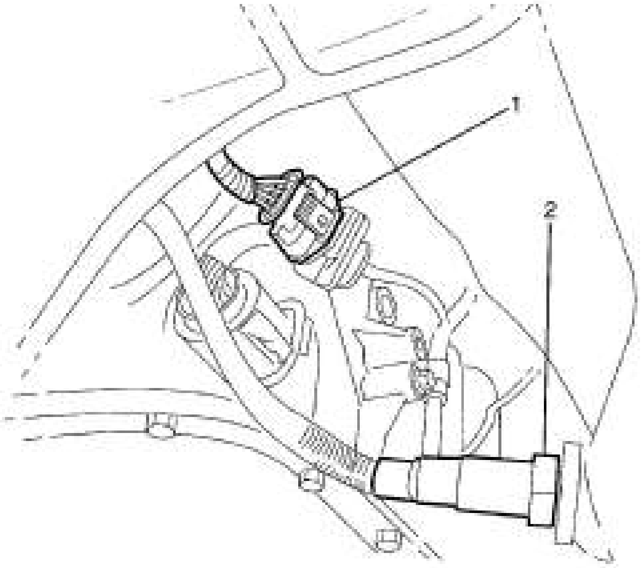
12. Connect the left pre-catalytic converter HO2S electrical connector (1).



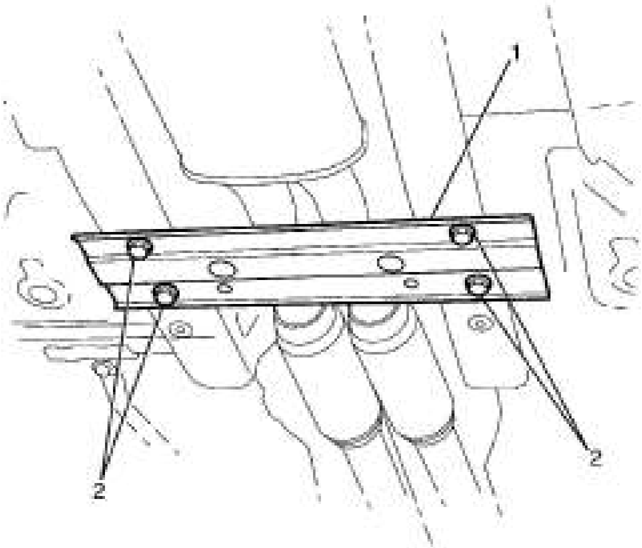
13. Connect the right pre-catalytic converter HO2S electrical connector (2).



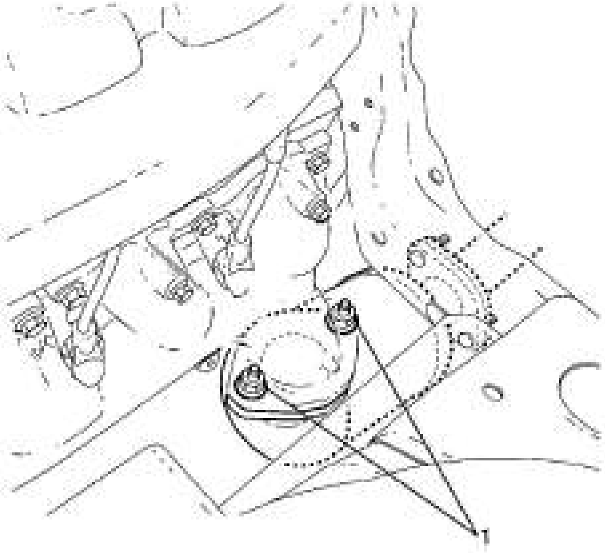
14. Connect the left post-catalytic converter HO2S electrical connector (1).



15. Connect the right post-catalytic converter HO2S electrical connector (1).

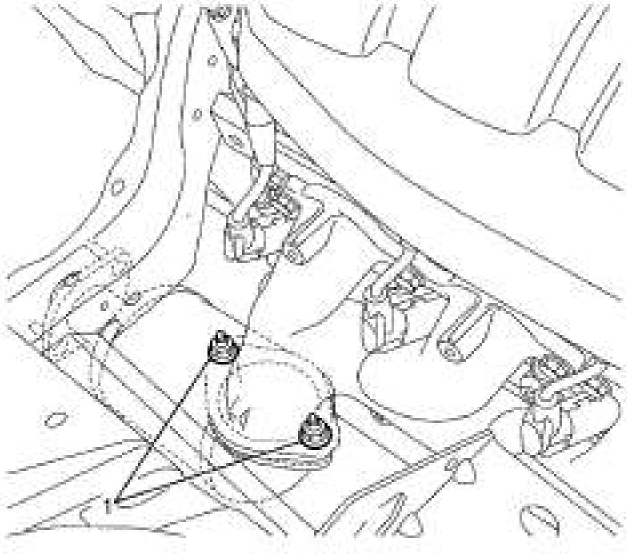


16. Install the transmission tunnel cross-brace (1).
17. Install the transmission tunnel cross-brace to body retaining bolts (2).
18. Remove the jack supporting the exhaust system.
19. Lower vehicle.



20. Tighten the left catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



21. Tighten the right catalytic converter to exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

22. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align.

Refer to Exhaust System Alignment.

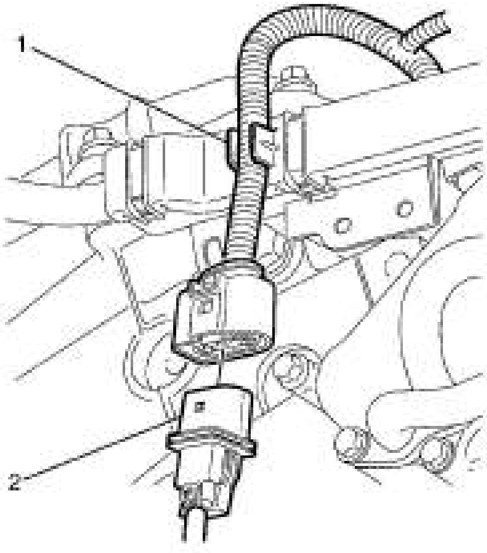
23. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
24. If re-programming is required. Refer to Control Module References.
25. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | Document ID: 2077346

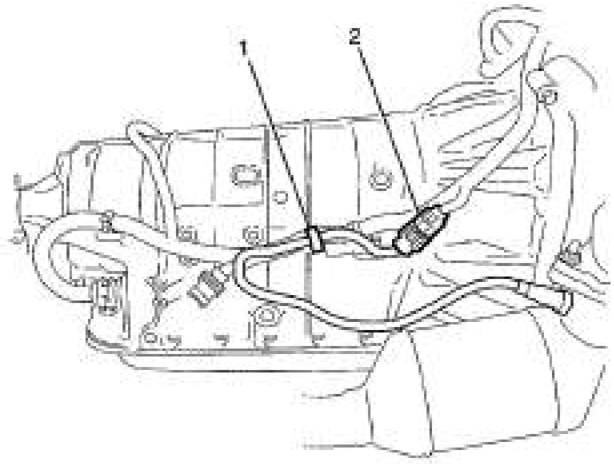
Exhaust System Replacement (LEO and LW2)

Removal Procedure - Up to 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine dress cover. Refer to Engine Cover Replacement .
3. Remove the sound shield to bulk head retainers.



4. Remove the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the engine wiring loom retaining clip (1).
5. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) from the main wiring harness.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



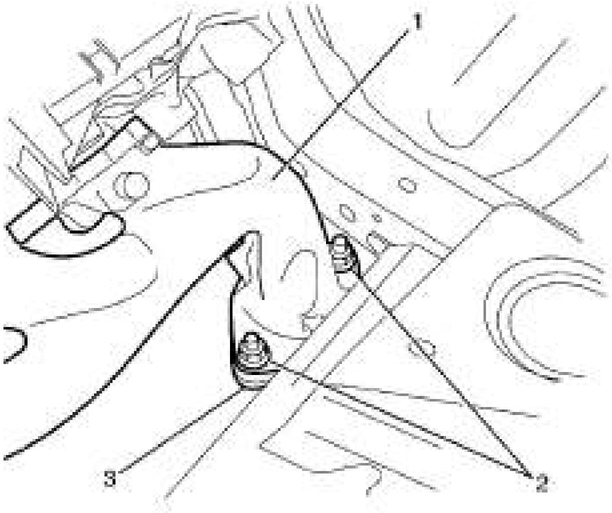
7. Remove the right pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the transmission wiring loom retraining clip (1).

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

8. Disconnect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

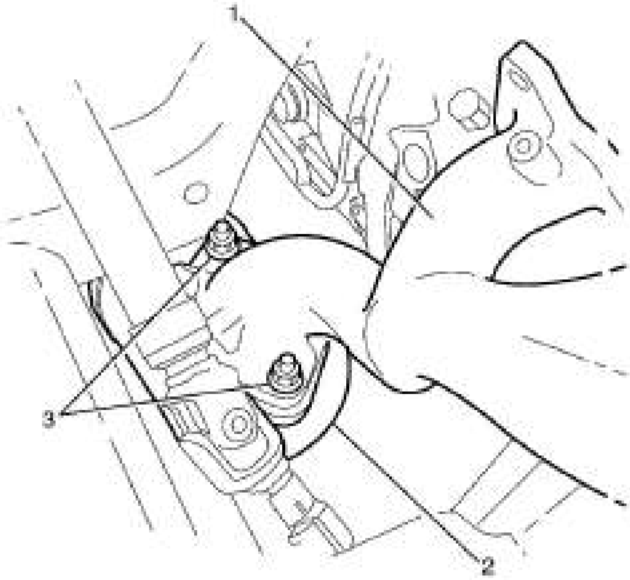


Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

9. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

   Discard the nuts.

10. Pull down and back on the left catalytic converter (3) to disconnect from the left exhaust manifold (1).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

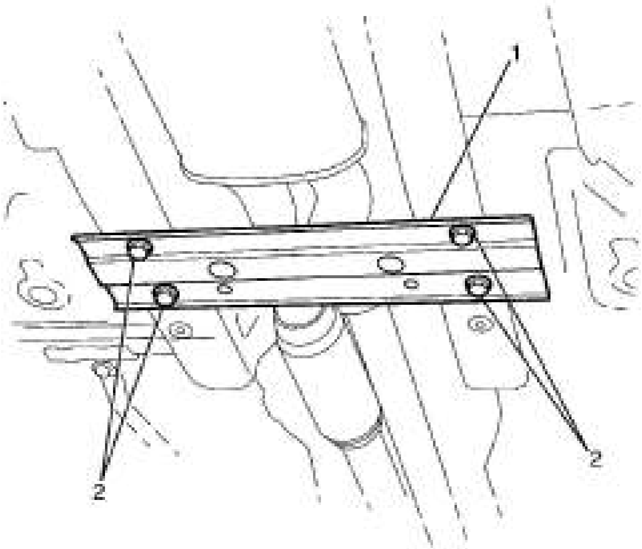
11. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

    Discard the nuts.

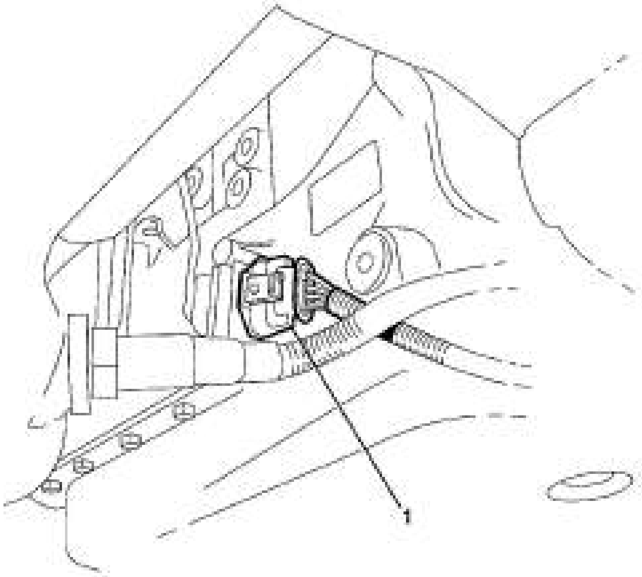
12. Pull down and back on the right catalytic converter (2) to disconnect from the right exhaust manifold (1).

    Caution: Refer to Vehicle Lifting Caution in the Preface section.

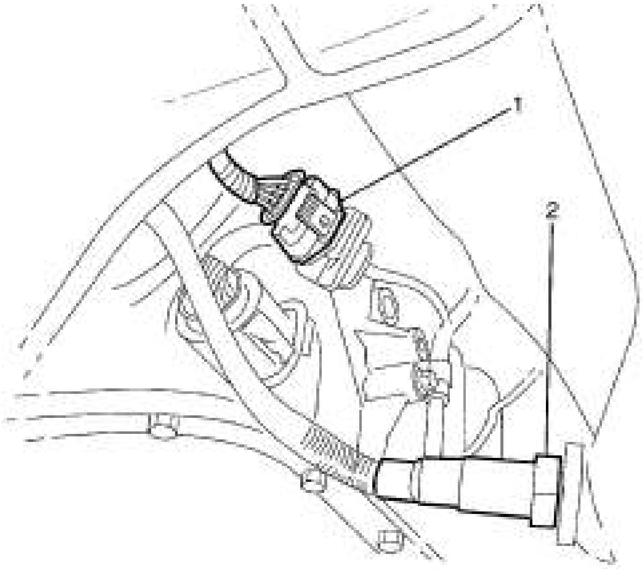
13. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



14. Remove the transmission tunnel cross-brace to body retaining bolts (2).
15. Remove the transmission tunnel cross-brace (1).



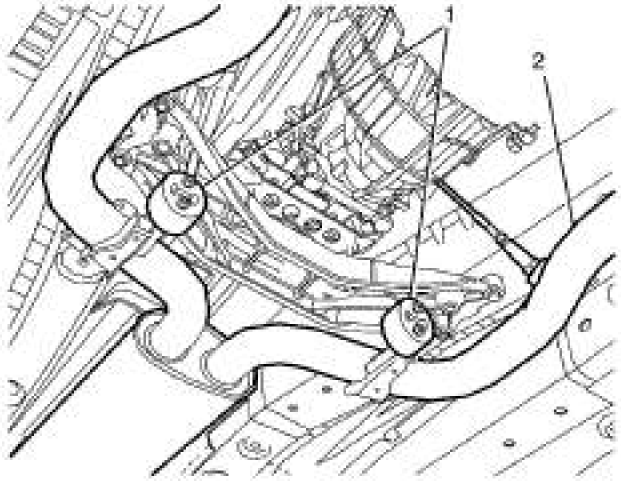
16. Disconnect the left post-catalytic converter HO2S electrical connector (1).



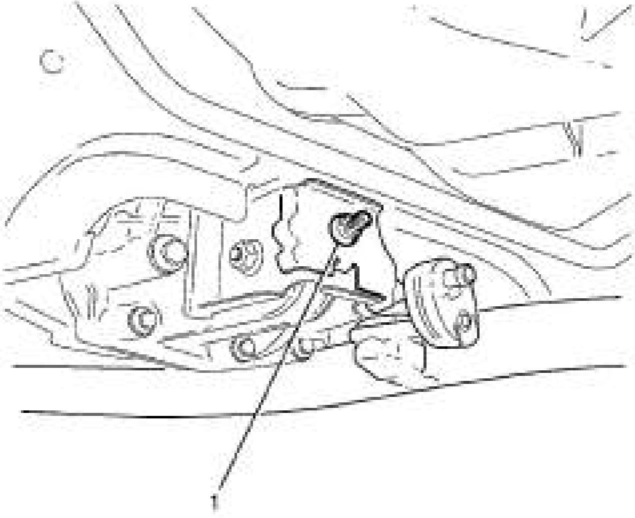
17. Disconnect the right post-catalytic converter HO2S electrical connector (1).

Notice: Refer to Exhaust System Inspection Notice in the Preface section.

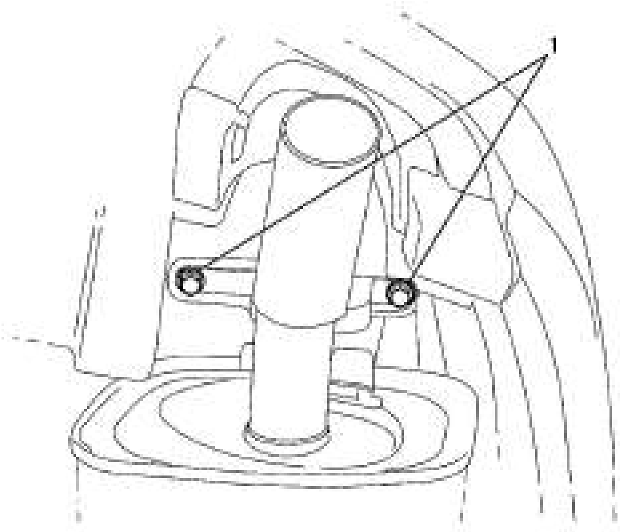
18. Support the exhaust system using a suitable jack.



19. Detach the exhaust system (2) by removing the front insulator hangers (1) if fitted.



20. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



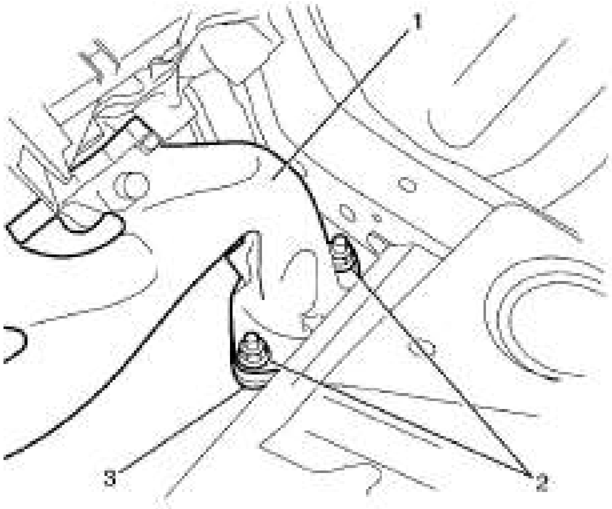
21. Remove the rear insulator hanger to body retaining bolts (1).
22. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
23. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
24. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
25. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
26. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

Installation Procedure - Up to 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

   Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.



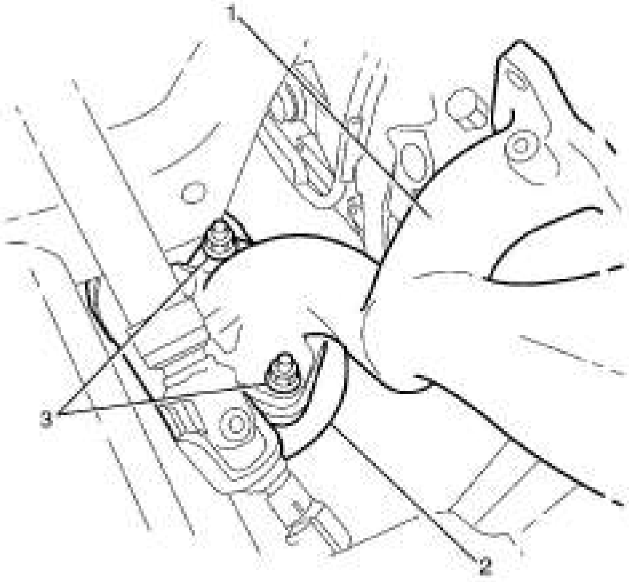
Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (3) to connect to the left exhaust manifold (1).

Important: Do not fully tighten the left catalytic converter to left exhaust manifold retaining nuts (2) at this stage.

7. Install the NEW left catalytic converter to left exhaust manifold retaining nuts (2).

Do not fully tighten at this stage.

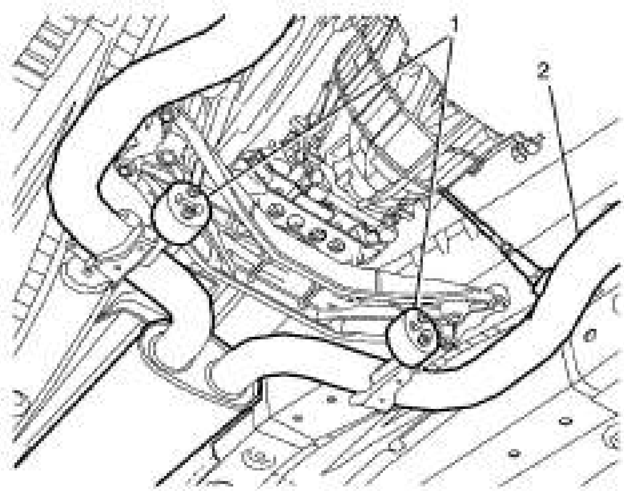


8. Push up and forward on the right catalytic converter (3) to connect to the right exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to right exhaust manifold retaining nuts (2) at this stage.

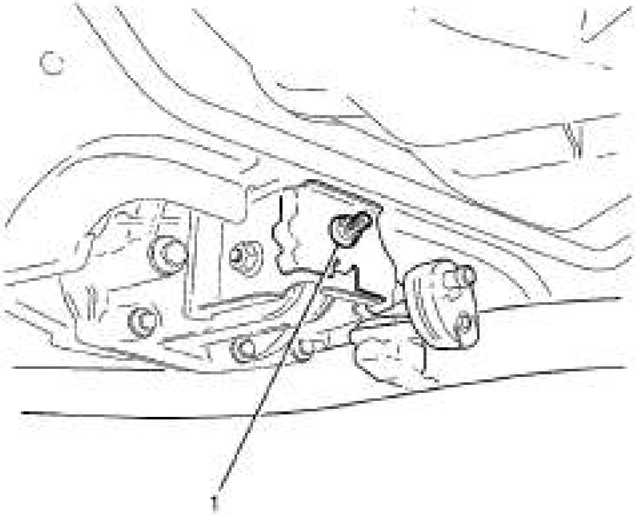
9. Install the NEW right catalytic converter to right exhaust manifold retaining nuts (2).

   Do not fully tighten at this stage.



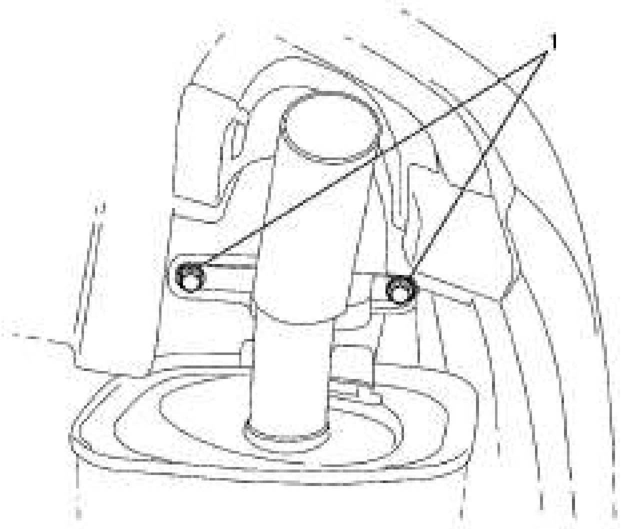
10. Attach the exhaust system (2) by installing the front insulator hangers (1) if fitted.

    Notice: Refer to Fastener Notice in the Preface section.



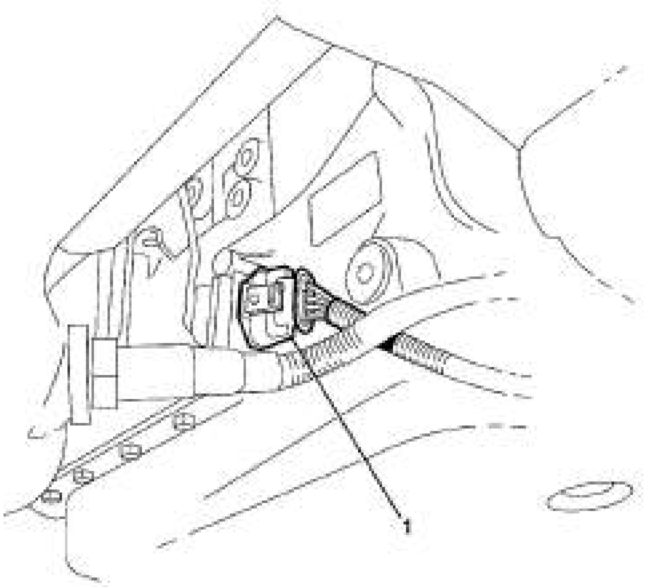
11. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

    Tighten
    Tighten the bolt to 45 N·m (33 lb ft).

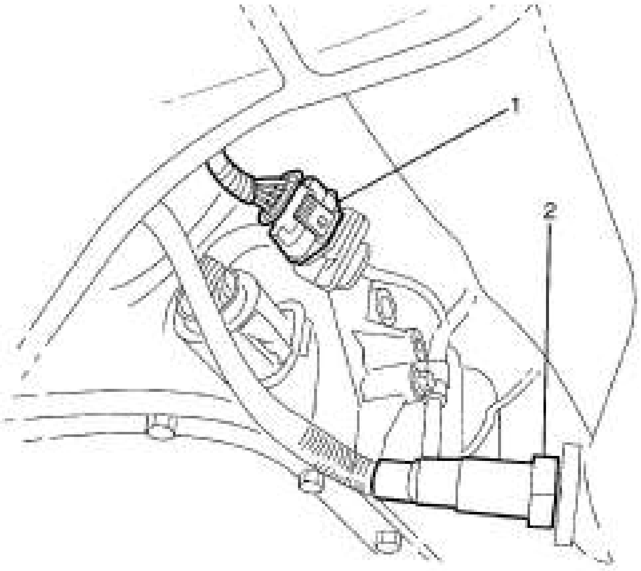


12. Install the rear insulator hanger to body retaining bolts (1).

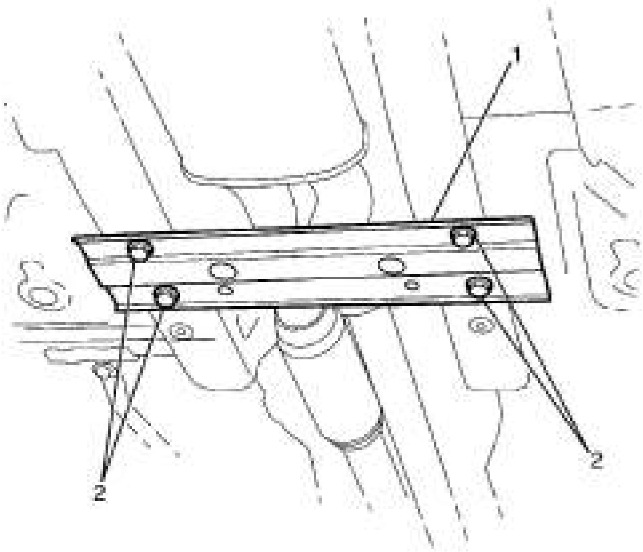
    Tighten
    Tighten the bolts to 26 N·m (19 lb ft).



13. Connect the left post-catalytic converter HO2S electrical connector (1).



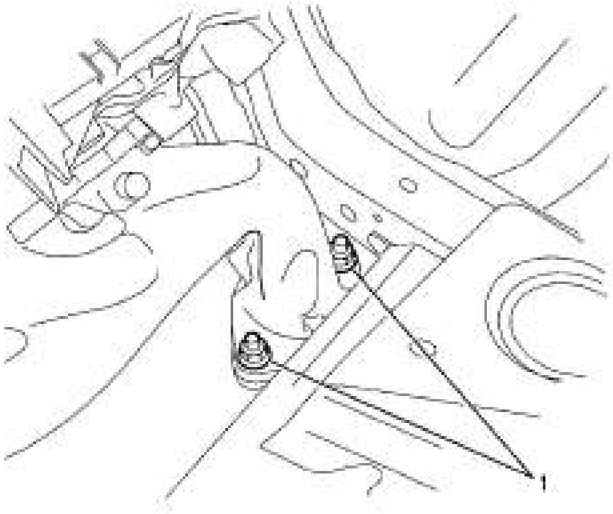
14. Connect the right post-catalytic converter HO2S electrical connector (1).



15. Install the transmission tunnel cross-brace (1).
16. Install the transmission tunnel cross-brace to body retaining bolts (2).

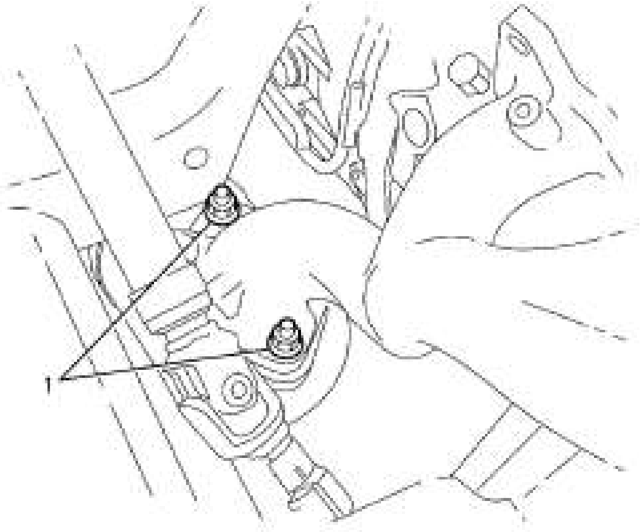
    Tighten
    Tighten the nuts to xx N·m (xx lb ft).

17. Remove the jack supporting the exhaust system.
18. Lower vehicle.



19. Tighten the left catalytic converter to left exhaust manifold retaining nuts (1).

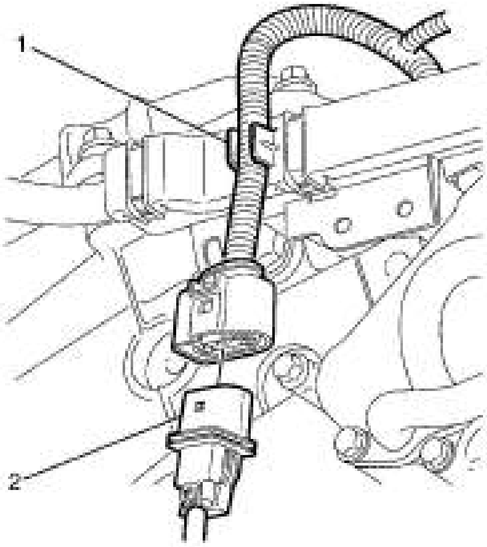
    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



20. Tighten the right catalytic converter to right exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

21. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .
22. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

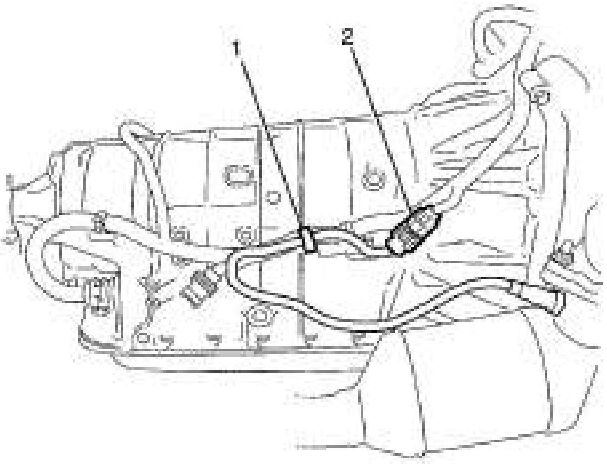


23. Connect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) to the main wiring harness.
24. Install the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom to the

engine wiring loom retaining clip (1).

25. Lower the vehicle.

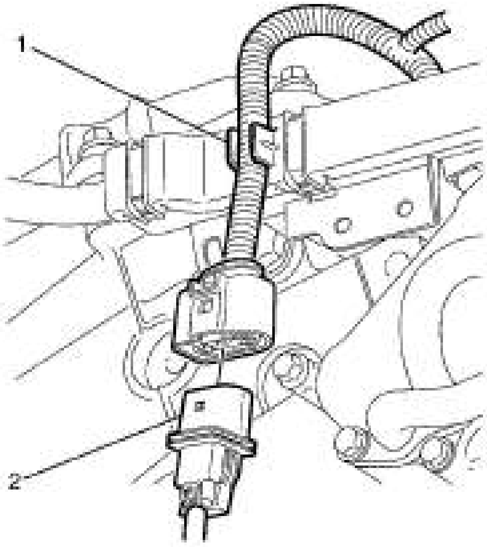
Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



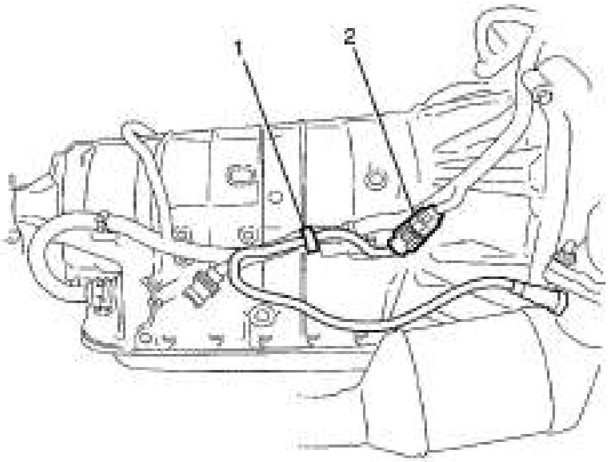
26. Connect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).
27. Install the right pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the transmission wiring loom retraining clip (1).
28. Install the engine dress cover. Refer to Engine Cover Replacement .
29. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
30. If re-programming is required. Refer to Control Module References .
31. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

Removal Procedure - From 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine dress cover. Refer to Engine Cover Replacement .
3. Remove the sound shield to bulk head retainers.



4. Remove the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the engine wiring loom retaining clip (1).
5. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) from the main wiring harness.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



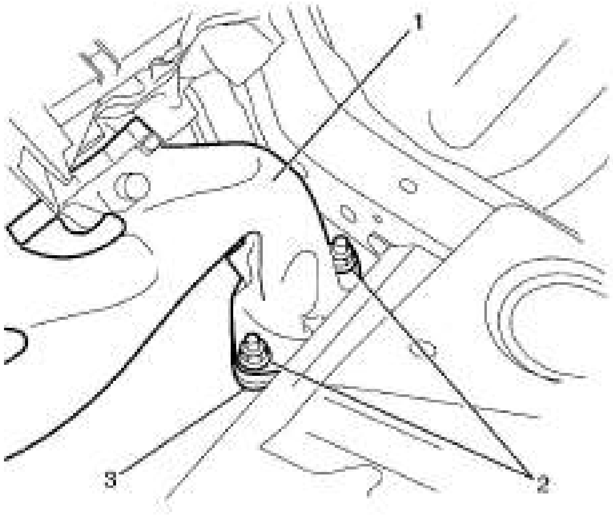
7. Remove the right pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the transmission wiring loom retraining clip (1).

   Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.

8. Disconnect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).

Caution: Refer to Exhaust Service Caution in the Preface section.

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

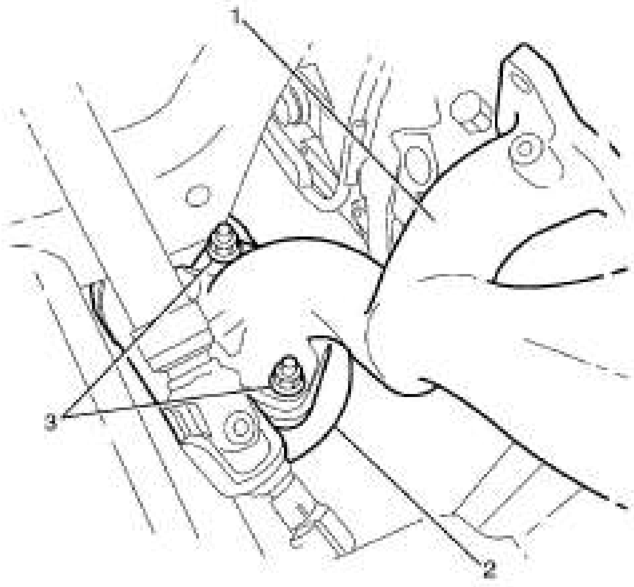


Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

9. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

   Discard the nuts.

10. Pull down and back on the left catalytic converter (3) to disconnect from the left exhaust manifold (1).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

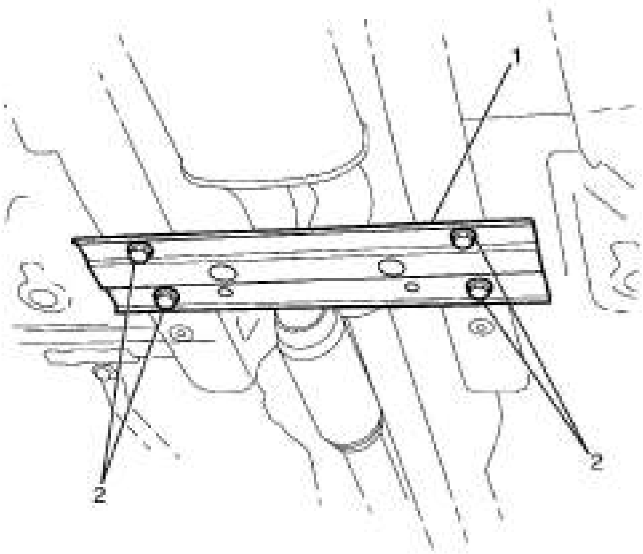
11. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

    Discard the nuts.

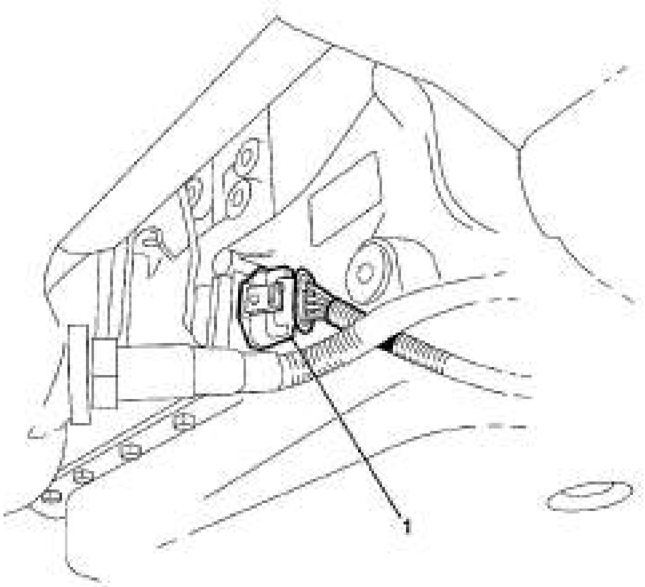
12. Pull down and back on the right catalytic converter (2) to disconnect from the right exhaust manifold (1).

    Caution: Refer to Vehicle Lifting Caution in the Preface section.

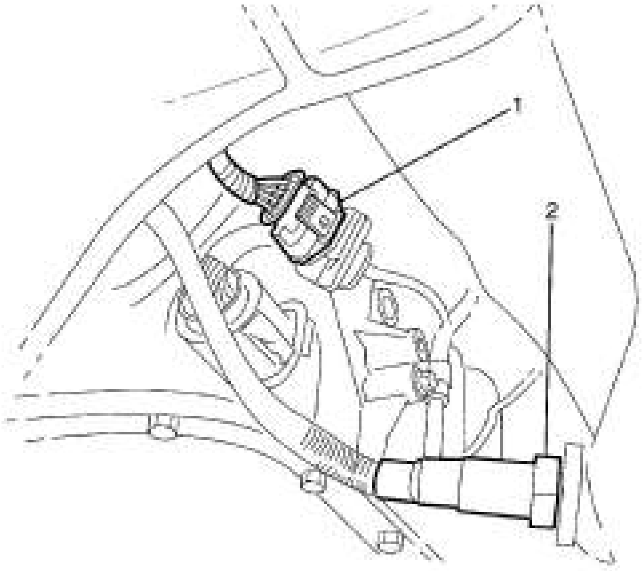
13. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



14. Remove the transmission tunnel cross-brace to body retaining bolts (2).
15. Remove the transmission tunnel cross-brace (1).



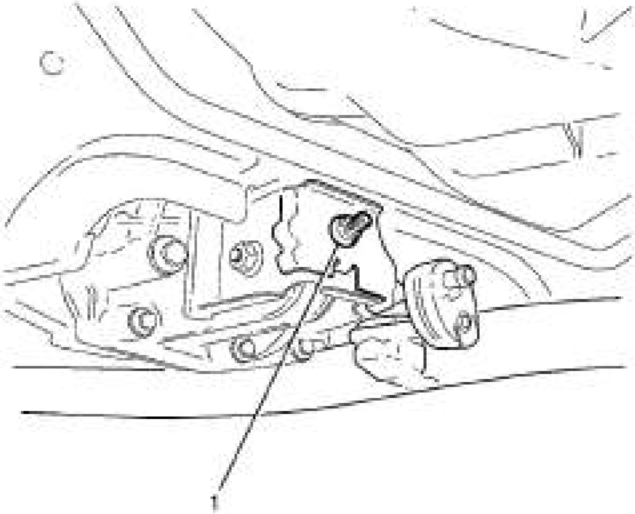
16. Disconnect the left post-catalytic converter HO2S electrical connector (1).



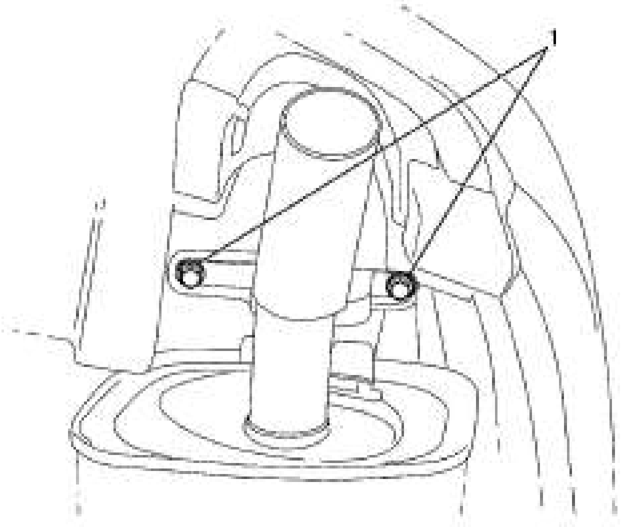
17. Disconnect the right post-catalytic converter HO2S electrical connector (1).

    Notice: Refer to Exhaust System Inspection Notice in the Preface section.

18. Support the exhaust system using a suitable jack.



19. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



20. Remove the rear insulator hanger to body retaining bolts (1).
21. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
22. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
23. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
24. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
25. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

Installation Procedure - From 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1.
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2.
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1.
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2.

   Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.

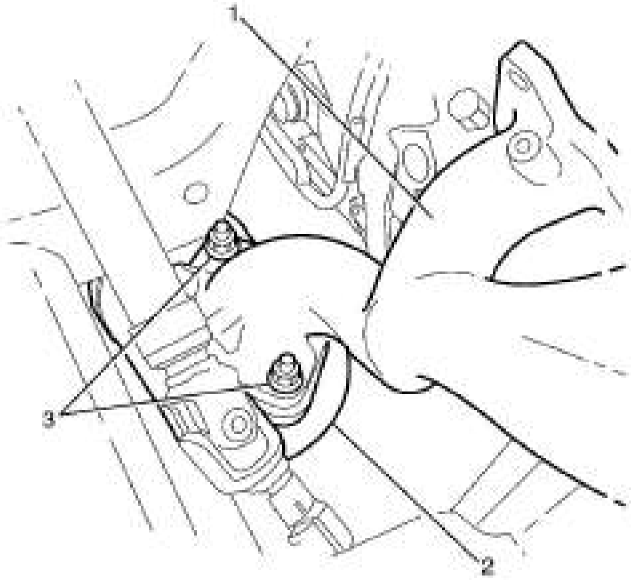
   Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (3) to connect to the left exhaust manifold (1).

   Important: Do not fully tighten the left catalytic converter to left exhaust manifold retaining nuts (2) at this stage.

7. Install the NEW left catalytic converter to left exhaust manifold retaining nuts (2).

   Do not fully tighten at this stage.



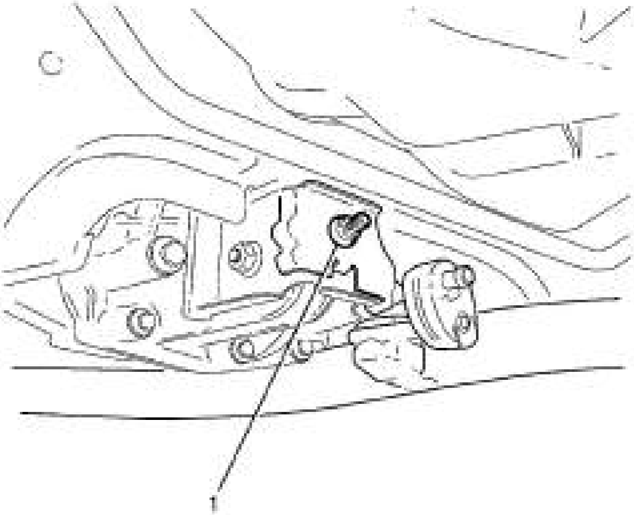
8. Push up and forward on the right catalytic converter (3) to connect to the right exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to right exhaust manifold retaining nuts (2) at this stage.

9. Install the NEW right catalytic converter to right exhaust manifold retaining nuts (2).

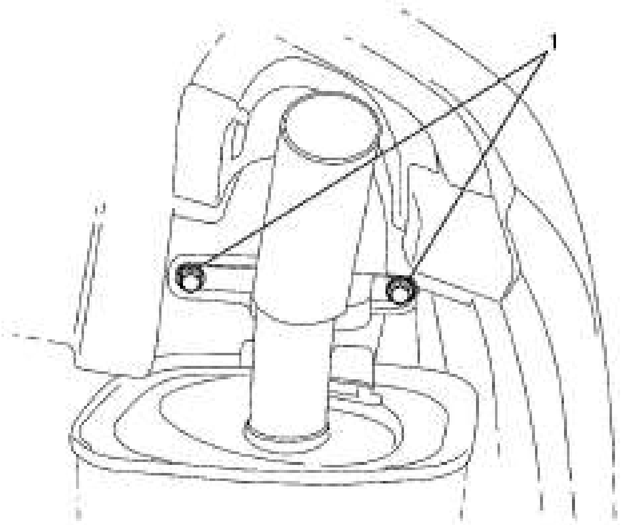
   Do not fully tighten at this stage.

   Notice: Refer to Fastener Notice in the Preface section.



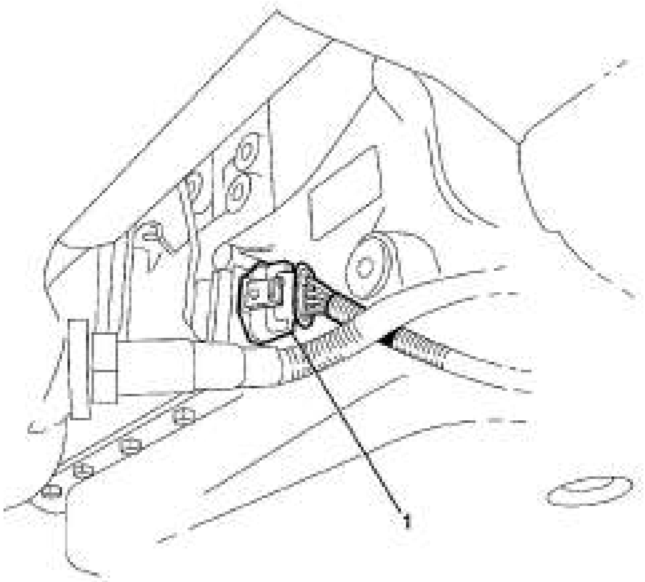
10. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

    Tighten
    Tighten the bolt to 45 N·m (33 lb ft).

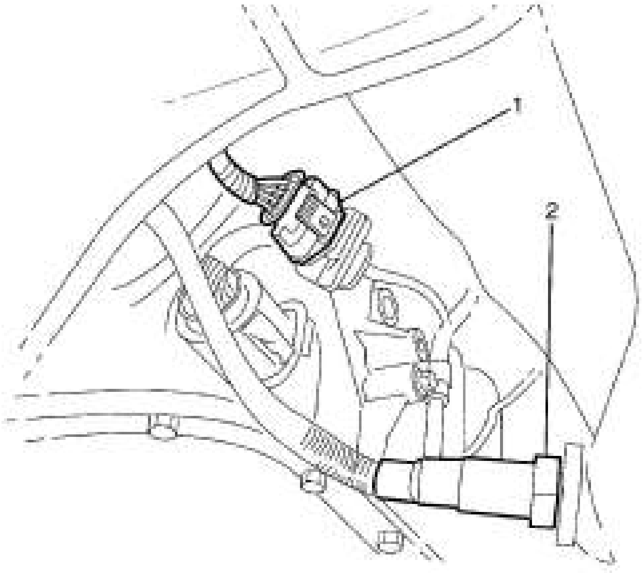


11. Install the rear insulator hanger to body retaining bolts (1).

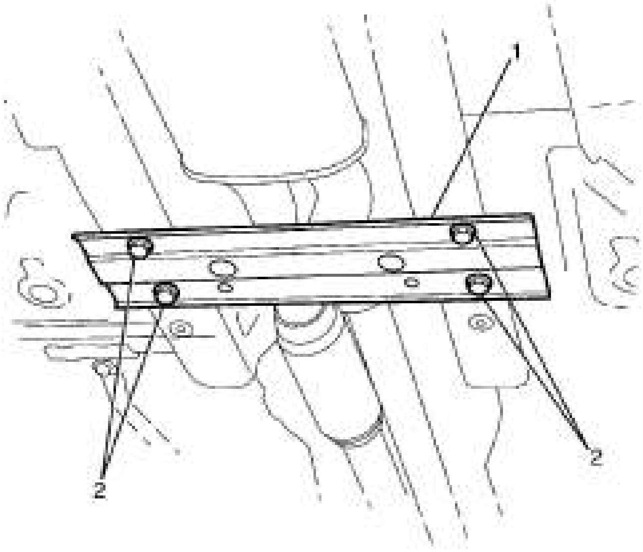
    Tighten
    Tighten the bolts to 26 N·m (19 lb ft).



12. Connect the left post-catalytic converter HO2S electrical connector (1).



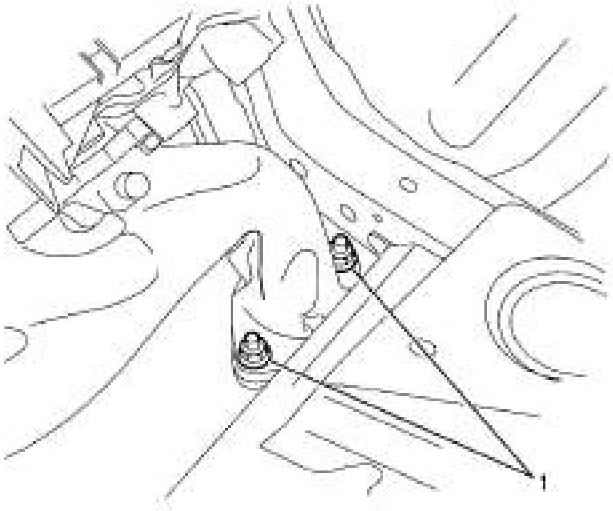
13. Connect the right post-catalytic converter HO2S electrical connector (1).



14. Install the transmission tunnel cross-brace (1).
15. Install the transmission tunnel cross-brace to body retaining bolts (2).

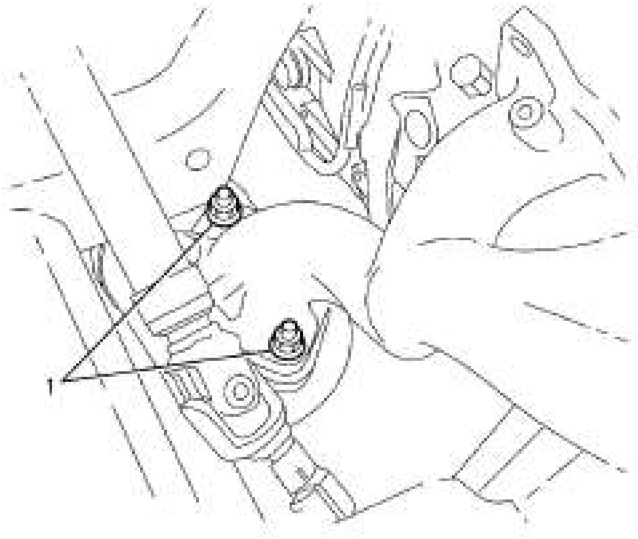
    Tighten
    Tighten the nuts to xx N·m (xx lb ft).

16. Remove the jack supporting the exhaust system.
17. Lower vehicle.



18. Tighten the left catalytic converter to left exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).



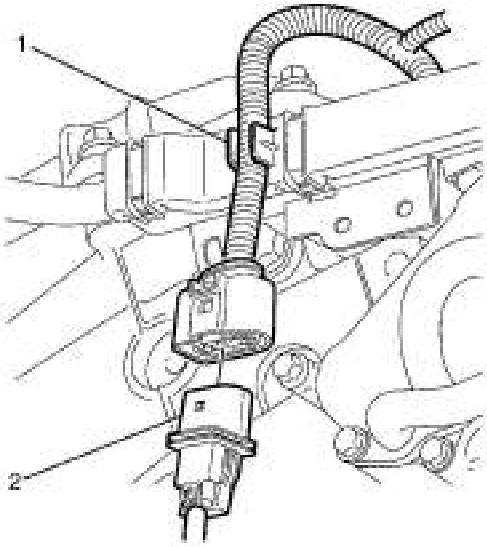
19. Tighten the right catalytic converter to right exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

20. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align.

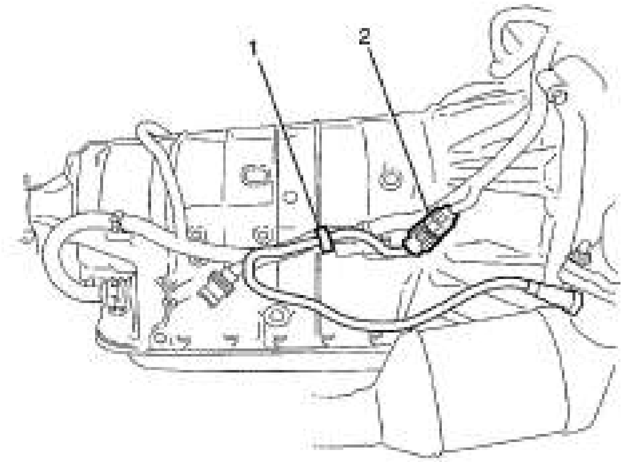
Refer to Exhaust System Alignment .

21. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



22. Connect the left pre-catalytic converter heated oxygen sensor (HO2S) wiring connector (2) to the main wiring harness.
23. Install the left pre-catalytic converter heated oxygen sensor (HO2S) wiring loom to the engine wiring loom retaining clip (1).
24. Lower the vehicle.

Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



25. Connect the right pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).

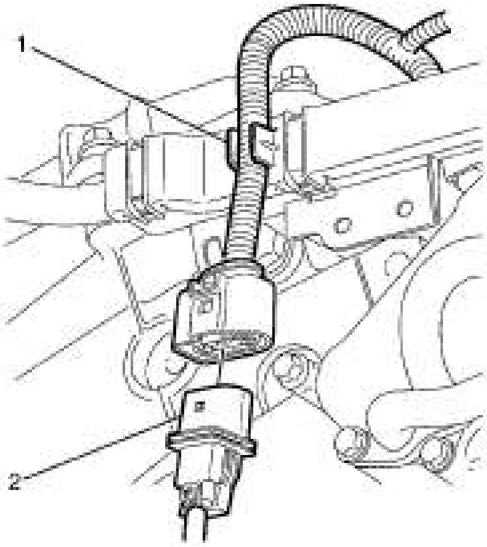
26. Install the right pre-catalytic converter heated oxygen sensor (HO2S) wiring loom from the transmission wiring loom retraining clip (1).
27. Install the engine dress cover. Refer to Engine Cover Replacement .
28. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
29. If re-programming is required. Refer to Control Module References .
30. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

Exhaust System Replacement (LY7)

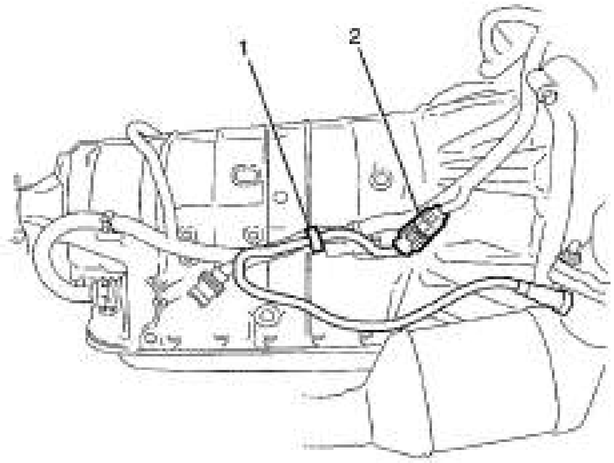
Removal Procedure - Up to 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine dress cover. Refer to Engine Cover Replacement .

Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



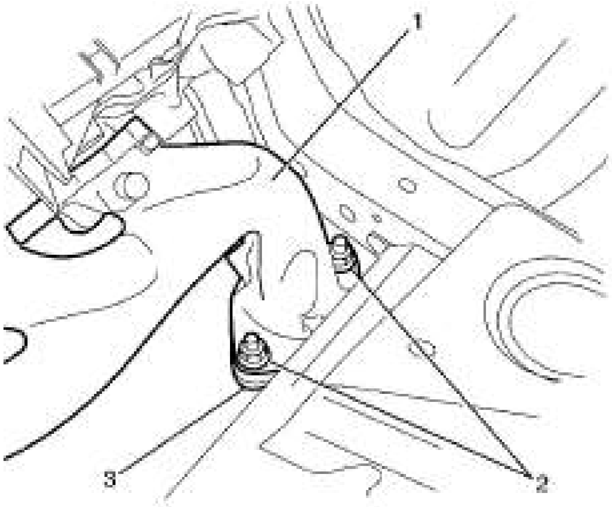
3. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).



4. Disconnect the right pre-catalytic converter HO2S electrical connector (1).

 Caution: Refer to Exhaust Service Caution in the Preface section.

 Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

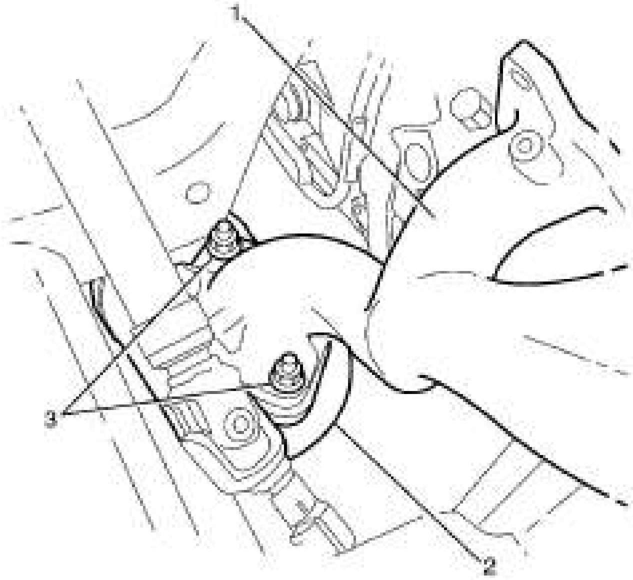


Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

5. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

Discard the nuts.

6. Pull down and back on the left catalytic converter (3) to disconnect from the left exhaust manifold (1).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

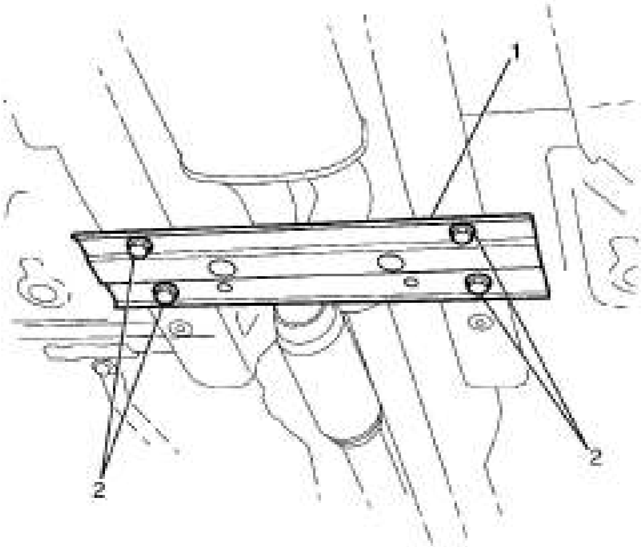
7. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

   Discard the nuts.

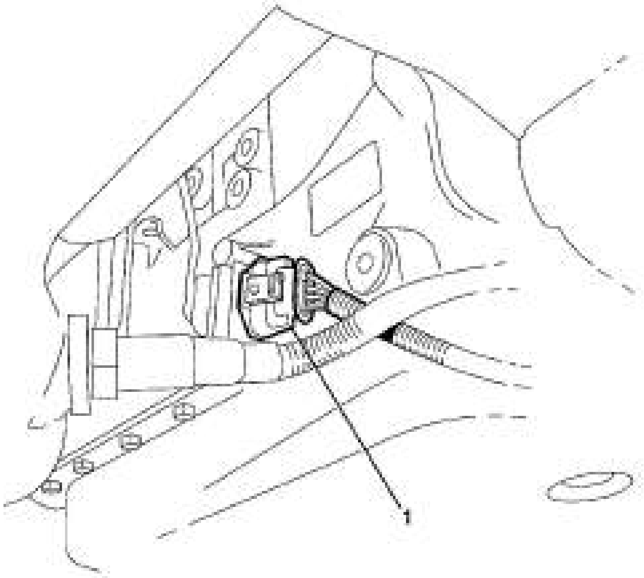
8. Pull down and back on the right catalytic converter (2) to disconnect from the right exhaust manifold (1).

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

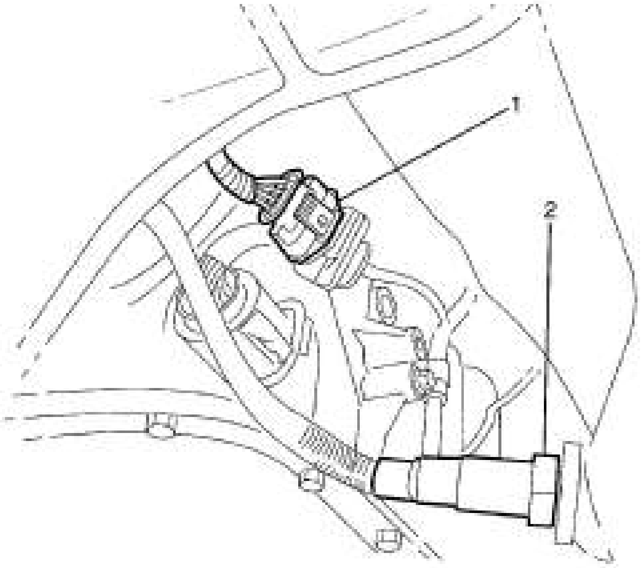
9. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



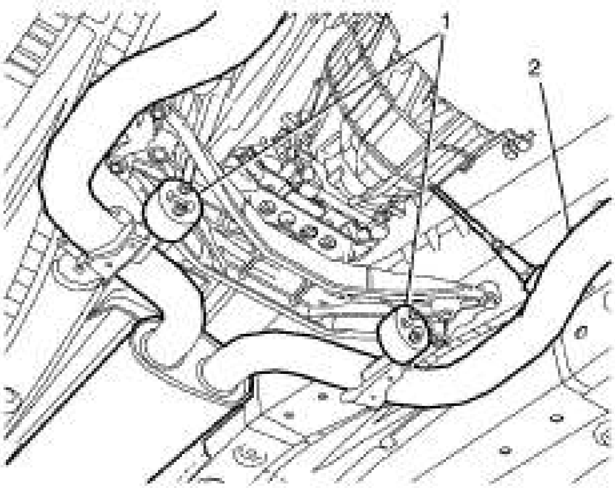
10. Remove the transmission tunnel cross-brace to body retaining bolts (2).
11. Remove the transmission tunnel cross-brace (1).



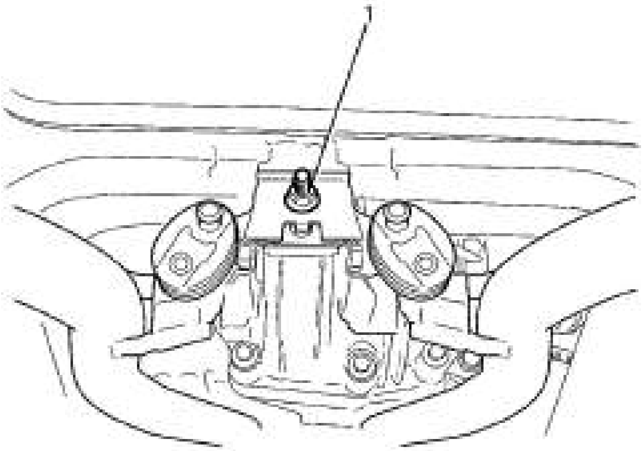
12. Disconnect the left post-catalytic converter HO2S electrical connector (1).



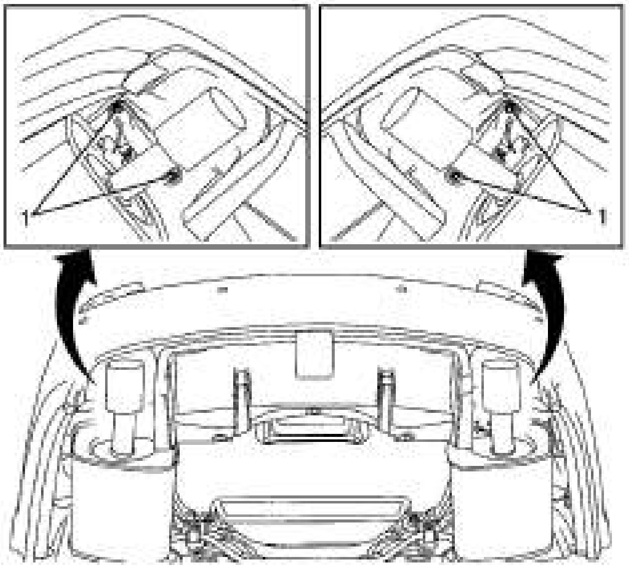
13. Disconnect the right post-catalytic converter HO2S electrical connector (1).
14. Support the exhaust system using a suitable jack.



15. Detach the exhaust system (2) by removing the front insulator hangers (1) if fitted.



16. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



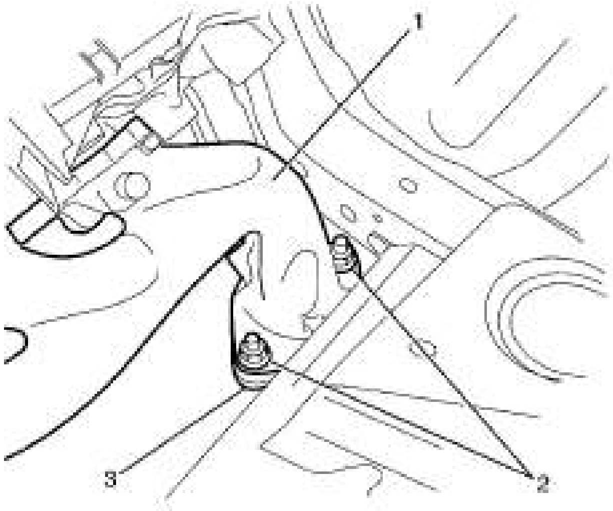
17. Remove the rear insulator hanger to body retaining bolts (1).
18. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
19. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
20. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
21. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
22. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

Installation Procedure - Up to 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

   Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.



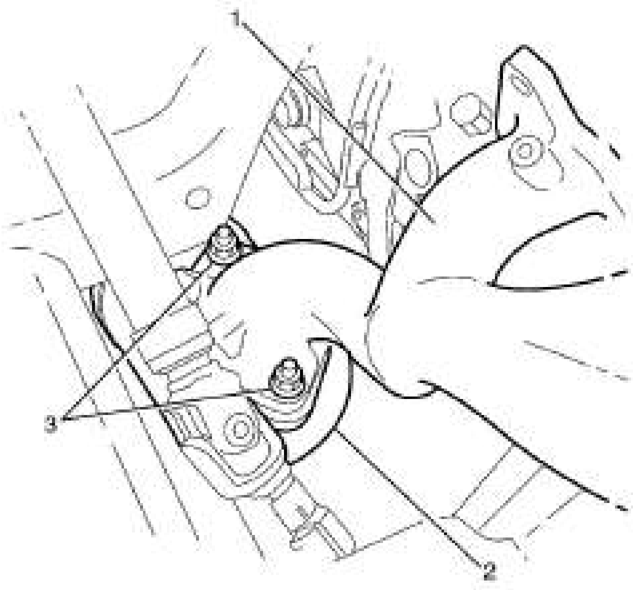
Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (3) to connect to the left exhaust manifold (1).

   Important: Do not fully tighten the left catalytic converter to left exhaust manifold retaining nuts (2) at this stage.

7. Install the NEW left catalytic converter to left exhaust manifold retaining nuts (2).

   Do not fully tighten at this stage.

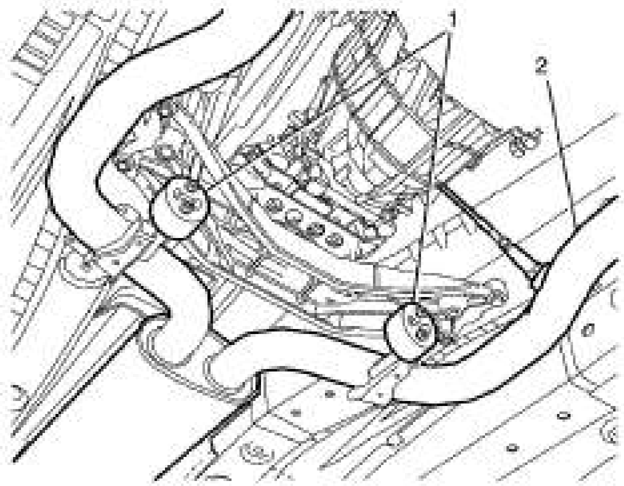


8. Push up and forward on the right catalytic converter (2) to connect to the right exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to right exhaust manifold retaining nuts (3) at this stage.

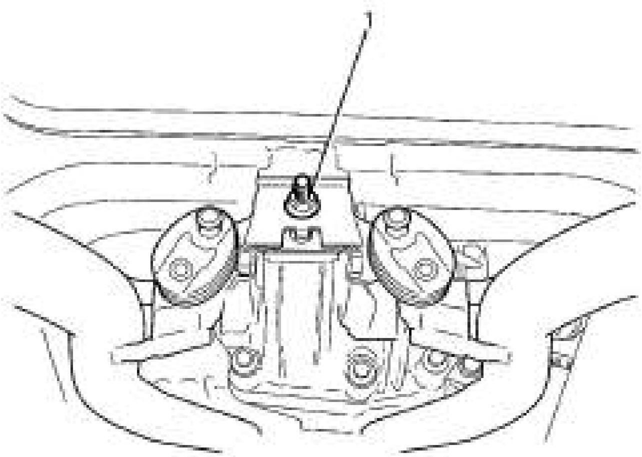
9. Install the NEW right catalytic converter to right exhaust manifold retaining nuts (3).

   Do not fully tighten at this stage.



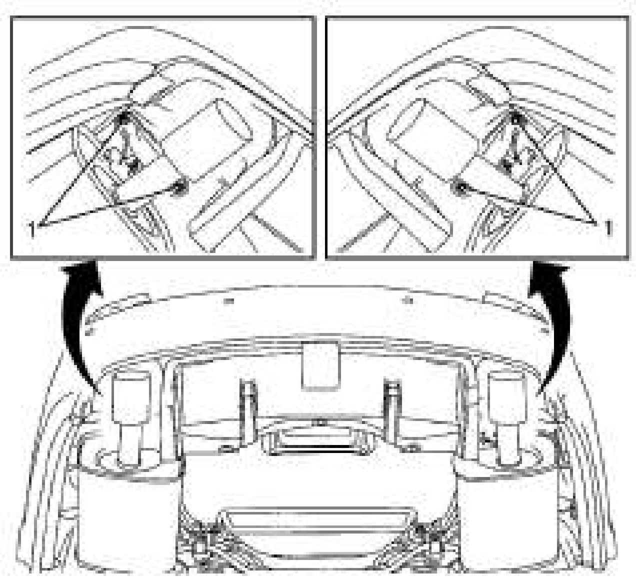
10. Attach the exhaust system (2) by installing the front insulator hangers (1) if fitted.

Notice: Refer to Fastener Notice in the Preface section.



11. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

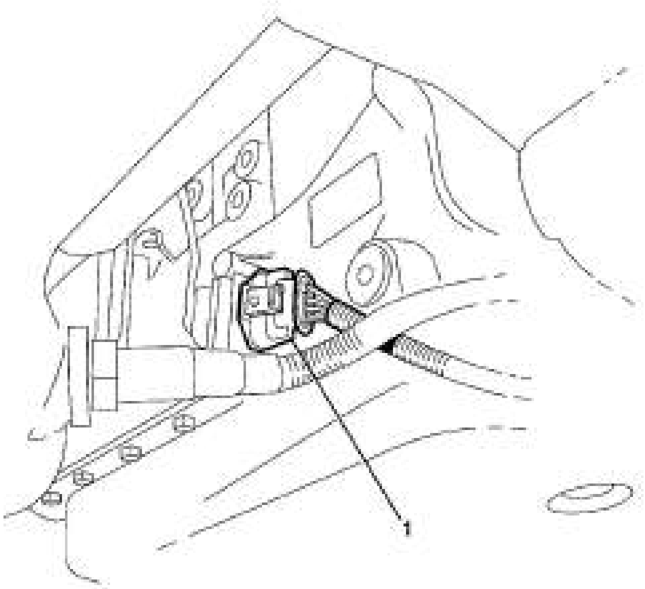
Tighten
Tighten the bolt to 45 N·m (33 lb ft).



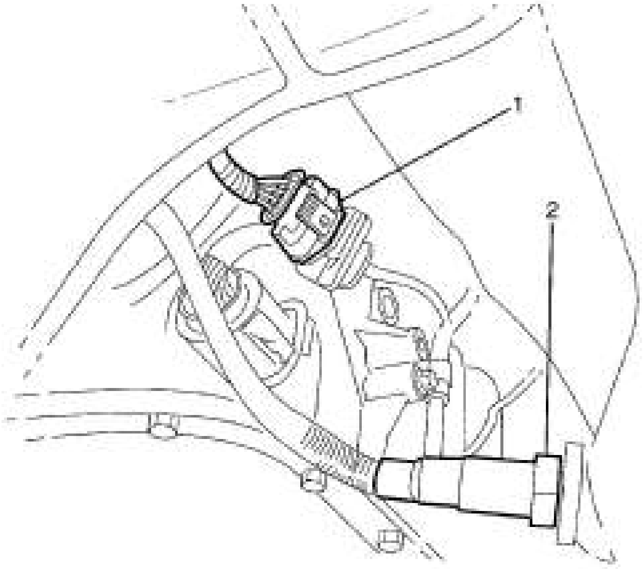
12. Install the rear insulator hanger to body retaining bolts (1).

Tighten

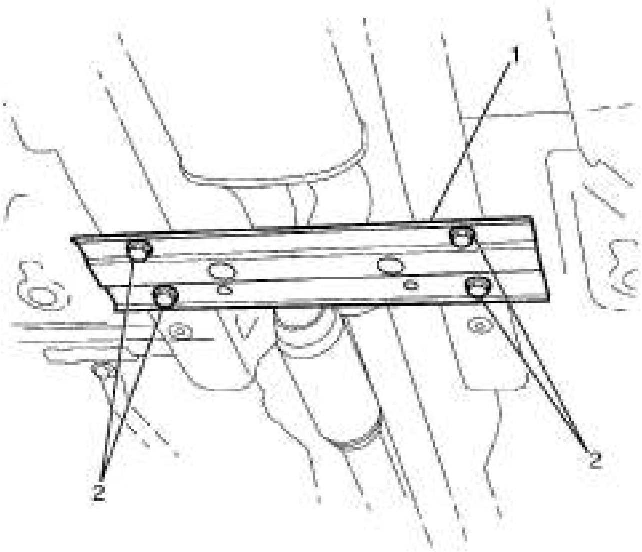
Tighten the bolts to 26 N·m (19 lb ft).



13. Connect the left post-catalytic converter HO2S electrical connector (1).



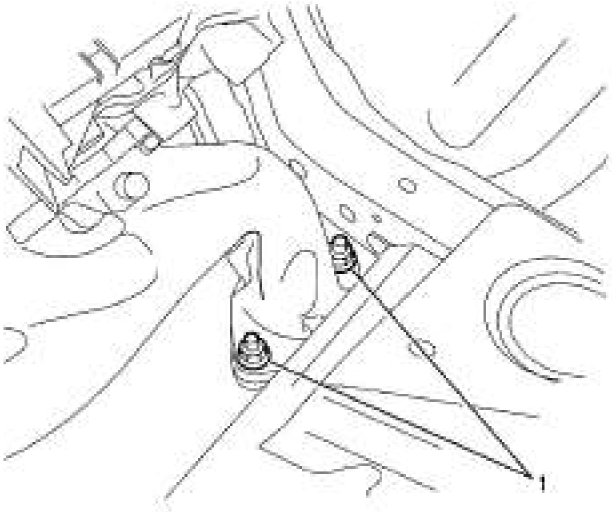
14. Connect the right post-catalytic converter HO2S electrical connector (1).



15. Install the transmission tunnel cross-brace (1).
16. Install the transmission tunnel cross-brace to body retaining bolts (2).

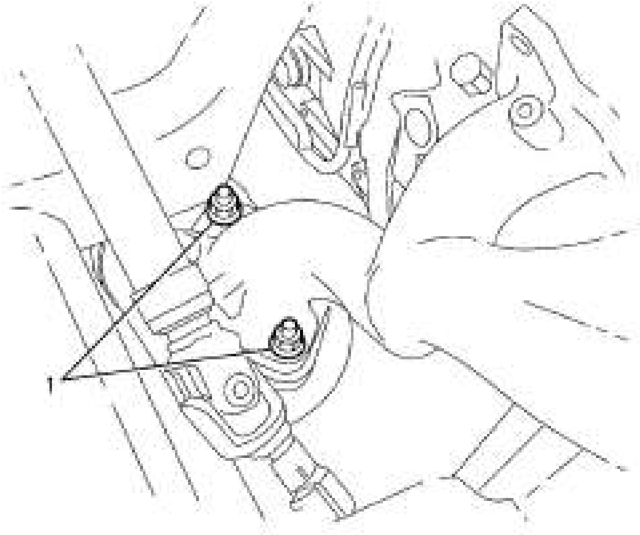
Tighten
Tighten the nuts to xx N·m (xx lb ft).

17. Remove the jack supporting the exhaust system.
18. Lower vehicle.



19. Tighten the left catalytic converter to left exhaust manifold retaining nuts (1).

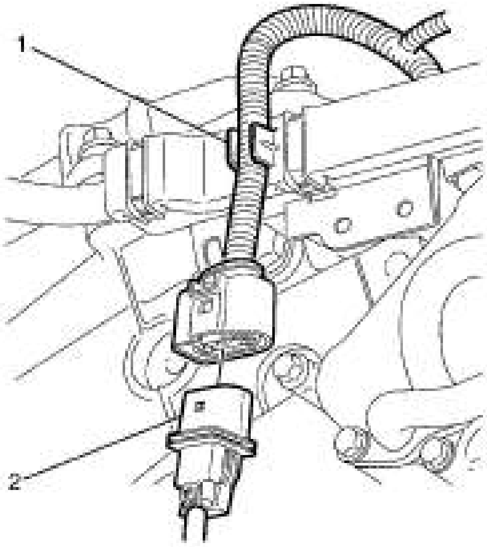
Tighten
Tighten the nuts to 45 N·m (33 lb ft).



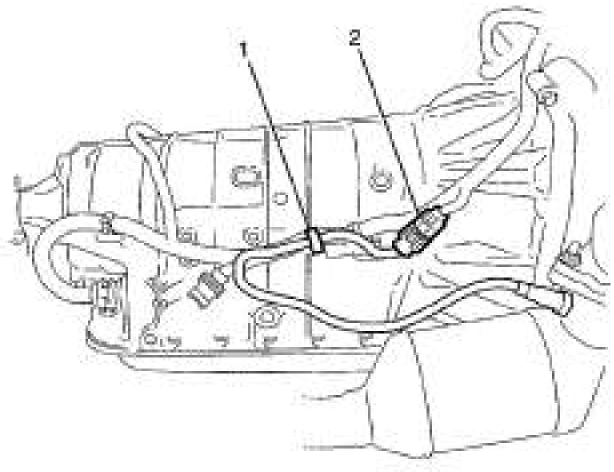
20. Tighten the right catalytic converter to right exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

21. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align. Refer to Exhaust System Alignment .



22. Connect the left pre-catalytic converter HO2S electrical connector (2).

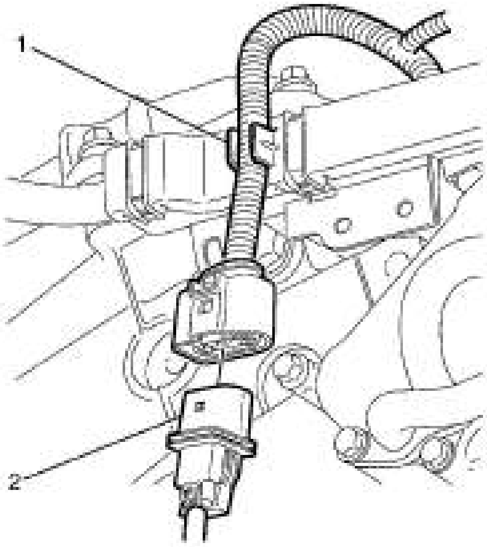


23. Connect the right pre-catalytic converter HO2S electrical connector (2).
24. Install the engine dress cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
25. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
26. If re-programming is required. Refer to Control Module References .
27. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

Removal Procedure - From 31 May 2007

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine dress cover. Refer to Engine Cover Replacement .

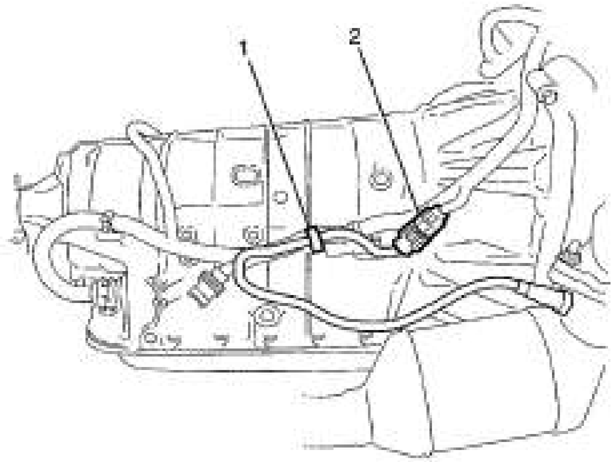
Notice: Refer to Heated Oxygen and Oxygen Sensor Notice in the Preface section.



3. Disconnect the left pre-catalytic converter heated oxygen sensor (HO2S) electrical connector (2).

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

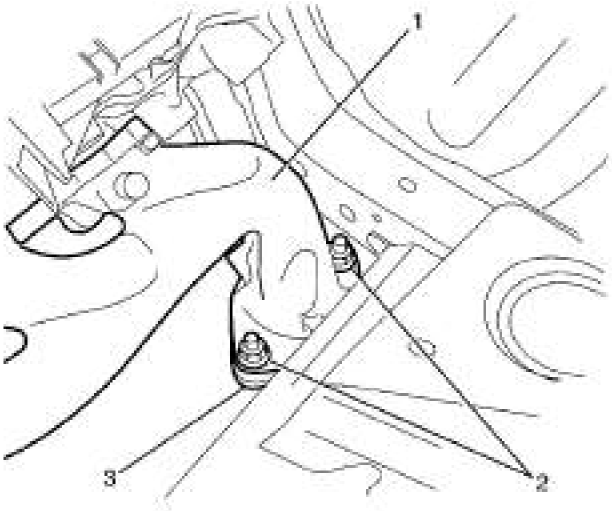
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



5. Disconnect the right pre-catalytic converter HO2S electrical connector (1).

   Caution: Refer to Exhaust Service Caution in the Preface section.

   Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

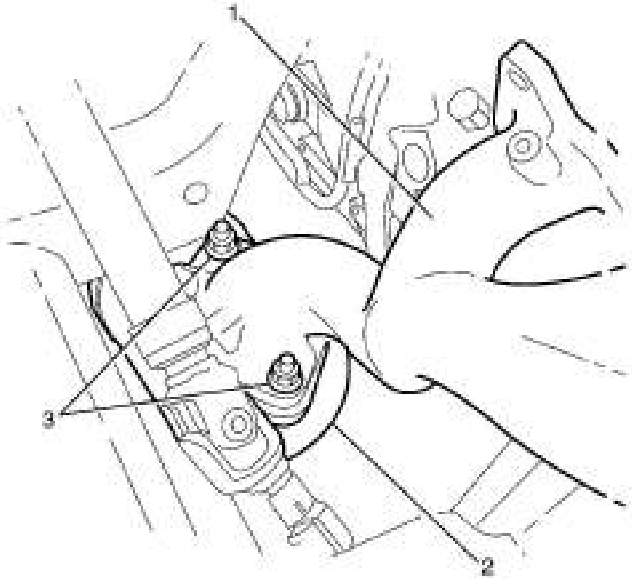


Important: The left catalytic converter to exhaust manifold retaining nuts (2) are single use parts. They must be discarded after removal.

6. Remove the left catalytic converter to exhaust manifold retaining nuts (2).

   Discard the nuts.

7. Pull down and back on the left catalytic converter (3) to disconnect from the left exhaust manifold (1).



Important: The right catalytic converter to exhaust manifold retaining nuts (3) are single use parts. They must be discarded after removal.

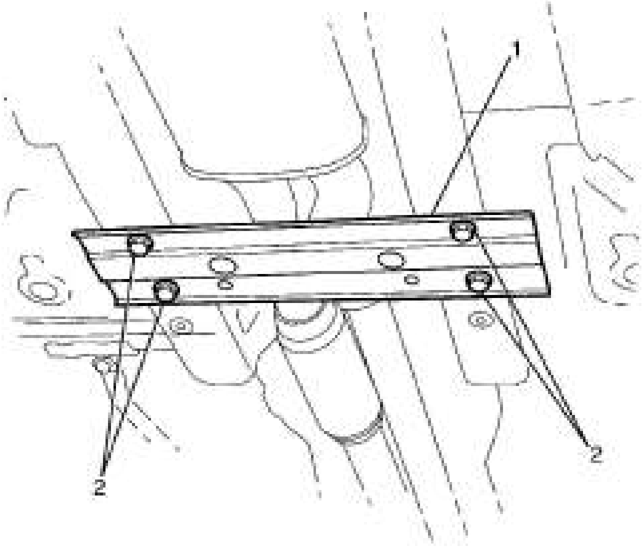
8. Remove the right catalytic converter to exhaust manifold retaining nuts (3).

   Discard the nuts.

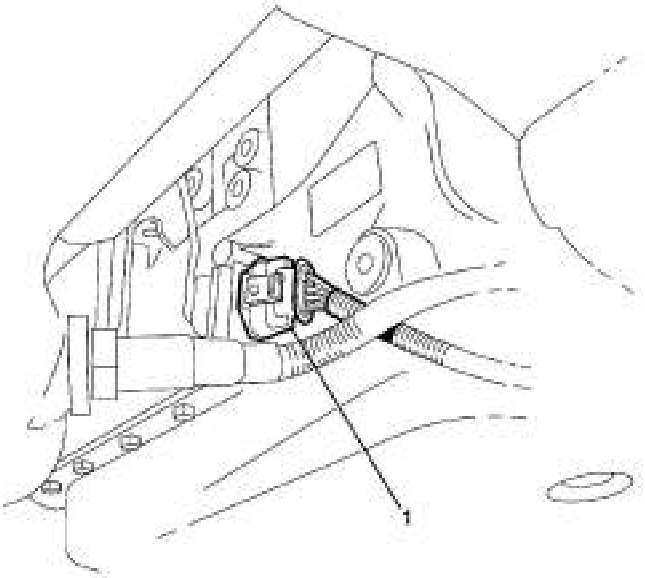
9. Pull down and back on the right catalytic converter (2) to disconnect from the right exhaust manifold (1).

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

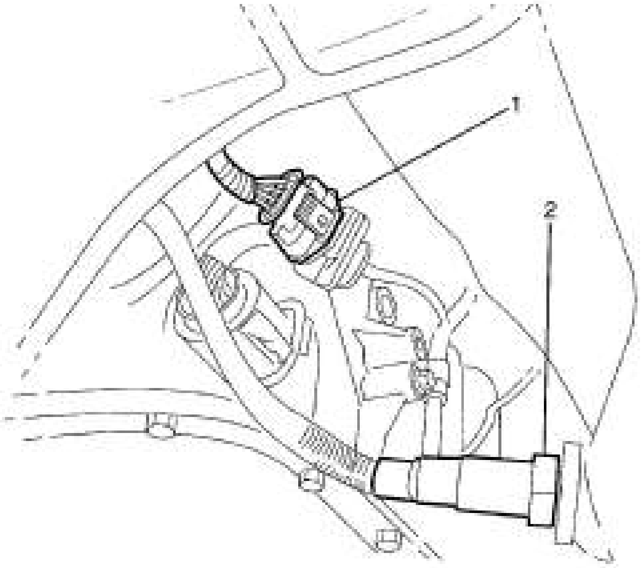
10. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



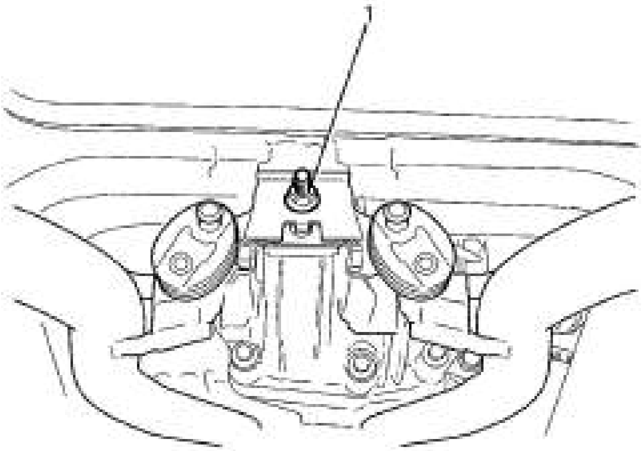
11. Remove the transmission tunnel cross-brace to body retaining bolts (2).
12. Remove the transmission tunnel cross-brace (1).



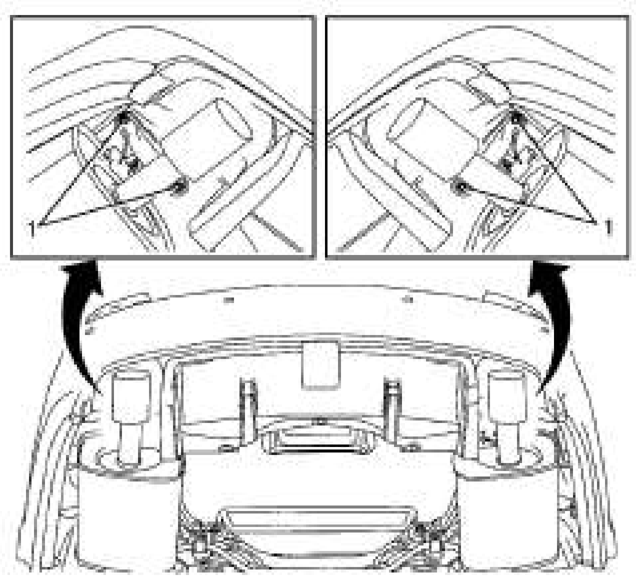
13. Disconnect the left post-catalytic converter HO2S electrical connector (1).



14. Disconnect the right post-catalytic converter HO2S electrical connector (1).
15. Support the exhaust system using a suitable jack.



16. Detach the exhaust system (2) by removing the centre insulator hanger bracket to differential retaining bolt (1).



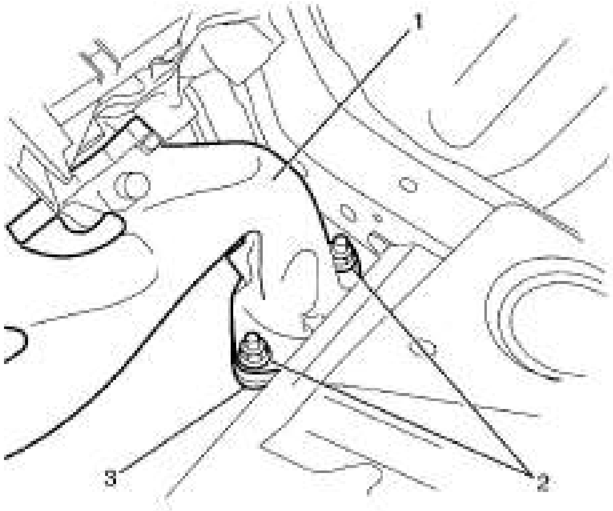
17. Remove the rear insulator hanger to body retaining bolts (1).
18. With the aid of an assistant or using a suitable jack; carefully lower the exhaust system from the vehicle.
19. Remove the left pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
20. Remove the left post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
21. Remove the right pre-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
22. Remove the right post-catalytic converter HO2S. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

Installation Procedure - From 31 May 2007

1. Install the left pre-catalytic converter HO2S to the left catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 1 .
2. Install the left post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 1 Sensor 2 .
3. Install the right pre-catalytic converter HO2S to the right catalytic converter. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 1 .
4. Install the right post-catalytic converter HO2S to the intermediate exhaust assembly. Refer to Heated Oxygen Sensor Replacement - Bank 2 Sensor 2 .

   Notice: Refer to Exhaust Service Caution in the Preface section.

5. With the aid of an assistant or using a suitable jack; carefully raise the exhaust system to the vehicle.



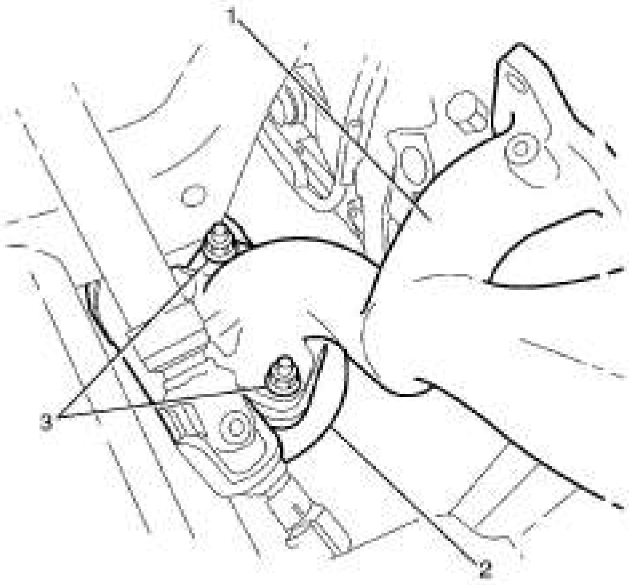
Important: Make sure that a NEW sealing ring is fitted prior to installation. Failure to comply may cause the exhaust system to perform poorly.

6. Push up and forward on the left catalytic converter (3) to connect to the left exhaust manifold (1).

   Important: Do not fully tighten the left catalytic converter to left exhaust manifold retaining nuts (2) at this stage.

7. Install the NEW left catalytic converter to left exhaust manifold retaining nuts (2).

   Do not fully tighten at this stage.



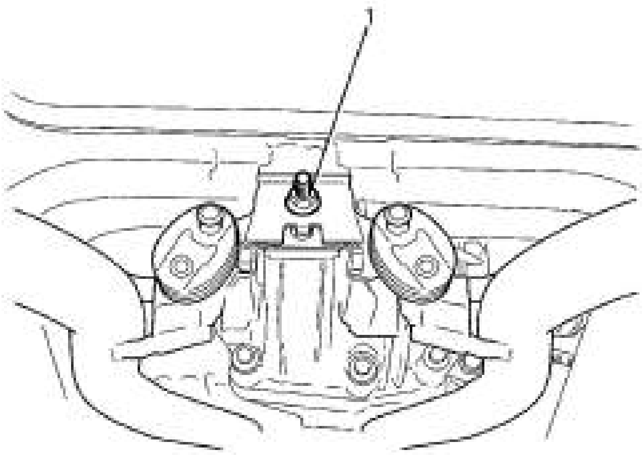
8. Push up and forward on the right catalytic converter (2) to connect to the right exhaust manifold (1).

   Important: Do not fully tighten the right catalytic converter to right exhaust manifold retaining nuts (3) at this stage.

9. Install the NEW right catalytic converter to right exhaust manifold retaining nuts (3).

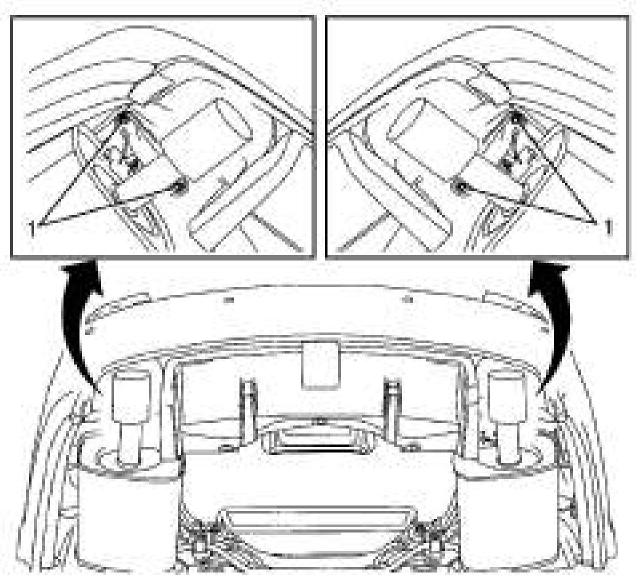
   Do not fully tighten at this stage.

   Notice: Refer to Fastener Notice in the Preface section.



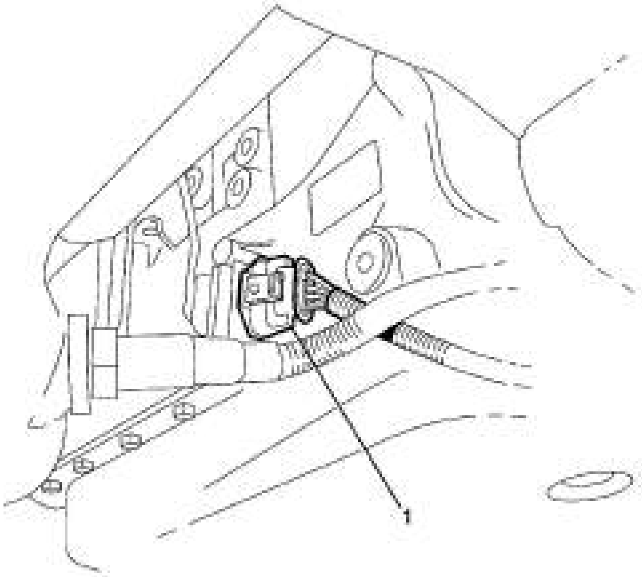
10. Attach the exhaust system (2) by installing the centre insulator hanger bracket to differential retaining bolt (1).

    Tighten
    Tighten the bolt to 45 N·m (33 lb ft).

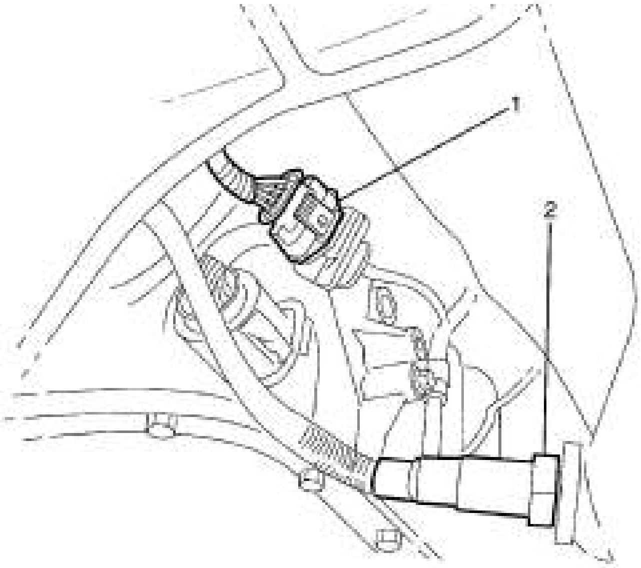


11. Install the rear insulator hanger to body retaining bolts (1).

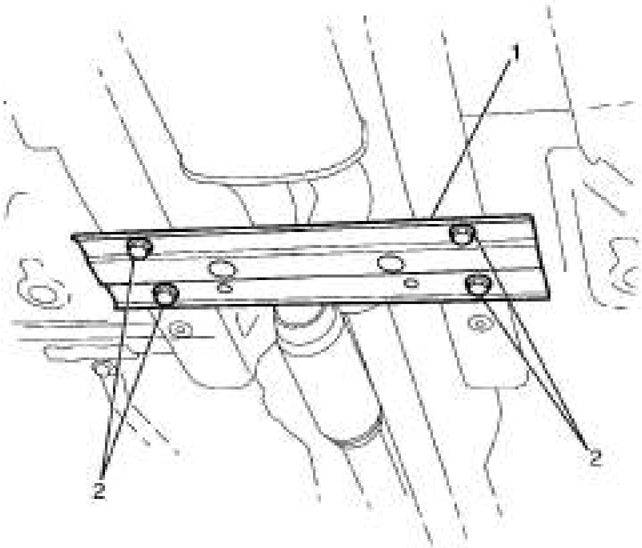
    Tighten
    Tighten the bolts to 26 N·m (19 lb ft).



12. Connect the left post-catalytic converter HO2S electrical connector (1).



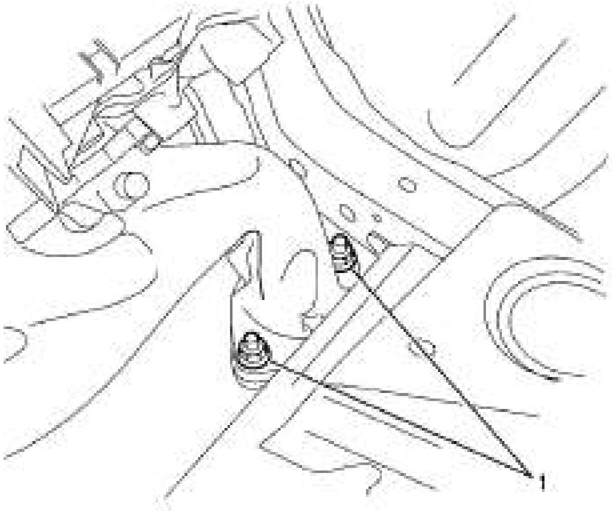
13. Connect the right post-catalytic converter HO2S electrical connector (1).



14. Install the transmission tunnel cross-brace (1).
15. Install the transmission tunnel cross-brace to body retaining bolts (2).

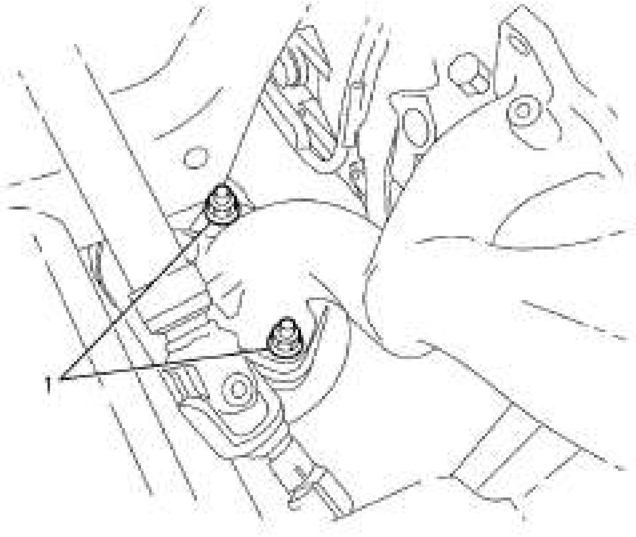
Tighten
Tighten the nuts to xx N·m (xx lb ft).

16. Remove the jack supporting the exhaust system.
17. Lower vehicle.



18. Tighten the left catalytic converter to left exhaust manifold retaining nuts (1).

    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

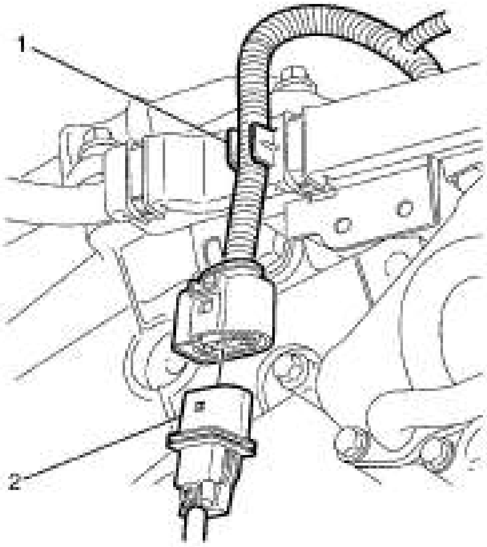


19. Tighten the right catalytic converter to right exhaust manifold retaining nuts (1).

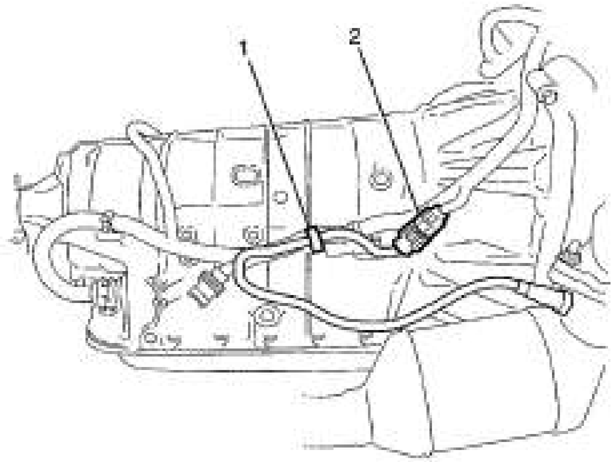
    Tighten
    Tighten the nuts to 45 N·m (33 lb ft).

20. Make sure that the exhaust system is clear of all other components and chassis. If the exhaust system is not clear of all the other components loosen all retaining nuts and re-align.

Refer to Exhaust System Alignment .



21. Connect the left pre-catalytic converter HO2S electrical connector (2).



22. Connect the right pre-catalytic converter HO2S electrical connector (2).
23. Install the engine dress cover. Refer to Engine Cover Replacement in Engine Mechanical - 3.6L.
24. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
25. If re-programming is required. Refer to Control Module References .
26. Perform diagnostic system check using diagnostic scan tool, clear all relative DTCs and inspect the system for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Exhaust | Repair Instructions | **Document ID: 1977396**

Fuel Tank Heat Shield Replacement

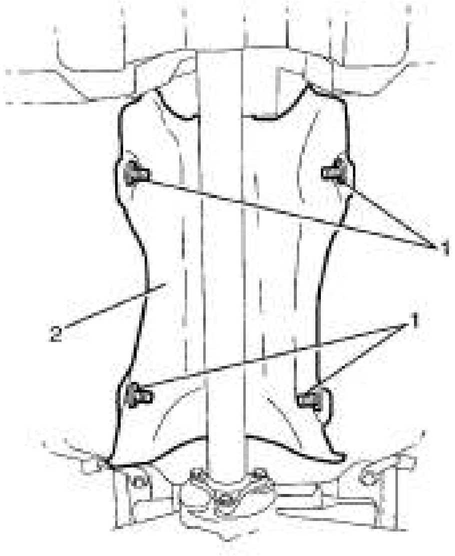
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

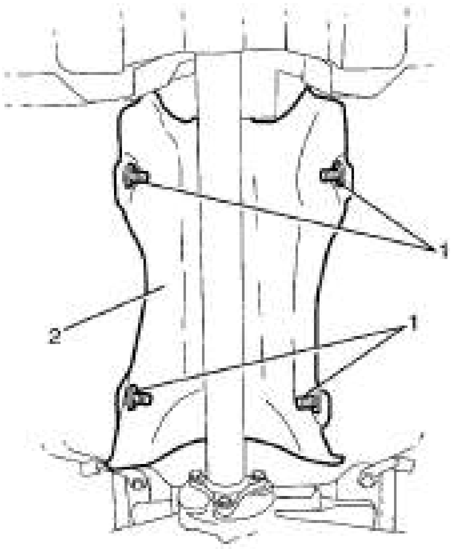
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Caution: Refer to Exhaust Service Caution in the Preface section.



2. Remove the fuel tank heat shield to fuel tank retaining nuts (1).
3. Remove the fuel tank heat shield (2).

Installation Procedure



1. Position the fuel tank heat shield (2) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the fuel tank heat shield to fuel tank retaining nuts (1).

   Tighten
   Tighten the nuts to 4 N·m (35 lb in).

3. Lower the vehicle to the ground.

Exhaust System Description

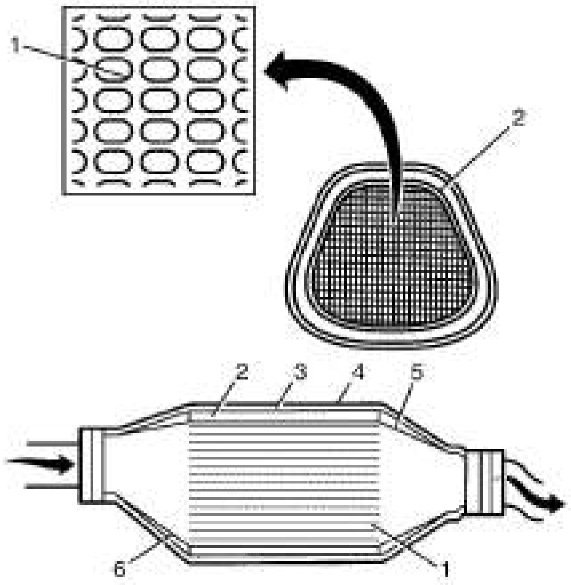
Important: Use of non-OEM parts may cause driveability concerns.

Information contained within this section describes the general exhaust system.

Through developments in various emissions reduction system, significant reductions in emissions have been achieved. The developments have been primarily concerned with refinements in engine calibration and the optimization of exhaust system catalytic converter configurations.

The catalytic converter is similar to a muffler in appearance however, within the outer stainless steel shell (4), there is a ceramic monolith (1) which is honeycombed in the direction of the exhaust, as shown. The ceramic monolith is surrounded by a mat (2), which has the primary function of holding the monolith firmly in place to prevent any contact with the inner shell (3). A mesh (5 and 6) at each end of the converter prevents exhaust gases from fouling and eroding the mat.

Surfaces of the ceramic monolith that are exposed to exhaust gases are coated with a catalytic material. This material contains rhodium and platinum, which act to facilitate the chemical reactions necessary to oxidize carbon monoxide and hydrocarbons into harmless carbon dioxide.



The catalytic converter is a substance that accelerates a chemical reaction without itself being changed. Engine exhaust gases contain carbon monoxide (CO), hydrocarbons (HC) and oxides of nitrogen (NOx). When the exhaust gases flow through the monolith, reactions with the catalytic converter occur. CO and HC are converted by oxidation with oxygen (O_2) in the exhaust gases to produce carbon dioxide (CO_2) and water vapour (H_2O). NOx is converted by reduction with CO to produce nitrogen (N_2). The catalytic converter is called a three-way type because it simultaneously converts three components of exhaust gas (CO, HC and NOx) to harmless natural gases.

Service Notes

- Vehicles fitted with a catalytic converter should not be operated with leaded petrol. Lead will contaminate the catalytic converter.
- Do not drop the catalytic converter as it will damage the ceramic monolith.
- Do not allow water, oil or fuel to enter the converter as the ceramic monolith will be contaminated.
- Do not drive the vehicle with the engine misfiring or with any of the spark plug leads disconnected.

Important: Catalytic converter can be damaged or rendered infective, if:

- Operated outside the limits of the closed loop mixture control system.
- The engine burns excessive amount of oil.
- The exhaust temperature at the converter is too high (exceeds 840°C).

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Specifications | **Document ID: 1998042**

Engine Mechanical Specifications (LLT)

Application	Specification	
	Metric	**English**
General		
• Engine Type	V-6	
• Displacement	3.6 Liter	217 cu in
• RPO	LLT	
• VIN	V	
• Bore	94 mm	3.7008 in
• Stroke	85.6 mm	3.37 in
• Compression Ratio	11.4:1	
• Cranking RPM - at 40° C (104°F)	80 RPM	
• Idle Speed	600 A/C Off - 700 A/C On	
• Firing Order	1-2-3-4-5-6	
• Spark Plug Gap	1.1 mm	0.0433 in
Block		
• Crankshaft Main Bearing Bore Diameter	72.867-72.881 mm	2.8688-2.8693 in
• Cylinder Bore Diameter	93.992-94.008 mm	3.7005-3.7011 in
• Cylinder Bore Out-of-Round - Production Max.	0.013 mm	0.0005 in
Camshaft		
• Camshaft Bearing Inside Diameter - Front Number 1	35.000-35.020 mm	1.3779-1.3787 in
• Camshaft Bearing Inside Diameter - Middle and Rear Number 2-4	27.000-27.020 mm	1.0630-1.0638 in
• Camshaft End Play	0.045-0.215 mm	0.0018-0.0085 in
• Camshaft Journal Diameter - Front Number 1	34.936-34.960 mm	1.3754-1.3764 in
• Camshaft Journal Diameter - Middle and Rear Number 2-4	26.936-26.960 mm	1.0605-1.0614 in
• Camshaft Journal Out-of-Round	0.006 mm	0.0002 in
• Camshaft Journal to Bore Clearance	0.040-0.084 mm	0.0016-0.0033 in
• Camshaft Lobe Duration - Exhaust @ 0.150 mm (0.0059 in) Lift	238 degrees	
• Camshaft Lobe Duration - Intake @ 0.150 mm (0.0059 in) Lift	237 degrees	
• Camshaft Lobe Lift - Exhaust	42.425-42.725 mm	1.6703-1.6821 in

Camshaft Lobe Lift - Intake	42.385-42.685 mm	1.6687-1.6805 in
Camshaft Lobe Overlap @ 0.150 mm (0.0059 in) Lift	0 degrees	
Camshaft Runout - Front and Rear Number 1 and 4	0.025 mm	0.0010 in
Camshaft Runout - Middle 2 and 3	0.050 mm	0.0020 in
Camshaft Timing @ 0.15 mm (0.0059 in) Lift		
Valve Opens - Exhaust	-229 degrees BTDC	
Valve Opens - Intake	14 degrees ATDC	
Centerline - Exhaust	111 degrees ATDC	
Centerline - Intake	132 degrees ATDC	
Valve Closes - Exhaust	9 degrees ATDC	
Valve Closes - Intake	251 degrees ATDC	
Valve Lift - Exhaust	10.8 mm	0.4252 in
Valve Lift - Intake	10.8 mm	0.4252 in

Valve Lifters - Stationary Hydraulic Lifter Assembly (SHLA)		
Valve Lifter (SHLA) Diameter	12.008-12.030 mm	0.4728-0.4736 in
Valve Lifter (SHLA)-to-Bore Clearance	0.037-0.041 mm	0.0015-0.0016 in
Rocker Arms		
Valve Rocker Arm Ratio	1.68 to 1	
Valve Rocker Arm Roller Diameter	17.750-17.800 mm	0.6988-0.7008 in
Valve Springs		
Valve Spring Coil Thickness	3.250 x 3.900 mm	0.1280 x 0.1535 in
Valve Spring Diameter - Inside Top	12.090-12.590 mm	0.4760-0.4957 in
Valve Spring Diameter - Outside Top	20.140 mm	0.7929 in
Valve Spring Diameter - Inside Bottom	17.950-18.450 mm	0.7067-0.7264 in
Valve Spring Diameter - Outside Bottom	26.000 mm	1.0236 in
Valve Spring Free Length	42.050-44.850 mm	1.6555-1.7657 in
Valve Spring Installed Height - Closed	35.000 mm	1.3779 in
Valve Spring Installed Height - Open	24.000 mm	0.9449 in
Valve Spring Load - Closed	247-273 N	56-61 lb
Valve Spring Load - Open	598-662 N	134-149 lb
Valve Spring Total Number of Coils	7.1	

Adhesives, Fluids, Lubricants, and Sealers

Application	Type of Material
Coolant and Oil Plug Threads	LOCTITE 242 ™ or equivalent
Oil Pan, Engine Front Cover, Crankshaft Rear Oil Seal Housing, Expansion Plugs	THREEBOND TB1207D™ or equivalent

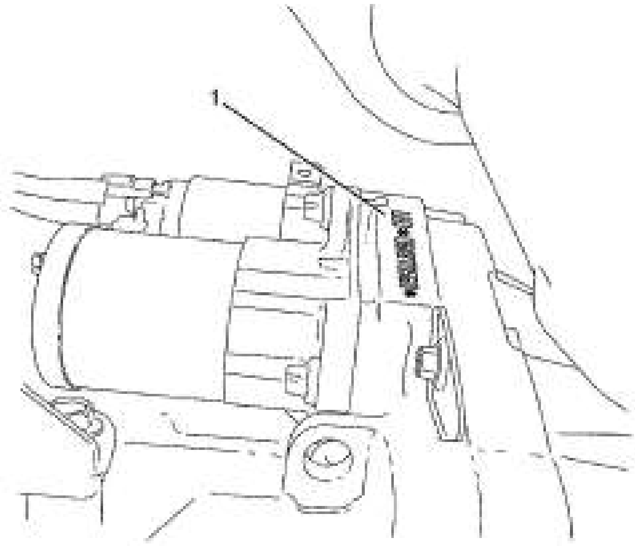
Engine Identification



Important: The location of the Engine Serial Number has changed from the previous model. The vehicle must be raised to view the Engine Serial Number as it can only be seen from underneath the vehicle.

The Engine Serial Number is located on the left-hand side at the rear of the engine cylinder block (1) and is stamped or laser etched onto the block at the assembly plant. When reading the Engine Serial Number the following information can be obtained:

Engine Serial Number LE0*061870560* is used as an example:

- The first three digits, LE0, identify the engine model by its Regular Production Option (RPO) code as an LE0 engine.
- The next digit, *, is a number limiter and has no meaning.
- The next two digits, 06, identify the build year as 2006.
- The next three digits, 187, identify the Julian date the engine was manufactured as day 187.
- The next four digits, 0560, identify the assembly plant sequence number as 0560.
- The next digit, *, is a number limiter and has no meaning.

Base Engine Misfire with Abnormal Internal Lower Engine Noises

Cause	Correction
Abnormalities, extreme cracking, bumps or missing areas, in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine RPM variations, noises similar to a faulty lower engine and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.	Replace the drive belt. Refer to Drive Belt Replacement.
Worn, damaged, or mis-aligned accessory drive components or pulley runout above acceptable tolerances. A misfire code may be present without an actual misfire condition.	Inspect the components, repair or replace as required.
Loose or incorrectly installed engine flywheel or crankshaft balancer. A misfire code may be present without an actual misfire condition.	Repair or replace the engine flywheel and/or crankshaft balancer as required. Refer to Engine Flywheel Replacement or Crankshaft Balancer Replacement.
Worn or broken piston rings Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform cylinder leak down and compression testing to determine the cause. • Repair or replace as required.
Worn crankshaft thrust bearings. Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft and create a DTC without an actual misfire condition.	Replace the crankshaft and bearings as required.

Base Engine Misfire with Abnormal Valve Train Noise

Cause	Correction
Worn or loose Stationary Hydraulic Lash Adjusters (SHLAs), valve rocker arms. The SHLAs, valve rocker arm, roller bearing should be intact and in the correct position.	Replace the SHLAs, valve rocker arms, as required.
Sticking valves. Carbon buildup on the valve stem can cause the valve not to close correctly.	Repair or replace as required.
Worn or mis-aligned above acceptable tolerances timing chain or chains.	Replace the timing chain or chains and sprockets as required.
Worn camshaft lobes.	Replace the camshaft or camshafts and high SHLAs, valve lifters.
Sticking SHLAs, lifters.	Replace the SHLAs as required.

Base Engine Misfire with Coolant Consumption

Cause	Correction
Faulty cylinder head gaskets and/or cracking or other damage to the cylinder heads and cylinder block cooling system passages. Refer to Diagnostic Starting Point - Engine Cooling. Coolant consumption may or may not cause the engine to overheat.	• Inspect for spark plugs saturated by coolant. Refer to Spark Plug Inspection. • Perform a cylinder leak down test. Refer to Cylinder Leakage Test • Inspect the cylinder heads and cylinder block for damage to the coolant passages and/or a faulty head gasket. • Repair or replace as required.

Base Engine Misfire with Excessive Oil Consumption

Cause	Correction
Worn valves, valve guides and/or valve stem oil seals.	1. Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. 2. Repair or replace as required.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	1. Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection 2. Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. 3. Perform cylinder leak down and compression testing to determine the cause. 4. Repair or replace as required.

Base Engine Misfire without Internal Engine Noises

Cause	Correction
Abnormalities, extreme cracking, bumps, or missing areas, in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine RPM variations and lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Replace the drive belt. Refer to Drive Belt Replacement.
Worn, damaged, or mis-aligned accessory drive components or pulley runout above acceptable tolerances may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components: Repair or replace as required.
Loose or incorrectly installed engine flywheel or crankshaft balancer. A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required. Refer to Engine Flywheel Replacementt or Crankshaft Balancer Replacement.
Restricted exhaust system. An extreme restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions include collapsed or dented pipes or plugged mufflers and/or catalytic converters.	Repair or replace as required. Refer to engine exhaust for the required procedure.
Incorrectly installed or damaged vacuum hoses.	Repair or replace as required.
Incorrect sealing between the intake manifold and cylinder heads, intake manifold and throttle body and/or pressure relief valve and intake manifold.	Replace the intake manifold, plenum duct, cylinder heads, throttle body, pressure relief valve or gaskets as required.
Incorrectly installed or damaged EVAP purge solenoid and/or O-ring seal.	Repair or replace the EVAP purge solenoid as required.
Worn or loose Stationary Hydraulic Lash Adjusters (SHLAs), valve rocker arms. The stationary hydraulic lash adjusters (SHLAs), valve rocker arm, roller bearing should be intact and in the correct position	Replace the SHLAs, valve rocker arms, as required.
Sticking valves. Carbon buildup on the valve stem can cause the valve not to close correctly.	Repair or replace as required.
Timing chain or chains worn or mis-aligned above acceptable tolerances.	Replace the timing chain or chains and sprockets as required.

Worn camshaft lobes.	Replace the camshaft or camshafts and high Stationary Hydraulic Lash Adjusters (SHLAs), valve lifters.
Oil pressure above acceptable tolerances. A lubrication system with oil pressure above acceptable tolerances may lead to valve lifter pump-up above acceptable tolerances and loss of compression.	• Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. • Repair or replace the oil pump as required.
Faulty cylinder head gaskets and/or cracking or other damage to the cylinder heads and cylinder block cooling system passages. Refer to Diagnostic Starting Point - Engine Cooling. Coolant consumption may or may not cause the engine to overheat.	• Inspect for spark plugs saturated by coolant. Refer to Spark Plug Inspection. • Inspect the cylinder heads, cylinder block, and/or head gaskets. • Repair or replace as required.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. Refer to Spark Plug Inspection. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform cylinder leak down and compression testing to identify the cause. • Repair or replace as required.
A damaged crankshaft reluctor wheel. A damaged crankshaft reluctor wheel can result in different symptoms depending on the severity and location of the damage. • Systems with EXTREME reluctor ring damage may exhibit periodic loss of crankshaft position, stop delivering a signal, and then re-sync the crankshaft position. • Systems with SLIGHT reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur. However, a P0300 DTC may be set.	Replace the crankshaft as required.

Coolant in Combustion Chamber

Cause	Correction
DEFINITION: White smoke and/or coolant type odor above acceptable tolerances coming from the exhaust pipe may indicate coolant in the combustion chamber. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an "overtemperature" condition which may cause engine component damage. 1. A slower than normal cranking speed may indicate coolant entering the combustion chamber. Refer to Engine Will Not Crank - Crankshaft Will Not Rotate. 2. Remove the spark plugs and inspect for spark plugs saturated by coolant or coolant in the cylinder bore. 3. Inspect by performing a cylinder leakage test. Refer to Cylinder Leakage Test. During this test, above acceptable air bubbles within the coolant may indicate a faulty gasket or damaged component. 4. Inspect by performing a cylinder compression test. Two cylinders "side-by-side" on the cylinder block, with low compression, may indicate a failed cylinder head gasket. Refer to Engine Compression Test.	
Cracked intake manifold or failed gasket.	Replace the components as required.
Faulty cylinder head gasket.	Replace the head gasket and components as required. Refer to Cylinder Head Cleaning and Inspection. Refer to Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side.
Warped cylinder head.	Machine the cylinder head to the correct flatness, if applicable and replace the cylinder head gasket. Refer to Cylinder Head Cleaning and Inspection.
Cracked cylinder head.	Replace the cylinder head and gasket.
Cracked cylinder liner or cylinder block.	Replace the components as required.
Cylinder head or cylinder block porosity.	Replace the components as required.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1978495**

Coolant in Engine Oil

Cause	Correction
DEFINITION: Foamy or discolored oil or an engine oil "overfill" condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an "overtemperature" condition which may cause engine component damage. Contaminated engine oil and oil filter should be changed. 1. Inspect the oil for above acceptable foaming or an overfill condition. Oil diluted by coolant may not correctly lubricate the crankshaft bearings and may lead to component damage. Refer to Lower Engine Noise, Regardless of Engine Speed . 2. Inspect by performing a cylinder leakage test. Refer to Cylinder Leakage Test . During this test, air bubbles within the cooling system may indicate a faulty gasket or damaged component. 3. Inspect by performing a cylinder compression test. Two cylinders "side-by-side" on the cylinder block with low compression may indicate a failed cylinder head gasket. Refer to Engine Compression Test .	
Faulty external engine oil cooler.	Replace the components as required.
Faulty cylinder head gasket.	Replace the head gasket and components as required. Refer to Cylinder Head Cleaning and Inspection . Refer to Cylinder Head Replacement - Left Side or Cylinder Head Replacement - Right Side
Warped cylinder head.	Machine the cylinder head to correct flatness, if applicable, and replace the cylinder head gasket. Refer to Cylinder Head Cleaning and Inspection .
Cracked cylinder head.	Replace the cylinder head and gasket.
Cracked cylinder liner or cylinder block.	Replace the components as required.
Cylinder head, block, or manifold porosity.	Replace the components as required.

Crankcase Ventilation System Inspection/Diagnosis

Crankcase Ventilation (CV) System Inspection

- Test for vacuum at the vacuum hose where it connects to the crankcase ventilation housing. There should be manifold vacuum present at the hose. If there is no vacuum, inspect for a plugged hose, leaking hose or a plugged vent adapter.
- Plug the end of the vacuum hose while the engine is running. Inspect the hose for any areas that collapse when the end of the hose is blocked. Replace the hose if it collapses when blocked.
- If oil has accumulated in the intake air duct, inspect for the following conditions:
  - Plugged vacuum orifice in the crankcase ventilation housing.
  - Plugged or restricted crankcase ventilation housing.
  - Crankcase pressure or blow-by above acceptable tolerances. Refer to Oil Consumption Diagnosis.
- Additional items to inspect:
  - Plugged or leaking fresh air vent hose assembly or vent adapter.
  - Plugged or restricted passages in the throttle body.
  - Missing or damaged O-ring seals on the vent adapter.
  - Inspect the cam covers, the oil pan gasket, and other sealing areas for leaks.

Results of Incorrect Operation

A plugged crankcase ventilation housing or hose may contribute to the following conditions:

- A rough idle.
- Stalling or a slow idle speed.
- Oil leaks.
- Oil accumulation in the intake air duct.
- Sludge in the engine.

A leaking housing or hose may contribute to the following conditions:

- A rough idle.
- Stalling.
- Unstable idle speed.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 2037595**

Cylinder Leakage Test

Tools Required

- J 35667-A Cylinder Head Leakdown Tester
- J 39313 Spark Plug Port Adapter

Important: A leakage test may be performed in order to measure cylinder/combustion chamber leakage. High cylinder leakage may indicate one or more of the following:

- Worn or burnt valves.
- Broken valve springs.
- Stuck valve lifters.
- Incorrect valve lash.
- Damaged piston.
- Worn piston rings.
- Worn or scored cylinder bore.
- Damaged cylinder head gasket.
- Cracked or damaged cylinder head.
- Cracked or damaged cylinder block.

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the spark plugs. Refer to Spark Plug Replacement.
3. Rotate the crankshaft to place the piston in the cylinder being tested at Top Dead Center (TDC) of the compression stroke.
4. Thread the J 39313 into the spark plug hole.
5. Install the J 35667-A or equivalent.

Important: It may be necessary to hold the crankshaft balancer bolt to prevent the engine from rotating.

6. Apply air pressure to the J 35667-A J 35667-A and adjust according to the manufacturers instructions.
7. Record the cylinder leakage value. Cylinder leakage that exceeds 25 percent is considered above acceptable and may require component service. In above acceptable leakage situations, inspect for the following conditions:
   - Air leakage sounds at the throttle body or air inlet hose may indicate a worn or burnt intake valve or a broken valve spring.
   - Air leakage sounds at the exhaust extension pipe may indicate a worn or burnt exhaust valve or a broken valve spring.
   - Air leakage sounds from the crankcase, oil level indicator tube, or oil fill tube may indicate worn piston rings, a damaged piston, a worn or scored cylinder bore, a damaged cylinder block or a damaged cylinder head.
   - Air bubbles in the cooling system may indicate a damaged cylinder head or a damaged

cylinder head gasket.

8. Perform the leakage test on the remaining cylinders and record the values.

Diagnostic Starting Point - Engine Mechanical

Begin the system diagnosis by reviewing the Disassembled Views, Engine Component Description, Drive Belt System Description and Lubrication Description. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Engine Mechanical to identify the correct procedure for diagnosing the system and where the procedure is located.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1990868**

Drive Belt Chirping, Squeal, and Whine Diagnosis (Squeal)

Diagnostic Aids

A loose or incorrect installation of a body component, a suspension component, or other items of the vehicle may cause the squeal noise.

If the noise is intermittent, verify the accessory drive components by varying their loads making sure they are operated to their maximum capacity. An overcharged A/C system, power steering system with a pinched hose or wrong fluid, or a alternator failing are suggested items to inspect.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. The noise may not be engine related. This step is to verify that the engine is making the noise. If the engine is not making the noise DO NOT proceed further with this table.

3. The noise may be an internal engine noise. Removing the drive belt and operating the engine for a brief period will verify the squeal noise is the drive belt or an accessory drive component. When removing the drive belt the water pump will not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belt removed.

4. This test is to verify that an accessory drive component does not have a seized bearing. With the belt removed test the bearings in the accessory drive components for turning smoothly. Also test the accessory drive components with the engine operating by varying the load on the components to verify that the components operate correctly.

5. This test is to verify that the drive belt tensioner operates correctly. If the drive belt tensioner is not operating correctly, correct belt tension may not be achieved to keep the drive belt from slipping which may cause a squeal noise.

6. This test is to verify that the drive belt is not too long, which may prevent the drive belt tensioner from working correctly. Also if an incorrect length drive belt was installed, it may not be routed correctly and may be turning an accessory drive component in the wrong direction.

7. Misalignment of the pulleys may be caused from incorrect mounting of the accessory drive component, incorrect installation of the accessory drive component pulley, or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found, refer to that accessory drive component for the correct installation procedure for that pulley.

8. This test is to verify that the pulleys are the correct diameter or width. Using a known good vehicle compare the pulley sizes.

Step	Action	Yes	No

Notice: Refer to Belt Dressing Notice in the Preface section.

DEFINITION: The following items are indications of drive belt squeal:

- A loud screeching noise that is caused by a slipping drive belt. This is unusual for a drive belt with multiple ribs.
- The noise occurs when a heavy load is applied to the drive belt, such as an air conditioning compressor engagement snapping the throttle, or slipping on a seized pulley or a faulty accessory drive component.

1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Verify that there is a squeal noise. Does the engine make the squeal noise?	Go to Step 3	Go to Diagnostic Aids
3	**Important:** When removing the drive belt the water pump will not be operating and the engine may overheat. 1. Remove the drive belt. Refer to Drive Belt Replacement. 2. Operate the engine for no longer than 30 to 40 seconds. Does the noise still exist?	Go to Symptoms - Engine Mechanical	Go to Step 4
4	Inspect for an accessory drive component seized bearing or a faulty accessory drive component. Did you find and correct the condition?	Go to Step 9	Go to Step 5
5	Test the drive belt tensioner for correct operation. Refer to Drive Belt Tensioner Diagnosis. Did you find and correct the condition?	Go to Step 9	Go to Step 6
6	Inspect for the correct drive belt length. Refer to Drive Belt Replacement. Did you find and correct the condition?	Go to Step 9	Go to Step 7
7	Inspect for misalignment of a pulley. Did you find and correct the condition?	Go to Step 9	Go to Step 8
8	Inspect for the correct pulley size. Did you find and correct the condition?	Go to Step 9	Go to Diagnostic Aids
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1990865**

Drive Belt Chirping, Squeal, and Whine Diagnosis (Whine)

Diagnostic Aids

The drive belts will not cause the whine noise.

If the whine noise is intermittent, verify the accessory drive components by varying their loads making sure they are operated to their maximum capacity. Such items, but not limited to, may be an A/C system overcharged, the power steering system restricted or the wrong fluid, or the alternator failing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This test is to verify that the noise is being caused by the drive belts or the accessory drive components. When removing the drive belt, the water pump will not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.
4. The inspection should include checking the drive belt tensioners and the drive belt idler pulley bearings. The drive belts may have to be installed and the accessory drive components operated separately by varying their loads. Refer to the suspected accessory drive component for the correct inspection and replacement procedure.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: A high pitched continuous noise that may be caused by an accessory drive component failed bearing.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Verify that there is a whine noise. Does the engine make the whine noise?	Go to Step 3	Go to Diagnostic Aids
3	**Important:** When removing the drive belt the water pump will not be operating and the engine may overheat. 1. Remove the drive belt. Refer to Drive Belt Replacement. 2. Operate the engine for no longer than 30 to 40 seconds. Does the whine noise still exist?	Go to Symptoms - Engine Mechanical	Go to Step 4

4	Inspect for a failed accessory drive component bearing. Did you find and repair the condition?	Go to Step 5	Go to Diagnostic Aids
5	Operate the system in order to verify the repair. Did you correct the condition?	System OK	--

Drive Belt Excessive Wear Diagnosis

Diagnostic Aids

Wear on a drive belt above acceptable tolerances is usually caused by an incorrect installation or the wrong drive belt for the application.

Minor misalignment of the drive belt pulleys will not cause wear above acceptable tolerances, but will probably cause the drive belt to make a noise or to fall off.

Misalignment of the drive belt pulleys above acceptable tolerances will cause wear above acceptable tolerances and may also make the drive belt fall off.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. The inspection is to verify the drive belt is correctly installed on all of the drive belt pulleys. Wear on the drive belt may be caused by miss-positioning the drive belt by one groove on a pulley.

3. The installation of a drive belt that is too wide or too narrow will cause wear on the drive belt. The drive belt ribs should match all of the grooves on all of the pulleys.

4. This inspection is to verify the drive belt is not contacting any parts of the engine or body while the engine is operating. There should be sufficient clearance when the drive belt accessory drive components load varies. The drive belt should not come in contact with an engine or a body component when snapping the throttle.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: Wear at the outside ribs of the drive belt due to an incorrectly installed drive belt.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Inspect the drive belt for the correct installation. Refer to Drive Belt Replacement. Did you find the condition?	Go to Step 5	Go to Step 3
3	Confirm the drive belt is the correct specification for the engine. Did you find the condition?	Go to Step 5	Go to Step 4
4	Inspect for the drive belt rubbing against a bracket, hose, or wiring harness.		

	Did you find and repair the condition?	Go to Step 6	Go to Diagnostic Aids
5	Replace the drive belt. Refer to Drive Belt Replacement. Did you complete the replacement?	Go to Step 6	-
6	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | Document ID: 1990854

Drive Belt Falls Off and Excessive Wear Diagnosis

Diagnostic Aids

If the drive belt repeatedly falls off the drive belt pulleys, this is because of pulley misalignment.

An extra load that is quickly applied or released by an accessory drive component may cause the drive belt to fall off the pulleys. Verify the accessory drive components operate correctly.

If the drive belt is the incorrect length, the drive belt tensioner may not keep the correct tension on the drive belt.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This inspection is to verify the condition of the drive belt. Damage may have occurred to the drive belt when the drive belt fell off. The drive belt may have been damaged, which caused the drive belt to fall off. Inspect the belt for cuts, tears, sections of ribs missing, or damaged belt plies.
4. Misalignment of the pulleys may be caused from incorrect mounting of the accessory drive component, incorrect installation of the accessory drive component pulley, or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found, refer to that accessory drive component for the correct installation procedure of that pulley.
5. Inspecting the pulleys for being bent should include inspecting for a dent or other damage to the pulleys that may prevent the drive belt from not seating correctly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used to drive the pulley.
6. Accessory drive component brackets that are bent or cracked will let the drive belt fall off.
7. Inspecting the fasteners can address the possibility that a wrong bolt, nut, spacer, or washer was installed. Missing, loose, or wrong fasteners, may cause pulley misalignment due to the bracket moving under load. Over tightening the fasteners may cause misalignment of the accessory drive component bracket.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: The drive belt falls off the pulleys or may not ride correctly on the pulleys.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Inspect for a damaged drive belt.	Go to	

	Did you find the condition?	Step 3	Go to Step 4
3	Install a new drive belt. Refer to Drive Belt Replacement. Does the drive belt continue to fall off?	Go to Step 4	System OK
4	Inspect for misalignment of the pulleys. Did you find and repair the condition?	Go to Step 12	Go to Step 5
5	Inspect for a bent or dented pulley. Did you find and repair the condition?	Go to Step 12	Go to Step 6
6	Inspect for a bent or cracked bracket. Did you find and repair the condition?	Go to Step 12	Go to Step 7
7	Inspect for incorrect, loose or missing fasteners. Did you find incorrect, loose or missing fasteners?	Go to Step 8	Go to Step 9
8	**Notice:** Refer to Fastener Notice in the Preface section. 1. Tighten any loose fasteners. Refer to Fastener Tightening Specifications. 2. Replace incorrect or missing fasteners. Does the drive belt continue to fall off?	Go to Step 9	System OK
9	Test the drive belt tensioner for operating correctly. Refer to Drive Belt Tensioner Diagnosis. Does the drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner. Refer to Drive Belt Tensioner Replacement. Does the drive belt continue to fall off?	Go to Step 11	System OK
11	Inspect for a failed drive belt idler and drive belt tensioner pulley bearings. Did you find and repair the condition?	Go to Step 12	Go to Diagnostic Aids
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1990850**

Drive Belt Rumbling and Vibration Diagnosis (Rumble)

Diagnostic Aids

Vibration from the engine operating may cause a body component or another part of the vehicle to make a rumbling noise.

The drive belt may have a condition that can not be seen or felt. Sometimes replacing the drive belt may be the only repair for the symptom.

If replacing the drive belt, completing the diagnostic table, and the noise is only heard when the drive belt is installed, there might be an inoperative accessory drive component. Varying the load on the different accessory drive components may aid in identifying which component is causing the rumbling noise.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This test is to verify that the symptom is present during diagnosing. Other vehicle components may cause a similar symptom.
3. This test is to verify the drive belt is causing the rumbling noise. A rumbling noise may be confused with an internal engine noise due to the similarity in the description. When removing the drive belt the water pump will not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.
4. Inspecting the drive belt is to ensure that it is not causing the noise. Small cracks across the ribs of the drive belt will not cause the noise. Belt separation is identified by the plies of the belt separating and may be seen at the edge of the belt or felt as a lump in the belt.
5. Small amounts of pilling is normal condition and acceptable. When the pilling is extreme the drive belt does not have a smooth surface for correct operation.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: • A low pitch tapping, knocking, or thumping noise heard at or just above idle. • Heard once per revolution of the drive belt or a pulley. • Rumbling may be caused from: - Pilling, the accumulation of rubber dust that forms small balls (pills) or strings in the drive belt pulley groove. - The separation of the drive belt. - A damaged drive belt.			

1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Verify that there is a rumbling noise. Does the engine make the rumbling noise?	Go to Step 3	Go to Diagnostic Aids
3	**Important:** When removing the drive belt the water pump will not be operating and the engine may overheat. 1. Remove the drive belt. Refer to Drive Belt Replacement. 2. Operate the engine for no longer than 30 to 40 seconds. Does the rumbling noise still exist?	Go to Symptoms - Engine Mechanical	Go to Step 4
4	Inspect the drive belt for damage, separation, or sections of missing ribs. Did you find any of these conditions?	Go to Step 7	Go to Step 5
5	Inspect for extreme pilling of more than 1/3 of the drive belt pulley grooves. Did you find extreme pilling?	Go to Step 6	Go to Step 7
6	1. Clean the drive belt pulleys using a suitable wire brush. 2. Reinstall the drive belt. Refer to Drive Belt Replacement. Did you complete the repair?	Go to Step 8	-
7	Install a new drive belt. Refer to Drive Belt Replacement. Did you complete the replacement?	Go to Step 8	-
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Diagnostic Aids

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1995038**

Drive Belt Rumbling and Vibration Diagnosis (Vibration)

Diagnostic Aids

The accessory drive components can have an affect on engine vibration. Such as, but not limited to, the A/C system over charged, the power steering system restricted or the incorrect fluid, or an extra load on the alternator. To help identify an intermittent or an incorrect condition, vary the loads on the accessory drive components.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This test is to verify that the symptom is present during diagnosing. Other vehicle components may cause a similar symptom such as the exhaust system, or the drivetrain.
3. This test is to verify that the drive belt or accessory drive components may be causing the vibration. When removing the drive belt the water pump will not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belt removed.
4. The drive belt may cause a vibration. While the drive belt is removed, this is the best time to inspect the condition of the belt.
6. Inspecting of the fasteners can address the possibility that a wrong bolt, nut, spacer, or washer was installed.
8. Inspect the water pump shaft for being bent. Also, inspect the water pump bearings for smooth operation and play above acceptable tolerances. Compare the water pump with a known good water pump.
9. Accessory drive component brackets that are bent, cracked, or loose may put extra strain on that accessory component causing it to vibrate.

Step	Action	Yes	No
Notice: Refer to Belt Dressing Notice in the Preface section. DEFINITION: The following items are indications of drive belt vibration: • The vibration is engine-speed related. • The vibration may be sensitive to accessory load.			
1	Did you review the Symptoms - Engine Mechanical diagnostic information, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical .
2	Verify that the vibration is engine related. Does the engine make the vibration?	Go to Step 3	Go to Diagnostic Aids

3	**Important:** When removing the drive belt the water pump will not be operating and the engine may overheat. 1. Remove the drive belt. Refer to Drive Belt Replacement . 2. Operate the engine for no longer than 30 to 40 seconds. Does the engine still make the vibration?	Go to Drive Belt Rumbling and Vibration Diagnosis	Go to Step 4
4	Inspect the drive belt for wear, damage, debris build-up and missing drive belt ribs. Did you find any of these conditions?	Go to Step 5	Go to Step 6
5	Install a new drive belt. Refer to Drive Belt Replacement . Did you complete the replacement?	Go to Step 10	-
6	Inspect for incorrect, loose or missing fasteners. Did you find any of these conditions?	Go to Step 7	Go to Step 8
7	**Notice:** Refer to Fastener Notice in the Preface section. 1. Tighten any loose fasteners. Refer to Fastener Tightening Specifications . 2. Replace incorrect or missing fasteners. Did you complete the repair?	Go to Step 10	-
8	Inspect for a bent water pump shaft. Refer to Water Pump Replacement . Did you find and correct the condition?	Go to Step 10	Go to Step 9
9	Inspect for bent or cracked brackets. Did you find and correct the condition?	Go to Step 10	Go to Diagnostic Aids
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Drive Belt Tensioner Diagnosis

Step	Action	Yes	No
1	Remove the drive belt. Refer to Drive Belt Replacement. Inspect the drive belt tensioner pulley. Is the drive belt tensioner pulley loose or misaligned?	Go to Step 4	Go to Step 2
2	Rotate the drive belt tensioner. Does the tensioner rotate without any unusual resistance or binding?	Go to Step 3	Go to Step 4
3	1. Use a torque wrench in order to measure the torque required to move the tensioner off of the stop. 2. Use a torque wrench on a known good tensioner in order to measure the torque required to move the tensioner off of the stop. Is the first torque reading within 10% of the second torque reading?	System OK	Go to Step 4
4	Replace the drive belt tensioner. Refer to Drive Belt Tensioner Replacement. Is the repair complete?	System OK	-

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 2037594**

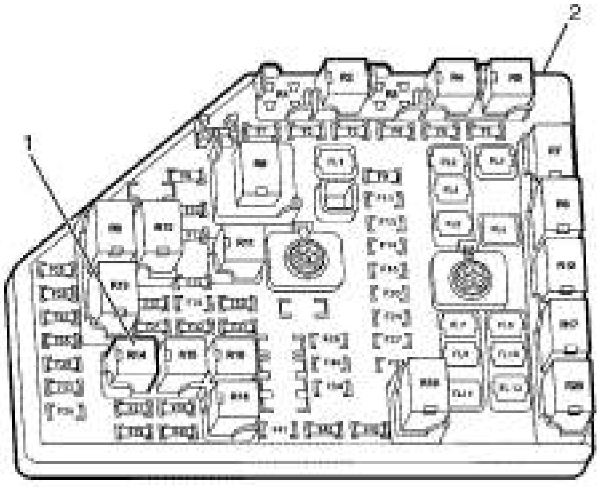
Engine Compression Test

Tools Required

J 39313 Spark Plug Port Adapter.

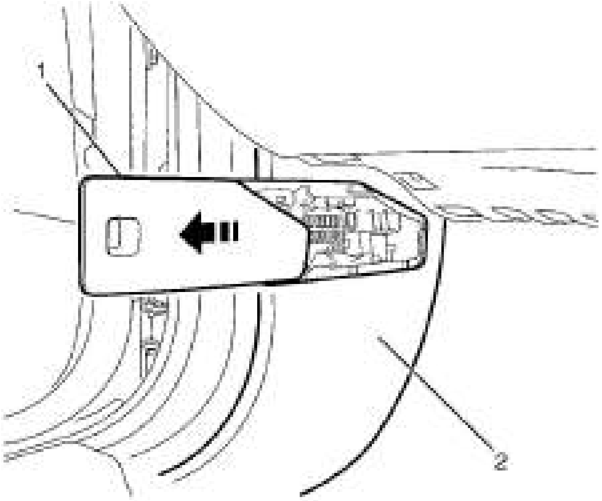
A compression pressure test of the engine cylinders determines the condition of the rings, the valves and the head gasket.

1. Run the engine until it reaches normal operating temperature. The battery must be at or near full charge.
2. Charge the battery if the battery is not fully charged.
3. Turn the engine to the OFF position.



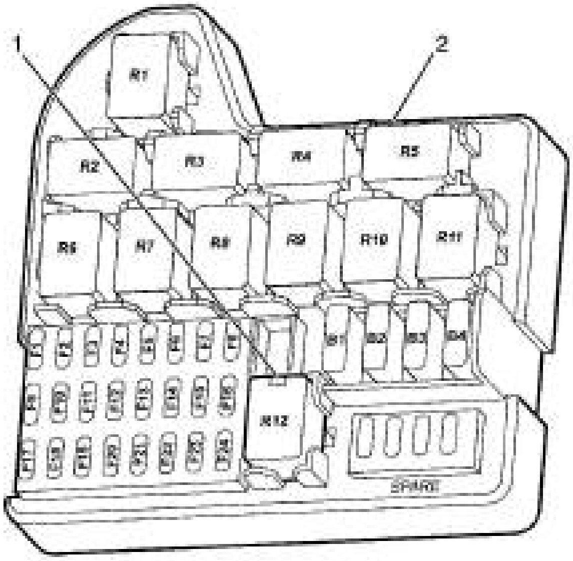
Important: Remove the ignition relay (1) from the under hood body electrical centre (2).

4. Disable the ignition system.



Important: Pull the instrument panel fuse block cover (1) rearward to disengage it from the left hand hinge pillar trim (2).

5. Remove the instrument panel fuse block cover (1).

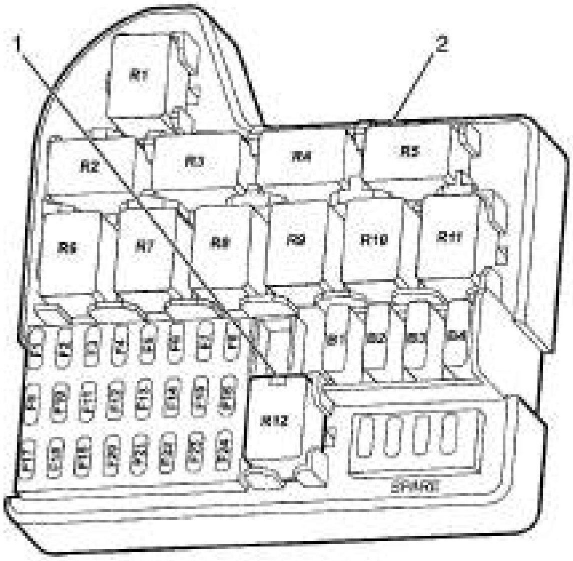


Important: Remove the fuel pump relay (1) from the instrument panel fuse block (2).

6. Disable the fuel injection system.
7. Remove the spark plugs from all cylinders. Refer to Spark Plug Replacement.
8. Measure the engine compression, using the following procedure:
    8.1. Thread the J 39313 into the spark plug hole.

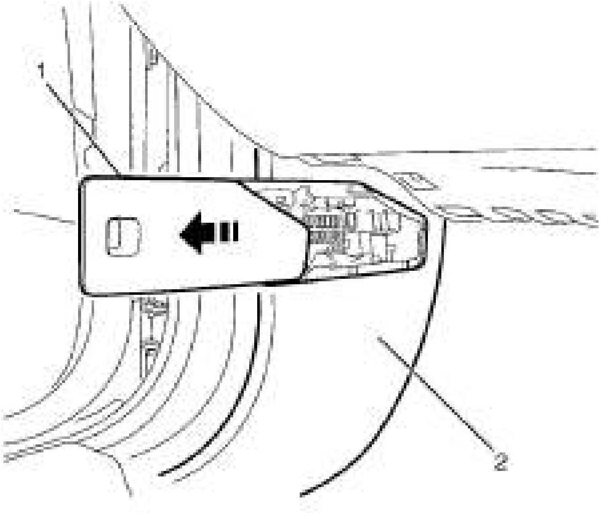
  8.2. Thread the compression gauge into the J 39313 .
  8.3. Have an assistant depress the accelerator to the wide open throttle position and crank the engine through, at least 4 compression strokes, in the testing cylinder.
  8.4. Check and record the readings on the gauge at each stroke.
  8.5. Remove the compression gauge from the J 39313 .
  8.6. Remove the J 39313 from the spark plug hole.
  8.7. Repeat the compression test for each cylinder.

9. Record the compression readings from all of the cylinders.
   - The lowest reading should not be less than 70 percent of the highest reading.
   - No cylinder reading should be less than 965 kPa (140 psi).
10. If a cylinder has low compression, inject approximately 15 ml (1 tablespoon) of engine oil into the combustion chamber through the spark plug hole. Measure the compression again and record the reading.
    - Normal -- Compression builds up quickly and evenly to the specified compression for each cylinder.
    - Piston Rings Leaking -- Compression is low on the first stroke. Compression builds up with the following strokes, but does not reach normal. Compression improves considerably when you add oil.
    - Valves Leaking -- Compression is low on the first stroke. Compression usually does not build up on the following strokes. Compression does not improve much when you add oil.
    - If 2 adjacent cylinders have lower than normal compression, and injecting oil into the cylinders does not increase the compression, the cause may be a head gasket leaking between the cylinders.



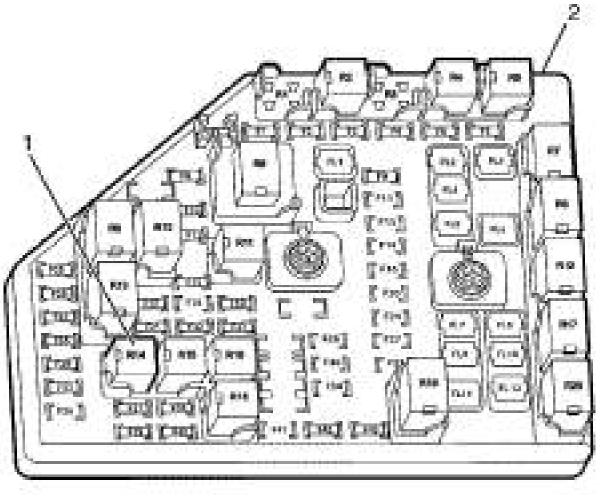
Important: Install the fuel pump fuse to the rear fuse and relay centre fuse block.

11. Enable the fuel injection system.



Important: Push the fuse block access cover (1) forward to engage it to the left hand hinge pillar trim (2).

12. Install the left hand hinge pillar trim fuse block access cover (1).



Important: Install the ignition relay (1) to the under bonnet fuse block (2).

13. Enable the ignition system.
14. Install the spark plugs to all cylinders. Refer to Spark Plug Replacement.

Engine Noise on Start-Up, but Only Lasting a Few Seconds

Cause	Correction
Incorrect oil filter.	Install the correct oil filter.
Incorrect oil viscosity.	Drain the engine oil and replace with the correct viscosity oil.
High Stationary Hydraulic Lash Adjuster (SHLA), valve lifter, leak down rate.	Replace the SHLAs, valve lifters, as required.
Worn crankshaft thrust bearing.	• Inspect the thrust bearing and crankshaft. • Repair or replace as required.
Damaged or faulty oil filter by-pass valve.	• Inspect the oil filter by-pass valve for correct operation. • Replace the oil filter as required.

Engine Noise Under Load

Cause	Correction
Low oil pressure.	1. Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. 2. Repair or replace as required.
Detonation or spark knock.	Verify the correct operation of the ignition controls. Refer to Electronic Ignition (EI) System Diagnosis.
Loose torque converter bolts.	1. Inspect the torque converter bolts and engine flywheel. 2. Repair as required.
Cracked engine flywheel.	1. Inspect the engine flywheel and bolts. 2. Repair as required.
Connecting rod bearing clearance above acceptable tolerances.	Inspect the following components, and repair as required: • The connecting rod bearings • The connecting rods • The crankshaft
Crankshaft bearing clearance above acceptable tolerances.	Inspect the following components, and repair as required: • The crankshaft bearings • The crankshaft journals • The cylinder block crankshaft bearing bore

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1978491**

Engine Will Not Crank - Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component.	1. Remove the accessory drive belt or belts. 2. Rotate the crankshaft by hand at the crankshaft balancer or the engine flywheel location. 3. Repair or replace as required.
Hydraulically locked cylinder. • Coolant/antifreeze in cylinder. • Oil in cylinder. • Fuel in cylinder.	1. Remove the spark plugs and check for fluid. 2. Inspect for broken head gasket or gaskets. 3. Inspect for cracked cylinder block or cylinder head. 4. Inspect for a sticking fuel injector. 5. Repair or replace as required.
Seized automatic transmission torque converter.	1. Remove the torque converter bolts. 2. Rotate the crankshaft by hand at the crankshaft balancer or the engine flywheel location. 3. Repair or replace as required.
Material in cylinder. • Broken valve. • Piston material. • Foreign material.	1. Inspect the cylinder for damaged components and/or foreign materials. 2. Repair or replace as required.
Seized crankshaft or connecting rod bearings.	1. Inspect the crankshaft and the connecting rod bearings. 2. Repair as required.
Bent or broken connecting rod.	1. Inspect the connecting rods. 2. Repair as required.
Broken crankshaft.	1. Inspect the crankshaft. 2. Repair as required.
Seized or broken camshaft.	1. Inspect the camshaft or camshafts. 2. Inspect the cylinder head camshaft journals for damage. 3. Repair as required.
Seized or broken camshaft timing components.	1. Inspect the following sprockets: • The crankshaft sprocket. • The exhaust sprockets. • The intake sprockets. 2. Inspect the following chains: • The primary camshaft drive chain. • The secondary camshaft drive chains. 3. Inspect the following guides: • The lower primary camshaft drive chain guide. • The upper primary camshaft drive chain guides.

	4. Inspect the secondary camshaft drive chain shoe. 5. Inspect the following tensioners: • The primary camshaft drive chain tensioner. • The secondary camshaft drive chain tensioners. 6. Repair as required.
Seized or broken valve train components.	1. Inspect the Stationary Hydraulic Lash Adjusters (SHLAs), rocker arms. 2. Inspect the lifters. 3. Inspect the valves. 4. Inspect the valve springs. 5. Repair as required.

Lower Engine Noise, Regardless of Engine Speed

Cause	Correction
Low oil pressure.	1. Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. 2. Repair or replace damaged components as required.
• Worn accessory drive components. • Abnormalities such as extreme cracking, bumps or missing areas in the accessory drive belt and/or misalignment of system components.	1. Inspect the accessory drive system. 2. Repair or replace as required.
Loose or damaged crankshaft balancer.	1. Inspect the crankshaft balancer. 2. Repair or replace as required.
Detonation or spark knock.	Verify the correct operation of the ignition controls system. Refer to Electronic Ignition (EI) System Diagnosis.
Loose torque converter bolts.	1. Inspect the torque converter bolts and engine flywheel. 2. Repair or replace as required.
Loose or damaged engine flywheel.	Repair or replace the engine flywheel.
• Damaged oil pan, contacting the oil pump screen. • An oil pan that has been damaged may incorrectly position the oil pump screen, preventing correct oil flow to the oil pump.	1. Inspect the oil pan. 2. Inspect the oil pump screen. 3. Repair or replace as required.
Oil pump screen loose, damaged or restricted.	1. Inspect the oil pump screen. 2. Repair or replace as required.
Piston-to-cylinder bore clearance above acceptable tolerances.	1. Inspect the piston and cylinder bore. 2. Repair as required.
Piston pin-to-bore clearance above acceptable tolerances.	1. Inspect the piston, piston pin, and the connecting rod. 2. Repair or replace as required.
Connecting rod bearing clearance above acceptable tolerances.	Inspect the following components, and repair as required: • The connecting rod bearings • The connecting rods • The crankshaft • The crankshaft journals
Crankshaft bearing clearance above acceptable	Inspect the following components, and

tolerances.	repair as required: • The crankshaft bearings • The crankshaft journals
• Incorrect piston, piston pin and connecting rod installation. • Pistons must be installed with the mark or dimple on the top of the piston facing the front of the engine. Piston pins must be centered in the connecting rod pin bore.	1. Verify the pistons, piston pins and connecting rods are installed correctly. 2. Repair as required.

Oil Consumption Diagnosis

Checks	Causes
DEFINITION: Oil consumption (not due to leaks) above acceptable tolerances is the use of 1.9 L (2 qts) or more of engine oil within 3 200 km (2,000 mi). The causes of oil consumption above acceptable tolerances may include the following conditions:	
Preliminary	• External oil leaks - Refer to Oil Leak Diagnosis. • Incorrect oil level or incorrect reading of the oil level indicator. Position the vehicle on a level surface, run the engine for a few minutes, allow adequate drain down time (2-3 minutes) and check for the correct engine oil level. • Incorrect oil viscosity. Refer to the vehicle owners manual and use the recommended SAE grade and viscosity for the prevailing temperatures. • Continuous high speed driving and/or extreme usage. • Crankcase ventilation system restrictions or malfunctioning components. • Worn valve guides and/or valve stems. • Worn, missing or incorrectly installed valve stem oil seals. • Piston rings not seated correctly. Allow adequate time for the rings to seat. • Piston rings broken or worn • Piston and rings incorrectly installed or miss-fitted to the cylinder bore

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 1996210**

Oil Leak Diagnosis

<table>
<tr><th>Checks</th><th>Action</th></tr>
<tr><td colspan="2">Caution: It is important to correctly identify the source of an oil leak. A power steering fluid leak or spillage can travel across the valley area of the engine and run out the weep hole, which is located at the back of the block. Failure to correctly identify the source of an oil leak can lead to the incorrect or unnecessary replacement of components.

Most fluid leaks can be repaired by first visually locating the leak, repairing or replacing the component, or by resealing the gasket surface. Once the leak is identified, determine the cause of the leak. Repair the cause of the leak as well as the leak itself.</td></tr>
<tr><td>Locating and identifying the leak</td><td>To determine if the leaking fluid is engine oil, transmission fluid, power steering fluid, brake fluid, or some other fluid, use the visual inspection method.</td></tr>
<tr><td>Visual Inspection Method</td><td>1. Bring the vehicle to normal operating temperature.
2. Park the vehicle over a clean surface.
3. Wait several minutes, then check for drips.
4. Identify the type of fluid, and the approximate location of the leak.
5. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas.
6. Check for leaks at sealing surfaces, fittings, or from cracked or damaged components.
7. If you cannot locate the leak, do the following:
7.1. Completely clean the entire engine and surrounding components.
7.2. Operate the vehicle for several kilometres at normal operation temperature and at varying speeds.
7.3. Park the vehicle over a clean surface.
7.4. Wait several minutes, then check for drips.
7.5. Identify the type of fluid, and the approximate location of the leak.
7.6. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas.
7.7. See possible causes for leaks.
8. If you still cannot locate the leak, use the powder method or the black light and dye method.</td></tr>
<tr><td>Powder Method</td><td>1. Completely clean the entire engine and surrounding components.
2. Apply an aerosol-type powder (baby powder, foot powder, etc.) to the suspected area.
3. Operate the vehicle for several miles at normal operation temperature and at varying speeds.
4. Identify the type of fluid, and the approximate location of the leak, from the discolorations in the powder surface.
5. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas.
6. See possible causes for leaks.</td></tr>
<tr><td>Black Light and</td><td>1. A dye and light kit is available for finding leaks. Use the J 28428-E</td></tr>
</table>

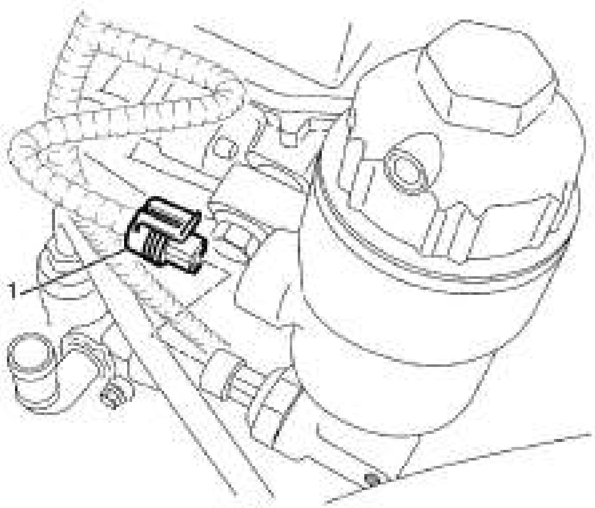
Dye Method	High-Intensity Black Light Kit or equivalent. Refer to the manufacturer's instructions when using the tool. 2. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 3. See possible causes for leaks.
Possible Causes for Leaks	Check for the following conditions: • Higher than recommended fluid levels. • Higher than recommended fluid pressures. • Plugged or malfunctioning fluid filters or pressure bypass valves. • Plugged or malfunctioning engine ventilation system. • Incorrectly tightened or damaged fasteners. • Cracked or porous components. • Incorrect sealants or gaskets where required. • Incorrect sealant or gasket installation. • Damaged or worn gaskets or seals. • Damaged or worn sealing surfaces.

Oil Pressure Diagnosis and Testing

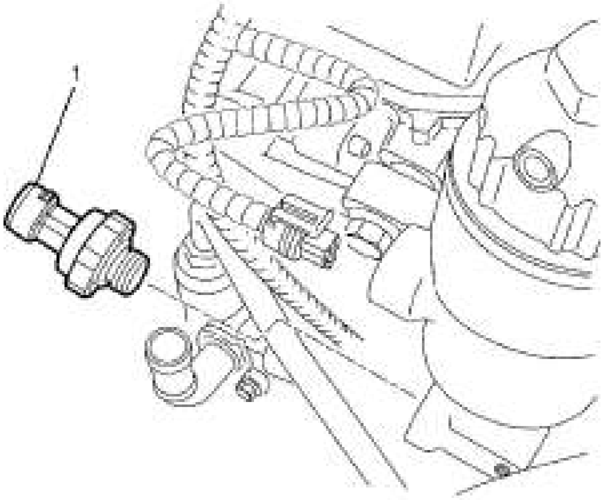
Tools Required

- J 21867 Pressure Gauge
- J-21867-6 Oil Pressure Adapter Fitting

1. Position the vehicle on a level surface, run the vehicle for a few minutes, allow adequate drain down time (2-3 minutes), and measure for a low oil level.
2. If required, add the recommended grade engine oil and fill the crankcase until the oil level measures full on the oil level indicator.
3. Run the engine briefly, 10-15 seconds, and verify low or no oil pressure on the vehicle gauge or light.
4. Listen for a noisy valve train or a knocking noise.
5. Inspect for the following:
   - Foamy oil
   - Slow idle speed
   - Plugged oil filter
   - Oil diluted by the following:
     - Water
     - Engine coolant
     - Unburned fuel mixtures
   - Malfunctioning oil filter bypass valve
   - Incorrect or faulty oil pressure gauge
   - Incorrect or faulty oil pressure gauge sensor
   - incorrect engine oil viscosity for the expected temperature



6. Disconnect the oil pressure sensor connector (1).



7. Remove the oil pressure sensor (1).
8. Install the J 21867 with the J-21867-6 to the oil filter adapter (2).
9. Measure the engine oil pressure.
10. Compare the readings to the Engine Mechanical Specifications.
11. If the engine oil pressure is below specifications, inspect the engine for one or more of the following:
    - Loose oil filter adapter bolts.
    - Missing or damaged oil filter adapter O-ring seal or seals.
    - Worn or dirty oil pump.
    - Loose oil pump-to-cylinder block bolts.
    - Loose, plugged or damaged oil pump screen.
    - Missing or damaged oil pump screen O-ring seal.
    - Damage or leak in the oil pump screen suction tube.
    - Malfunctioning oil pump pressure regulator valve.
    - Missing or incorrectly installed oil gallery plugs.
    - Loose camshaft intermediate drive shaft bolts.
    - Bearing clearance above acceptable tolerances for the following:
        - Connecting rod or rods.
        - Crankshaft.
        - Camshaft or camshafts.
        - Camshaft intermediate drive shaft sprocket.
    - Cracked, porous or restricted oil galleries.
    - Broken valve lifters.
12. Repair or replace components as necessary.

Symptoms - Engine Mechanical

Strategy Based Diagnostics

1. Perform a Diagnostic System Check - Vehicle, before using the symptom tables, if applicable.
2. Review the system operations in order to familiarise yourself with the system functions. Refer to Disassembled Views and Engine Component Description and Drive Belt System Description and Lubrication Description.

All diagnosis on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow may always be used in order to resolve a system condition. The diagnostic flow is the place to start when repairs are necessary. For a detailed explanation, refer to Strategy Based Diagnosis.

Visual / Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the engine. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Check for the correct oil level, correct oil viscosity, and correct filter application.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, ambient temperature, engine temperature, amount of engine warm-up time, and other specifics.
- Compare the engine sounds, if applicable, to a known good engine and make sure you are not trying to correct a normal condition.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating correctly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Base Engine Misfire without Internal Engine Noises.
- Base Engine Misfire with Abnormal Internal Lower Engine Noises.
- Base Engine Misfire with Abnormal Valve Train Noise.
- Base Engine Misfire with Coolant Consumption.
- Base Engine Misfire with Excessive Oil Consumption.
- Engine Noise on Start-Up, but Only Lasting a Few Seconds.
- Upper Engine Noise, Regardless of Engine Speed.
- Lower Engine Noise, Regardless of Engine Speed.
- Engine Noise Under Load

- Engine Will Not Crank - Crankshaft Will Not Rotate.
- Engine Compression Test.
- Oil Consumption Diagnosis.
- Oil Pressure Diagnosis and Testing.
- Oil Leak Diagnosis.

Upper Engine Noise, Regardless of Engine Speed

Cause	Correction
Low oil pressure.	1. Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. 2. Repair or replace as required.
Loose and/or worn Stationary Hydraulic Lash Adjuster (SHLA), valve rocker arm.	1. Inspect the SHLA, valve rocker arm. 2. Repair or replace as required.
Incorrect lubrication to the SHLAs, valve rocker arms.	Inspect the following components, and repair or replace as required: • The SHLA, valve rocker arm • The high stationary SHLA, valve lifter • The oil filter • The oil pump and pump screen • The cylinder head oil galleries • The cylinder block oil galleries
Broken valve spring	Replace the valve spring.
Worn or dirty SHLAs, valve lifters	Replace the SHLAs, valve lifters.
Stretched or broken timing chain or chains and/or damaged sprocket teeth	Replace the timing chain or chains and sprockets.
Worn timing chain tensioner or tensioners	Replace the timing chain tensioner or tensioners as required.
Worn timing chain shoe or shoes	Replace the timing chain shoe or shoes as required.
Worn timing chain guide or guides	Replace the timing chain guide or guides as required.
Worn engine camshaft lobes	1. Inspect the engine camshaft lobes. 2. Replace the camshaft or camshafts and SHLAs, valve lifters, as required.
Worn valve guides or valve stems	Inspect the following components, and repair as required: • The valves • The valve guides
• Stuck valves • Carbon on the valve stem or valve seat may cause the valve to stay open	Inspect the following components, and repair as required: • The valves • The valve guides

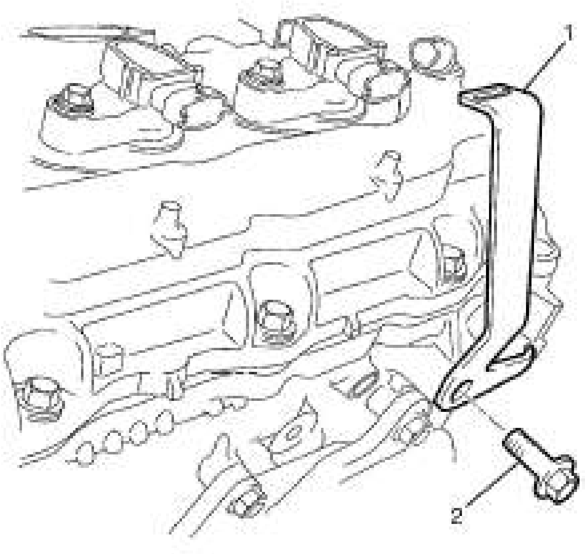
Camshaft Cover Replacement - Left Side

Tools Required

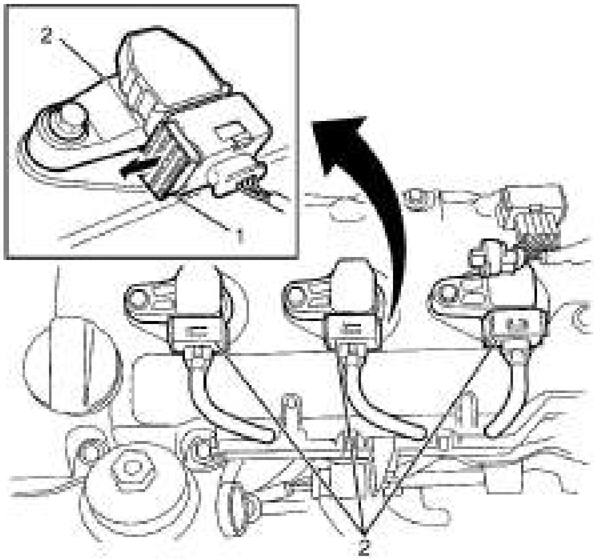
EN 46101 Spark Plug Tube Plugs

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement .
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .

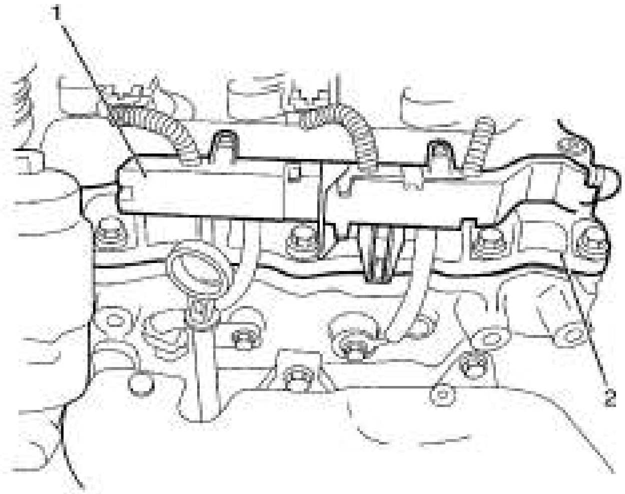


3. Remove the engine covers mounting bracket to cylinder head retaining bolt (2).
4. Remove the engine covers mounting bracket (1).



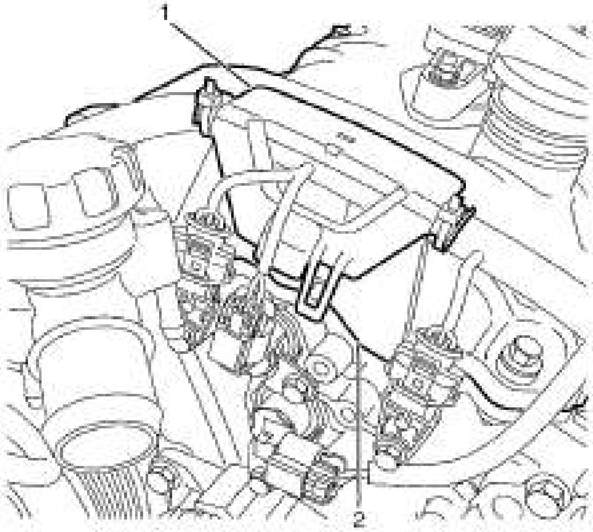
Important: Use a suitable tool to slide the connector retaining latch (1) in the direction of the arrow.

5. Disconnect the ignition coil electrical connectors (2).



Important: Use a suitable tool to detach the wiring harness (1) clips from the camshaft cover (2), then lift the wiring harness (1) upwards to detach from the camshaft cover (2).

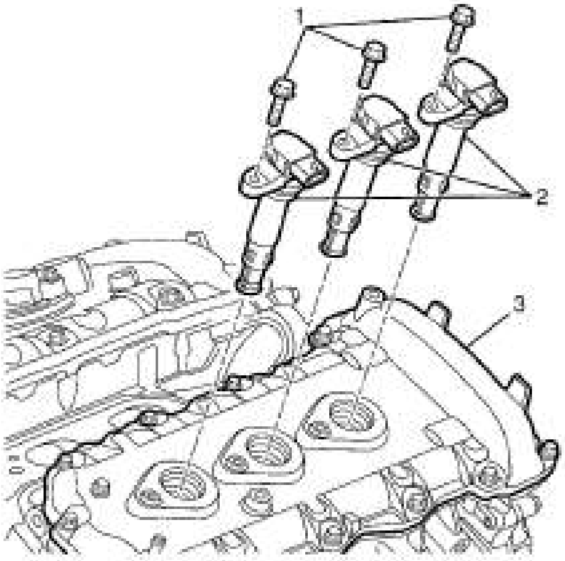
6. Remove the wiring harness (1) from the camshaft cover (2).



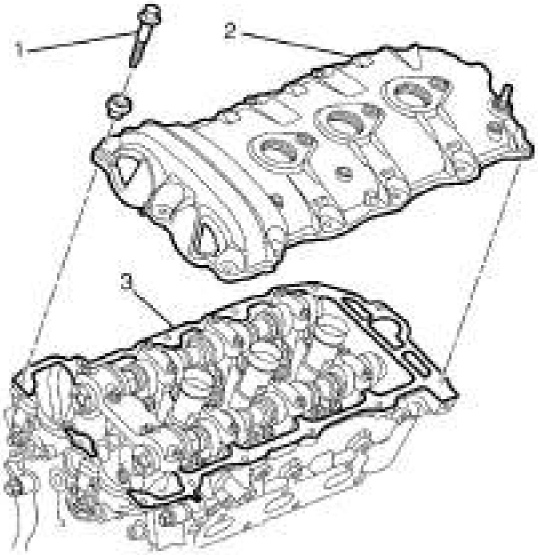
Important: It is not necessary to disconnect the engine front cover electrical connectors.

Important: Use a suitable tool to detach the wiring harness (1) clip from the camshaft cover (2), then lift the wiring harness (1) upwards to detach from the camshaft cover (2).

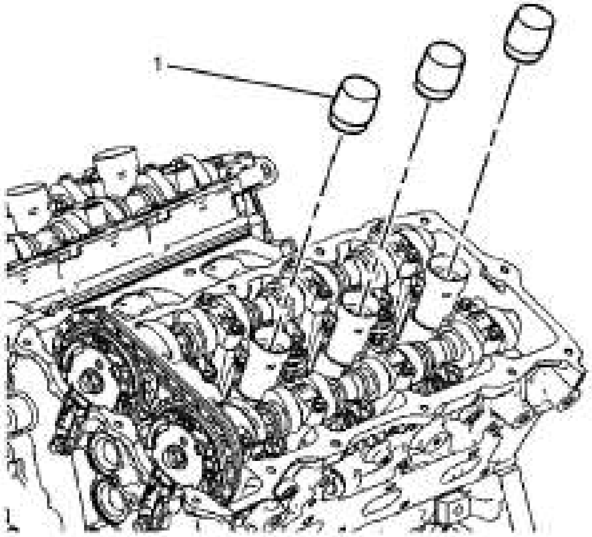
7. Remove the wiring harness (1) from the front of the camshaft cover (2).
8. Reposition and secure the wiring harness (1) away from the camshaft cover (2) in order to provide clearance for removal of the camshaft cover (2).



9. Remove the ignition coil to camshaft cover retaining bolts (1).
10. Remove the ignition coils (2) from the camshaft cover (3).



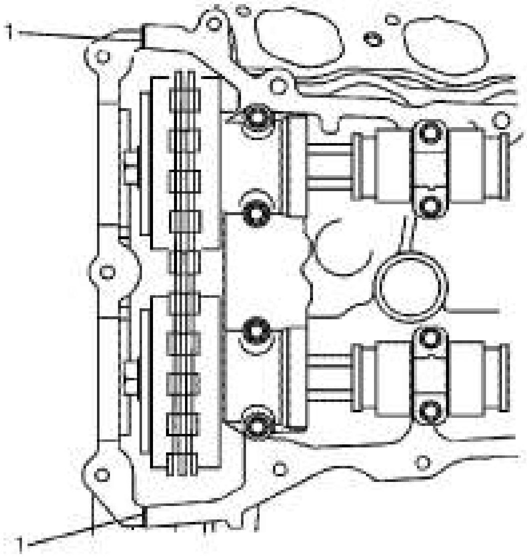
11. Remove the camshaft cover to cylinder head retaining bolts (1).
12. Remove the camshaft cover (2) from the cylinder head (3).
13. Remove and discard the camshaft cover seal and grommets.



14. Install the EN-46101 (1) to the spark plug tubes to prevent dirt and other contaminants from entering the cylinders.

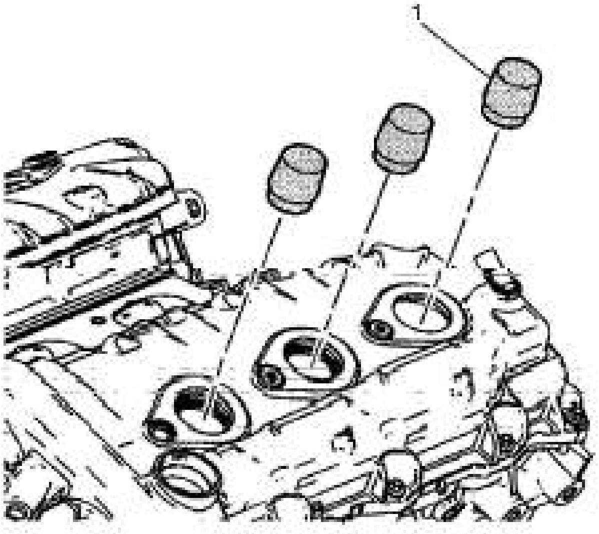
Installation Procedure

1. Install a NEW camshaft cover seal and NEW grommets.

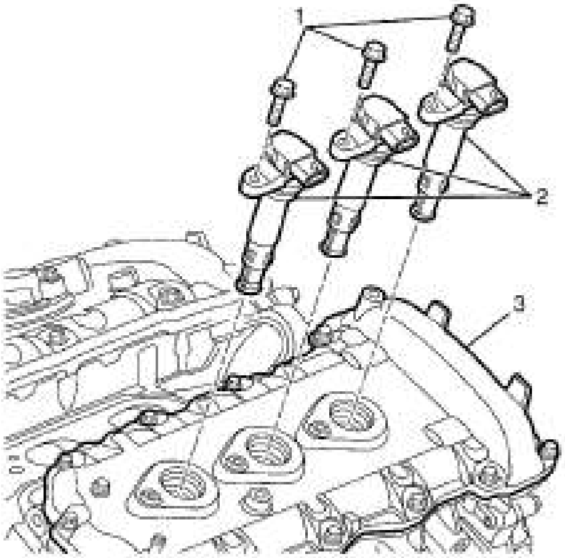


Important: Make sure the sealing surfaces of the cylinder head and camshaft cover are clean.

2. Place a 3mm bead of RTV sealant (1) on the join line between the engine front cover and the cylinder head.
3. Install the camshaft cover. Refer to Camshaft Cover Installation - Left Side .



4. Remove the EN 46101 EN 46101 (1) from the spark plug tubes of the left cylinder head.

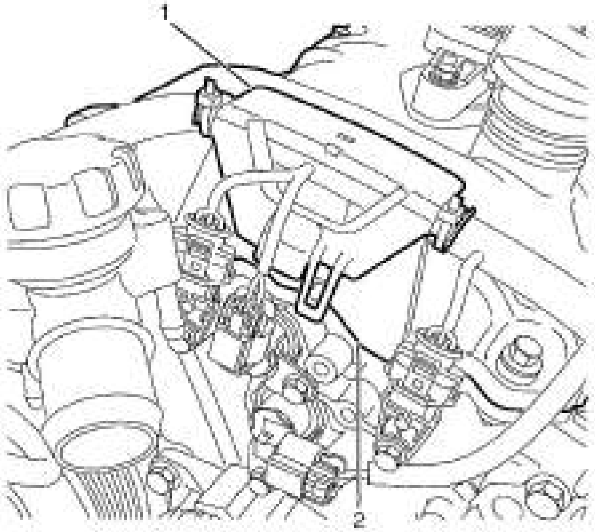


5. Install the ignition coils (2) to the camshaft cover (3).

   Notice: Refer to Fastener Notice in the Preface section.

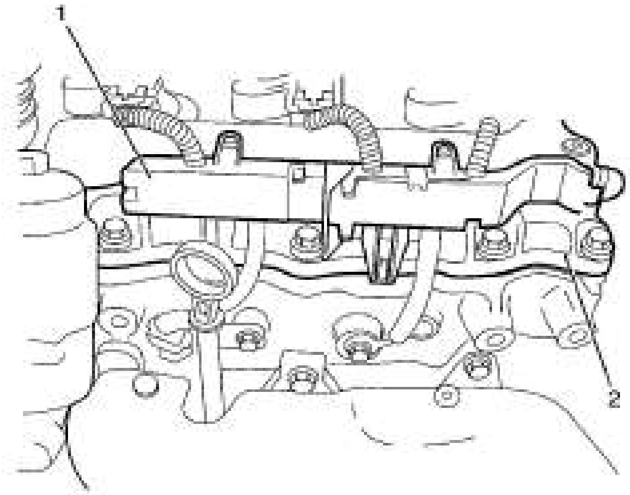
6. Install the ignition coil to camshaft cover retaining bolts (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



Important: Make sure the wiring harness (1) is located on the camshaft cover (2) locating lugs and the clips are engaged.

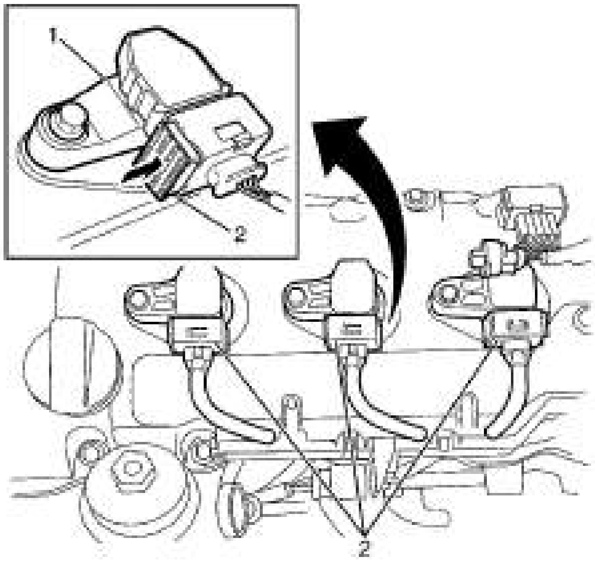
7. Install the wiring harness (1) to the front of the camshaft cover (2).



Important: Make sure the wiring harness (1) is located on the camshaft cover (2) locating lugs and the clips are engaged.

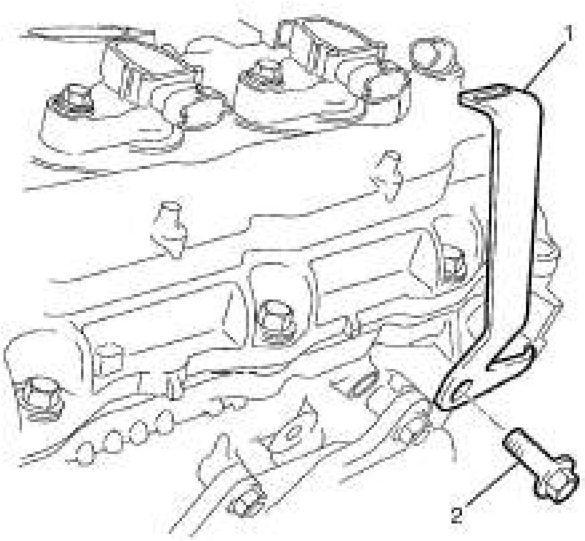
Important: Install the wiring harness from the side of the camshaft cover by sliding the conduit up and inboard.

8. Install the wiring harness (1) to the camshaft cover (2).



Important: Slide the connector retaining latch (2) in the direction of the arrow.

9. Connect the ignition coil electrical connectors (1).



10. Install the engine covers mounting bracket to cylinder head retaining bolt (1).

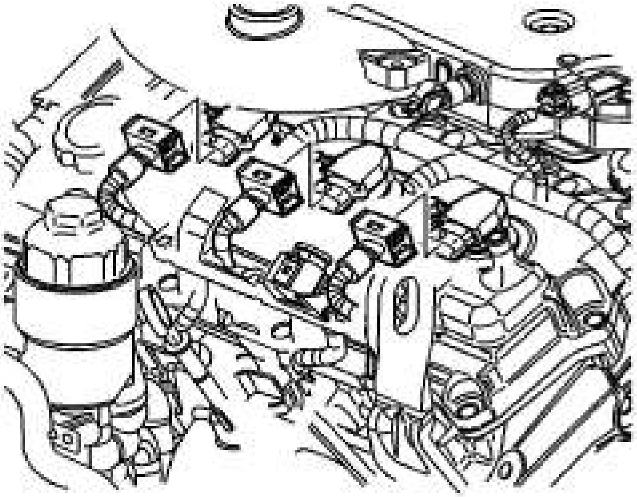
    Tighten
    Tighten the bolt to 35 N·m (26 lb ft).

11. Install the engine covers mounting bracket (2).
12. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
13. Install the engine covers. Refer to Engine Cover Replacement .

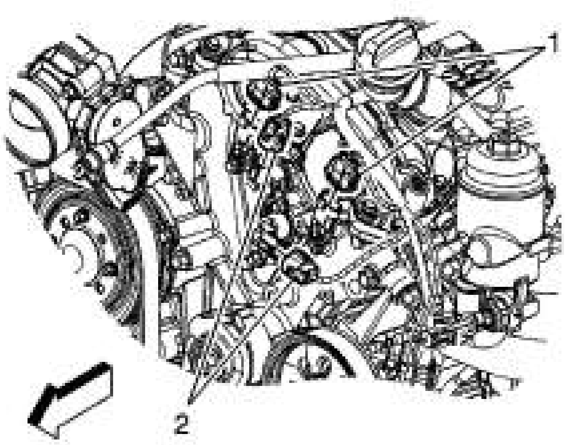
2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 2114959

Camshaft Cover Replacement - Left Side (LLT)

Removal Procedure



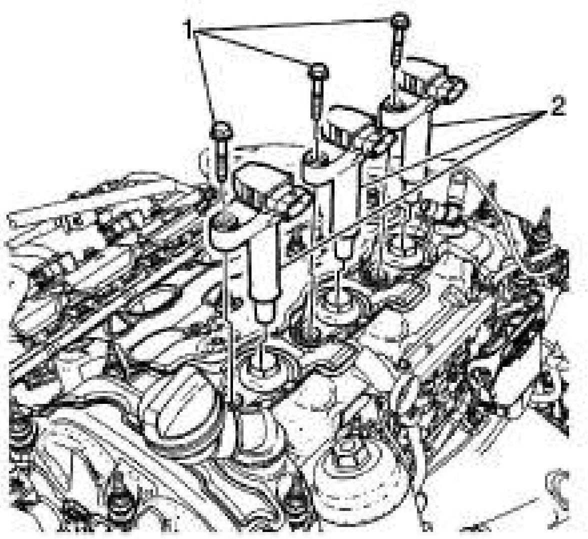
1. Remove the intake manifold. Refer to Intake Manifold Replacement.
2. Remove the fuel pipe shield. Refer to Fuel Pipe Shield Replacement.
3. Remove the crankcase ventilation pipe. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement.
4. Disconnect the ignition coil electrical connectors.



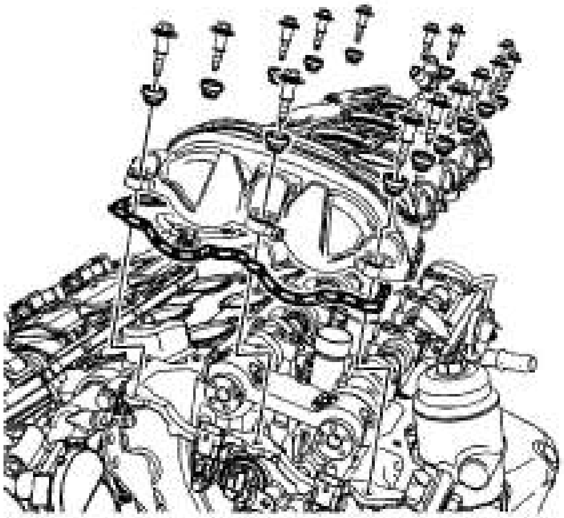
5. Remove the wiring harness from the side of the camshaft cover by sliding the conduit down and outboard.
6. Remove the wiring conduit retainers from the camshaft cover by rotating the wiring harness conduit retainers counterclockwise.

Note: It is not necessary to disconnect the engine front cover electrical connectors.

7. Disconnect the camshaft position sensors (1) and camshaft actuator valve (2) electrical connectors.
8. Reposition and secure the wiring harnesses away from the camshaft cover in order to provide clearance.

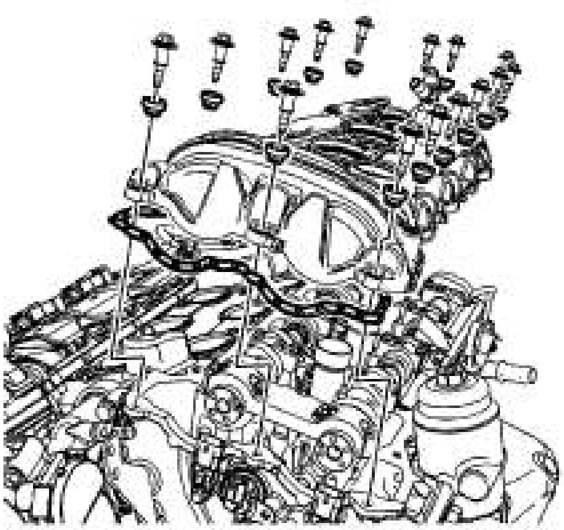


9. Remove the ignition coil bolts (1).
10. Remove the ignition coils (2).

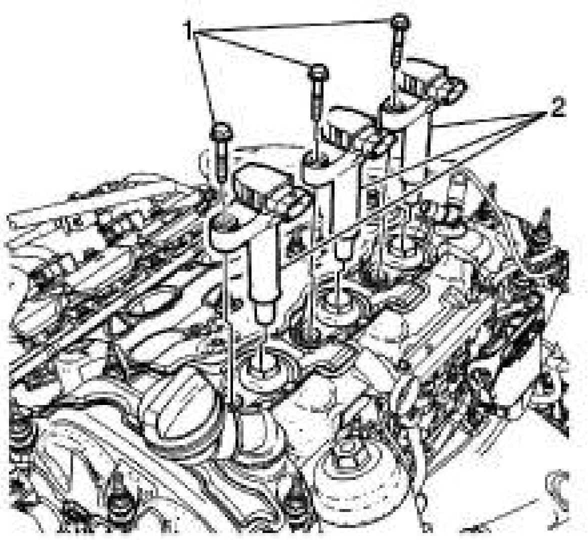


11. Remove the camshaft cover.
12. Remove and discard the camshaft cover seal (1) and grommets (2).

Installation Procedure



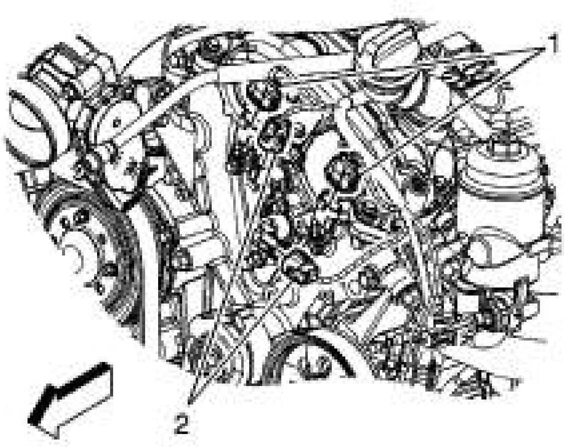
1. Install a NEW camshaft cover seal (1) and NEW grommets (2).
2. Install the camshaft cover. Refer to Camshaft Cover Installation - Left Side.



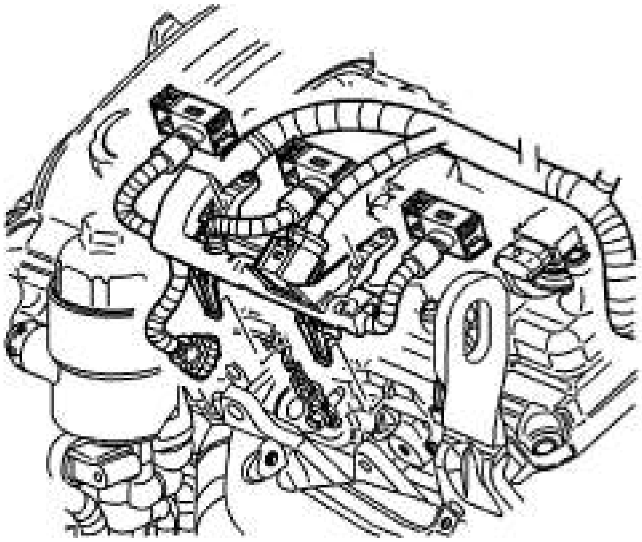
3. Install the ignition coils (2).

Caution: Refer to Fastener Caution in the Preface section.

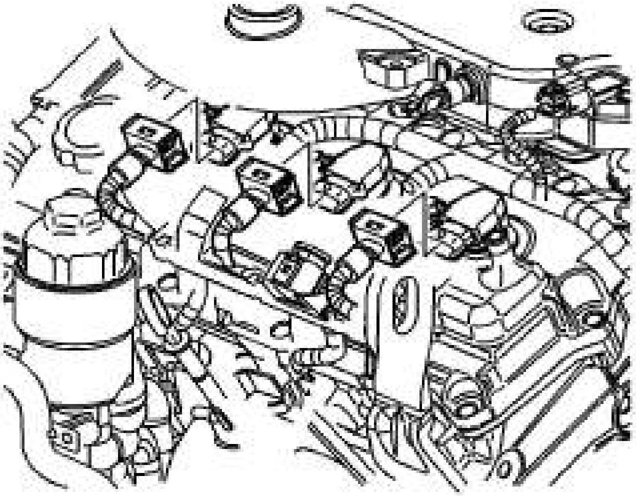
4. Install the ignition coil bolts (1) and tighten to **10 N·m (89 lb in)**.



5. Connect the camshaft actuator valves (2) and the camshaft position sensor (1) electrical connectors.
6. Install the wiring harness conduit retainers to the wiring harness conduit.



7. Install the wiring harness to the side of the camshaft cover.



8. Connect the ignition coil electrical connectors.
9. Install the crankcase ventilation pipe. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement.
10. Install the fuel pipe shield. Refer to Fuel Pipe Shield Replacement.
11. Install the intake manifold. Refer to Intake Manifold Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977629**

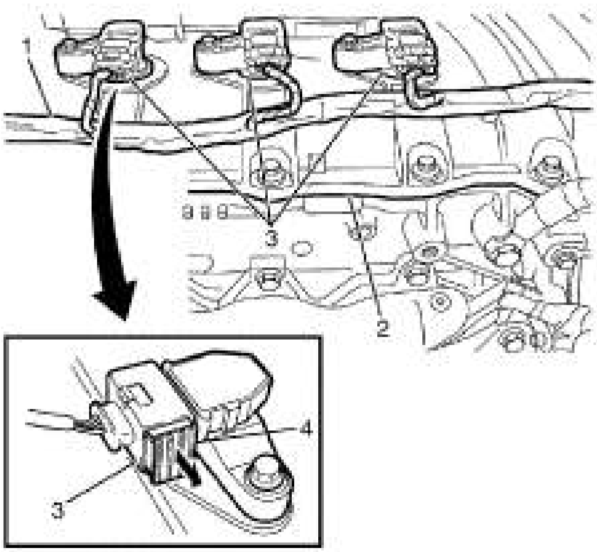
Camshaft Cover Replacement - Right Side

Tools Required

EN 46101 Spark Plug Tube Plugs

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement .
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .

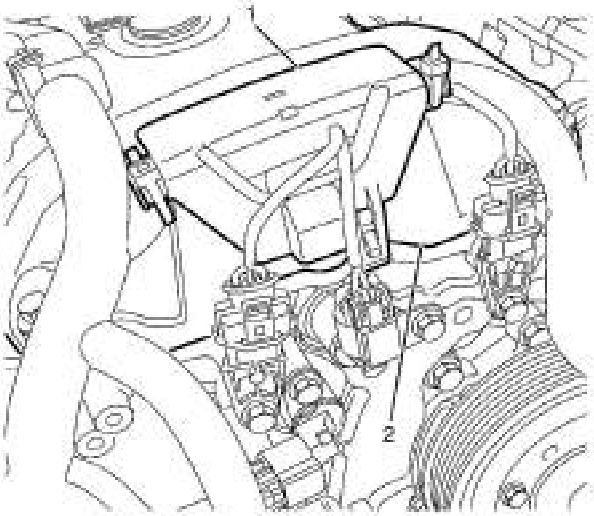


Important: Use a suitable tool to slide the connector retaining latch (4) in the direction of the arrow.

3. Disconnect the ignition coil electrical connectors (3).

Important: Use a suitable tool to detach the wiring harness (1) clips from the camshaft cover (2).

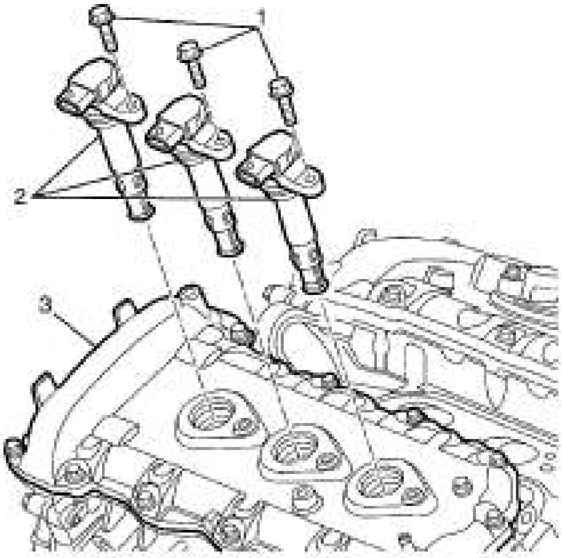
4. Remove the wiring harness (1) from the camshaft cover (2).



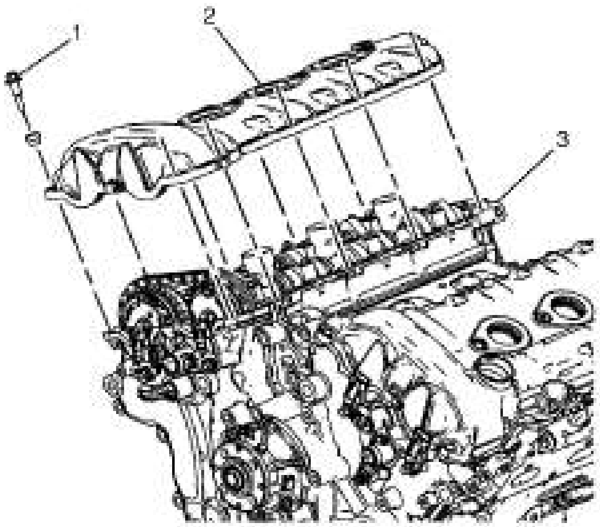
Important: It is not necessary to disconnect the engine front cover electrical connectors.

Important: Use a suitable tool to detach the wiring harness (1) clip from the camshaft cover (2), then lift the wiring harness (1) upwards to detach from the camshaft cover (2).

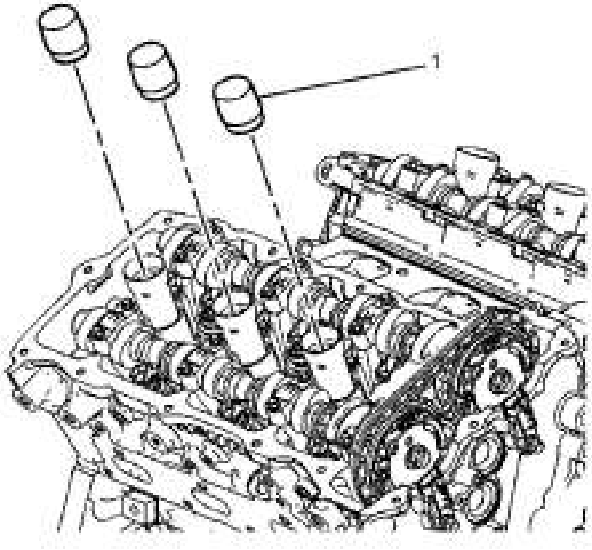
5. Remove the wiring harness (1) from the front of the camshaft cover (2).
6. Reposition and secure the wiring harness (1) away from the camshaft cover (2) in order to provide clearance for removal of the camshaft cover (2).



7. Remove the ignition coil to camshaft cover retaining bolts (1).
8. Remove the ignition coils (2) from the camshaft cover (3).

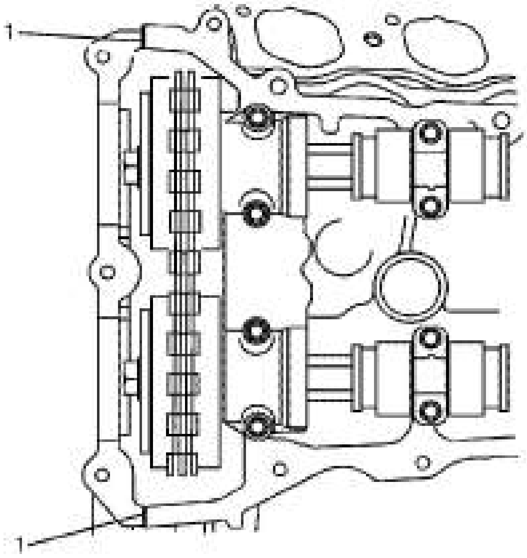


9. Remove the camshaft cover to cylinder head retaining bolts (1).
10. Remove the camshaft cover (2) from the cylinder head (3).
11. Remove and discard the camshaft cover seal and grommets.



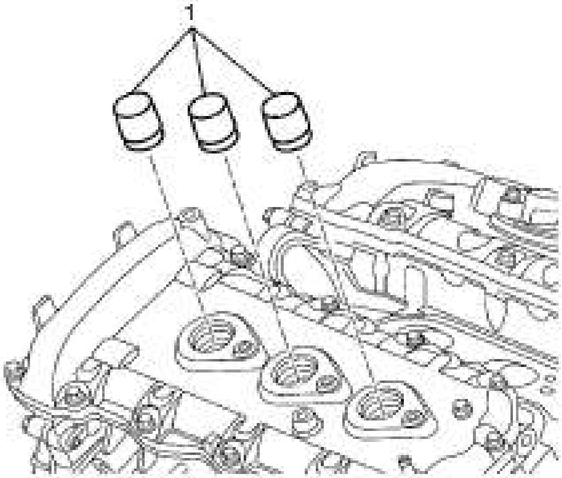
12. Install the EN-46101 (1) to the spark plug tubes to prevent dirt and other contaminants from entering the cylinders.

Installation Procedure

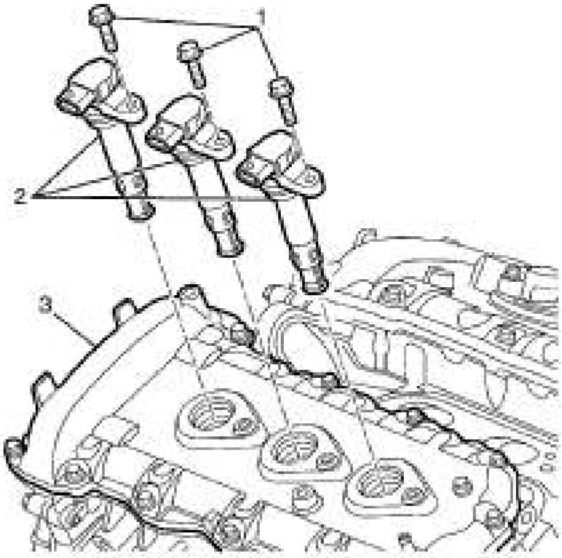


Important: Make sure the sealing surfaces of the cylinder head and camshaft cover are clean.

1. Place a 3mm bead of RTV sealant (1) on the join line between the engine front cover and the cylinder head.
2. Install a NEW camshaft cover seal and NEW grommets.
3. Install the camshaft cover. Refer to Camshaft Cover Installation - Right Side .



4. Remove the EN-46101 (1).

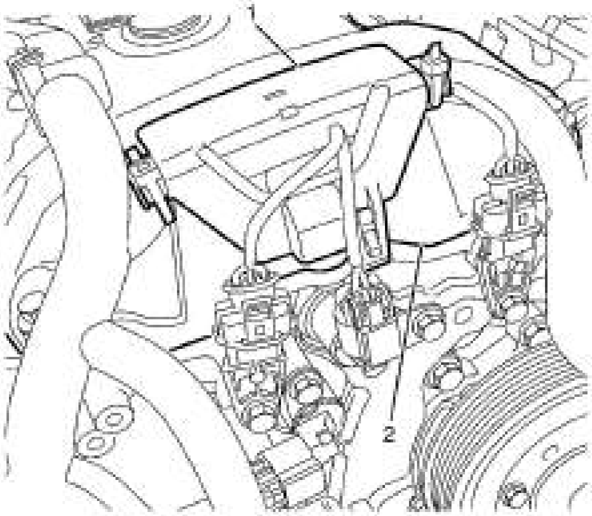


5. Install the ignition coils (2) to the camshaft cover (3).

   Notice: Refer to Fastener Notice in the Preface section.

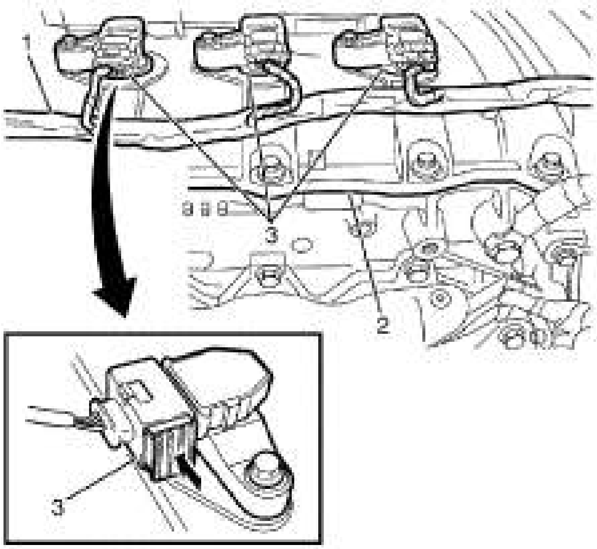
6. Install the ignition coil to camshaft cover retaining bolts (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



Important: Make sure the wiring harness (1) is located on the camshaft cover (2) locating lugs and the clips are engaged.

7. Install the wiring harness (1) to the front of the camshaft cover (2).



Important: Make sure the wiring harness (1) is located on the camshaft cover (2) locating lugs and the clips are engaged.

8. Install the wiring harness (1) to the camshaft cover (2).

Important: Slide the connector retaining latch (4) in the opposite direction of the arrow.

9. Connect the ignition coil electrical connectors (1).
10. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
11. Install the engine covers. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1995135

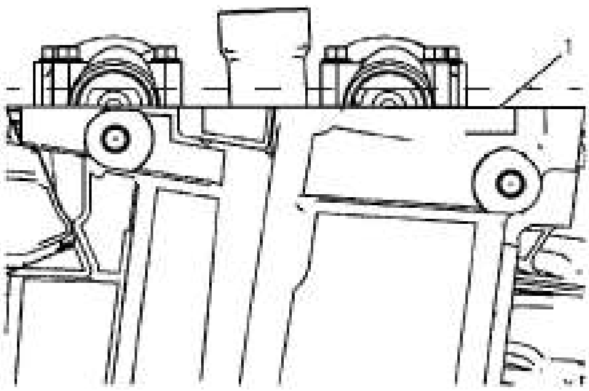
Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust

Tools Required

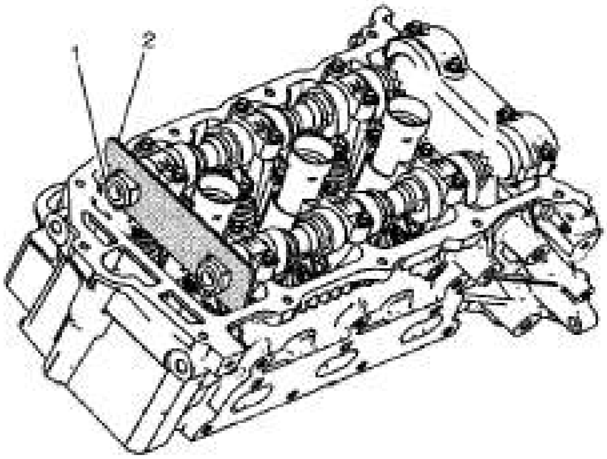
- EN 46105 Camshaft Locking Tools
- EN-48313 Timing Chain Retention Tool
- EN 46111 Crankshaft Rotation Socket

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
3. Remove the right side camshaft cover. Refer to Camshaft Cover Replacement - Right Side.
4. Remove the camshaft position sensors. Refer to Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake.
5. Remove the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake.
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.

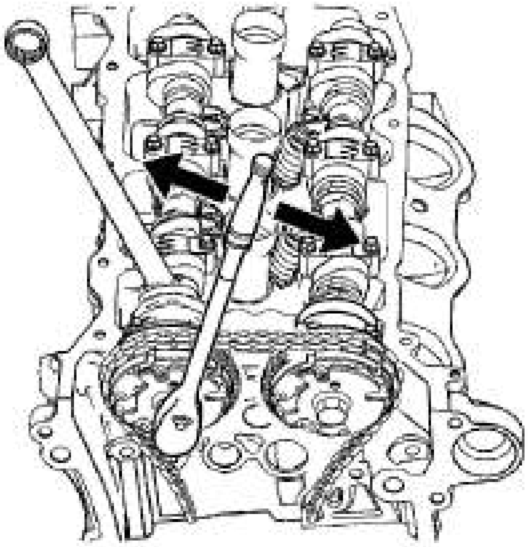


7. Rotate the crankshaft with the EN 46111 until the camshafts are in a neutral (low tension) position. The camshaft flats will be parallel with the camshaft cover rail (1).



8. Install the EN 46105 (1) onto the rear of the right side camshafts (2)

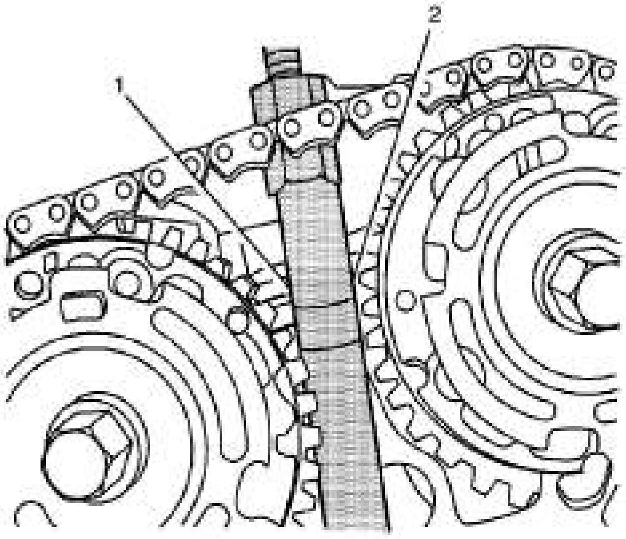
Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.



Important:

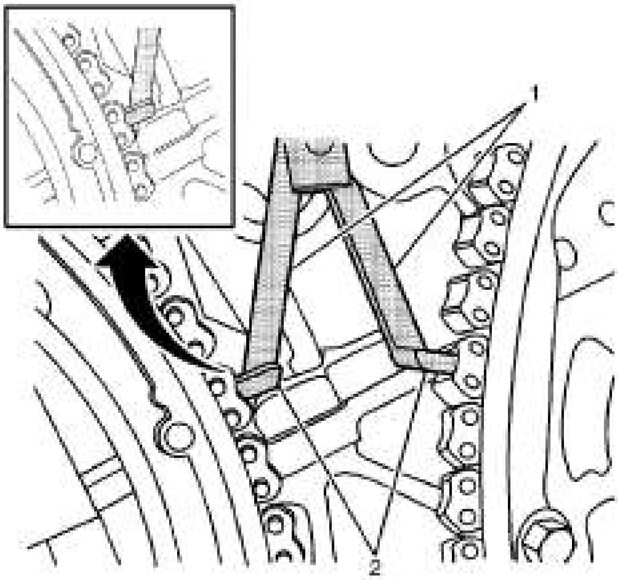
- Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.
- DO NOT remove the camshaft position actuator to camshaft retaining bolt at this time.

9. Loosen the right side exhaust camshaft position actuator to camshaft retaining bolt.



Important: The front engine cover is removed in the following graphics for illustration purposes and is not required to perform the procedure.

10. Loosen the EN-48313 so that the legs are retracted.
11. Insert the EN-48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed in the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.



12. Make sure that the feet (2) on the legs (1) of the EN-48313 are facing the front of the engine.

Important: DO NOT tighten EN-48313 at this stage.

13. Partially expand the legs (1) of the EN-48313 by turning the T-shaped handle clockwise.

    Important: Make sure that the feet (2) of the EN-48313 are correctly engaged into one of the link pockets to prevent chain slipping during tightening.

14. Continue expanding the EN-48313 until the feet (2) contact the timing chain.

    Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

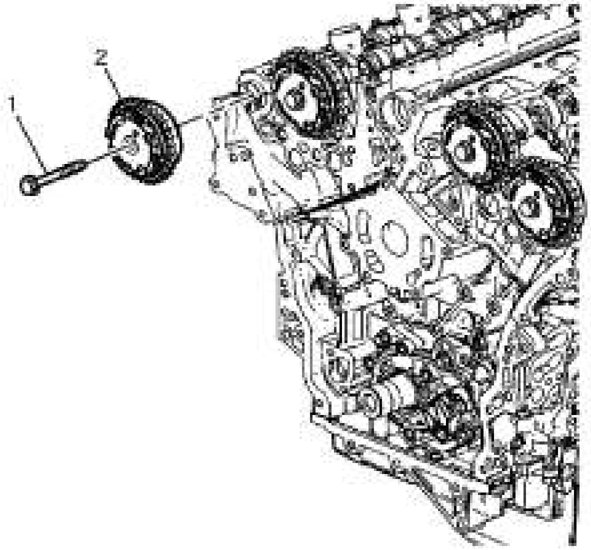
15. Hand tighten the EN-48313 .

    Important: DO NOT allow the body of the EN-48313 to rotate when tightening the T-handle.

16. Use an open-end wench on the hex cast into the body of the EN-48313 and hand tighten the T-handle.
17. Use an open-end wrench on the hex cast into the right intake and exhaust camshafts and rotate the camshafts towards each other in order create slack in the chain between the actuators.
18. The EN-48313 is now correctly installed to hold the timing chain in position.

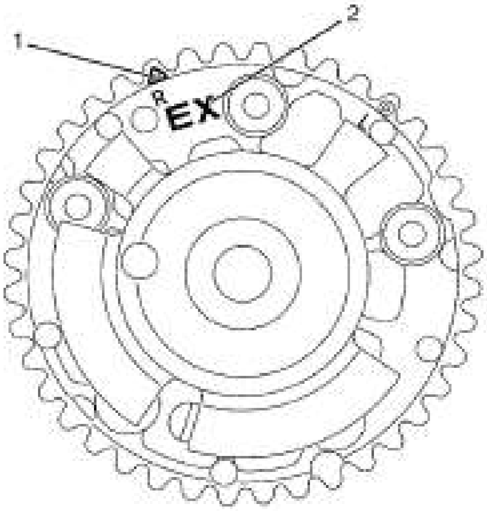
    Important: Make sure that the camshaft timing chain and the camshaft position actuators are marked for correct assembly.

19. Mark the timing chain and the camshaft position actuators.

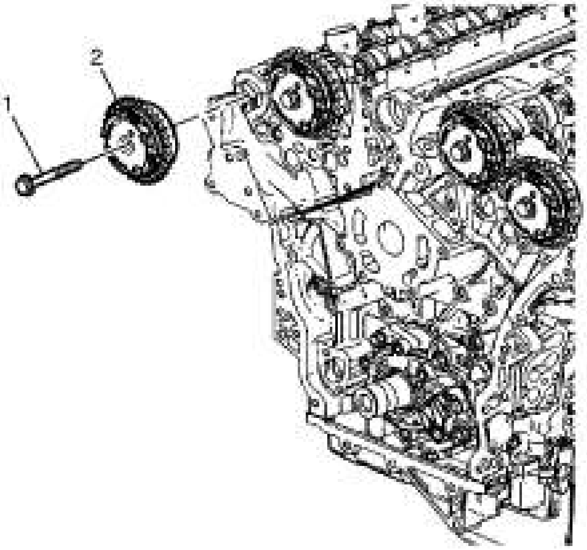


20. Remove the right side exhaust camshaft position actuator to camshaft retaining bolt (1).
21. Remove the right side exhaust camshaft position actuator (2).

Installation Procedure



1. Make sure the correct camshaft position actuator is installed. Observe the body of the camshaft position actuator for the "EX" marking (1). The marking is for an exhaust camshaft position actuator.
2. Make sure the correct timing mark is used. Observe the outer ring of the camshaft position actuator for the "R" and triangle marking (2). The marking is for alignment to the highlighted timing chain link on the right side of the engine.



3. Install the right side exhaust camshaft position actuator (2).

Important:

- Make sure that the marks on the camshaft position actuators and the timing chain are aligned.
- DO NOT tighten the right intake camshaft position actuator to camshaft retaining bolt (1) at this time.

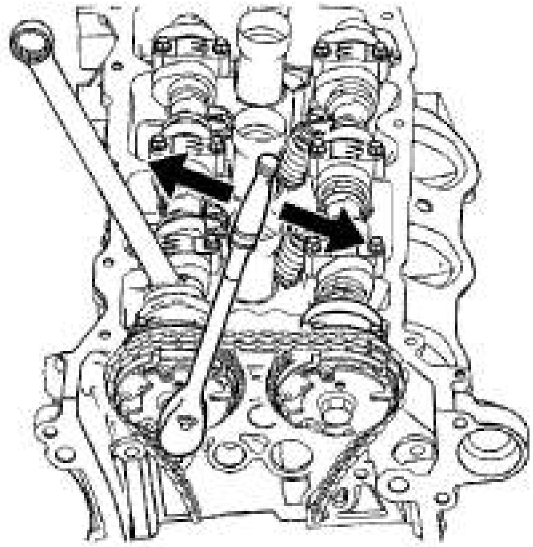
4. Install the right side camshaft position actuator to camshaft retaining bolt (1).

   DO NOT fully tighten at this stage.

5. Remove EN-48313 .

   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

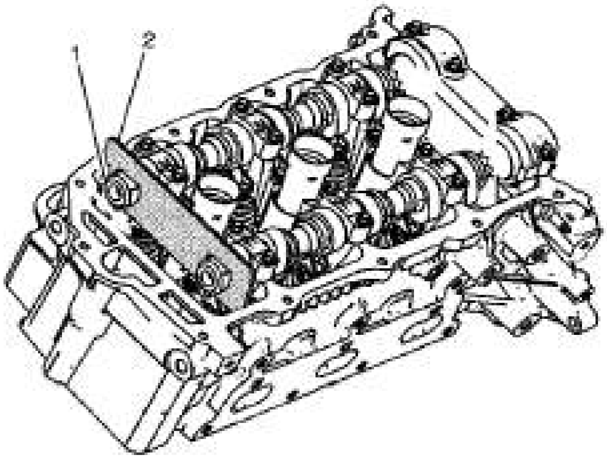
   Notice: Refer to Fastener Notice in the Preface section.



Important: Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.

6. Tighten the camshaft position actuator to camshaft retaining bolt.

   Tighten
   Tighten bolt to 58 N·m (43 lb ft).



7. Remove the EN 46105 (2) from the rear of the right side camshafts (1)
8. Install the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake.
9. Install the camshaft position sensors. Refer to Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake.
10. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
11. Install the right side camshaft cover. Refer to Camshaft Cover Replacement - Right Side.
12. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
13. Install the engine covers. Refer to Engine Cover Replacement.

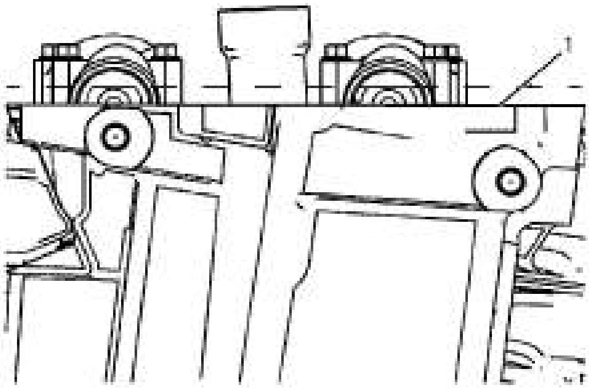
Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake

Tools Required

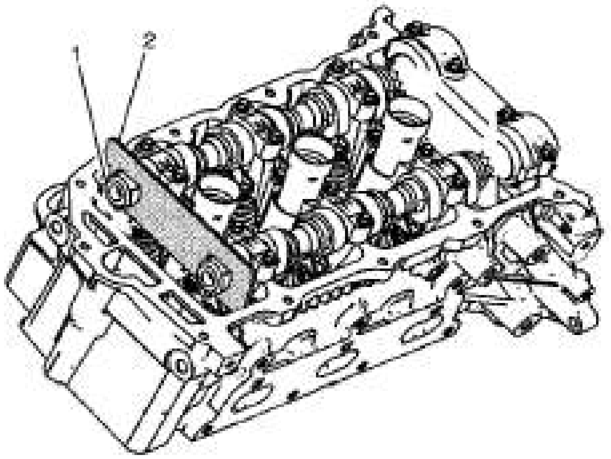
- EN 46105 Camshaft Locking Tools
- EN-48313 Timing Chain Retention Tool
- EN 46111 Crankshaft Rotation Socket

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement .
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
3. Remove the right side camshaft cover. Refer to Camshaft Cover Replacement - Right Side .
4. Remove the camshaft position sensors. Refer to Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake .
5. Remove the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake .
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal .

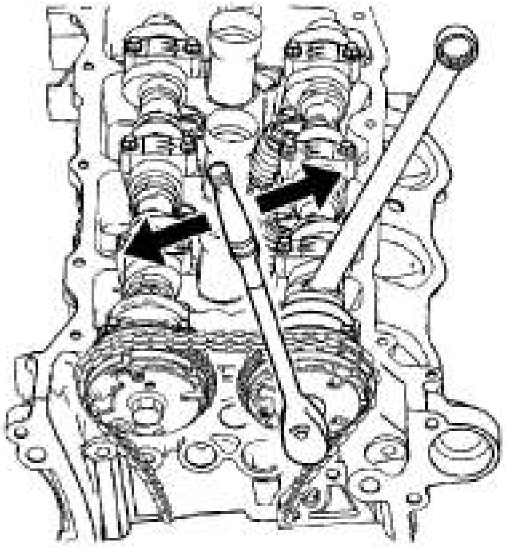


7. Rotate the crankshaft with the EN 46111 until the camshafts are in a neutral (low tension) position. The camshaft flats will be parallel with the camshaft cover rail (1).



8. Install the EN 46105 (2) onto the rear of the right side camshafts (1)

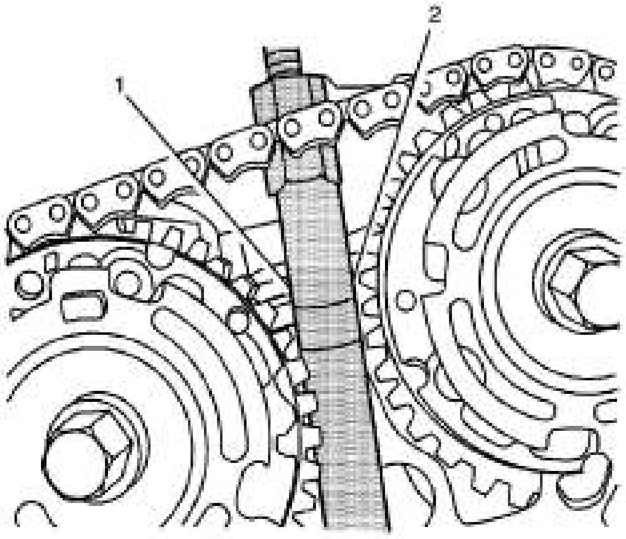
Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.



Important:

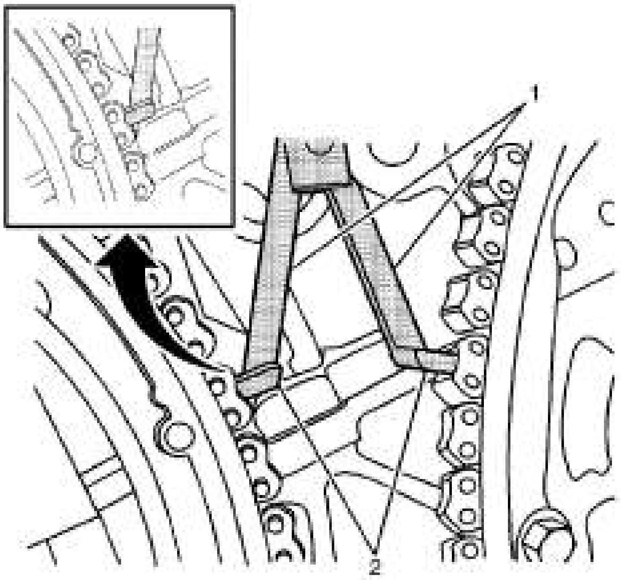
- Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.
- DO NOT remove the camshaft position actuator to camshaft retaining bolt at this time.

9. Loosen the right side intake camshaft position actuator to camshaft retaining bolt.
10. Loosen the EN-48313 so that the legs are retracted.



Important: The front engine cover is removed in the following graphics for illustration purposes and is not required to perform the procedure.

11. Insert the EN-48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed in the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.



12. Make sure that the feet (2) on the legs (1) of the EN-48313 are facing the front of the engine.

Important: DO NOT tighten EN-48313 at this stage.

13. Partially expand the legs (1) of the EN-48313 by turning the T-shaped handle clockwise.

Important: Make sure that the feet (2) of the EN-48313 is correctly engaged into one of the link pockets to prevent chain slipping during tightening.

14. Continue expanding the EN-48313 until the feet (2) contact the timing chain.

Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

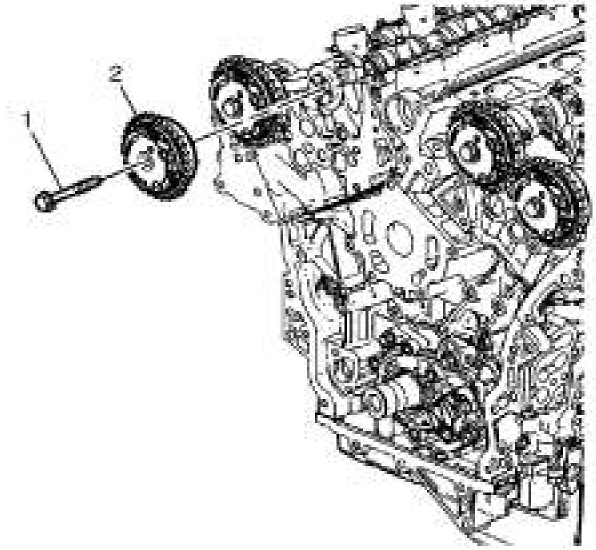
15. Hand tighten the EN-48313 .

Important: DO NOT allow the body of the tool to rotate when tightening the T-handle.

16. Use an open-end wench on the hex cast into the body of the EN-48313 and hand tighten the T-handle.
17. Use an open-end wrench on the hex cast into the right intake and exhaust camshafts and rotate the camshafts towards each other in order create slack in the chain between the actuators.
18. The EN-48313 is now correctly installed to hold the timing chain in position.

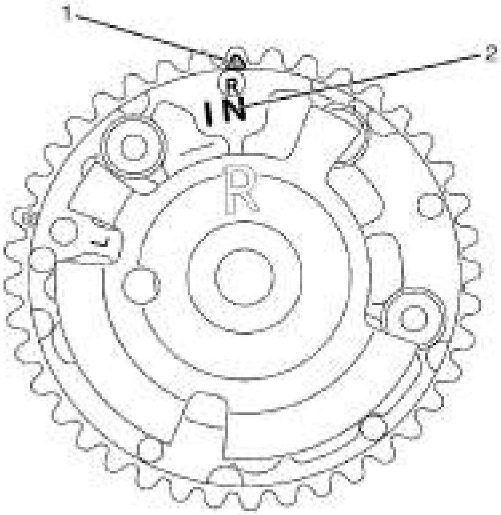
Important: Make sure that the camshaft timing chain and the camshaft position actuators are marked for correct assembly.

19. Mark the timing chain and the camshaft position actuators.

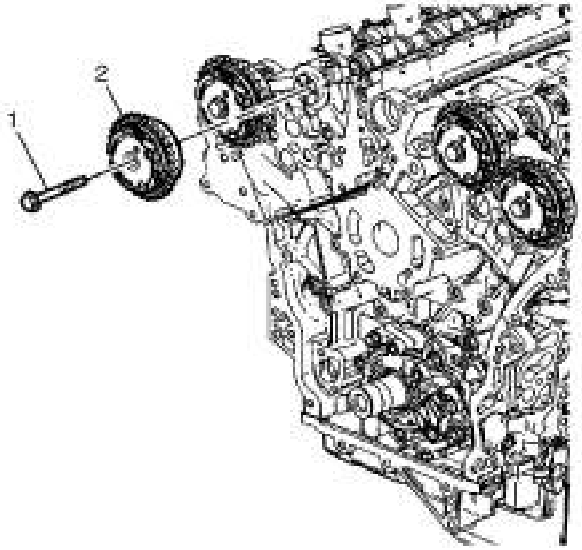


20. Remove the right side intake camshaft position actuator to camshaft retaining bolt (1).
21. Remove the right side intake camshaft position actuator (2).

Installation Procedure



1. Make sure the correct camshaft position actuator is installed. Observe the body of the camshaft position actuator for the "IN" marking (2). The marking is for an intake camshaft position actuator.
2. Make sure the correct timing mark is used. Observe the outer ring of the camshaft position actuator for the "R" and triangle marking (1). The marking is for alignment to the highlighted timing chain link on the right side of the engine.



3. Install the right side intake camshaft position actuator (2).

Important:

- Make sure that the marks on the camshaft position actuators and the timing chain are aligned.
- DO NOT tighten the right intake camshaft position actuator to camshaft retaining bolt (1) at this time.

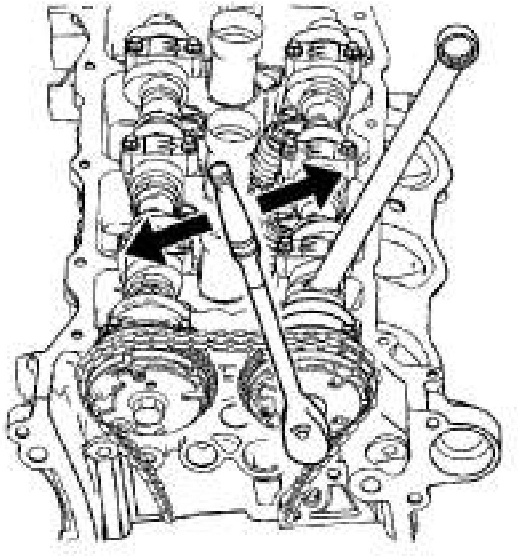
4. Install the right side intake camshaft position actuator to camshaft retaining bolt (1).

   DO NOT fully tighten at this stage.

5. Remove the EN 46108 EN 48313.

   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

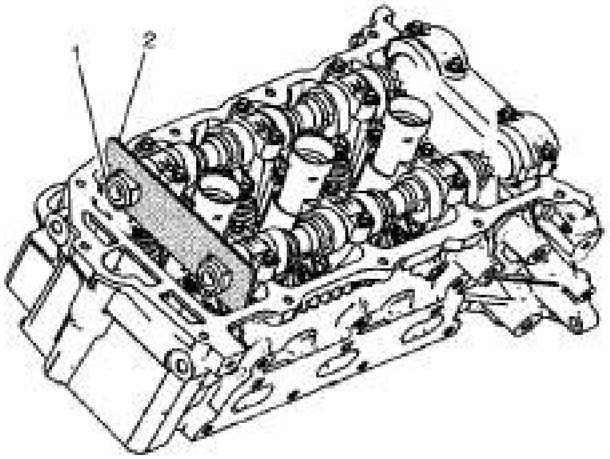
   Notice: Refer to Fastener Notice in the Preface section.



Important: Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.

6. Tighten the camshaft position actuator to camshaft retaining bolt.

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).



7. Remove the EN 46105 (2) from the rear of the right side camshafts (1)
8. Install the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake .
9. Install the camshaft position sensors. Refer to Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake .
10. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation .
11. Install the right side camshaft cover. Refer to Camshaft Cover Replacement - Right Side .
12. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
13. Install the engine covers. Refer to Engine Cover Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995131**

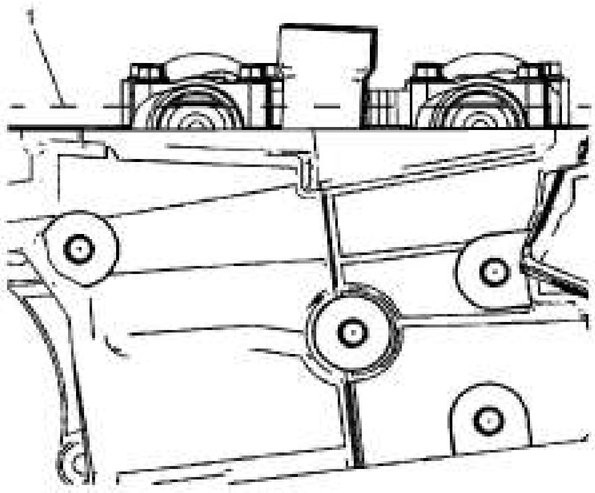
Camshaft Position Actuator Replacement - Bank 2 (Left Side) Exhaust

Tools Required

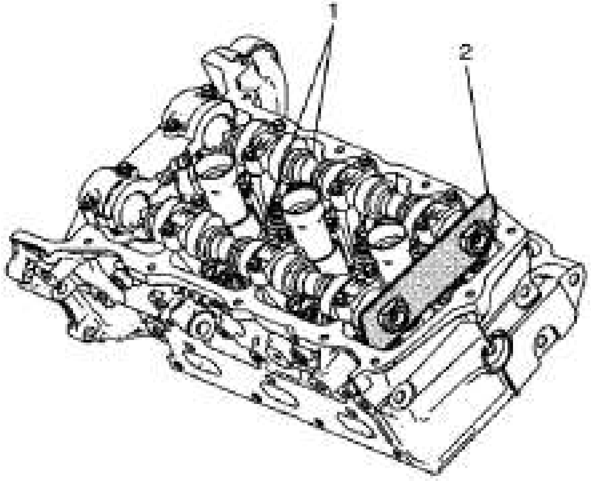
- EN 46105 Camshaft Locking Tools
- EN-48313 Timing Chain Retention Tool
- EN 46111 Crankshaft Rotation Socket

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
3. Remove the left side camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
4. Remove the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake.
5. Remove the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake.
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.

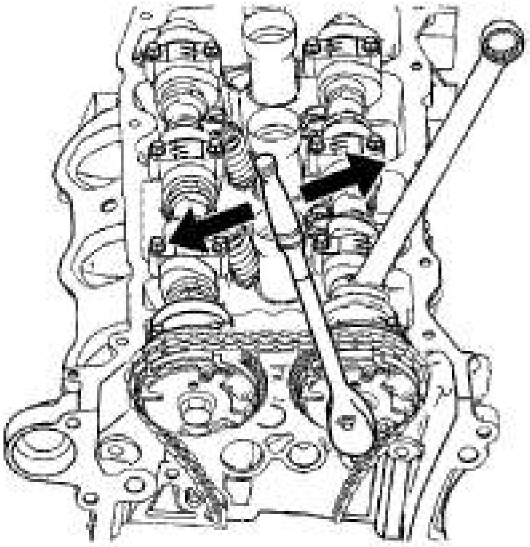


7. Rotate the crankshaft with the EN 46111 until the camshafts are in a neutral (low tension) position. The camshaft flats will be parallel with the camshaft cover rail (1).



8. Install the EN 46105 (2) onto the rear of the left side camshafts (1).

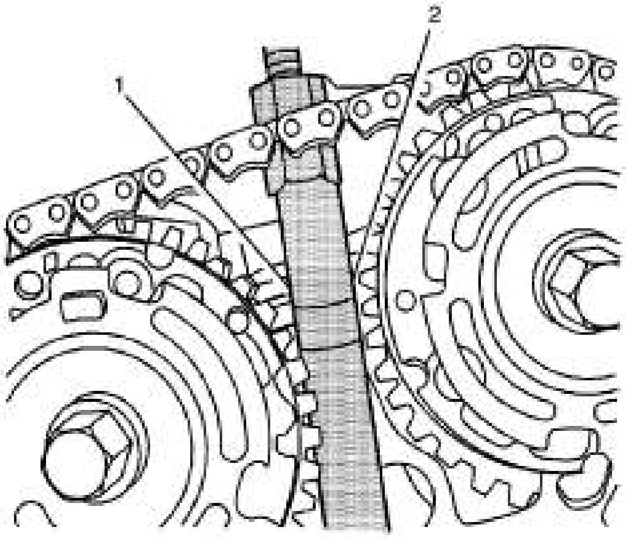
   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.



Important:

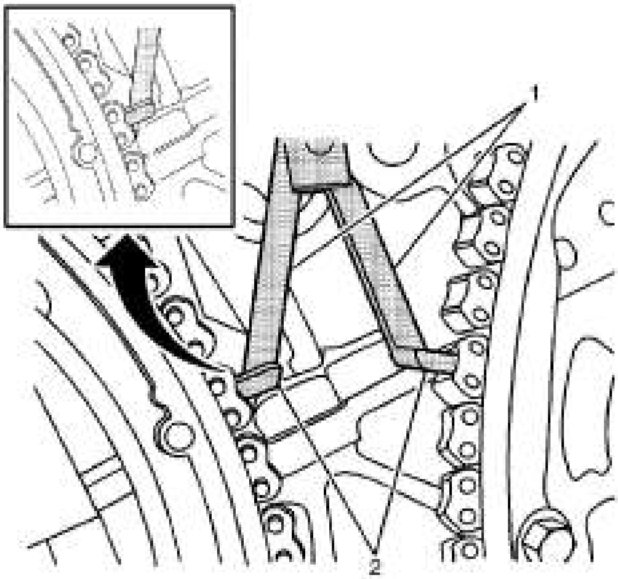
- Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.
- DO NOT remove the camshaft position actuator to camshaft retaining bolt at this time.

9. Loosen the left side exhaust camshaft position actuator to camshaft retaining bolt.
10. Loosen the EN-48313 so that the legs are retracted.



Important: The front engine cover is removed in the following graphics for illustration purposes and is not required to perform the procedure.

11. Insert the EN-48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed in the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.



12. Make sure that the feet (2) on the legs (1) of the EN-48313 are facing the front of the engine.

Important: DO NOT tighten the EN-48313 at this stage.

13. Partially expand the legs (1) of EN-48313 by turning the T-shaped handle clockwise.

Important: Make sure that the feet (2) of the EN-48313 are correctly engaged into one of the link pockets to prevent chain slipping during tightening.

14. Continue expanding the EN-48313 until the feet (2) contact the timing chain.

Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

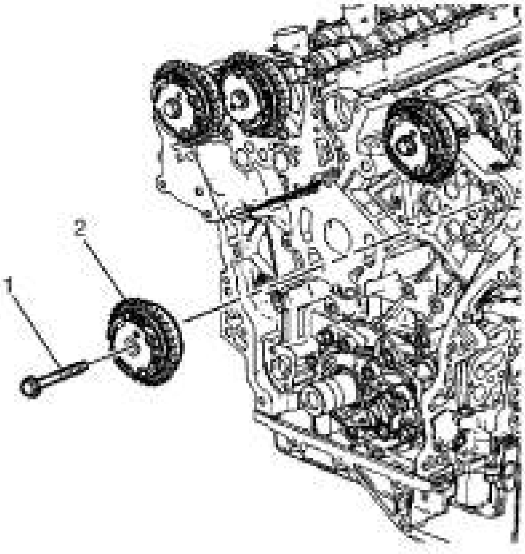
15. Hand tighten the EN-48313 .

Important: DO NOT allow the body of the EN-48313 to rotate when tightening the T-handle.

16. Use an open-end wench on the hex cast into the body of the EN-48313 and hand tighten the T-handle.
17. Use an open-end wrench on the hex cast of the left side intake and exhaust camshafts and rotate the camshafts towards each other in order create slack in the chain between the actuators.
18. The EN-48313 is now correctly installed to hold the timing chain in position.

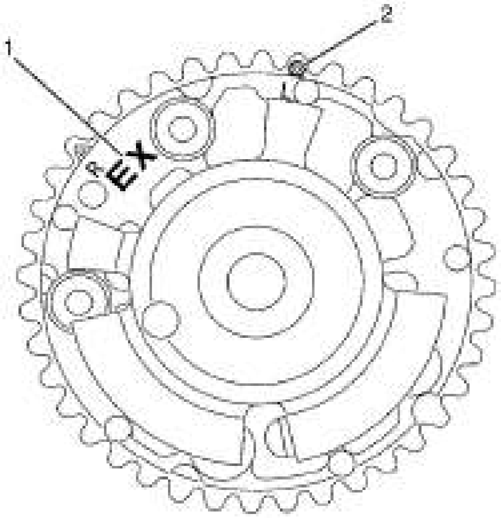
Important: Make sure that the camshaft timing chain and the camshaft position actuators are marked for correct assembly.

19. Mark the timing chain and the camshaft position actuators.

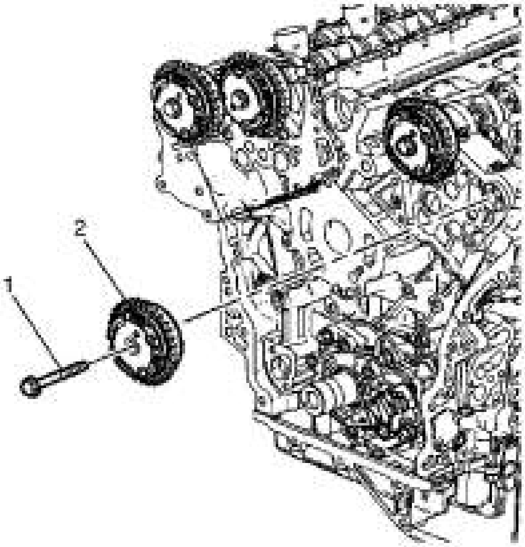


20. Remove the left side exhaust camshaft position actuator to camshaft retaining bolt (1).
21. Remove the left side exhaust camshaft position actuator (2).

Installation Procedure



1. Make sure the correct camshaft position actuator is installed. Observe the body of the camshaft position actuator for the "EX" marking (1). The marking is for an exhaust camshaft position actuator.
2. Make sure the correct timing mark is used. Observe the outer ring of the camshaft position actuator for the "L" and circle marking (2). The marking is for alignment to the highlighted timing chain link on the left side of the engine.



3. Install the left side exhaust camshaft position actuator (2).

Important:

- Make sure that the marks on the camshaft position actuators and the timing chain are aligned.
- DO NOT tighten the left side exhaust camshaft position actuator to camshaft retaining bolt (1) at this time.

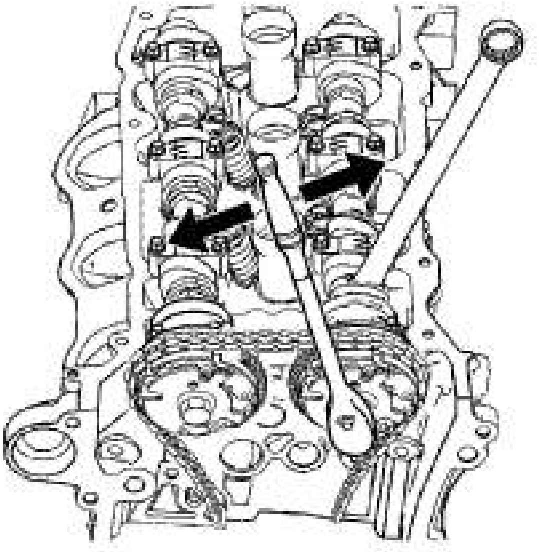
4. Install the camshaft position actuator to camshaft retaining bolt (1).

   DO NOT fully tighten at this stage.

5. Remove EN-48313 .

   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

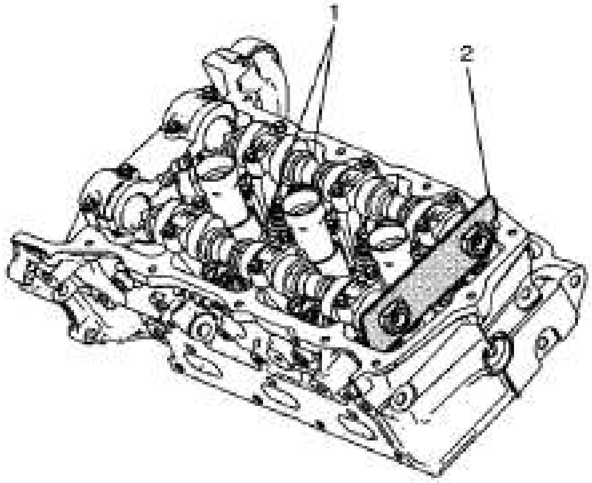
   Notice: Refer to Fastener Notice in the Preface section.



Important: Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.

6. Tighten the camshaft position actuator to camshaft retaining bolt.

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).



7. Remove the EN 46105 (2) from the rear of the left side camshafts (1).
8. Install the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake
9. Install the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake.
10. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
11. Install the left bank camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
12. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
13. Install the engine covers. Refer to Engine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1995140

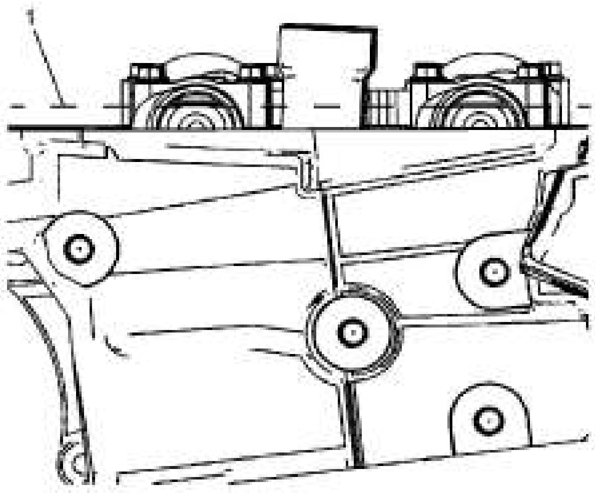
Camshaft Position Actuator Replacement - Bank 2 (Left Side) Intake

Tools Required

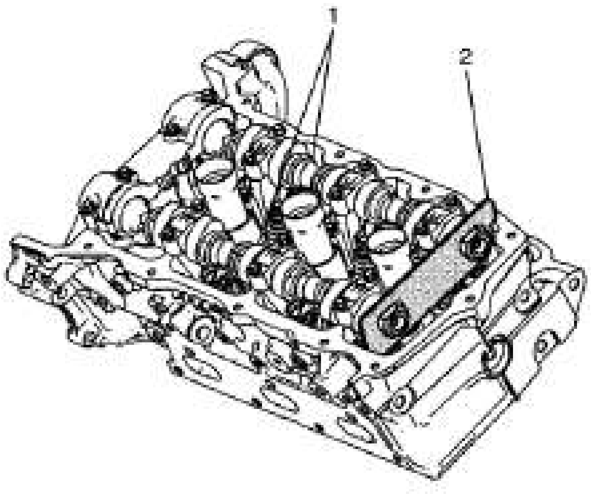
- EN 46105 Camshaft Locking Tools
- EN-48313 Timing Chain Retention Tool
- EN 46111 Crankshaft Rotation Socket

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
3. Remove the left side camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
4. Remove the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake.
5. Remove the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake.
6. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.

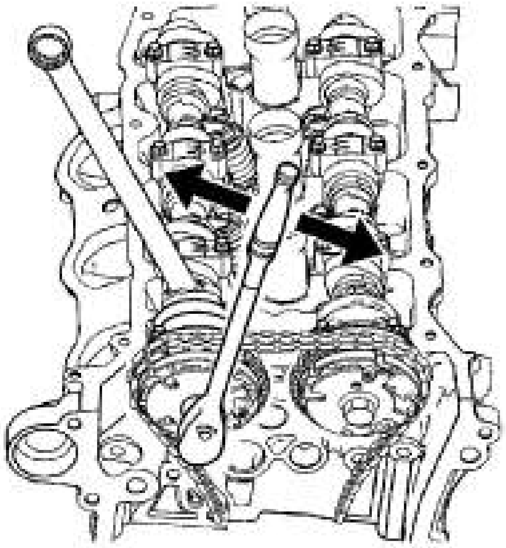


7. Rotate the crankshaft with the EN 46111 until the camshafts are in a neutral (low tension) position. The camshaft flats will be parallel with the camshaft cover rail (1).



8. Install the EN 46105 (2) onto the rear of the left side camshafts (1).

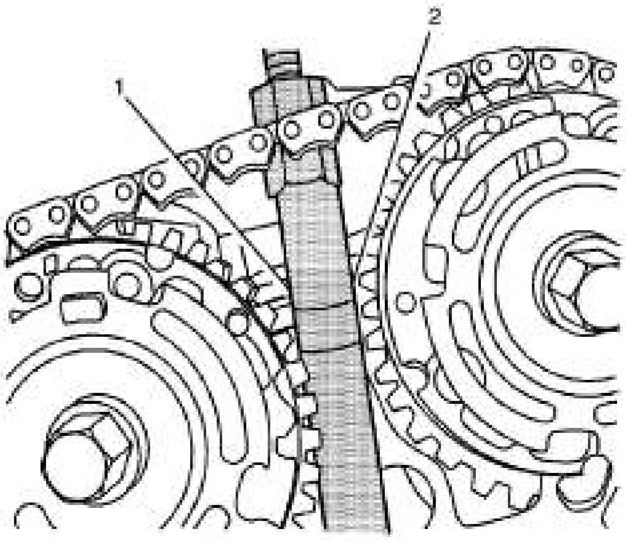
   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.



Important:

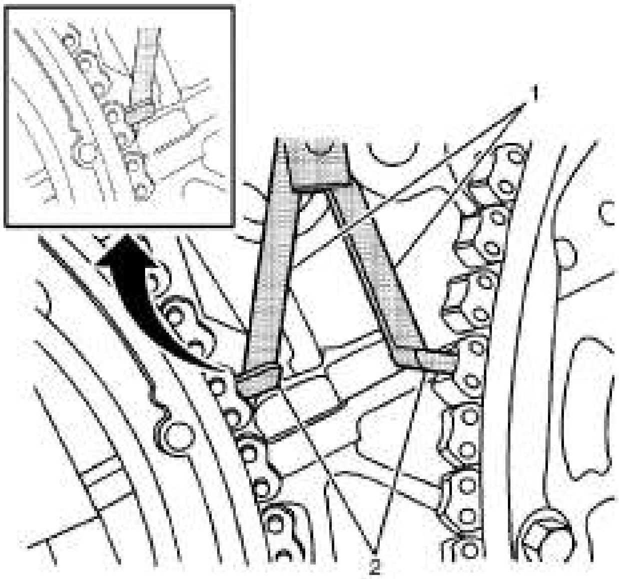
- Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.
- DO NOT remove the camshaft position actuator to camshaft retaining bolt at this time.

9. Loosen the left side intake camshaft position actuator to camshaft retaining bolt.
10. Loosen the EN-48313 so that the legs are retracted.



Important: The front engine cover is removed in the following graphics for illustration purposes and is not required to perform the procedure.

11. Insert the EN-48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed in the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.



12. Make sure that the feet (2) on the legs (1) of the EN-48313 are facing the front of the engine.

Important: DO NOT tighten EN-48313 at this stage.

13. Partially expand the legs (1) of the EN-48313 by turning the T-shaped handle clockwise.

Important: Make sure that the feet (2) of the EN-48313 are correctly engaged into one of the link pockets to prevent chain slipping during tightening.

14. Continue expanding the EN-48313 until the feet (2) contact the timing chain.

Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

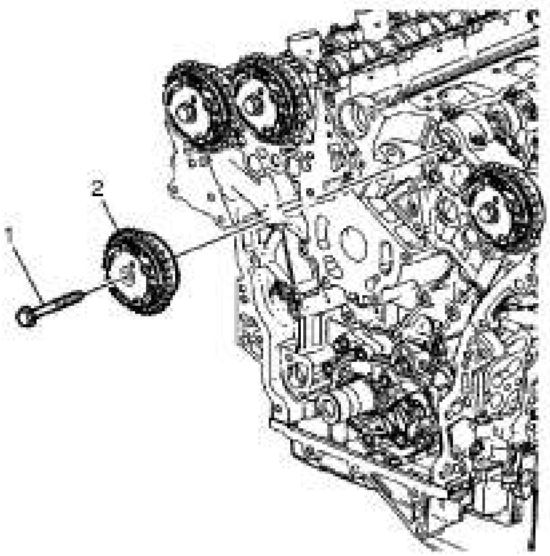
15. Hand tighten the EN-48313 .

Important: DO NOT allow the body of the EN-48313 to rotate when tightening the T-handle.

16. Use an open-end wench on the hex cast into the body of the EN-48313 and hand tighten the T-handle.
17. Use an open-end wrench on the hex cast of the left side intake and exhaust camshafts and rotate the camshafts towards each other in order create slack in the chain between the actuators.
18. The EN-48313 is now correctly installed to hold the timing chain in position.

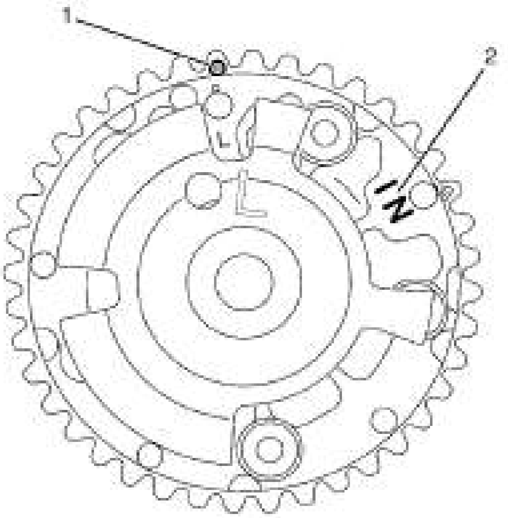
Important: Make sure that the camshaft timing chain and the camshaft position actuators are marked for correct assembly.

19. Mark the timing chain and the camshaft position actuators.

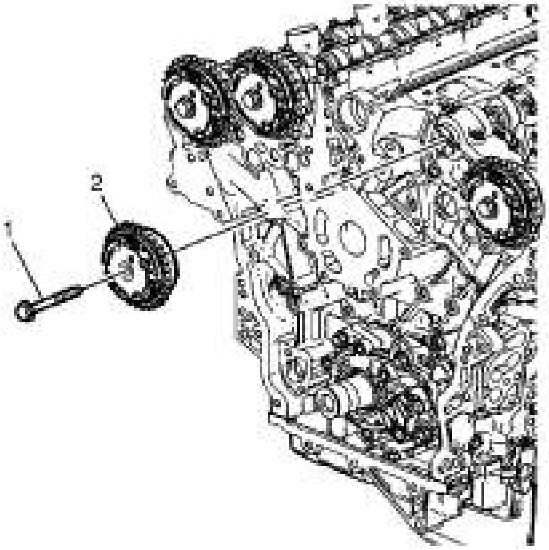


20. Remove the left side intake camshaft position actuator to camshaft retaining bolt (1).
21. Remove the left side intake camshaft position actuator (2).

Installation Procedure



1. Make sure the correct camshaft position actuator is installed. Observe the body of the camshaft position actuator for the "IN" marking (2). The marking is for an intake camshaft position actuator.
2. Make sure the correct timing mark is used. Observe the outer ring of the camshaft position actuator for the "L" and circle marking (1). The marking is for alignment to the highlighted timing chain link on the left side of the engine.



3. Install the left side intake camshaft position actuator (2).

Important:

- Make sure that the marks on the camshaft position actuators and the timing chain are aligned.
- DO NOT tighten the right intake camshaft position actuator to camshaft retaining bolt (1) at this time.

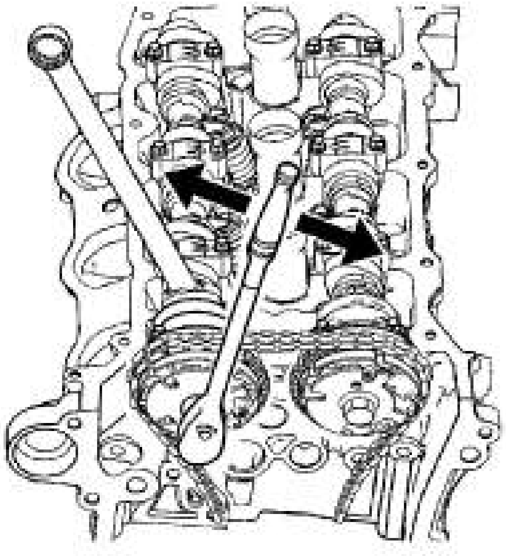
4. Install the camshaft position actuator to camshaft retaining bolt (1).

   DO NOT fully tighten at this stage.

5. Remove EN-48313 .

   Notice: Refer to Torque Reaction Against Timing Drive Chain Notice in the Preface section.

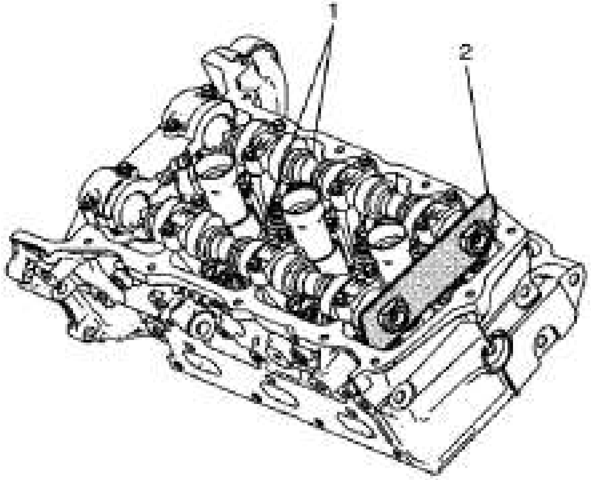
   Notice: Refer to Fastener Notice in the Preface section.



Important: Use an open-end wrench at the camshaft hex to prevent camshaft/engine rotation.

6. Tighten the camshaft position actuator to camshaft retaining bolt.

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).



7. Remove the EN 46105 (2) from the rear of the left side camshafts (1)
8. Install the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaustand Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake.
9. Install the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake.
10. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
11. Install the left bank camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
12. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.
13. Install the engine covers. Refer to Engine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977521**

Camshaft Replacement - Left Side

Removal Procedure

1. Remove the left side camshaft position actuators. Refer to Camshaft Position Actuator Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Replacement - Bank 2 (Left Side) Intake.
2. Remove the left side camshafts. Refer to Camshaft Removal - Left Side.

Installation Procedure

1. Install the left side camshafts. Refer to Camshaft Removal - Left Side.
2. Install the left side camshaft position actuators. Refer to Camshaft Position Actuator Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Replacement - Bank 2 (Left Side) Intake.

Camshaft Replacement - Right Side

Removal Procedure

1. Remove the right side camshaft position actuators. Refer to Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake.
2. Remove the right side camshafts. Refer to Camshaft Removal - Right Side.

Installation Procedure

1. Install the right side camshafts. Refer to Camshaft Installation - Right Side.
2. Install the right side camshaft position actuators. Refer to Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977627

Crankshaft Balancer Replacement

Tools Required

- EN 46106 Flywheel Holding Tool.
- J 45059 Angle Meter.

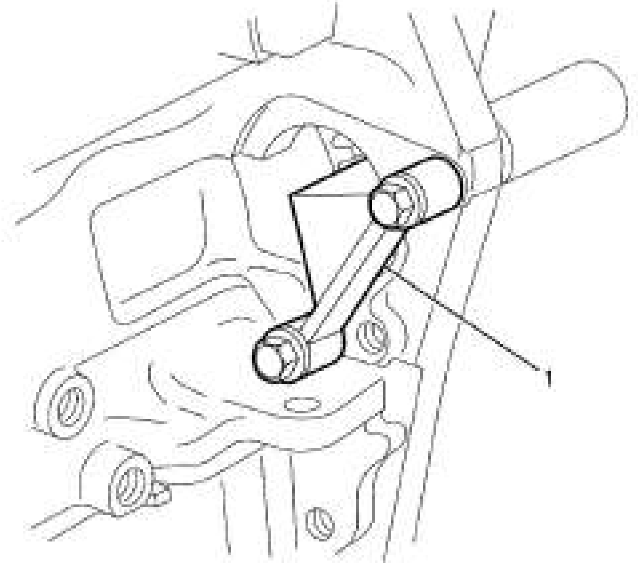
Removal Procedure

1. Remove the drive belt. Refer to Drive Belt Replacement .

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

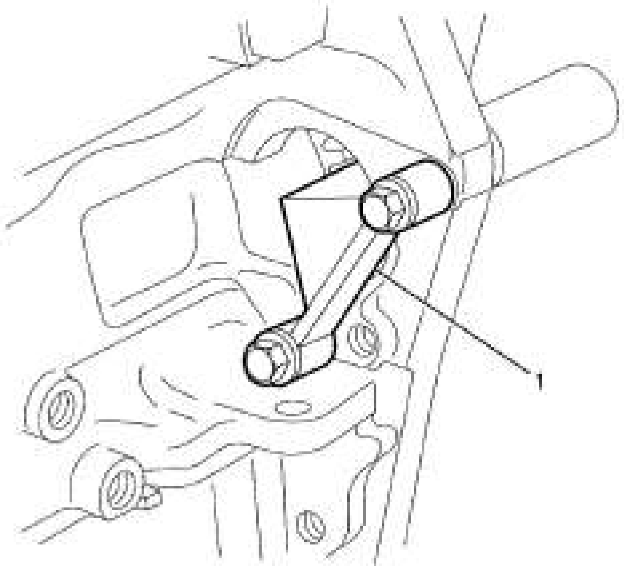
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the starter motor. Refer to Starter Motor Replacement .



4. Install the EN 46106 (1) through the starter mounting hole.
5. Lower the vehicle.
6. Remove the front air deflector. Refer to Front Air Deflector Replacement .
7. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal .

Installation Procedure

1. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation .
2. Install the front air deflector. Refer to Front Air Deflector Replacement .
3. Raise the vehicle.



4. Remove EN 46106 (1) from the starter mounting hole.
5. Remove the starter motor. Refer to Starter Motor Replacement .
6. Install the drive belt. Refer to Drive Belt Replacement .

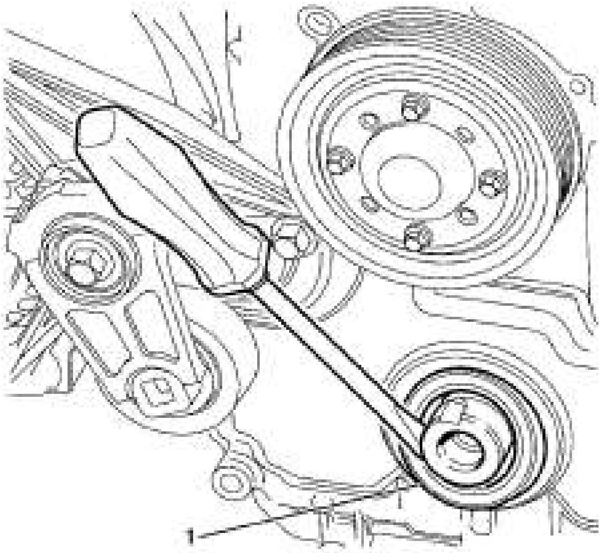
Crankshaft Front Oil Seal Replacement

Tools Required

J 29184 Oil Seal Installer

Removal Procedure

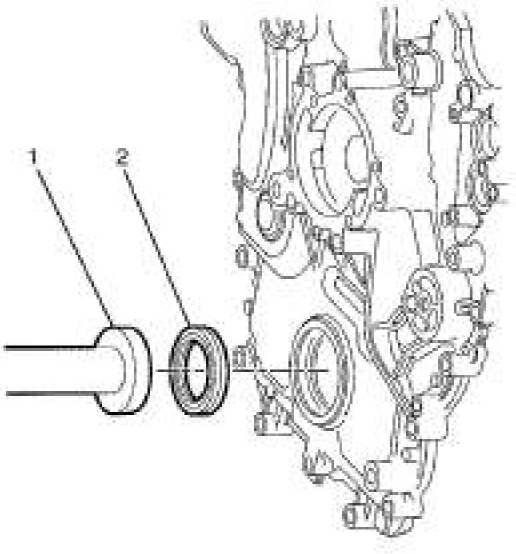
1. Remove the drive belt. Refer to Drive Belt Replacement.
2. Remove the crankshaft balancer. Refer to Crankshaft Balancer Replacement.



Important: DO NOT damage the sealing surfaces of the front cover or the crankshaft when prying the crankshaft front oil seal for removal. Damaging the sealing surface may cause leakage or require replacement of the damaged component.

3. Use a flat-bladed tool in order to remove the crankshaft oil seal (1).

Installation Procedure



Important: DO NOT lubricate the crankshaft front oil seal or the crankshaft balancer sealing surfaces.

1. Use the J 29184 (1) or equivalent to install the crankshaft front oil seal (2).
2. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
3. Install the drive belt. Refer to Drive Belt Replacement.

Crankshaft Rear Oil Seal and Housing Replacement

Removal Procedure

1. Remove the engine flywheel. Refer to Engine Flywheel Replacement.
2. Remove the oil pan. Refer to Oil Pan Replacement.
3. Remove the crankshaft rear oil seal and housing. Refer to Crankshaft Rear Oil Seal and Housing Removal.

Installation Procedure

1. Install the crankshaft rear oil seal and housing. Refer to Crankshaft Rear Oil Seal and Housing Installation.
2. Install the oil pan. Refer to Oil Pan Replacement.
3. Install the engine flywheel. Refer to Engine Flywheel Replacement.

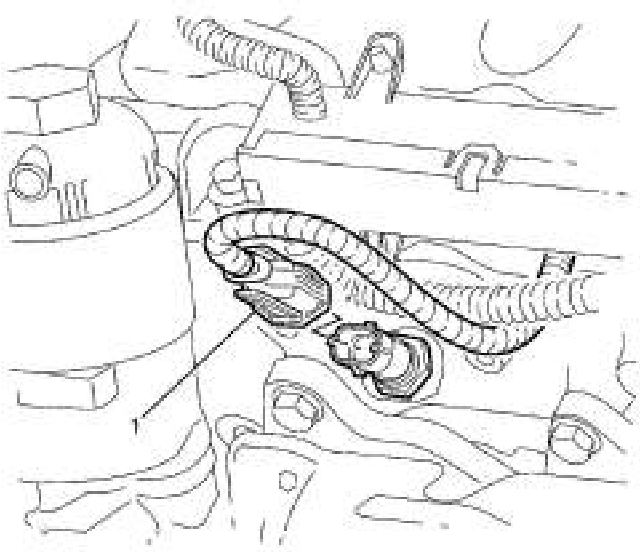
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977645**

Cylinder Head Replacement - Left Side (RHD)

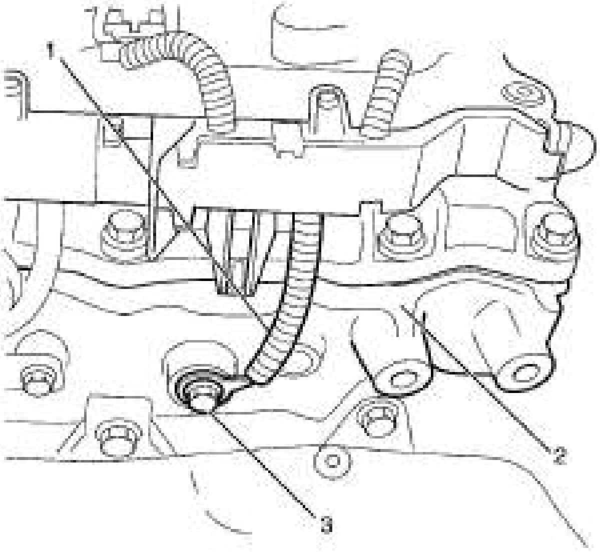
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

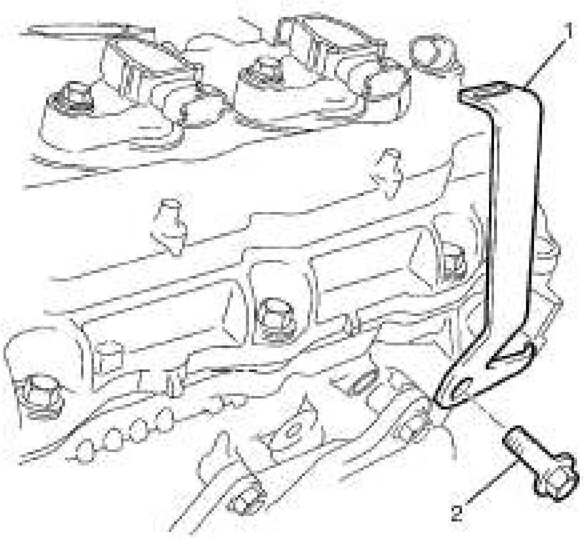
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
3. Remove the engine covers. Refer to Engine Cover Replacement.
4. Remove the left camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
5. Remove the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain Replacement - Left Side.
6. Remove the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.



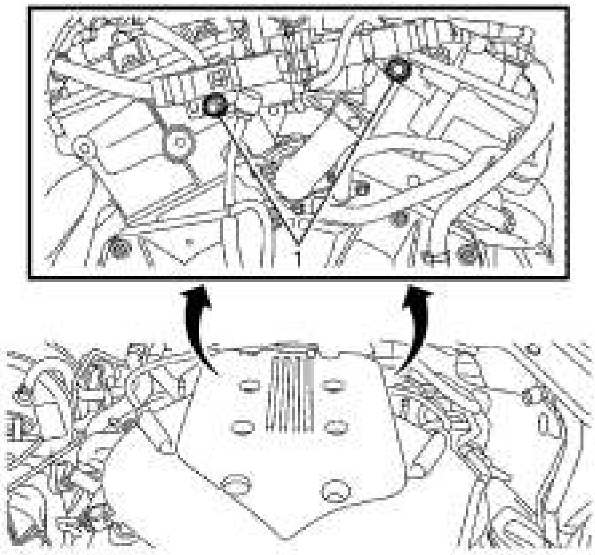
7. Disconnect the coolant temperature sensor electrical connector (1).



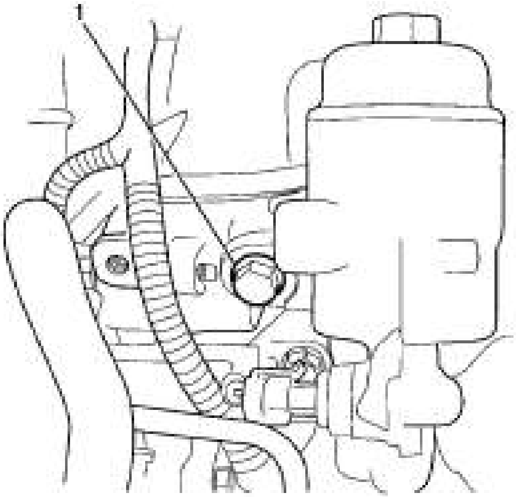
8. Remove the wiring harness ground to cylinder head retaining bolt (3).
9. Remove the wiring harness ground (1) from the cylinder head (2).
10. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.



11. Remove the left engine cover mounting bracket to cylinder head retaining bolt (2).
12. Remove the left engine cover mounting bracket (2) from the cylinder head.

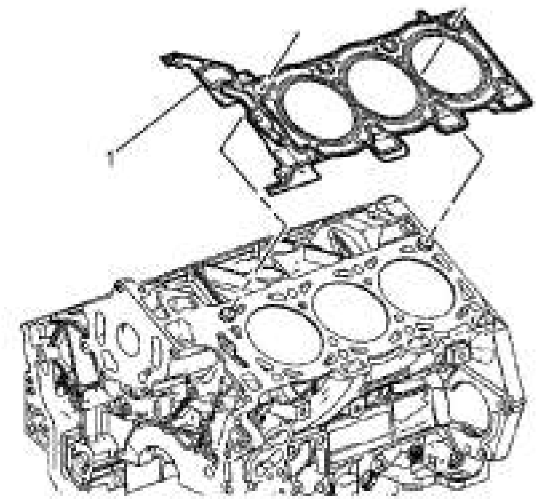


13. Remove the engine wiring harness bracket to cylinder head retaining bolts (1).
14. Remove the catalytic converter. Refer to Catalytic Converter Replacement - Left Side.



Important: DO NOT remove the oil filter adapter.

15. Remove the oil filter adapter upper bolt (1).
16. Remove the cylinder head with the exhaust manifold. Refer to Cylinder Head Removal - Left Side.



Important: Cylinder head gaskets must be discarded whenever the cylinder head has been removed from the cylinder block.

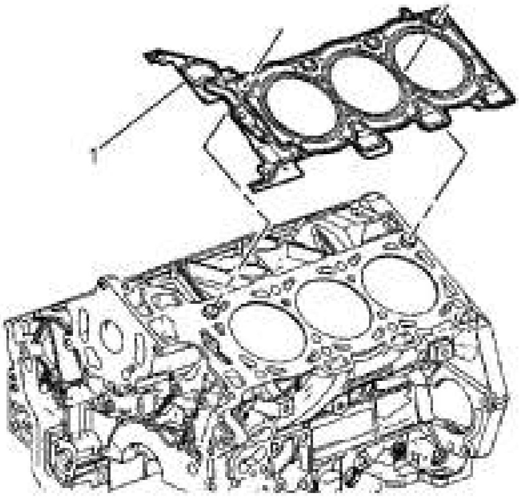
17. Remove the cylinder head gasket (1).

    Discard the gasket.

18. Clean and inspect the cylinder head and the cylinder block sealing surfaces. Refer to Cylinder Head Cleaning and Inspection and Engine Block Cleaning and Inspection.
19. If necessary, perform the following steps:
    - Remove the exhaust manifold from the cylinder head. Refer to Exhaust Manifold Removal - Left Side.
    - Disassemble the cylinder head. Refer to Cylinder Head Disassemble.

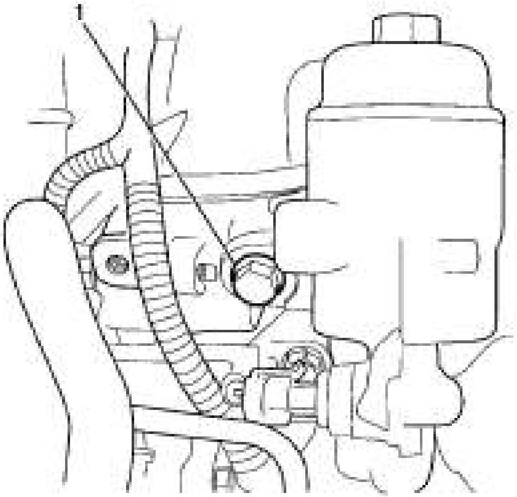
Installation Procedure

1. If necessary, perform the following steps:
    - Assemble the cylinder head. Refer to Cylinder Head Assemble.
    - Install the exhaust manifold to the cylinder head. Refer to Exhaust Manifold Installation - Left Side.



2. Install a NEW cylinder head gasket (1).
3. Install the cylinder head with the exhaust manifold to the engine. Refer to Cylinder Head Installation - Left Side.

   Notice: Refer to Fastener Notice in the Preface section.

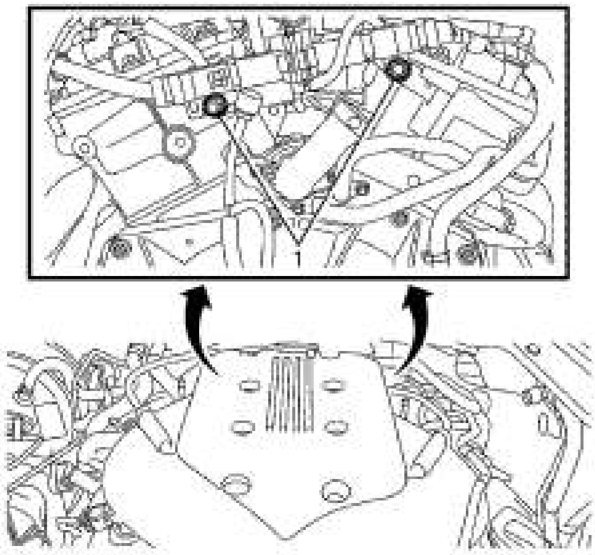


4. Install the oil filter adapter upper retaining bolt (1).

   Tighten
   Tighten the bolt to 65 N·m (48 lb in).

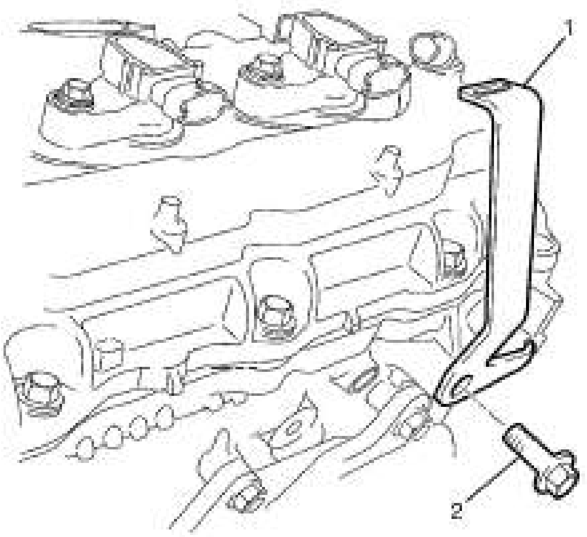
5. Install the catalytic converter to the exhaust manifold. Refer to Catalytic Converter

Replacement - Left Side.



6. Install the wiring harness bracket (2) to the rear of the cylinder head (3).
7. Install the wiring harness bracket to cylinder head retaining bolts (1).

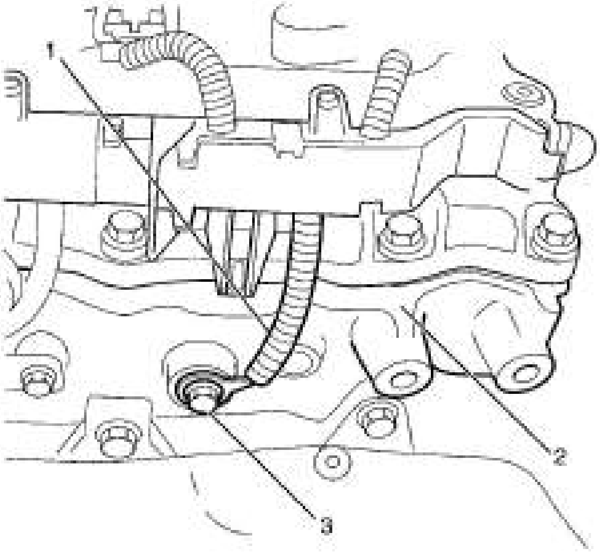
Tighten
Tighten the bolts to 10 N·m (89 lb in).



8. Install the left engine cover mounting bracket (1) to cylinder head retaining bolt (2).

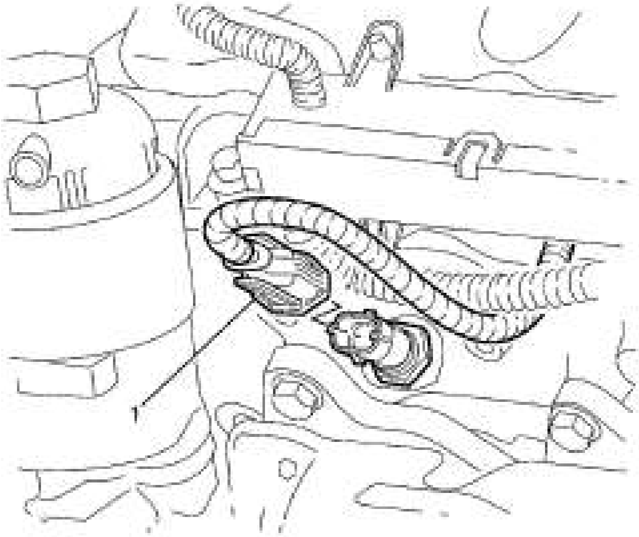
Tighten
Tighten the bolt to 35 N·m (26 lb in).

9. Install the engine covers mounting bracket to cylinder head retaining bolt (2).
10. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement.



11. Install the wiring harness ground (1) to the cylinder head (2).
12. Install the wiring harness ground to cylinder head retaining bolt (3).

Tighten
Tighten the bolt to 10 N·m (89 lb in).



13. Connect the coolant temperature sensor electrical connector (1).
14. Install the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.
15. Install the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain

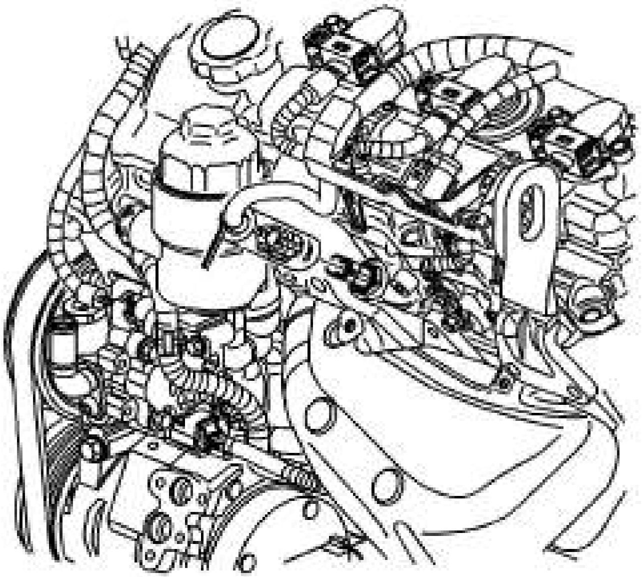
Replacement - Left Side.

16. Install the left camshaft cover. Refer to Camshaft Cover Replacement - Left Side.
17. Install the engine covers. Refer to Engine Cover Replacement.
18. Install the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
19. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

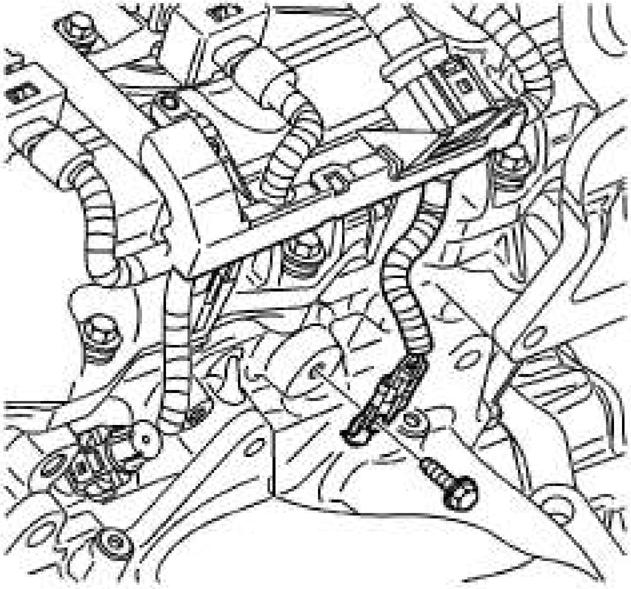
Cylinder Head Replacement - Left Side (LLT)

Removal Procedure

1. Remove the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain Replacement - Left Side.
2. Remove the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.
3. Remove the fuel pump. Refer to Fuel Pump Replacement.



4. Remove the heat shield from the coolant temperature sensor and disconnect the coolant temperature sensor electrical connector.



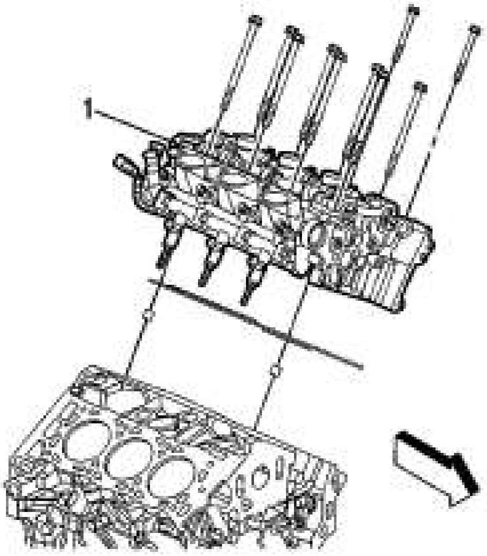
5. Remove the wiring harness ground from the cylinder head.
6. Disconnect the wiring harness electrical connector located at the side of the cylinder head.
7. Remove the wiring harness connector bracket from the side of the cylinder head.

Note: DO NOT disconnect the power steering pipes and/or hoses.

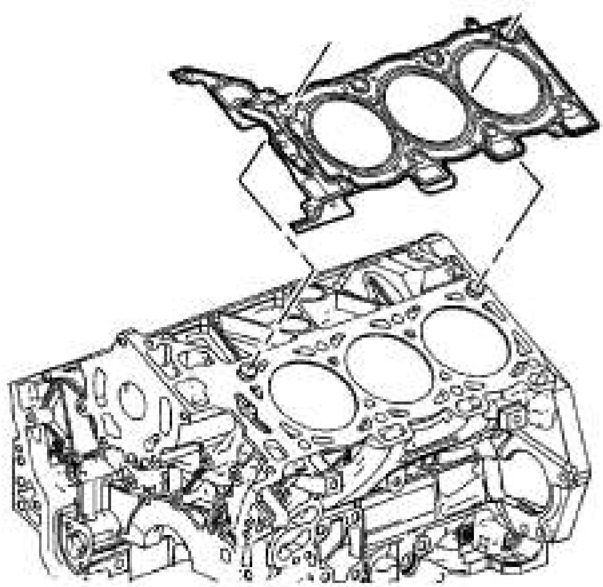
8. Remove the power steering pump bolts. Refer to Power Steering Pump Replacement.
9. Remove the surge tank hose from the bracket at the rear of the cylinder head.
10. Remove the wiring harness bracket from the rear of the cylinder head.
11. Remove the catalytic converter. Refer to Catalytic Converter Replacement - Left Side.
12. Remove the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.

Note: Do not remove the oil filter adapter.

13. Remove the oil filter adapter upper bolt.



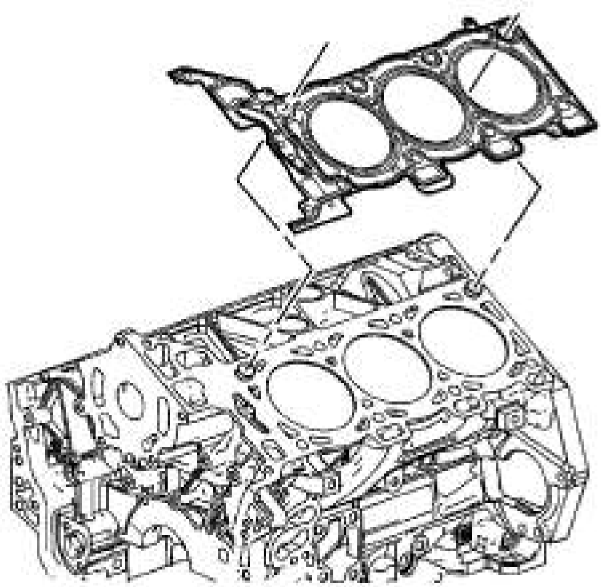
14. Remove the cylinder head (1) with the exhaust manifold. Refer to Cylinder Head Removal - Right Side.



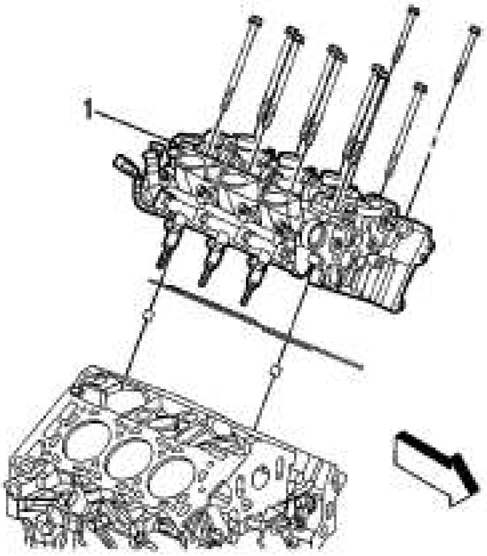
15. Remove and discard the cylinder head gasket.
16. Clean and inspect the cylinder head and the engine block sealing surfaces. Refer to Cylinder Head Cleaning and Inspection and Engine Block Cleaning and Inspection.
17. If necessary, perform the following steps:
    - 17.1. Remove the exhaust manifold from the cylinder head. Refer to Exhaust Manifold Removal - Left Side.
    - 17.2. Disassemble the cylinder head. Refer to Cylinder Head Disassemble.

Installation Procedure

1. If necessary, perform the following steps:
    - 1.1. Assemble the cylinder head. Refer to Cylinder Head Assemble.
    - 1.2. Install the exhaust manifold to the cylinder head. Refer to Exhaust Manifold Installation - Left Side.

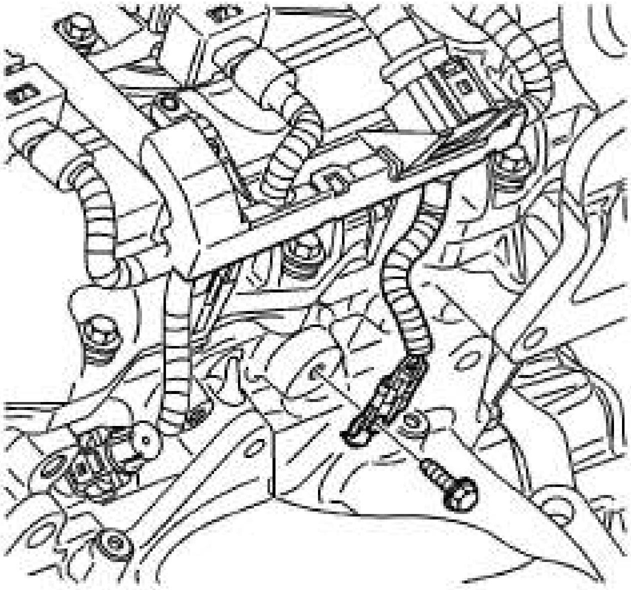


2. Install a NEW cylinder head gasket.

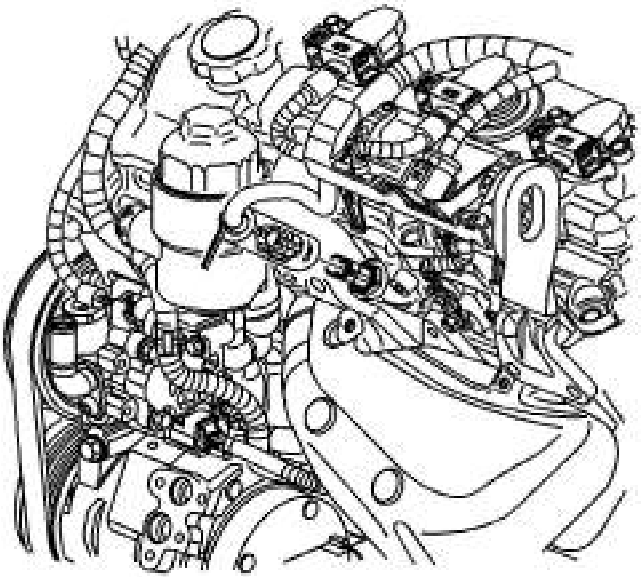


3. Carefully install the cylinder head (1) with the exhaust manifold to the engine. Refer to Cylinder Head Installation - Left Side.
4. Install the oil filter adapter upper bolt. Refer to Oil Filter Adapter Installation.
5. Install the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.
6. Install the catalytic converter to the exhaust manifold. Refer to Catalytic Converter Replacement - Left Side.
7. Install the wiring harness bracket to the rear of the cylinder head.
8. Install the surge tank hose to the bracket at the rear of the cylinder head.
9. Install the power steering pump bolts. Refer to Power Steering Pump Replacement.
10. Install the wiring harness connector bracket from the side of the cylinder head.
11. Disconnect the wiring harness electrical connector located at the side of the cylinder head.

Caution: Refer to Fastener Caution in the Preface section.



12. Install the wiring harness ground to the cylinder head and tighten the bolt to **10 N·m (89 lb in)**.



13. Install the coolant temperature sensor electrical connector heat shield.
14. Install the fuel pump. Refer to Fuel Pump Replacement.
15. Install the oil level indicator. Refer to Oil Level Indicator and Tube Replacement.
16. Install the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain Replacement - Left Side.

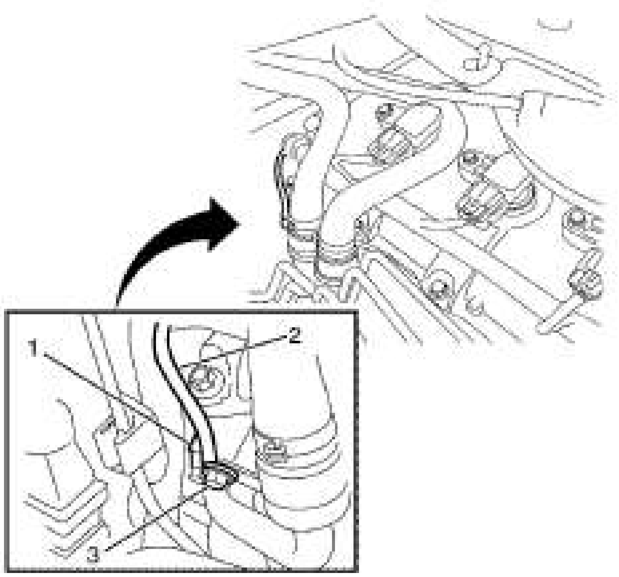
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977646

Cylinder Head Replacement - Right Side (RHD)

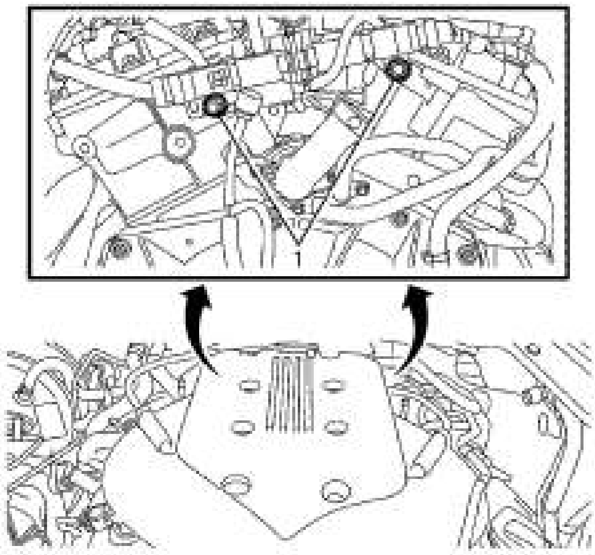
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

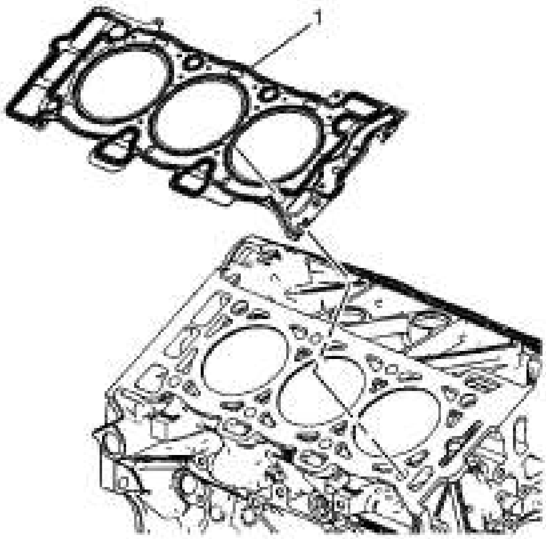
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
3. Remove the engine covers. Refer to Engine Cover Replacement.
4. Remove the right camshaft cover. Refer to Camshaft Cover Replacement - Right Side.
5. Remove the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain Replacement - Left Side.



6. Remove the wiring harness ground to cylinder head retaining bolts (1).
7. Remove the wiring harness ground (2) from the side of the cylinder head (3).
8. Remove the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement.



9. Remove the engine wiring harness bracket to cylinder head retaining bolts (1).
10. Remove the catalytic converter. Refer to Catalytic Converter Replacement - Right Side.
11. Remove the cylinder head with the exhaust manifold..



Important: Cylinder head gaskets must be discarded whenever the cylinder head has been removed from the cylinder block

12. Remove and discard the cylinder head gasket (1).

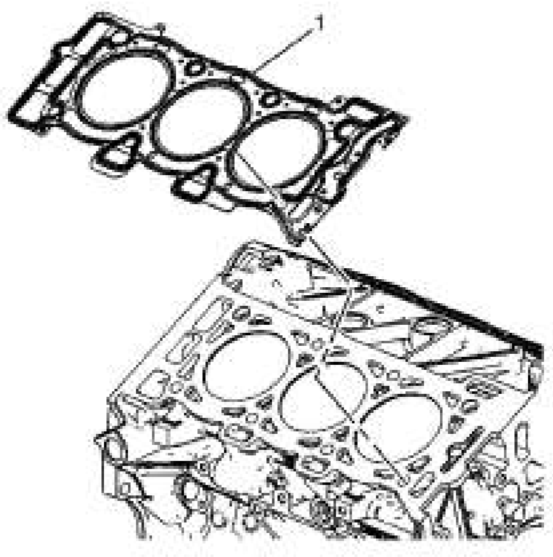
    Discard the gasket

13. Clean and inspect the cylinder head and the cylinder block sealing surfaces. Refer to Cylinder Head Cleaning and Inspectionand Engine Block Cleaning and Inspection.

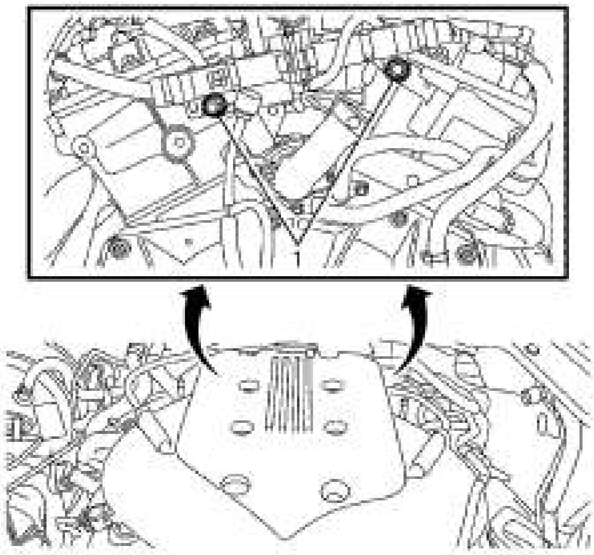
14. If necessary, perform the following steps:
    - Remove the exhaust manifold from the cylinder head. Refer to Exhaust Manifold Removal - Right Side.
    - Disassemble the cylinder head. Refer to Cylinder Head Disassemble.

Installation Procedure

1. If necessary, perform the following steps:
    - Assemble the cylinder head. Refer to Cylinder Head Assemble.
    - Install the exhaust manifold to the cylinder head. Refer to Exhaust Manifold Installation - Right Side.



2. Install a NEW cylinder head gasket (1).
3. Install the cylinder head with the exhaust manifold to the engine..
4. Install the catalytic converter to the exhaust manifold. Refer to Catalytic Converter Replacement - Right Side.

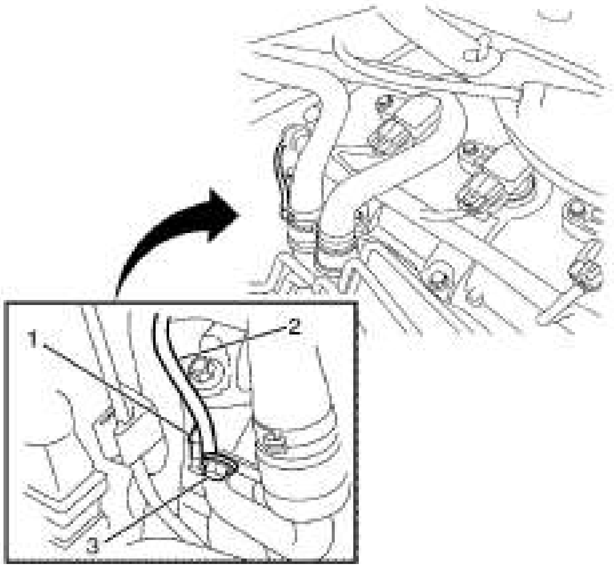


5. Install the engine wiring harness bracket to cylinder head retaining bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.

6. Install the wiring harness bracket to cylinder head retaining bolts (1).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).



7. Install the wiring harness ground to the side of the cylinder head.
8. Install the wiring harness ground to right cylinder head retaining bolt (3).

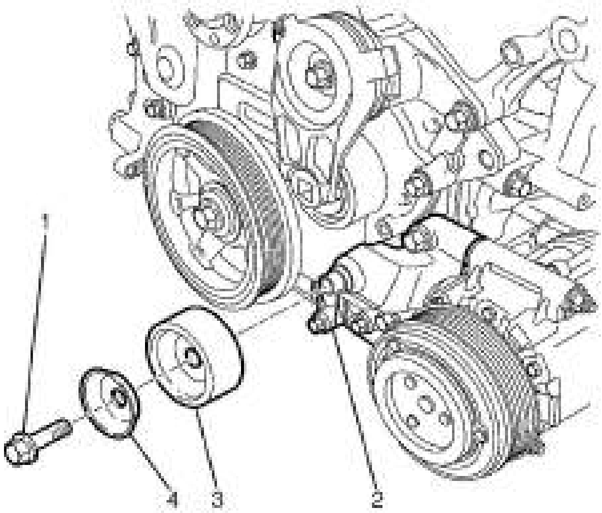
Tighten
Tighten the bolt to 10 N·m (89 lb in).

9. Install the coolant inlet pipe. Refer to Engine Coolant Inlet Pipe Replacement.
10. Install the right camshaft cover. Refer to Camshaft Cover Replacement - Right Side.
11. Install the left bank secondary timing chain. Refer to Secondary Camshaft Drive Chain Replacement - Left Side.
12. Install the engine covers. Refer to Engine Cover Replacement.
13. Install the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement.
14. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

Drive Belt Idler Pulley Replacement

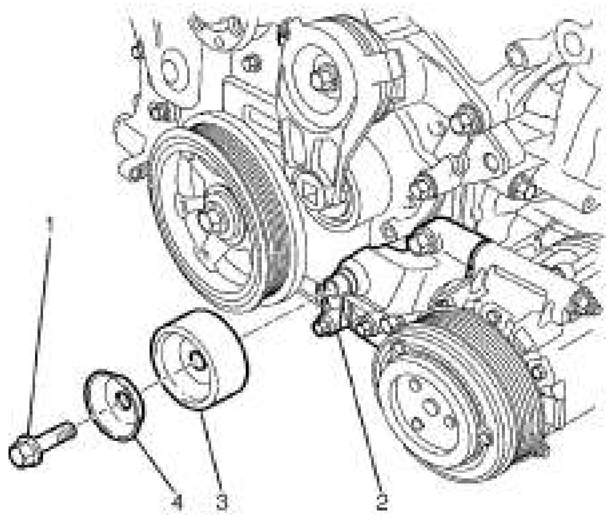
Removal Procedure

1. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.
2. Remove the drive belt. Refer to Drive Belt Replacement.



3. Remove the drive belt idler pulley to accessory drive mounting bracket retaining bolt (1).
4. Remove the dished washer (4) and drive belt idler pulley (3) from the accessory drive mounting bracket (2).

Installation Procedure



1. Install the dished washer (4) and drive belt idler pulley (3) to the accessory drive mounting bracket (2).
2. Hand tighten the drive belt idler pulley to accessory drive mounting bracket retaining bolt (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Tighten the drive belt idler pulley to accessory drive mounting bracket retaining bolt.

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).

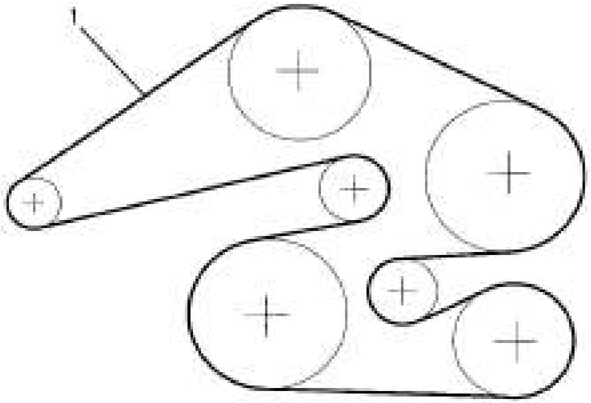
4. Install the drive belt. Refer to Drive Belt Replacement.
5. Install the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 2023902**

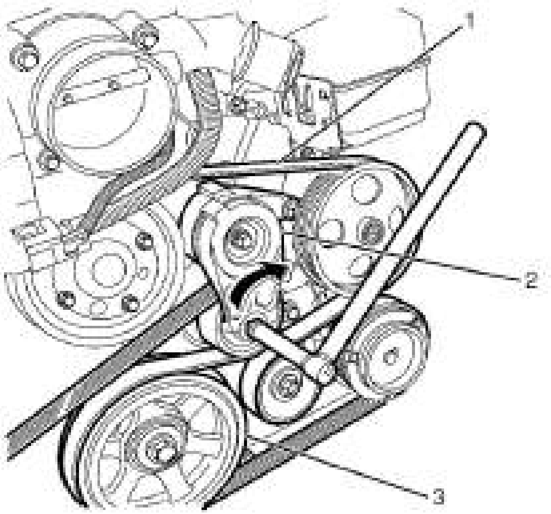
Drive Belt Replacement (With Air Conditioning)

Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.



2. Note the routing of the drive belt (1).

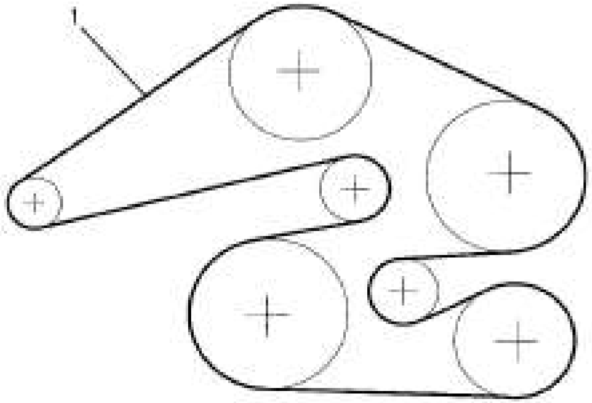


Important: Using a suitable tool rotate the drive belt tensioner (2) clockwise.

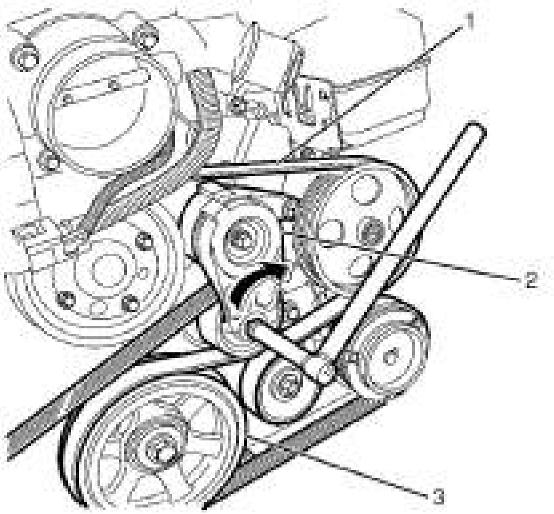
3. Rotate the drive belt tensioner (2) clockwise in order to release tension on the drive belt (1).

4. Remove the drive belt (1) from the crankshaft pulley (3).
5. Slowly release the drive belt tensioner (2).
6. Remove the drive belt (1).

Installation Procedure



1. Install and correctly route the drive belt (1) around the following:
   - Water pump pulley
   - Generator
   - Drive belt tensioner
   - Crankshaft balancer
   - Air conditioning compressor
   - Power steering pump



2. Using a suitable tool rotate the drive belt tensioner (2) clockwise.
3. Install the drive belt (1) to the crankshaft pulley (3).

   Important: Make sure the drive belt (1) is correctly aligned and seated into the grooves of the accessory drive pulleys.

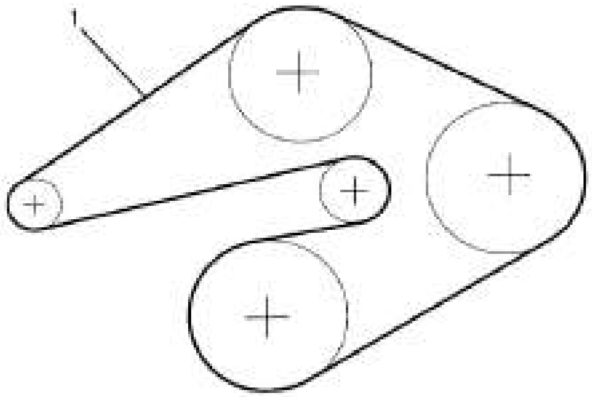
4. Slowly release the drive belt tensioner (2).
5. Remove the suitable tool from the drive belt tensioner (2).
6. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 2023873**

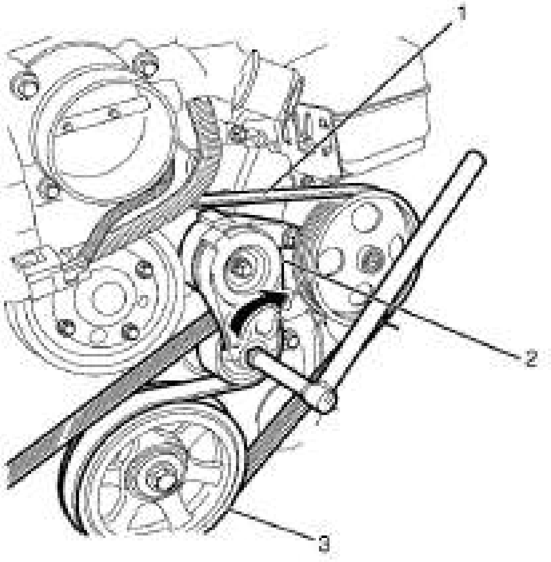
Drive Belt Replacement (Without Air Conditioning)

Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.



2. Note the routing of the drive belt (1).

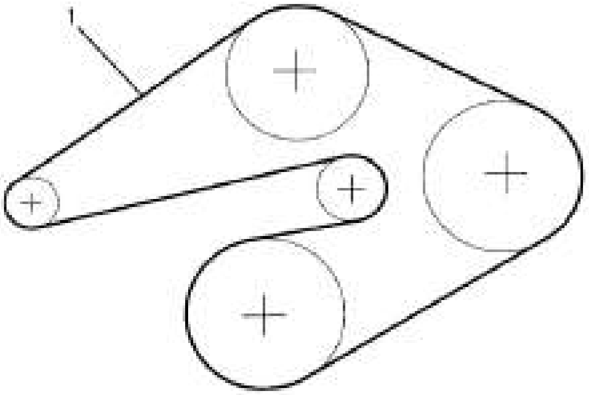


Important: Using a suitable tool rotate the drive belt tensioner (2) clockwise.

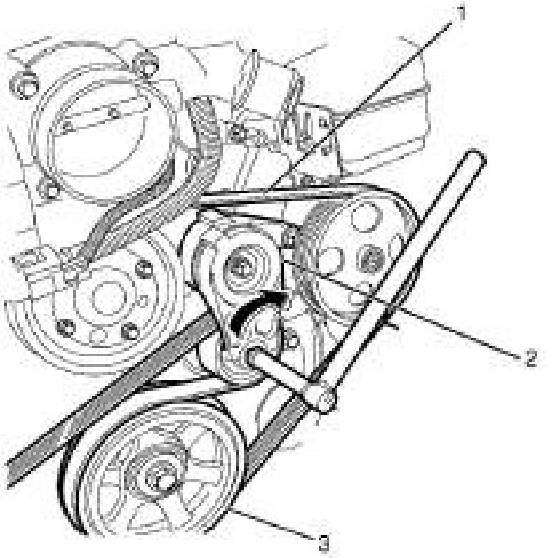
3. Rotate the drive belt tensioner (2) clockwise in order to release tension on the drive belt (1).

4. Remove the drive belt (1) from the crankshaft pulley (3).
5. Slowly release the drive belt tensioner (2).
6. Remove the drive belt (1).

Installation Procedure



1. Install and correctly route the drive belt (1) around the following:
   - Water pump pulley
   - Generator
   - Drive belt tensioner
   - Crankshaft balancer
   - Power steering pump



2. Using a suitable tool rotate the drive belt tensioner (2) clockwise.
3. Install the drive belt (1) to the crankshaft pulley (3).

   Important: Make sure the drive belt (1) is correctly aligned and seated into the grooves of the accessory drive pulleys.

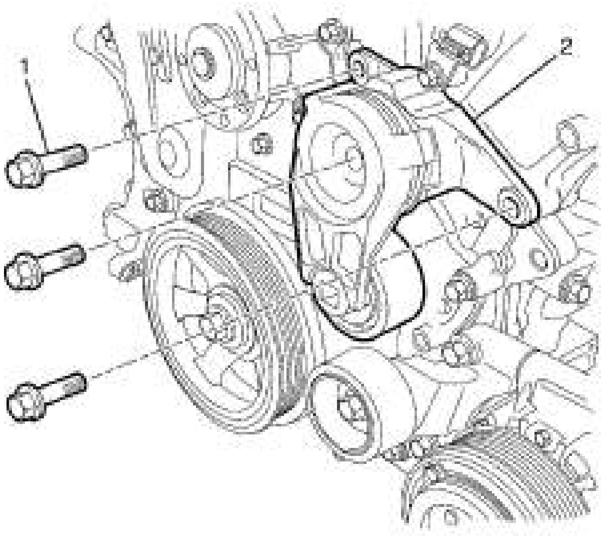
4. Slowly release the drive belt tensioner (2).
5. Remove the suitable tool from the drive belt tensioner (2).
6. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 2025494**

Drive Belt Tensioner Replacement (With Air Condictioning)

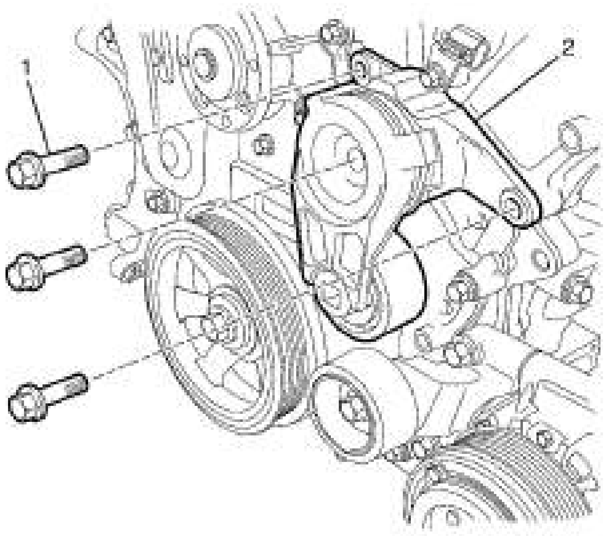
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
2. Remove the drive belt. Refer to Drive Belt Replacement.



3. Remove the drive belt tensioner to engine front cover retaining bolts (1).
4. Remove the drive belt tensioner (2).

Installation Procedure



1. Install the drive belt tensioner (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the drive belt tensioner to engine front cover retaining bolts (1).

   Tighten
   Tighten the bolts to 22 N·m (17 lb ft).

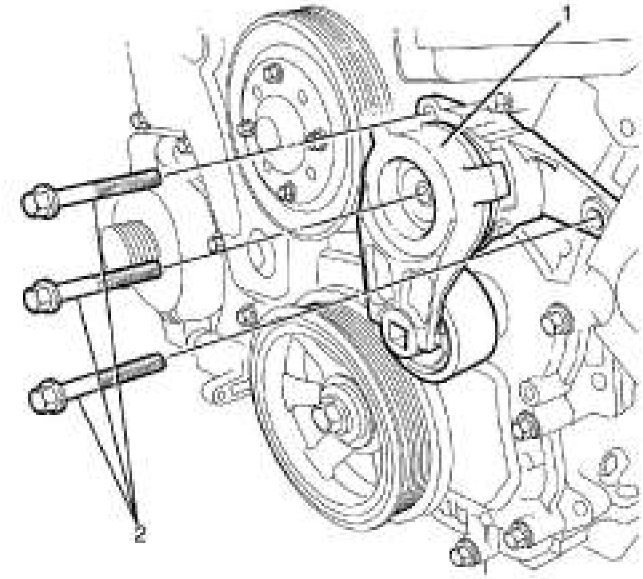
3. Install the drive belt. Refer to Drive Belt Replacement.
4. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 2025495

Drive Belt Tensioner Replacement (Without Air Condictioning)

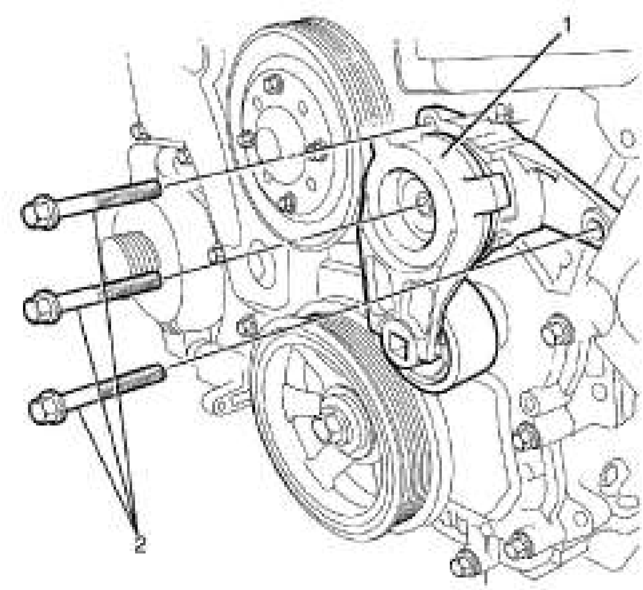
Removal Procedure

1. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
2. Remove the drive belt. Refer to Drive Belt Replacement.



3. Remove the drive belt tensioner to engine front cover retaining bolts (2).
4. Remove the drive belt tensioner (1).

Installation Procedure



1. Install the drive belt tensioner (1) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the drive belt tensioner to engine front cover retaining bolts (2).

   Tighten
   Tighten the bolts to 22 N·m (17 lb ft).

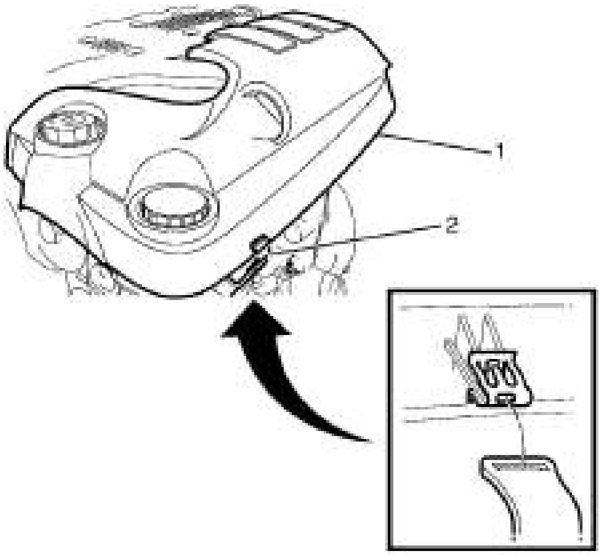
3. Install the drive belt. Refer to Drive Belt Replacement.
4. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1996221**

Engine Cover Replacement

Removal Procedure

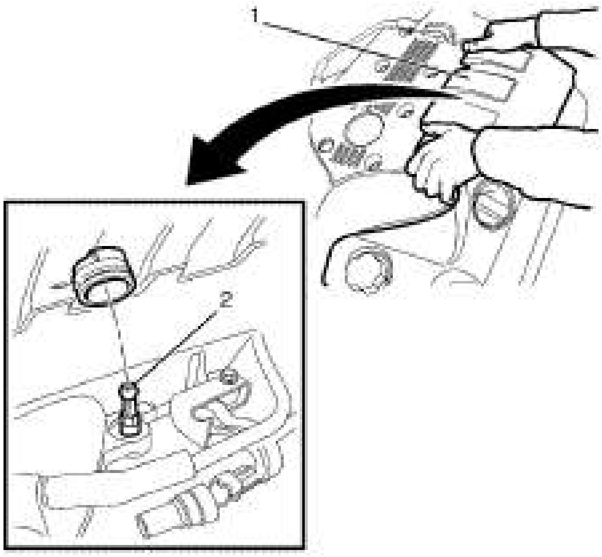
1. Remove the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement .



Important: The right hand engine cover has only one outer retaining clip (2) at the front. The left hand engine cover has one front and one rear outer retaining clip.

Important: Grasp and pry the engine covers (1) upwards to detach the engine covers (1) from the outer retaining clips (2).

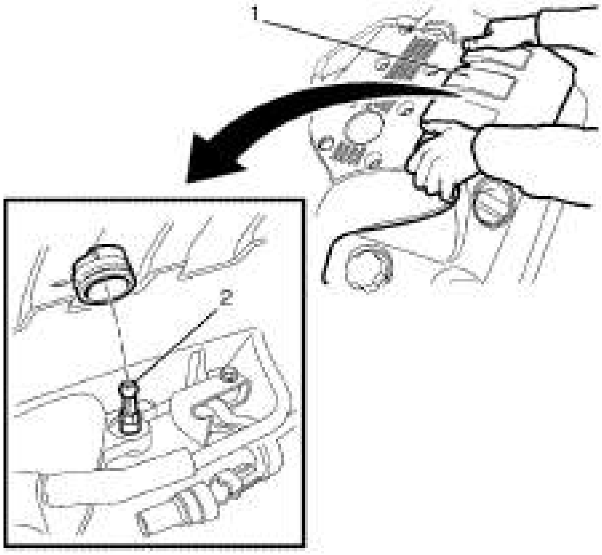
2. Detach the engine covers (1) from the outer retaining clips (2).



Important: Disengage the engine covers (1) from the ball studs (2) by pulling up firmly on the rear and front of the engine covers (1).

3. Detach the engine covers (1) from the ball studs (2).
4. Remove the engine covers (1).

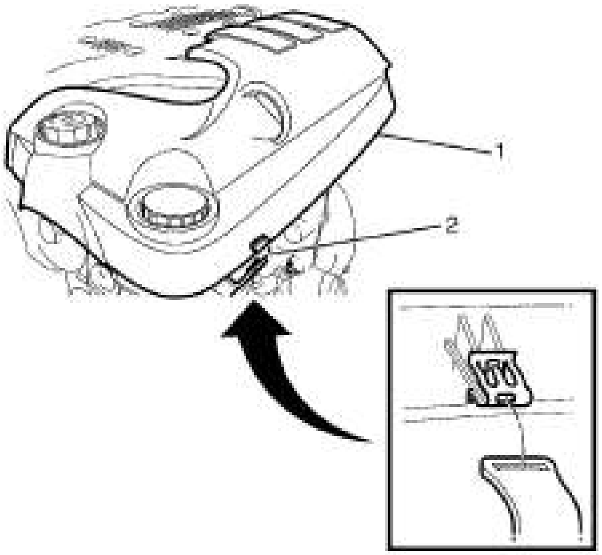
Installation Procedure



1. Position the engine covers (1) over the intake manifold so the grommets are aligned with the ball studs (2).

Important: Press the engine covers (1) down firmly near the ball studs to attach the engine covers (1) to the ball studs (2).

2. Attach the engine covers (1) to the ball studs (2).



Important: The right hand engine cover has only one outer retaining clip (2) at the front. The left hand engine cover has one front and one rear outer retaining clip.

Important: Press the engine covers (1) down firmly near the outer retaining clips to attach the engine covers (1) to the outer retaining clips (2).

3. Attach the engine covers (1) to the outer retaining clips (2).
4. Install the cross car brace, if fitted. Refer to Front End Panel Module Carrier Assembly Replacement

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995062**

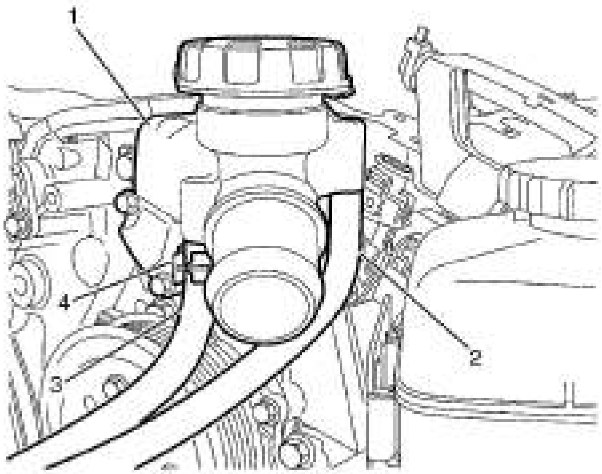
Engine Front Cover Replacement

Tools Required

EN 46109 Engine Front Cover Installation Guide Pins

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement .
2. Remove the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
3. Remove the camshaft covers. Refer to Camshaft Cover Replacement - Left Side and Camshaft Cover Replacement - Right Side .
4. Drain the engine coolant. Refer to Cooling System Draining and Filling .
5. Remove the radiator outlet hose. Refer to Radiator Outlet Hose Replacement .



6. Compress the coolant bleed hose retaining clamp (4) at the outlet housing (1) end and slide 50 mm (2 in) along the coolant bleed hose (3).
7. Remove the coolant bleed hose (3) from the outlet housing (1).

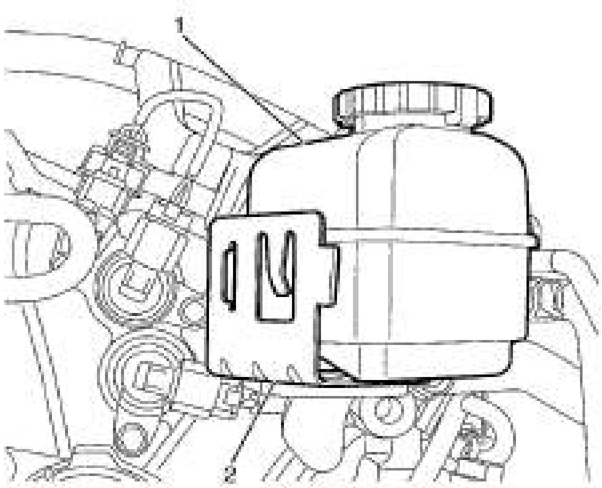
   Important: Twist and pull the coolant recovery hose (2) to remove from the outlet housing (1).

8. Disconnect the coolant recovery hose (2) from the outlet housing (1).

   Important: Plug or cap the hoses and inlets when separating the cooling system components, this prevents dirt and other contaminants from entering the cooling system.

9. Plug or cap the cooling system hoses and inlets
10. Remove the water outlet housing. Refer to Water Outlet Housing Replacement .
11. Remove the drive belt. Refer to Drive Belt Replacement .

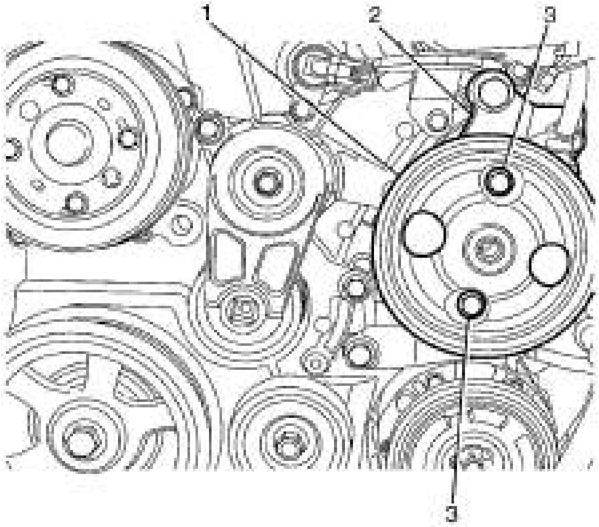
12. Remove the drive belt tensioner. Refer to Drive Belt Tensioner Replacement .
13. Remove the alternator bracket with the alternator. Refer to Generator Bracket Replacement .



Important: DO NOT disconnect the power steering pipes or drain the power steering fluid.

Important: The locking tang on the power steering reservoir bracket (2) must be released before removing the power steering reservoir (1). Release the locking tang on the power steering reservoir bracket (2) with a suitable tool.

14. Separate power steering fluid reservoir (1) from the power steering fluid reservoir bracket (2).
15. Reposition and secure the power steering fluid reservoir away from the power steering fluid reservoir (1) bracket (2).

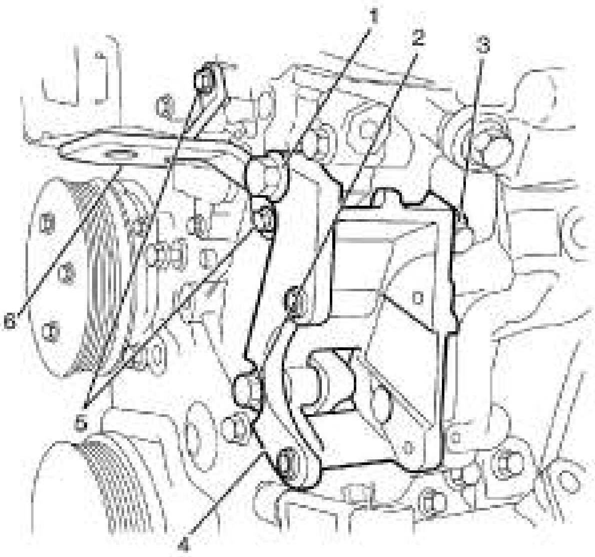


Important: DO NOT disconnect the power steering pipes/hoses.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

16. Remove the power steering pump to power steering bracket retaining bolts (3).
    - Discard the bolts.
    - Clean the bolt holes.
17. Remove the power steering pump (1) from the power steering bracket (2).
18. Secure and reposition the power steering pump (1) away from the power steering bracket (2).



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

19. Remove the power steering fluid reservoir bracket to engine front cover retaining bolts (5).
    - Discard the bolts.
    - Clean the bolt holes.
20. Remove the power steering fluid reservoir bracket (6).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

21. Remove the power steering bracket to cylinder head retaining bolt (3).
    - Discard the bolt.
    - Clean the bolt hole.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

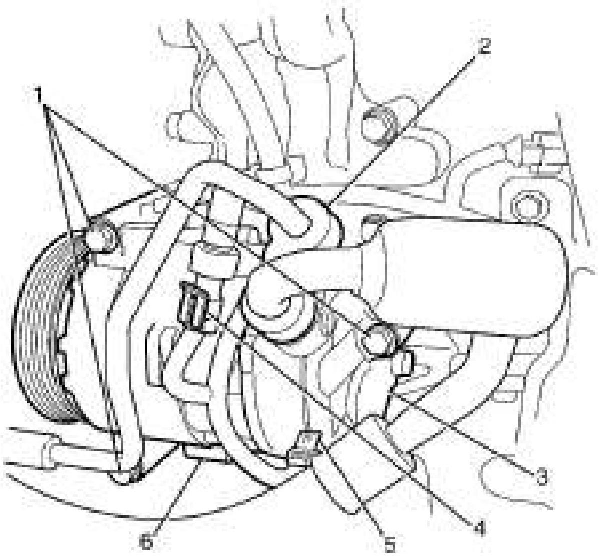
Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

22. Remove the power steering bracket to engine front cover retaining bolt (1).
    - Discard the bolt.
    - Clean the bolt hole.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

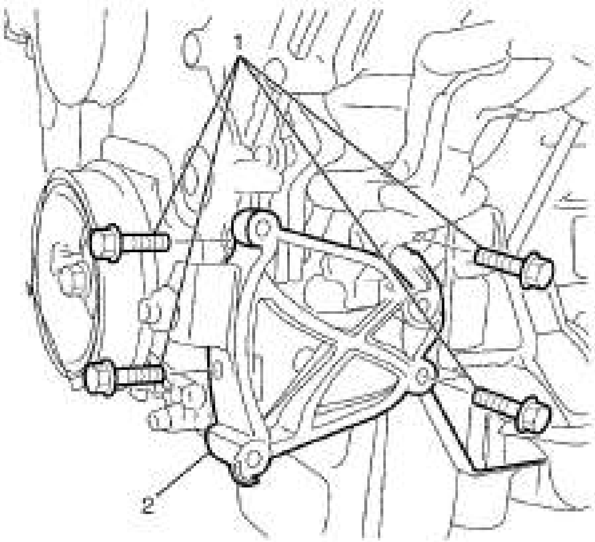
23. Remove the power steering bracket to cylinder block retaining bolt (2).
    - Discard the bolt.
    - Clean the bolt hole.
24. Remove the power steering pump bracket (4).



25. Disconnect the A/C pressure transducer electrical connector (4).
26. Disconnect the A/C compressor electrical connector (5).

Important: DO NOT disconnect the A/C pipes (2) from the A/C compressor (6).

27. Remove the A/C compressor to A/C compressor/power steering pump mounting bracket retaining bolts (1).
28. Secure and reposition the A/C compressor (6) away from the A/C compressor mounting bracket (3).



29. Remove the compressor bracket mounting bolts (1).
30. Remove the compressor bracket (2).
31. Remove the crankshaft balancer. Refer to Crankshaft Balancer Replacement .
32. Remove the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust . Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake . Refer to Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake .
33. Remove the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake (if fitted) Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake .
34. Remove the engine front cover with the water pump. Refer to Engine Front Cover Removal .
35. Disassemble the engine front cover as necessary. Refer to Engine Front Cover Disassemble .

Important: DO NOT use sharp and/or metal gasket scrapers in order to clean the sealing surfaces.

36. Carefully clean the engine front cover sealing surfaces. Refer to Engine Front Cover Cleaning and Inspection .

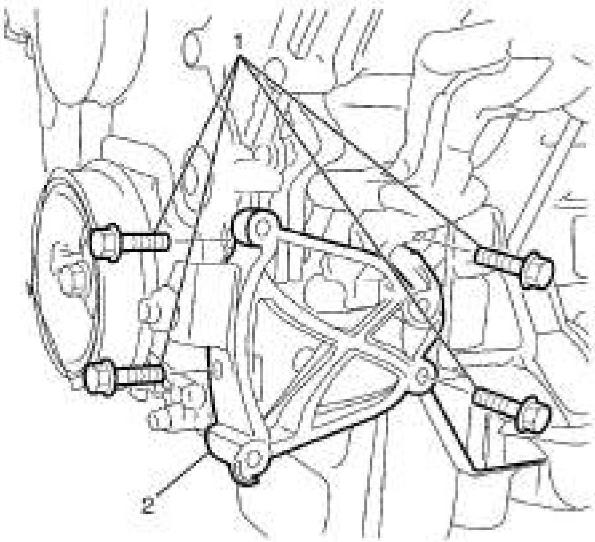
Important: Insert a piece of cardboard between the oil pan front and the oil pump in order to prevent any contaminants from falling into the oil pan.

37. Carefully clean the engine front cover sealing surfaces. Refer to Engine Front Cover Cleaning and Inspection .
38. Use compressed air in order to remove any engine coolant from the engine cooling passages and from the top of the oil pan scraper (windage tray).

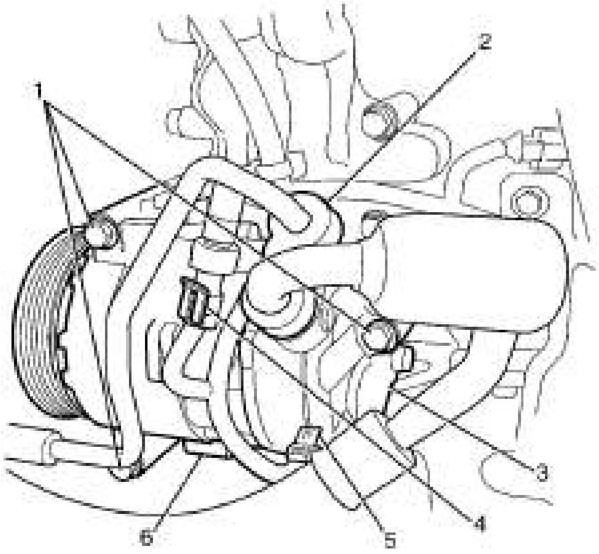
Installation Procedure

1. Assemble the engine front cover as necessary. Refer to Engine Front Cover Assemble .

2. Use the EN 46109 to install the engine front cover. Refer to Engine Front Cover Installation .
3. Install the camshaft position (CMP) actuator solenoids. Refer to (if fitted) Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake . Refer to (if fitted) Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake .
4. Install the camshaft position sensors. Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust and Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake . Refer to (if fitted) Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust and Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake .
5. Install the crankshaft balancer. Refer to Crankshaft Balancer Replacement .



6. install the compressor bracket (2).
7. Install the compressor bracket mounting bolts (1).



Important: Make sure the A/C pipes (2) are not twisted or kinked upon compressor installation.

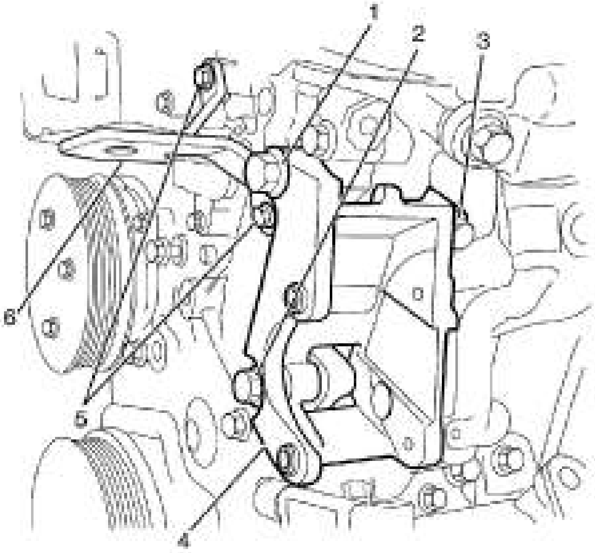
8. Install the A/C compressor (6) with the A/C pipes (2) to the A/C compressor mounting bracket (3).

Notice: Refer to Fastener Notice in the Preface section.

9. Install the compressor to compressor mounting bracket retaining bolts (1)

Tighten
Tighten the bolts to 22 N·m (16 lb ft).

10. Connect the A/C pressure transducer electrical connector (4).
11. Connect the A/C compressor electrical connector (5).



12. Install the power steering pump bracket (4).
13. Install a NEW power steering bracket to cylinder head retaining bolt (3).

Tighten
Tighten the bolt to 58 N·m (43 lb ft).

14. Install a NEW power steering bracket to engine front cover retaining bolts (1).

Tighten
Tighten the bolt to 58 N·m (43 lb ft).

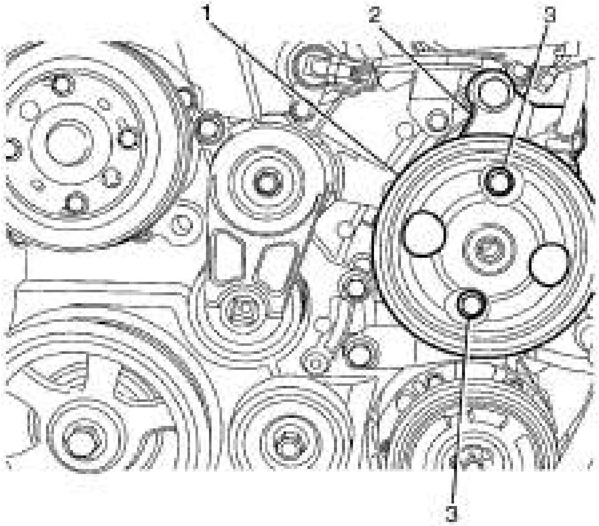
15. Install a NEW power steering bracket to cylinder block retaining bolt (2).

Tighten
Tighten the bolt to 58 N·m (43 lb ft).

16. Install the power steering fluid reservoir bracket (6).
17. Install the NEW power steering fluid reservoir bracket to engine front cover retaining

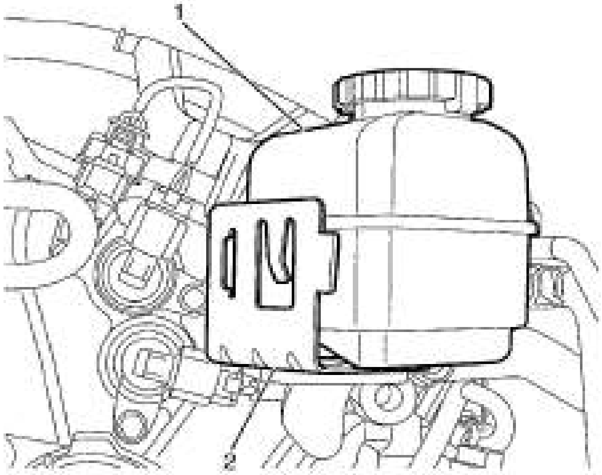
bolts (5).

Tighten
Tighten the bolts to 9 N·m (80 lb ft).



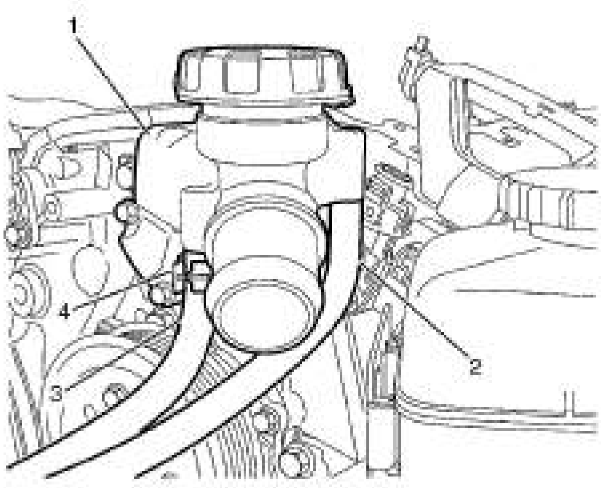
18. Install the power steering pump (2) to the power steering pump bracket (1).
19. Install the NEW power steering pump to power steering pump bracket retaining bolts (3).

Tighten
Tighten the bolts to 27 N·m (22 lb ft).



Important: Make sure the power steering reservoir (1) and the locking tang on the power steering reservoir bracket (2) are engaged to avoid an induced rattle condition.

20. Install the power steering fluid reservoir (1) to the power steering fluid reservoir bracket (2).
21. Install the alternator bracket with the alternator. Refer to Generator Bracket Replacement .
22. Install the belt tensioner. Refer to Drive Belt Tensioner Replacement .
23. Install the drive belt. Refer to Drive Belt Replacement .
24. Install the water outlet housing. Refer to Water Outlet Housing Replacement .



25. Remove the plug or cap at the cooling system hoses and inlets
26. Install the coolant bleed hose (3) to the outlet housing (1).
27. Compress the coolant bleed hose retaining clamp (4) and position back to its original location on the coolant bleed hose (3).
28. Connect the coolant recovery hose (2) from the outlet housing (1).
29. Install the radiator outlet hose. Refer to Radiator Outlet Hose Replacement .
30. Install the camshaft covers. Refer to Camshaft Cover Replacement - Left Side and Camshaft Cover Replacement - Right Side .
31. Install the upper intake manifold with the lower intake manifold. Refer to Lower Intake Manifold Replacement .
32. Install the engine covers. Refer to Engine Cover Replacement .
33. Fill the cooling system. Refer to Cooling System Draining and Filling .
34. Change the engine oil. Refer to Engine Oil and Oil Filter Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977514**

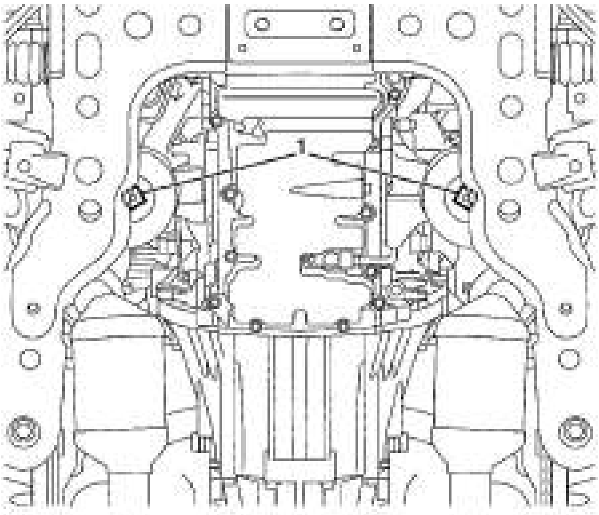
Engine Mount Bracket Replacement - Left Side

Removal Procedure

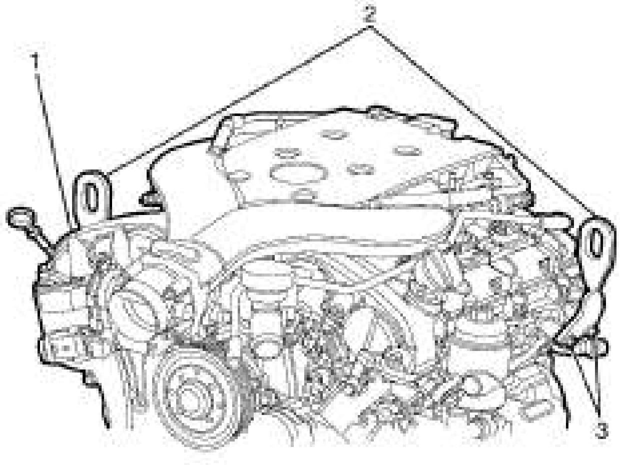
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.



3. Remove the lower engine mount retaining nuts (1).
4. Lower the vehicle.



5. Position the EN 46114 (2) on the engine (1).

   Notice: Refer to Fastener Notice in the Preface section.

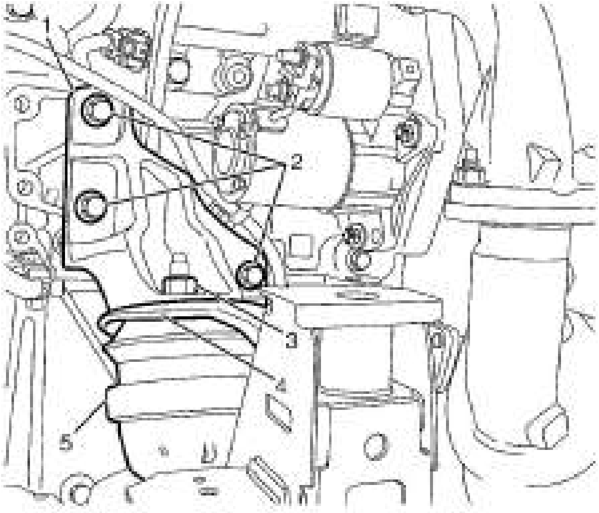
6. Install the EN 46114 to cylinder head retaining bolts (3).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).

   Important: Use a suitable tool to raise the engine.

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

7. Raise the engine until the weight of the engine is removed from the left hand engine mount.



8. Remove the left hand engine mount to engine mount bracket retaining nut (3).

   Important: If required raise the engine further to provide adequate space.

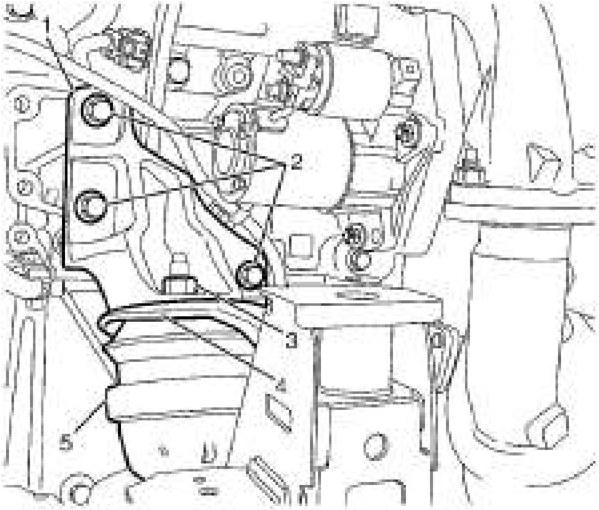
   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

9. Remove the left hand engine mount (5) from the left hand engine mount bracket (1).

   Important: DO NOT distort or bend the left hand engine mount heat shield (4).

10. Remove the left hand engine mount bracket to cylinder block retaining bolts (2).
11. Remove the left hand engine mount bracket (1).

Installation Procedure



Important: DO NOT distort or bend the left hand engine mount heat shield (4).

1. Install the left hand engine mount bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the left hand engine mount bracket to cylinder block retaining bolts (2).

   Tighten
   Tighten the bolts to 60 N·m (44 lb ft).

3. Position the left hand engine mount (5) on the left hand engine mount bracket (1).
4. Install the left hand engine mount to engine mount bracket retaining nut (3).

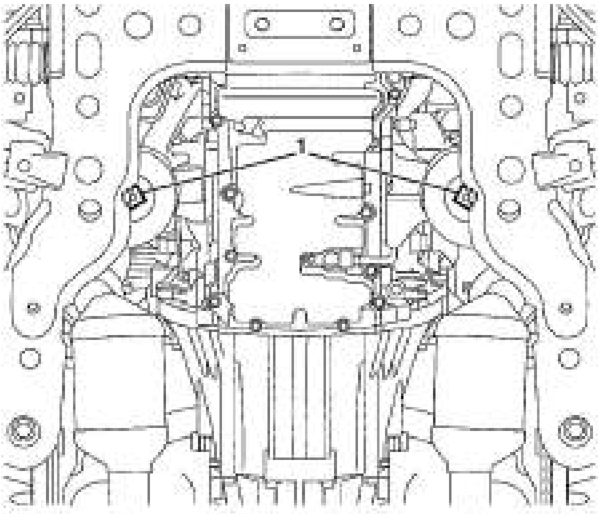
   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

5. Lower the engine until the weight is resting on the left hand engine mount.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

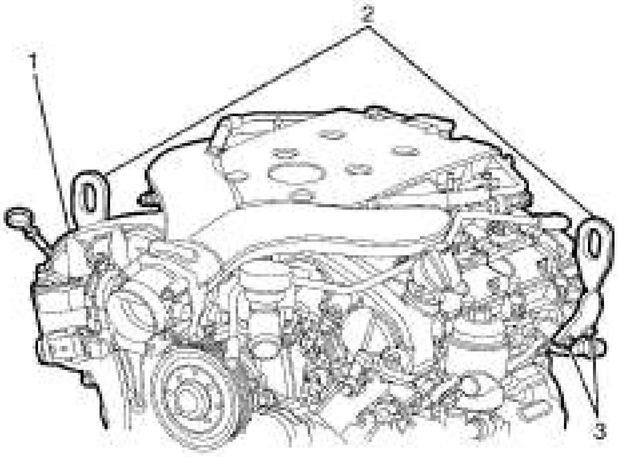
6. Raise the vehicle.



7. Install the engine mount to front subframe retaining nut (1).

   Tighten
   Tighten the nuts to 80 N·m (59 lb ft).

8. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
9. Lower the vehicle to the ground.



10. Remove the EN 46114 to cylinder head retaining bolts (3).
11. Remove the EN 46114 (2) from the engine (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977515**

Engine Mount Bracket Replacement - Right Side

Removal Procedure

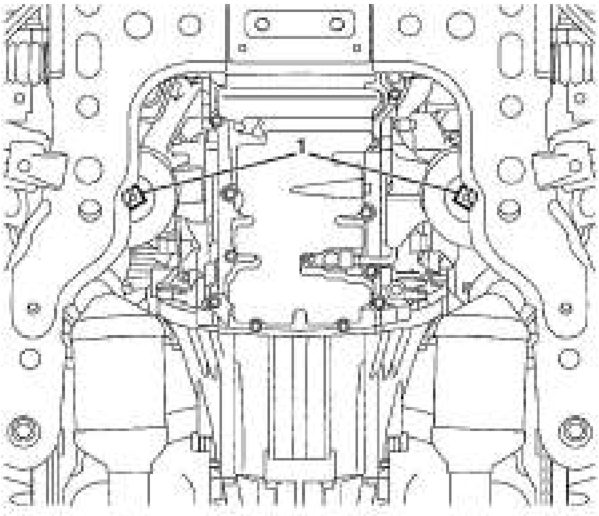
Tools Required

EN 46114 Engine Lift Brackets.

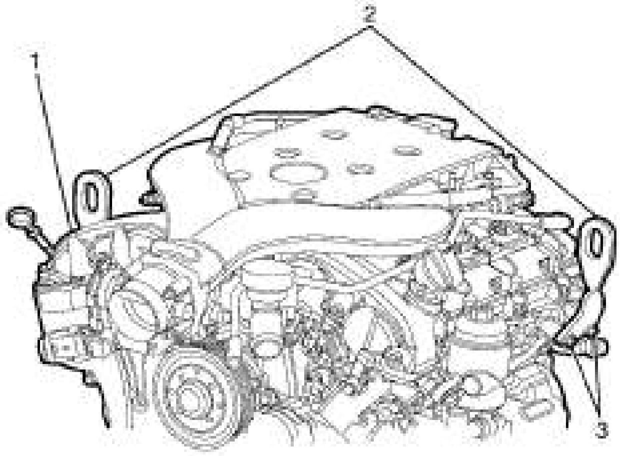
> **Caution:** Refer to Safety Glasses Caution in the Preface section.

> **Caution:** Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the engine splash shield. Refer to Engine Splash Shield Replacement .



3. Remove the lower engine mount retaining nuts (1).
4. Lower the vehicle.



5. Position the EN 46114 (2) on the engine (1).

   Notice: Refer to Fastener Notice in the Preface section.

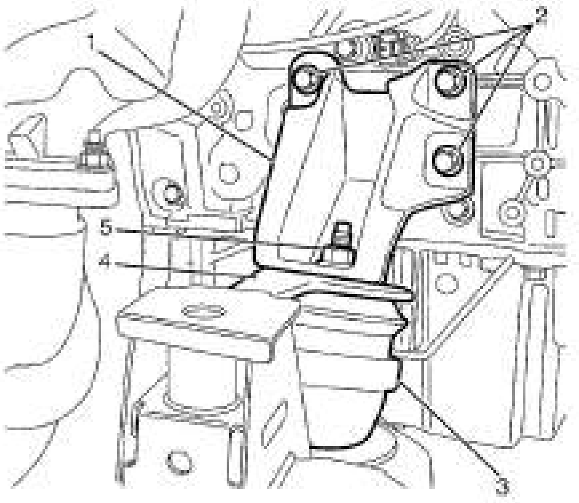
6. Install the EN 46114 to cylinder head retaining bolts (3).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).

   Important: Use a suitable tool to raise the engine.

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

7. Raise the engine until the weight of the engine is removed from the right hand engine mount.



8. Remove the right hand engine mount to engine mount bracket retaining nut (5).

   Important: If required raise the engine further to provide adequate space.

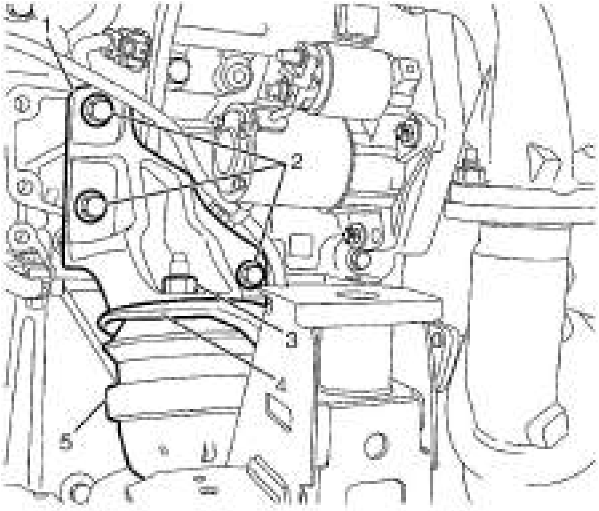
   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

9. Remove the right hand engine mount (3) from the right hand engine mount bracket (1).

   Important: DO NOT distort or bend the right hand engine mount heat shield (4).

10. Remove the right hand engine mount bracket to cylinder block retaining bolts (2).
11. Remove the right hand engine mount bracket (1).

Installation Procedure



Important: DO NOT distort or bend the right hand engine mount heat shield (4).

1. Install the right hand engine mount bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the right hand engine mount bracket to cylinder block retaining bolts (2).

   Tighten
   Tighten the bolts to 60 N·m (44 lb ft).

3. Position the right hand engine mount (3) on the right hand engine mount bracket (1).
4. Install the right hand engine mount to engine mount bracket retaining nut (5).

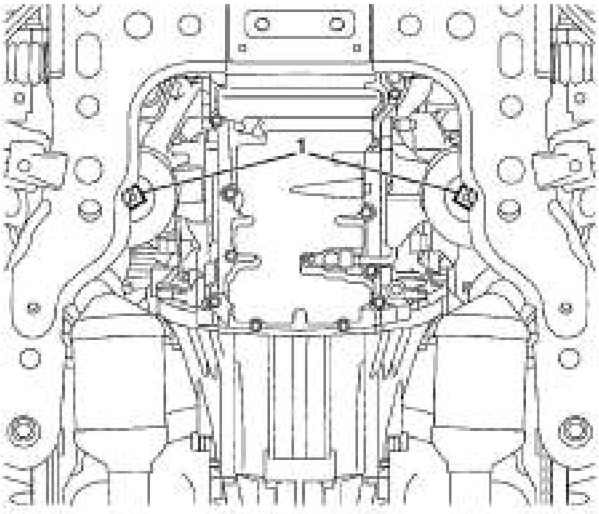
   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

5. Lower the engine until the weight is resting on the right hand engine mount.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

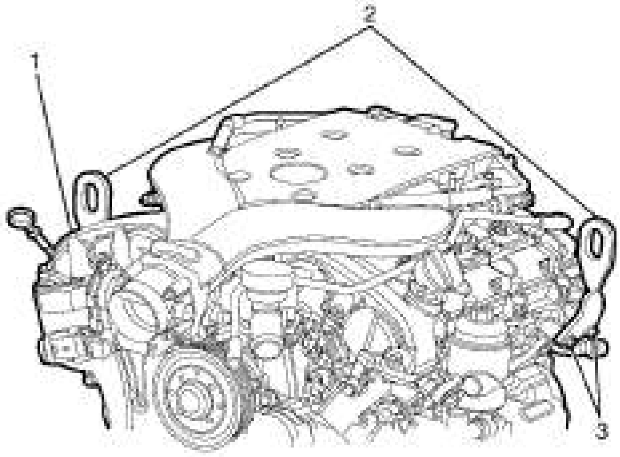
6. Raise the vehicle.



7. Install the engine mount to front subframe retaining nut (1).

   Tighten
   Tighten the nuts to 80 N·m (59 lb ft).

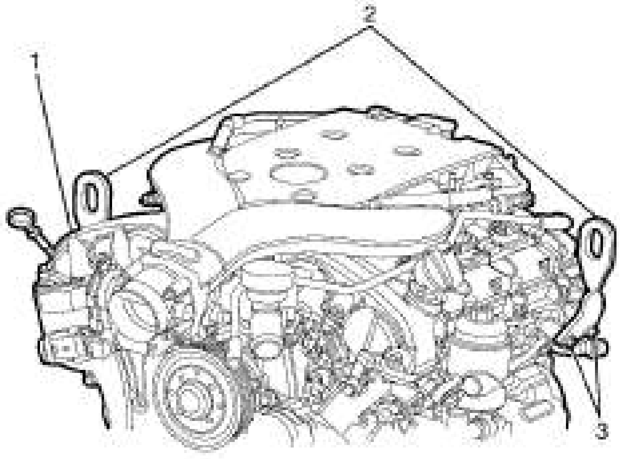
8. Install the engine splash shield. Refer to Engine Splash Shield Replacement .
9. Lower the vehicle to the ground.



10. Remove the EN 46114 to cylinder head retaining bolts (3).
11. Remove the EN 46114 (2) from the engine (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995048**

Engine Mount Inspection



1. Position the EN 46114 (2) on the engine (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the EN 46114 to cylinder head retaining bolts (3).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).

   Notice: Broken or deteriorated mounts can cause misalignment and destruction of certain drive train components. When a single mount breaks, the remaining mounts are subjected to abnormally high stresses.

   Important: Raising the engine, will remove the weight from the engine mount and create a slight tension in the rubber mount.

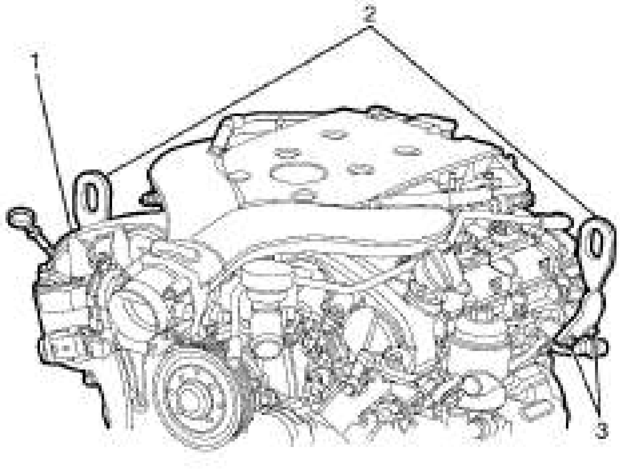
3. Use a suitable engine lifting tool to raise the engine until the weight of the engine is removed from the engine mounts.

   Important: Before replacing any engine mount due to suspected fluid loss, verify that the source of the fluid is actually the engine mount, not the engine or other accessories.

4. Observe the engine mount while raising the engine. Replace the engine mount if the mount exhibits any of the following conditions:
   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the engine mount.

- The rubber is split through the center of the engine mount.
- The GLYCOL™ fluid is leaking from the engine mount.

5. If there is movement between the metal plate of the engine mount and its attaching points, lower the engine on the engine mount. Tighten the bolts or nuts attaching the engine mount to the frame or engine mount bracket. Refer to Engine Mount Replacement - Left Side or Engine Mount Replacement - Right Side.



6. Remove the EN 46114 to cylinder head retaining bolts (3).
7. Remove the EN 46114 (2) from the engine (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977512

Engine Mount Replacement - Left Side

Removal Procedure

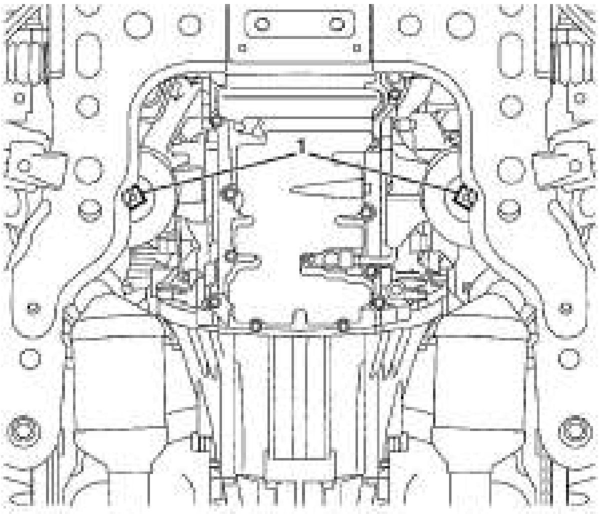
Tools Required

EN 46114 Engine Lift Brackets.

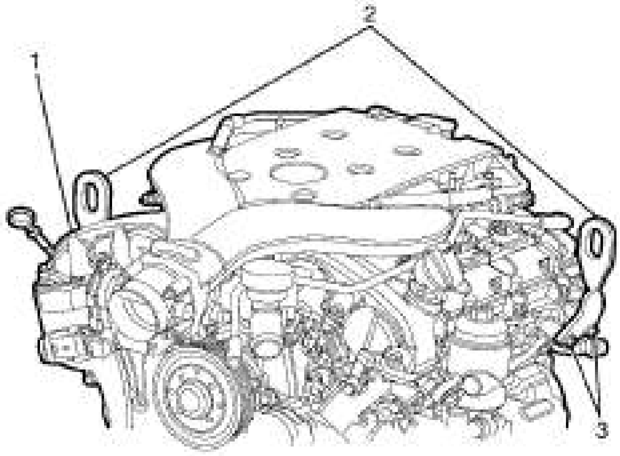
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the engine splash shield. Refer to Engine Splash Shield Replacement .



3. Remove the engine mount to front subframe retaining nuts (1).
4. Lower the vehicle.



5. Position the EN 46114 (2) on the engine (1).

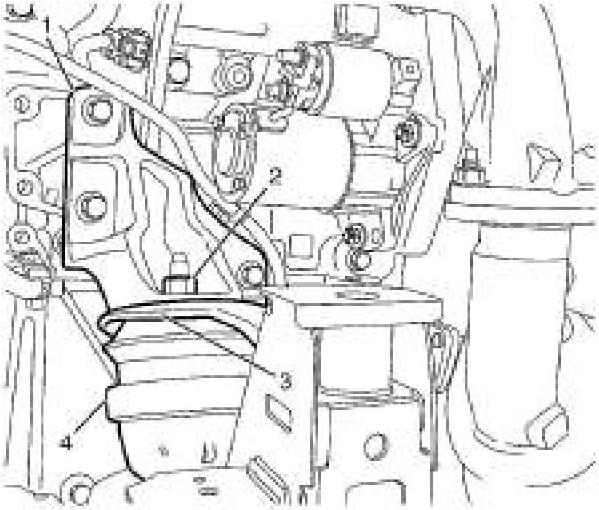
   Notice: Refer to Fastener Notice in the Preface section.

6. Install the EN 46114 to cylinder head retaining bolts (3).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

7. Use a suitable engine lifting tool to raise the engine until the weight of the engine is removed from the left hand engine mount.



8. Remove the left hand engine mount to engine mount bracket retaining nut (2).

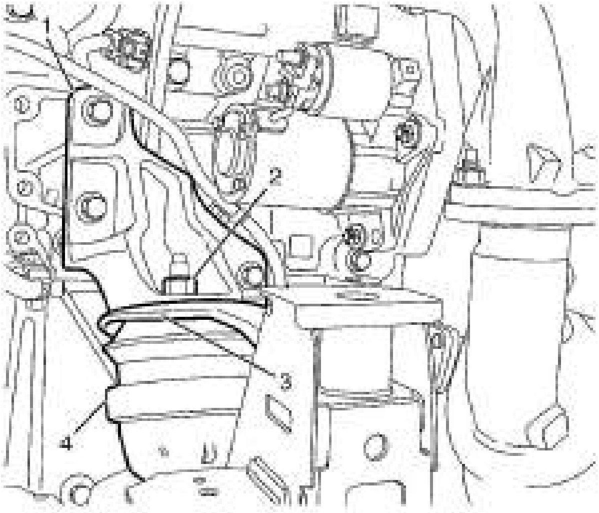
   Important: If required raise the engine further to provide adequate space.

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

   Important: DO NOT distort or bend the left hand engine mount heat shield (3).

9. Remove the left hand engine mount (4) from the left hand engine mount bracket (1).

Installation Procedure



Important: DO NOT distort or bend the left hand engine mount heat shield (3).

1. Position the left hand engine mount (4) on the left hand engine mount bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the left hand engine mount to engine mount bracket retaining nut (2).

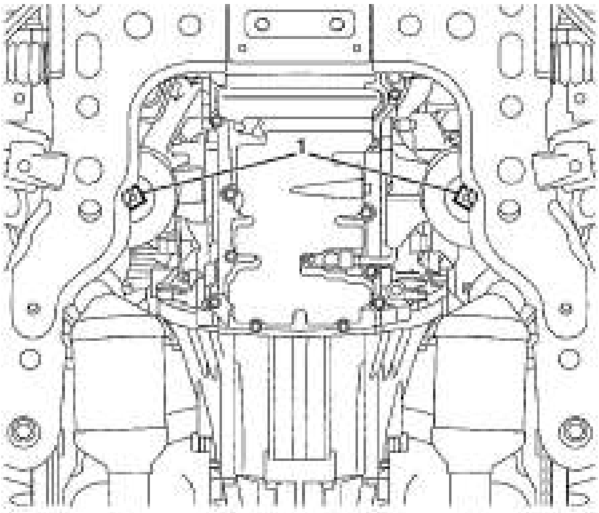
   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

3. Lower the engine until the weight is resting on the left hand engine mount.

   Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

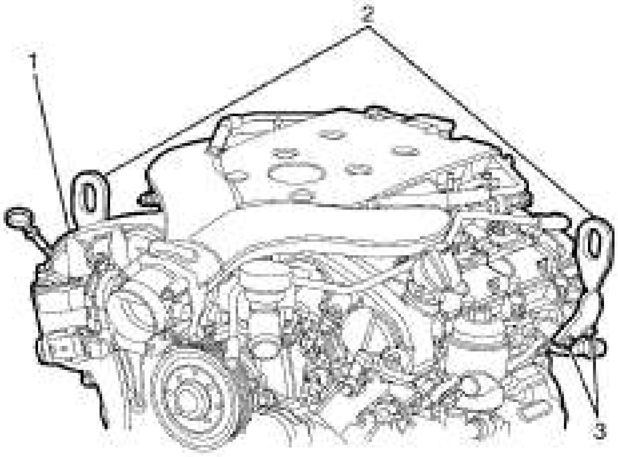
4. Raise the vehicle.



5. Install the engine mount to front subframe retaining nuts (1).

Tighten
Tighten the nuts to 80 N·m (59 lb ft).

6. Install the engine splash shield. Refer to Engine Splash Shield Replacement .
7. Lower the vehicle to the ground.



8. Remove the EN 46114 to cylinder head retaining bolts (3).
9. Remove the EN 46114 (2) from the engine (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977513

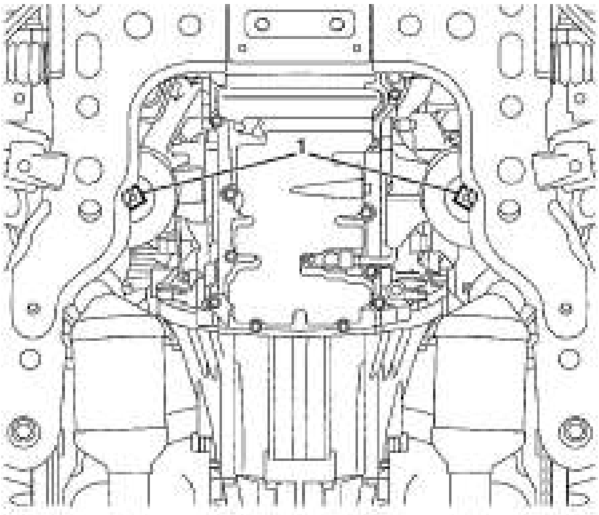
Engine Mount Replacement - Right Side

Removal Procedure

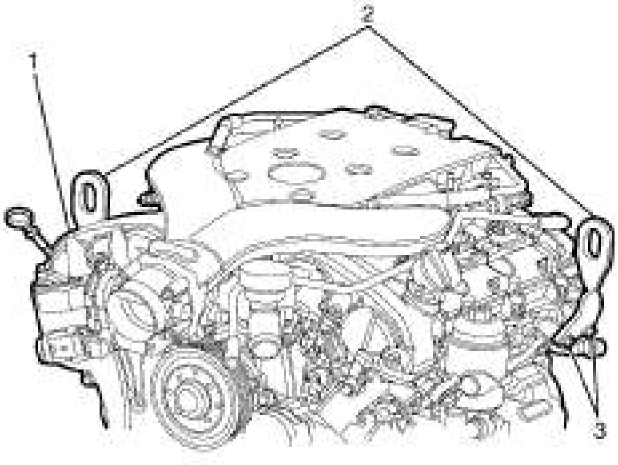
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.



3. Remove the engine mount to front subframe retaining nuts (1).
4. Lower the vehicle.



5. Position the EN 46114 (2) on the engine (1).

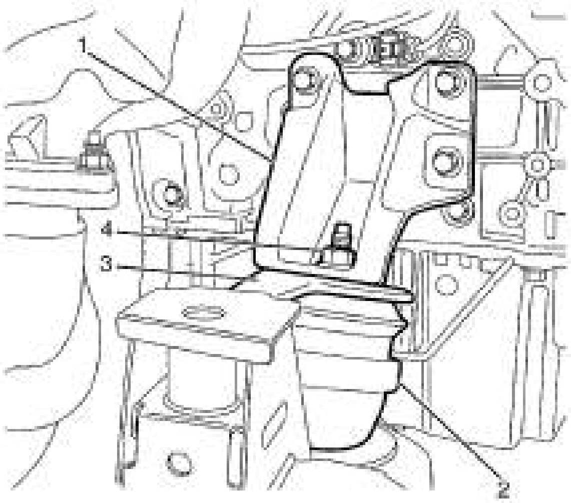
   Notice: Refer to Fastener Notice in the Preface section.

6. Install the EN 46114 to cylinder head retaining bolts (3).

   Tighten
   Tighten the bolts to 50 N·m (36 lb ft).

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

7. Use a suitable engine lifting tool to raise the engine until the weight of the engine is removed from the right hand engine mount.



8. Remove the right hand engine mount to engine mount bracket retaining nut (4).

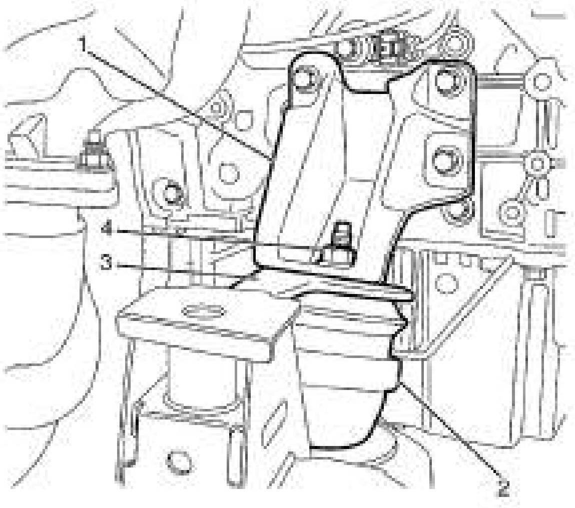
   Important: If required raise the engine further to provide adequate space.

   Important: When lifting the engine assembly, observe the clearance between the rear of the engine assembly and the dash panel.

   Important: DO NOT distort or bend the right hand engine mount heat shield (3).

9. Remove the right hand engine mount (2) from the right hand engine mount bracket (1).

Installation Procedure



Important: DO NOT distort or bend the right hand engine mount heat shield (3).

1. Position the right hand engine mount (2) on the right hand engine mount bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the right hand engine mount to engine mount bracket retaining nut (4).

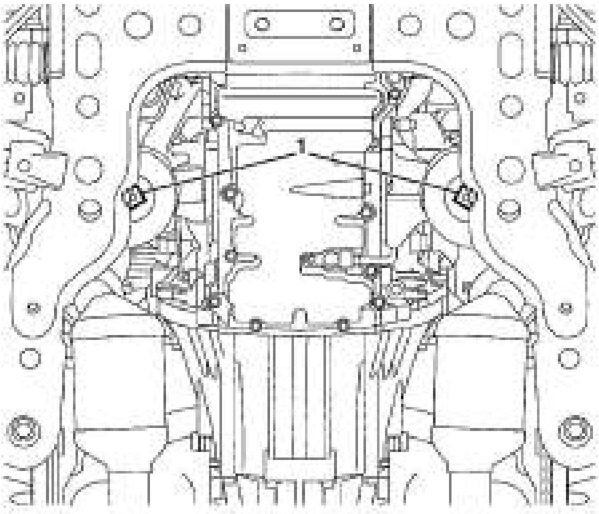
   Tighten
   Tighten the nut to 80 N·m (59 lb ft).

3. Lower the engine until the weight is resting on the right hand engine mount.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

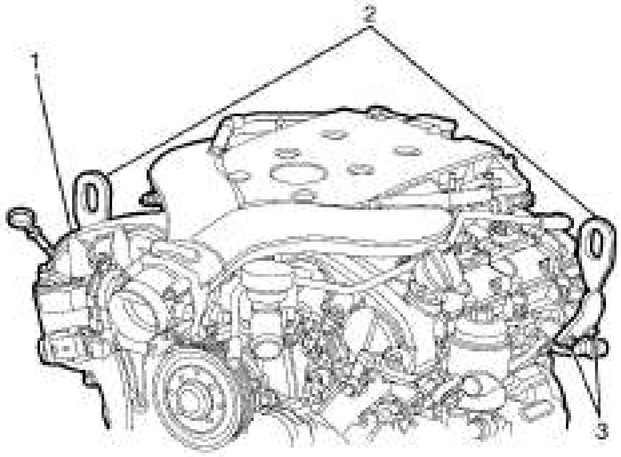
4. Raise the vehicle.



5. Install the engine mount to front subframe retaining nuts (1).

   Tighten
   Tighten the nuts to 80 N·m (59 lb ft).

6. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
7. Lower the vehicle to the ground.

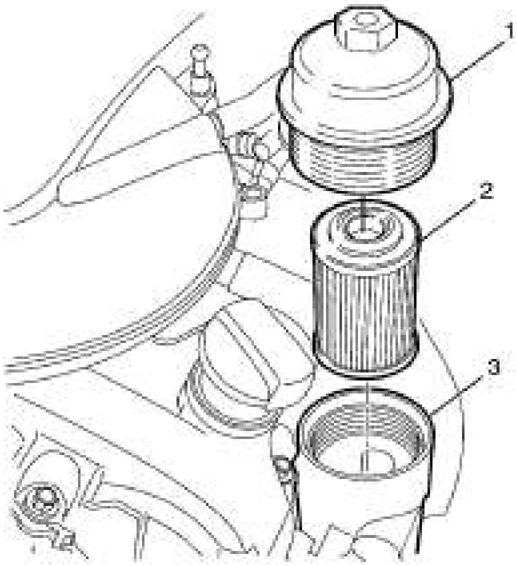


8. Remove the EN 46114 to cylinder head retaining bolts (3).
9. Remove the EN 46114 (2) from the engine (1).

Engine Oil and Oil Filter Replacement

Removal Procedure

1. Turn the ignition OFF.



Important: Use a six-point socket to remove the oil filter cap (1).

2. Remove the oil filter adapter cap (1) from the engine oil filter adapter (3).

Important: The oil filter cartridge (2) must be replaced at every service interval.

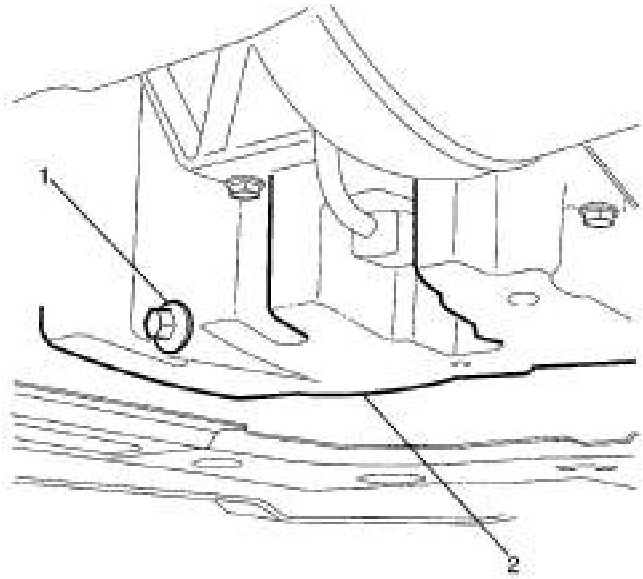
3. Remove the oil filter cartridge (2).

Discard the oil filter cartridge (2).

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

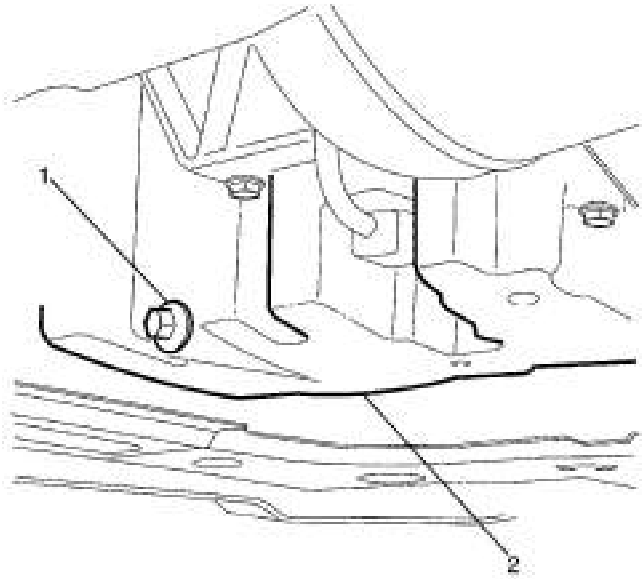
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



5. Place a suitable container below the oil pan drain plug (1).
6. Remove the oil pan drain plug (1) from the oil pan (2).
7. Allow the oil to drain completely.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.

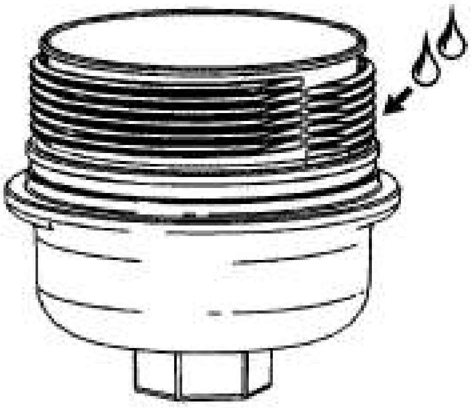


1. Install the oil pan drain plug (1) to the oil pan (2).

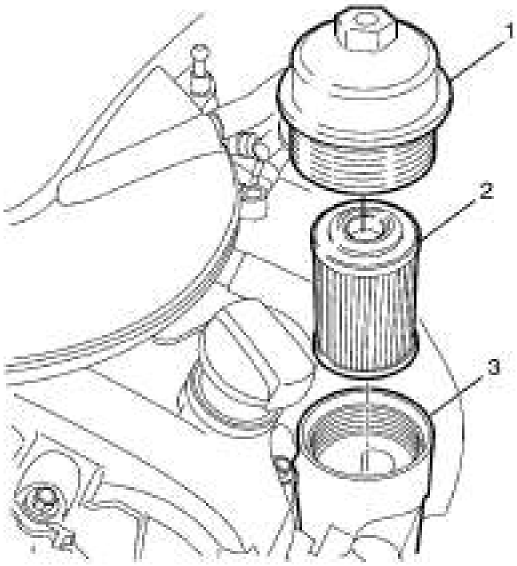
   Tighten
   Tighten the oil pan drain plug to 25 N·m (18 lb ft).

2. Lower the vehicle.

Notice: Refer to General Repair Instructions in the Preface section.



3. Lubricate the oil filter cap threads with clean engine oil.



4. Install the NEW oil filter cartridge (2).

Notice: Refer to Fastener Notice in the Preface section.

Notice: Refer to General Repair Instructions in the Preface section.

Important: Use a six-point socket to install the oil filter cap.

5. Install the oil filter cap (1) to the engine oil filter adapter (3).

   Tighten
   Tighten the oil filter cap to 25 N·m (18 lb ft).

6. Fill the engine with the appropriate oil type and quantity. Refer to Fluid and Lubricant Recommendations and Approximate Fluid Capacities .
7. Reset the service reminder display. Refer to Service Display Reminders .

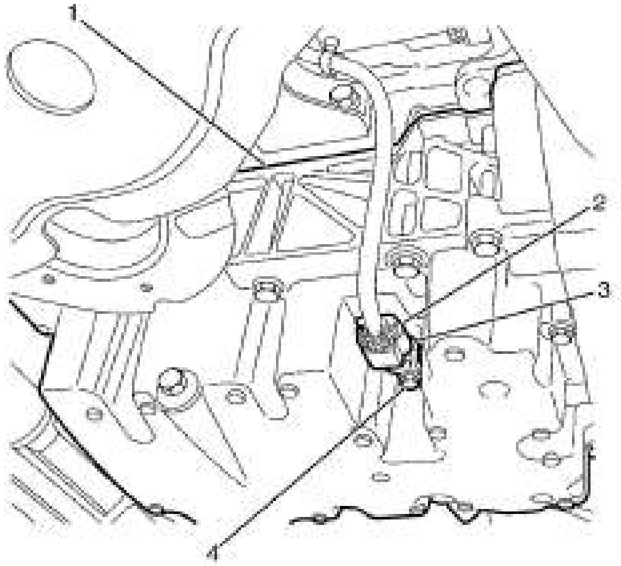
Engine Oil Level Sensor and/or Switch Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

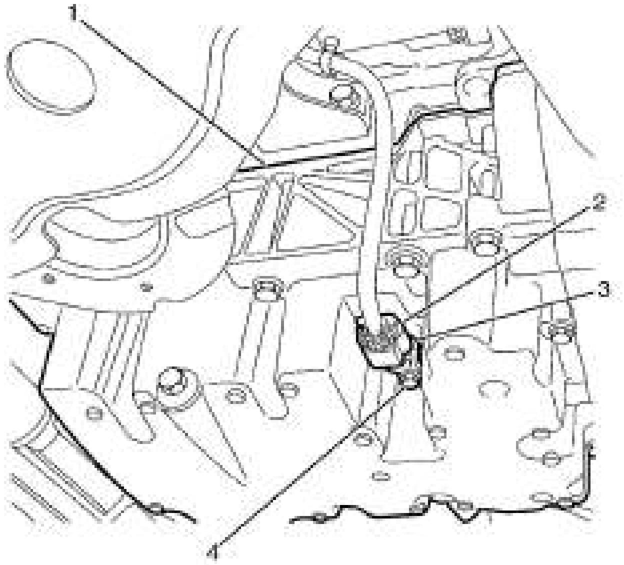
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the Engine Splash Shield. Refer to Engine Splash Shield Replacement .



3. Drain the engine oil. Refer to Engine Oil and Oil Filter Replacement .
4. Disconnect the engine oil level switch electrical connector (2).
5. Remove the engine oil level switch to oil pan retaining bolt (4).
6. Remove the engine oil level switch (3) from the oil pan (1).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the engine oil level switch (2) to the oil pan (3).

   Tighten
   Tighten the engine oil level switch bolt to 20 N·m (15 lb ft).

2. Connect the engine oil level switch electrical connector (1).
3. Install the front air deflector. Refer to Front Air Deflector Replacement .
4. Lower the vehicle.
5. Fill the engine oil. Refer to Engine Oil and Oil Filter Replacement .
6. Inspect for oil leaks after engine start up.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995144**

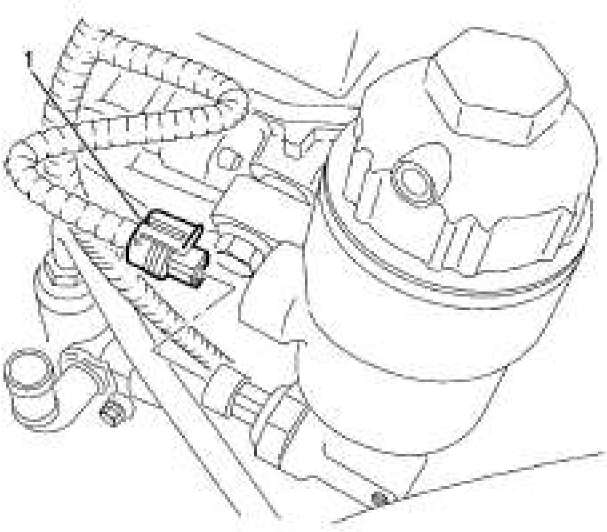
Engine Oil Pressure Sensor and/or Switch Replacement

Tools Required

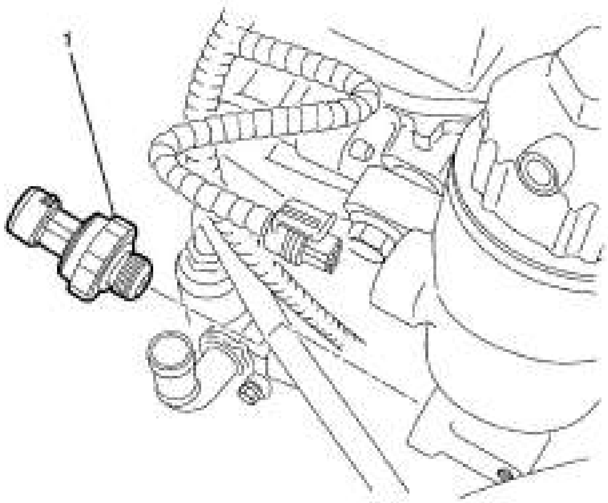
J 41712 Oil Pressure Sensor Socket

Removal Procedure

1. Turn the ignition OFF.
2. Remove the left hand engine cover. Refer to Engine Cover Replacement.



3. Disconnect the oil pressure sensor electrical connector (1).

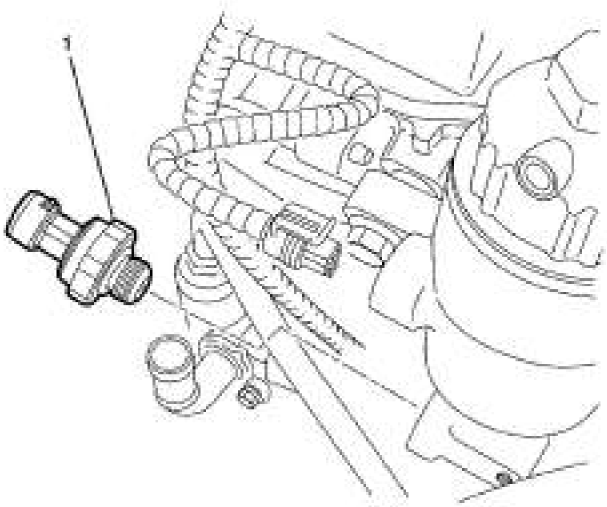


Important: A small amount of oil will drain out of the oil filter housing when the oil pressure sensor is removed. Use a shop towel to absorb the oil.

4. Use the J 41712 in order to remove the oil pressure sensor (1).

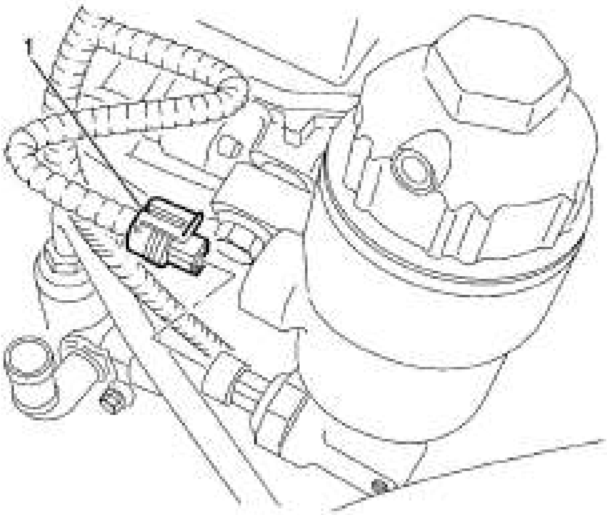
Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Use the J 41712 in order to install the oil pressure sensor (1).

Tighten
Tighten the oil pressure sensor to 20 N·m (15 lb ft).



2. Connect the oil pressure sensor electrical connector (1).
3. Install the left hand engine cover. Refer to Engine Cover Replacement.

Engine Replacement (RHD)

Tools Required

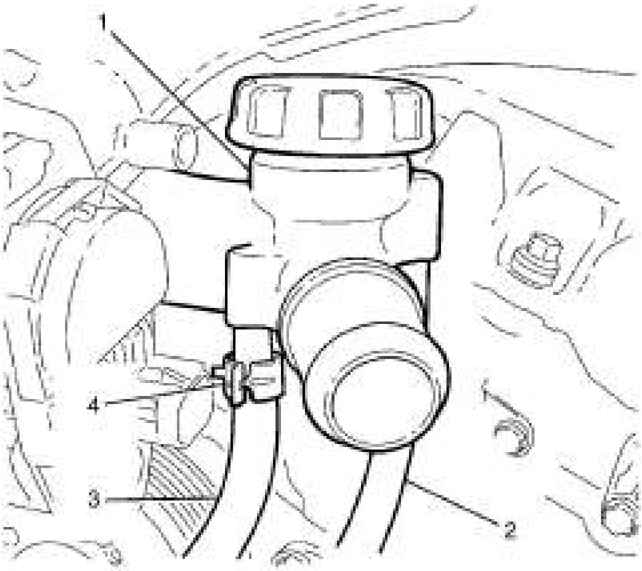
- AU-525 Quick Connect Release Tool.
- EN 46114 Engine Lift Brackets.

Important: The front wheels of the vehicle must be maintained in the straight ahead position and the steering column must be in the LOCK position before disconnecting the steering column or intermediate shaft. Failure to follow these procedures will cause incorrect alignment of some components during installation and result in damage to the SIR coil assembly.

1. Turn the ignition key to the LOCK position.

Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the engine covers. Refer to Engine Cover Replacement .
4. Remove the radiator air intake baffle. Refer to Cooling Fan and Shroud Replacement .
5. Recover the air conditioning (A/C) refrigerant. Refer to Refrigerant Recovery and Recharging .
6. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
7. Depressurise the fuel system. Refer to Fuel Pressure Relief .
8. Drain the cooling system. Refer to Cooling System Draining and Filling .
9. Remove the radiator outlet hose. Refer to Radiator Outlet Hose Replacement .



10. Compress the coolant bleed hose retaining clamp (4) at the outlet housing (1) end and slide 50 mm (2 in) along the coolant bleed hose (3).
11. Remove the coolant bleed hose (3) from the outlet housing (1).

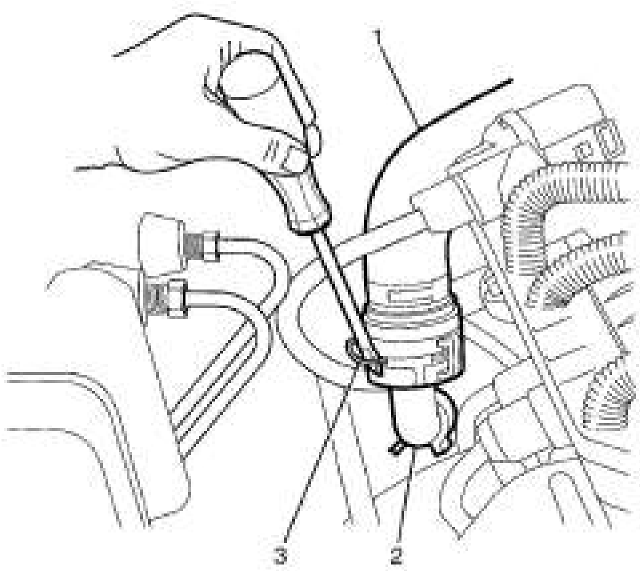
Important: Twist and pull the coolant recovery hose (2) to remove from the outlet housing (1).

12. Disconnect the coolant recovery hose (2) from the outlet housing (1).

Important: Plug or cap the hoses and inlets when separating the cooling system components, this prevents dirt and other contaminants from entering the cooling system.

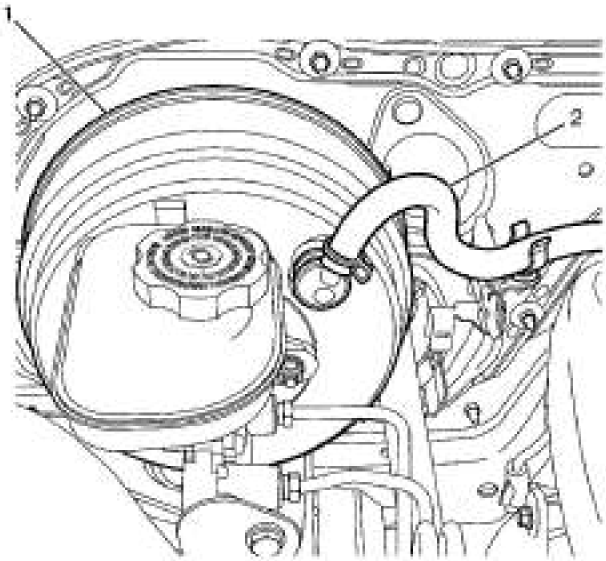
13. Plug or cap the cooling system hoses and inlets

Caution: Refer to Safety Glasses Caution in the Preface section.



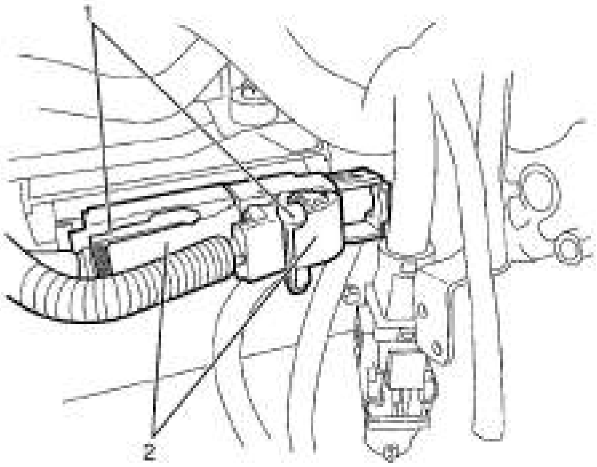
Important: The inlet and outlet heater hoses (1) are retained to the heater pipes (2) by quick connect fittings. Disconnect the heater hose (1) quick connect fittings by releasing the retaining clips (3) with a suitable screwdriver.

14. Disconnect the heater hose (1) from the heater pipes (2) in two places.

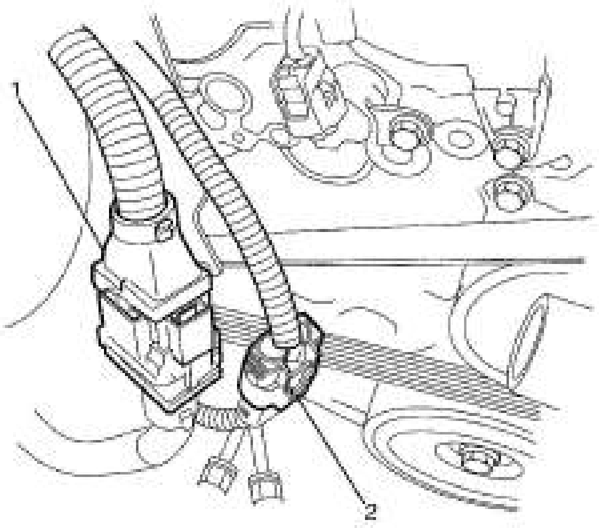


Important: With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the vacuum brake booster power reserve.

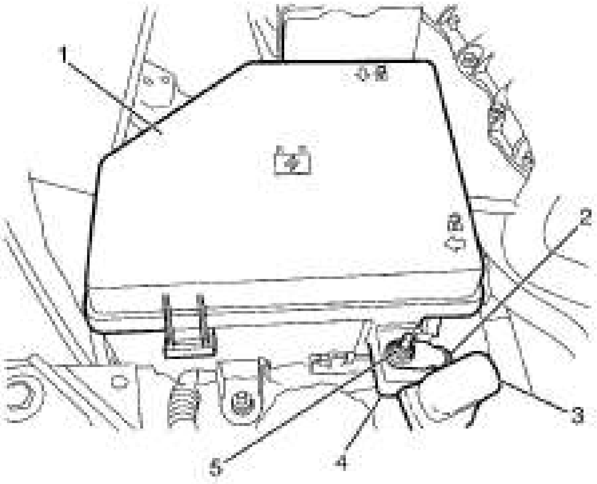
15. Deplete the vacuum brake booster power reserve.
16. Disconnect the vacuum hose and the vacuum brake booster check valve (2) from vacuum brake booster (1).



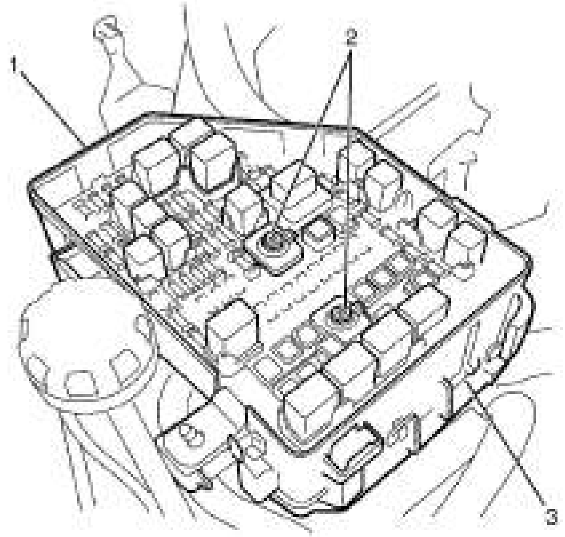
17. Rotate the engine control module (ECM) electrical connector levers (1) up to the unlocked position.
18. Disconnect ECM electrical connectors (2).



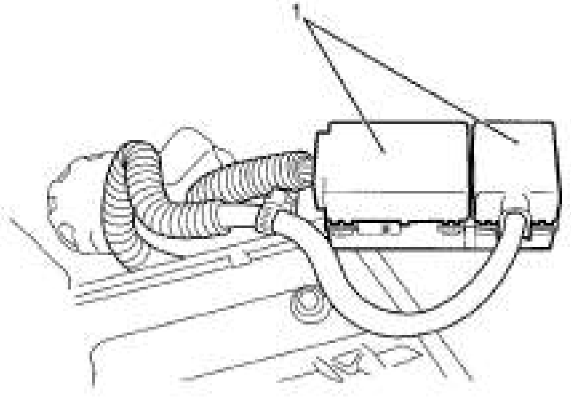
19. Disconnect the 56 pin engine wiring harness to main wiring harness electrical connector (1).
20. Disconnect the 2 pin engine wiring harness to main wiring harness electrical connector (2).



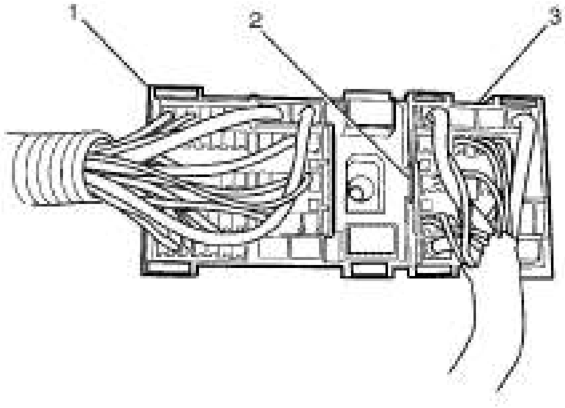
21. Remove the under hood body electrical centre (BEC) lid (1).
22. Remove the positive cable protective cover (3).
23. Remove the positive cable to under hood BEC plate retaining bolt (5).
24. Disconnect the positive cable (2) from the upper under hood BEC plate (4).



25. Remove the under hood BEC upper plate to lower plate retaining bolts (2).
26. Raise the upper under hood BEC plate (1) from the lower under hood BEC plate (3).

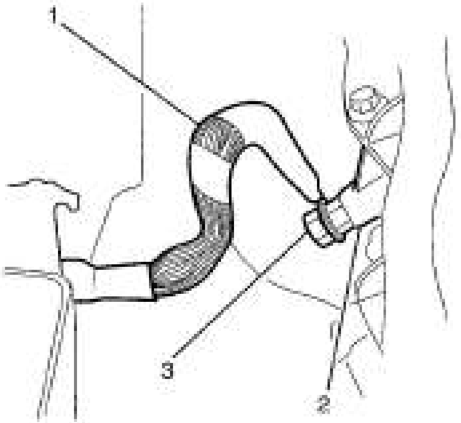


27. Detach the protector (1) from the base of the under hood BEC connector.

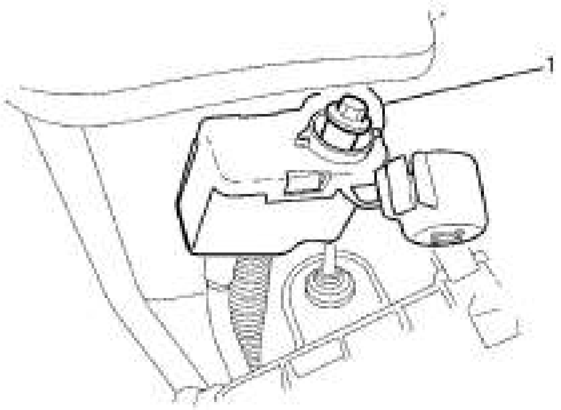


Important: Use a suitable tool to depress the connector locking tang (2), then pull the body harness connector (1) upward and the engine connector (3) downward to separate the body harness connector (1) from the engine connector (3).

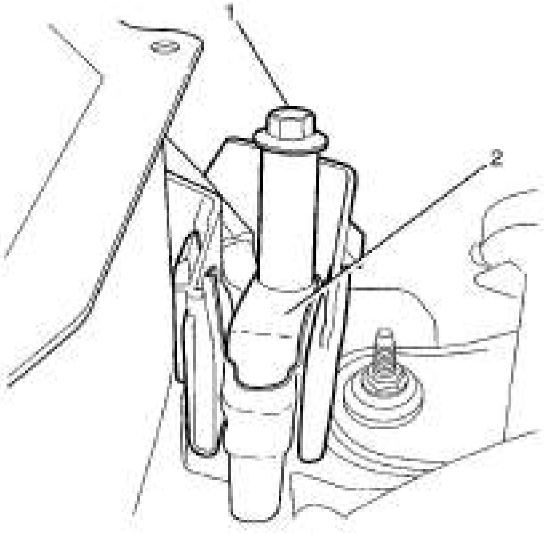
28. Separate the body harness connector (1) from the engine connector (3).
29. Reposition and secure the engine wiring harness and connector (3) on the engine.



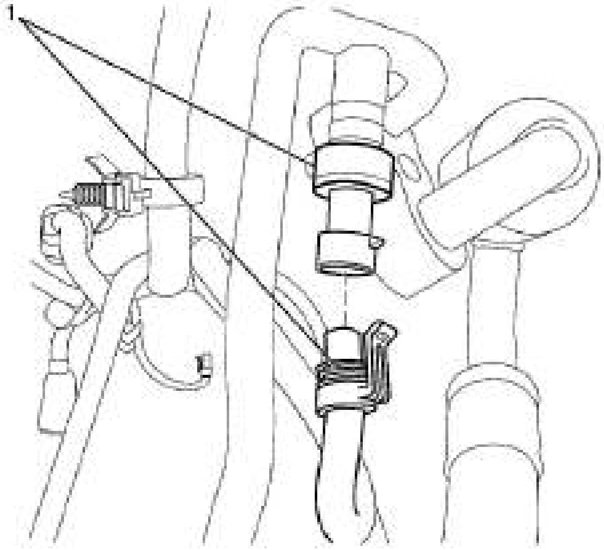
30. Remove the vehicle body ground cable to cylinder head retaining bolt (3)
31. Disconnect the vehicle body ground cable (1) from the cylinder head (2).



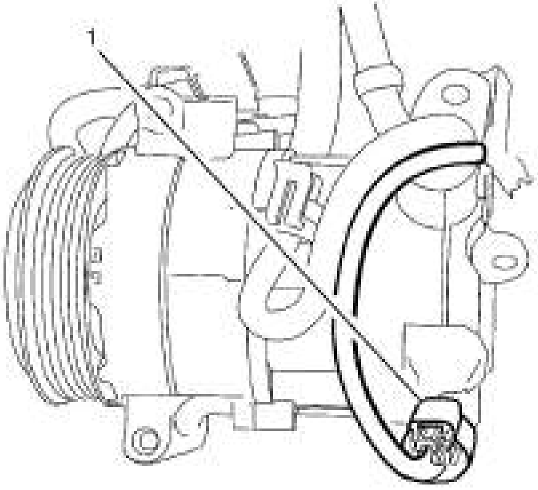
32. Remove the remote battery positive post cover (1).



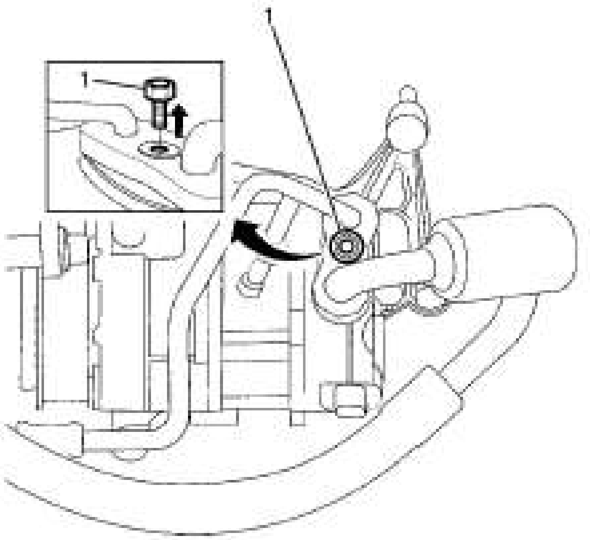
33. Remove the remote battery positive post to wiring harness retaining bolt (1).
34. Remove the wiring harness (2).



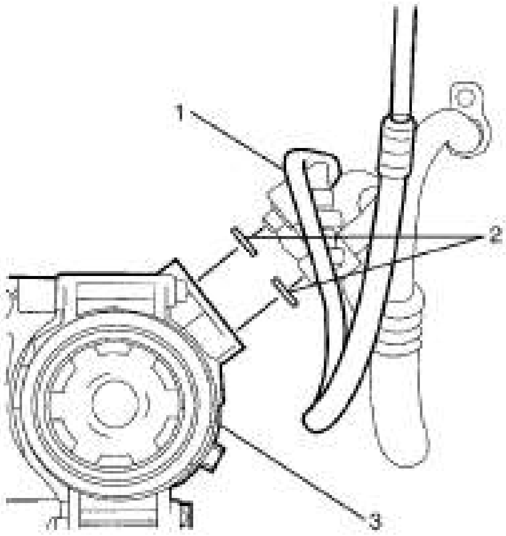
35. Disconnect the A/C pressure transducer electrical connector (1).



36. Disconnect the A/C compressor electrical connector (1).



37. Remove the suction/discharge line pad to A/C compressor retaining nut (1).



38. Disconnect the A/C suction/discharge line pad (1) from the A/C compressor (3).

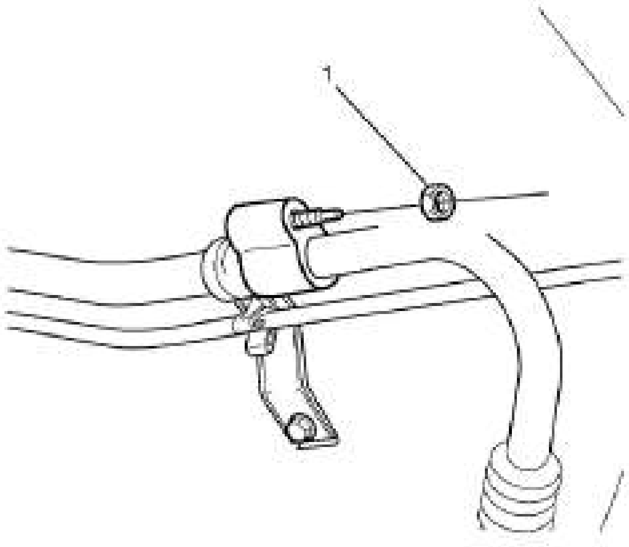
Important: Plug or cap the A/C suction/discharge pipe ends and the compressor ports immediately to prevent contamination and absorption of moisture from the atmosphere.

39. Plug or cap the A/C suction/discharge pipe (1) ends and the compressor (3) ports.

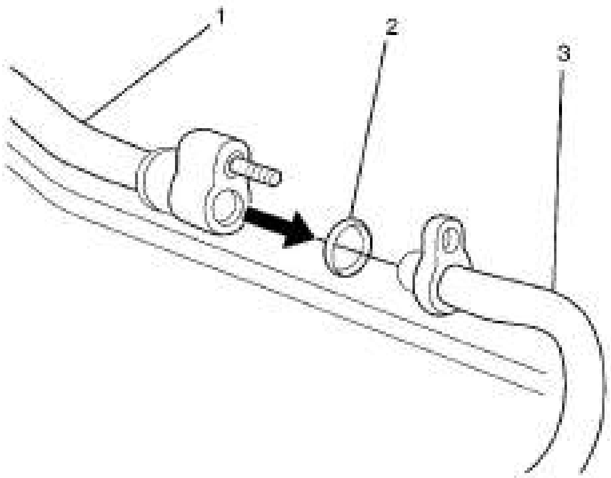
Important: The A/C sealing O-rings (2) are a single use component and will not reseal. Install NEW A/C sealing O-rings (2) whenever the A/C suction/discharge line pad (1) is removed from the A/C compressor (3).

40. Remove and discard the A/C suction/discharge pipe sealing O-rings (2).

Discard the A/C suction/discharge pipe sealing O-rings (2).



41. Remove the A/C suction pipe pad to A/C suction pipe retaining nut (1).



42. Disconnect the upper A/C suction pipe (1) from the lower A/C suction tube (3).

Important: Plug or cap the A/C suction pipe ends (1 and 3) immediately to prevent contamination and absorption of moisture from the atmosphere.

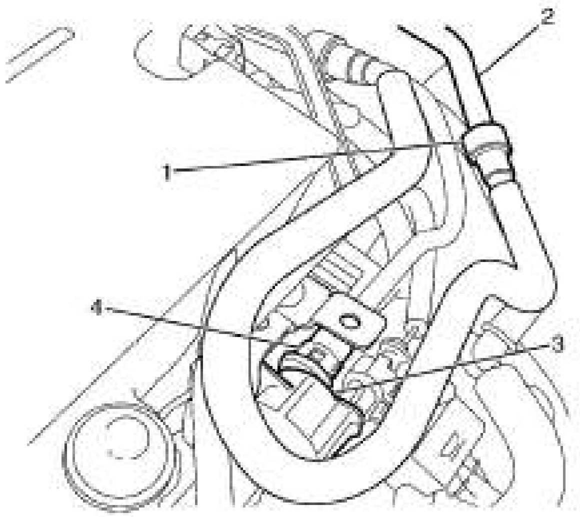
43. Plug or cap the A/C suction pipe ends.

Important: The A/C suction pipe sealing O-ring (2) is a single use component and will not reseal. Install a NEW A/C suction pipe sealing O-ring (2) whenever the upper A/C suction pipe (1) is removed from the lower A/C suction pipe (3).

44. Remove and discard the A/C suction pipe sealing O-ring (2).

    Discard the A/C suction pipe sealing O-ring (2).

45. Reposition and retain the A/C suction/discharge pipes away from the engine.



46. Disconnect the fuel feed hose (1) from the fuel feed pipe (2). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .

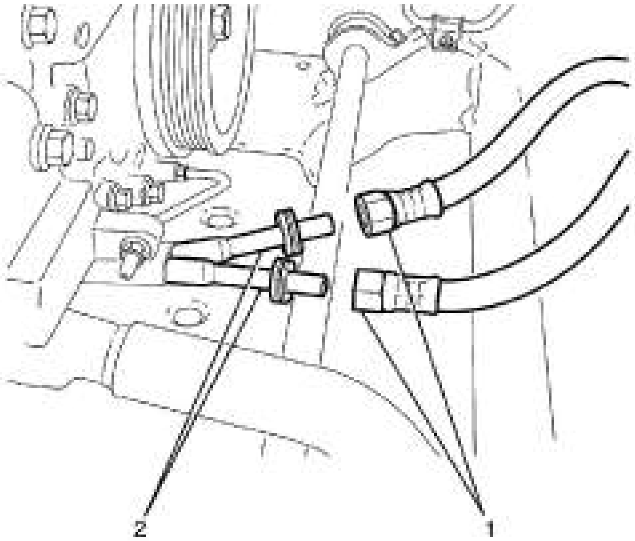
    Important: Plug or cap the fuel feed pipe (2) and fuel feed hose (1) ends to prevent fuel leaks and/or contamination.

47. Plug or cap the fuel feed pipe (2) and fuel feed hose (1) ends.
48. Disconnect the evaporative emission (EVAP) purge line (4) from the purge solenoid (3). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .
49. Plug or cap the (EVAP) purge line (4) and the purge solenoid (3) ends.

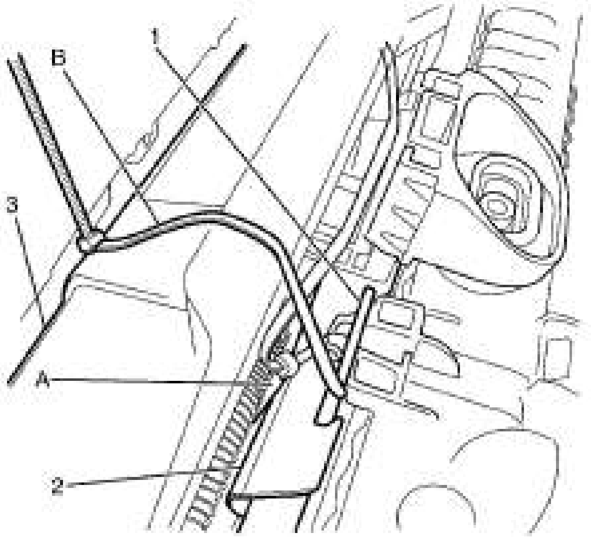
    Important: The flexible hoses are not serviced separately. Therefore if the hose's require replacement, then the hose and radiator to hose cooler hose assembly must be fitted.

    Important: When removal is complete plug hose openings with a clean lint free cloth to prevent foreign matter entry.

50. Place a suitable container beneath the radiator and engine.



51. Disconnect the transmission cooler line (2) from the flexible hose (1) at the quick connect fitting using the AU-525 .
    - Open the AU-525 then close and clip around the hose to be disconnected.
    - While holding the flexible hose (1) push the hose inwards with one hand, then pull back to separate from the steel hose piping (2).
    - Repeat for the second fitting if required.
52. Reposition and secure the flexible hoses (1) away from the engine and subframe.



Important: It is necessary to secure the radiator and condenser assembly (2) to the front end assembly (3) as the radiator and condenser assembly is supported to the subframe.

Important: Thread zip tie A around the front end assembly and zip tie B through the radiator and condenser mount (1). Insert zip tie A into the retainer of zip tie B and insert zip tie B into the retainer of zip tie A.

53. Secure radiator and condenser assembly (2) to the front end assembly (3) with large zip ties or equivalent.

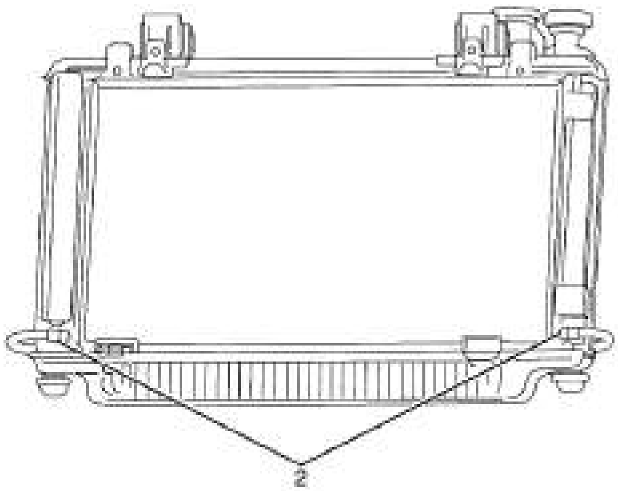
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

54. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
55. Remove the front air deflector. Refer to Front Air Deflector Replacement .
56. Remove the Engine Splash Shield. Refer to Engine Splash Shield Replacement .
57. Disconnect the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .

Important: Plug or cap the hoses and inlets when separating the cooling system components, this prevents dirt and other contaminants from entering the cooling system.

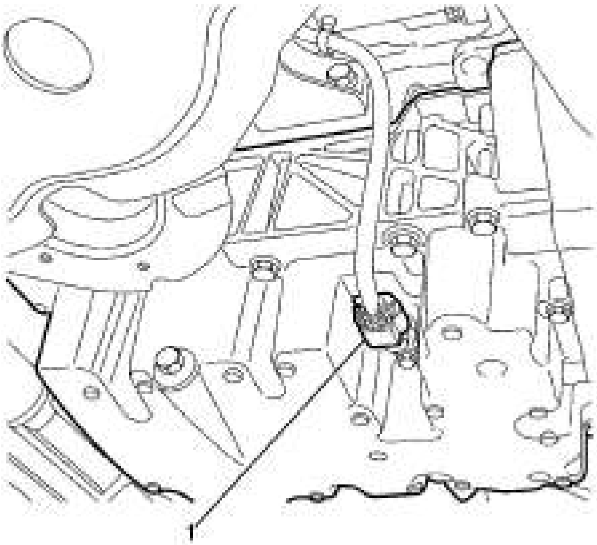
58. Plug or cap the cooling system hoses and inlets.



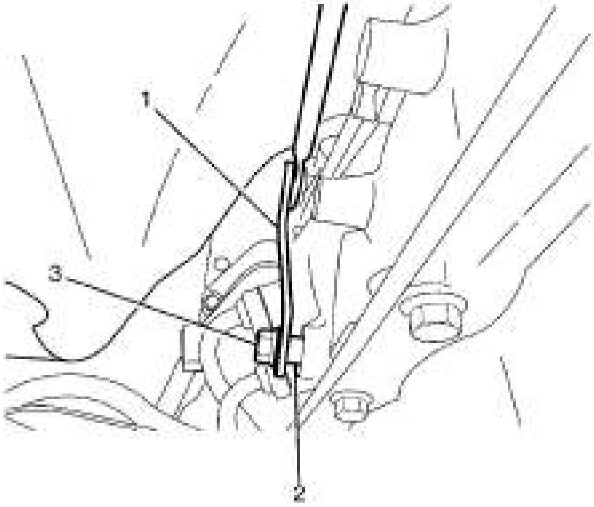
59. Disconnect the power steering cooler hoses (1).

Important: Plug or cap the power steering cooler hose (1) ends to prevent leaks and/or contamination.

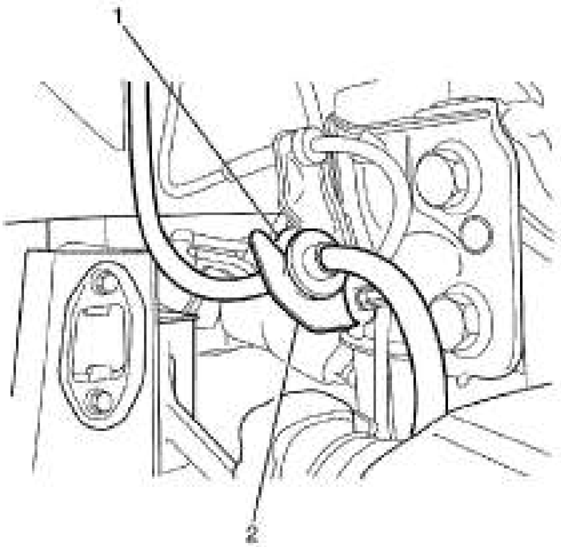
60. Plug or cap the power steering cooler hose (1) ends.



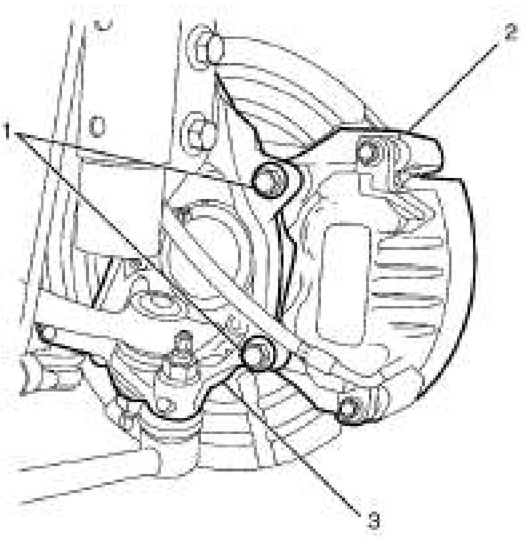
61. Disconnect the oil level/temperature sensor electrical connector (1).
62. Remove the Exhaust system. Refer to Exhaust System Replacement .
63. Remove the centre exhaust heat shield. Refer to Exhaust Heat Shield Replacement - Center .
64. Remove the propeller shaft. Refer to Propeller Shaft Replacement .



65. Remove the shift selector linkage rod to shift selector shaft retaining nut (3).
66. Remove the shift selector linkage rod (1) from the shift selector shaft (2).
67. Remove the starter motor. Refer to Starter Motor Replacement .
68. Partially lower the vehicle.
69. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .



70. Detach the brake hose (1) from the strut mounted brake hose retaining bracket (2).



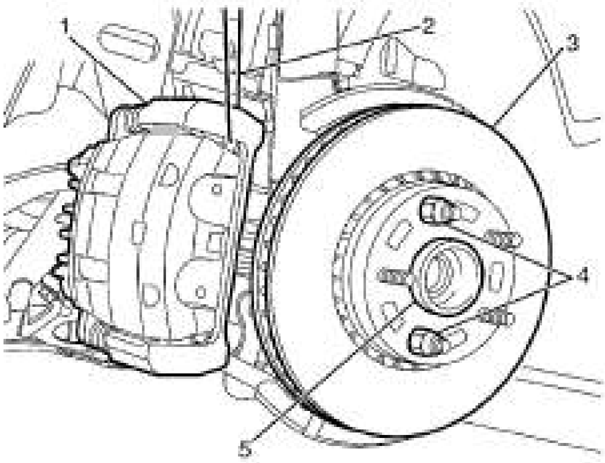
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

71. Remove the brake caliper anchor plate to knuckle retaining bolts (1).
    - Discard the bolts.
    - Clean the bolt holes.

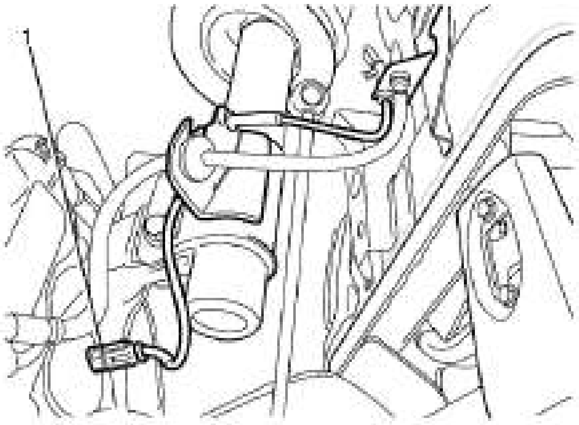
Important: DO NOT disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

72. Remove the brake caliper (2) from the steering knuckle (3).

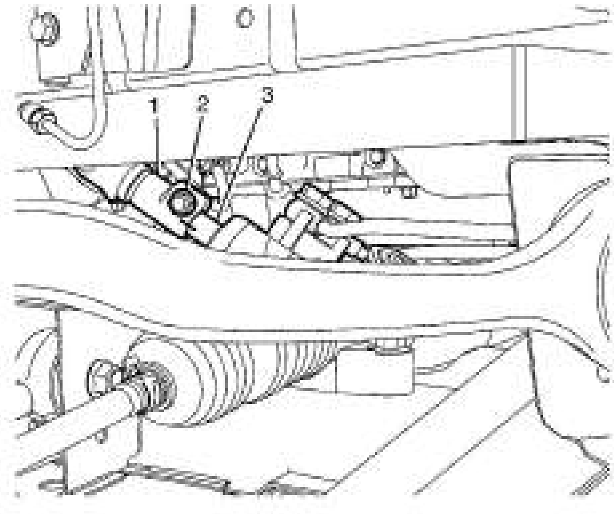


Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

73. Support the brake caliper (1) with heavy mechanic's wire, or equivalent (2).
74. Install 2 wheel nuts (4) to retain the brake disc (3) to the hub (5).



75. Disconnect the wheel speed sensor jumper harness electrical connector (1) and secure away from the subframe and suspension components.



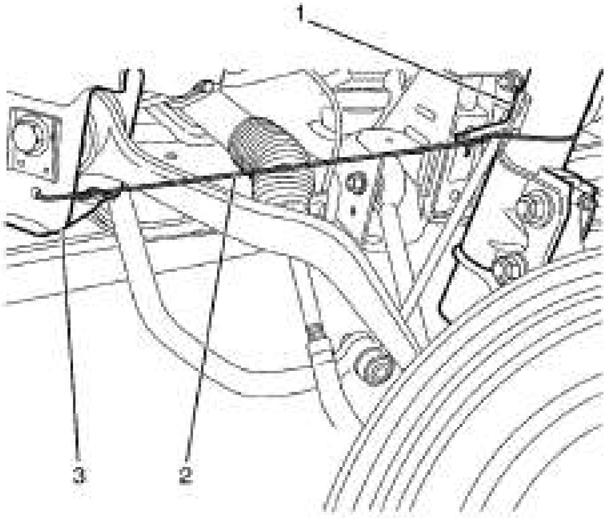
Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

76. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3).
77. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

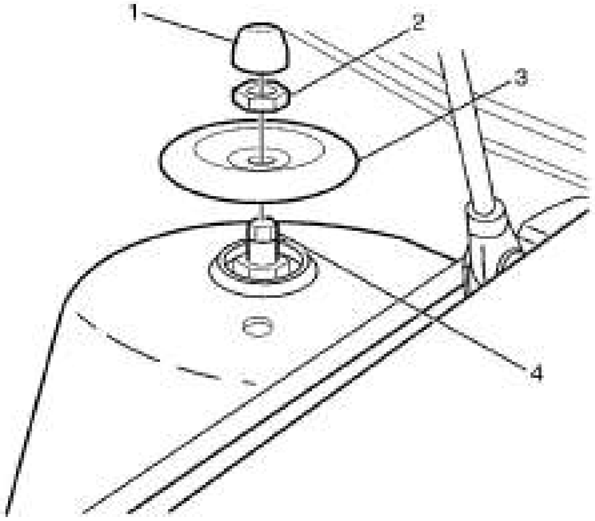
Important: Make sure the bolt hole is thoroughly cleaned and all micro-encapsulated thread sealant is removed.

78. Disconnect the intermediate shaft (2) from the pinion shaft (3).
    - Discard the bolt.
    - Clean the bolt hole.
79. Partially lower the vehicle.



Important: The strut assembly (1) must be secured to the subframe (3) to prevent damage to the front wheelhouse liner, fenders and suspension components.

80. Retain the strut assembly (1) to the subframe (3) using heavy mechanics wire or equivalent (2).



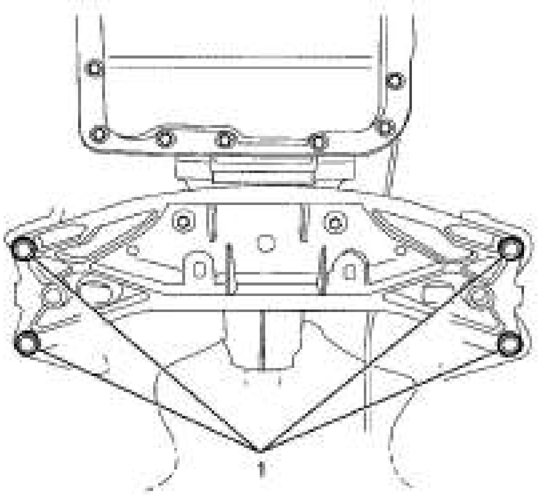
81. Remove the stud dust cover (1) from the strut assembly to body retaining nut (2).

Important: The strut assembly (4) must be supported from underneath before the strut assembly to body retaining nut (2) is removed.

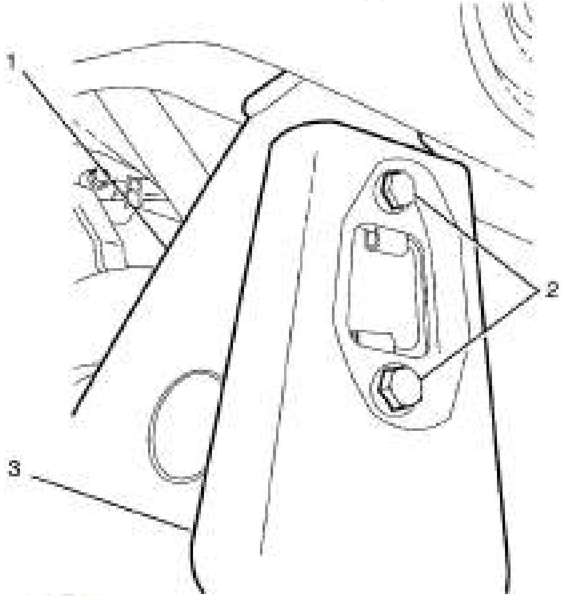
82. Remove the strut assembly to body retaining nut (2) while holding the strut piston shaft (4).

Discard the nut.

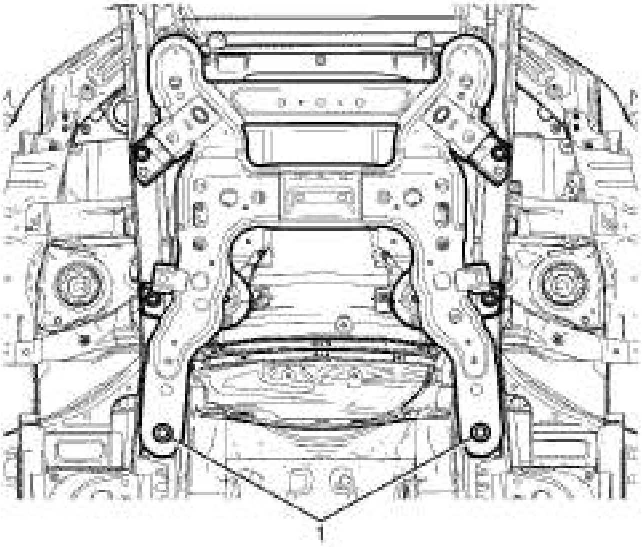
83. Remove the strut assembly to body retaining plate (3).
84. Position a suitable powertrain and/or engine lift table below the frame, engine and transmission.
85. Raise the lift table and/or lower the vehicle to support the frame, engine and transmission.



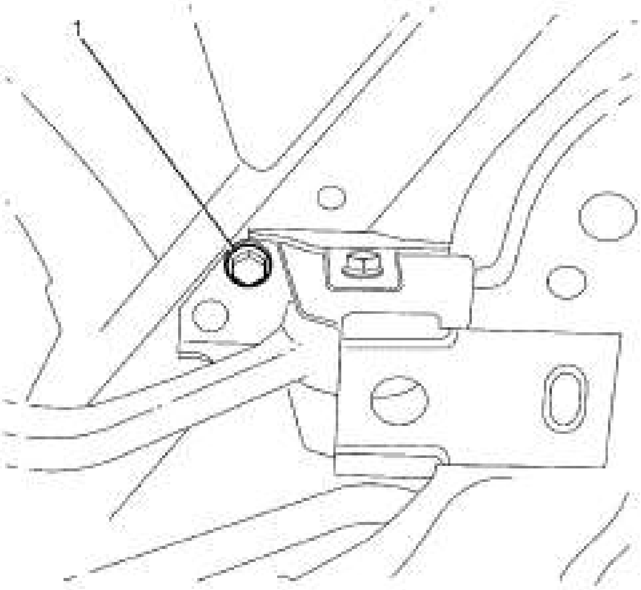
86. Remove the transmission support to body retaining bolts (1).



87. Remove the subframe reinforcement plate to subframe retaining bolts (2).
88. Remove the subframe reinforcement plate (3) from the subframe (1).

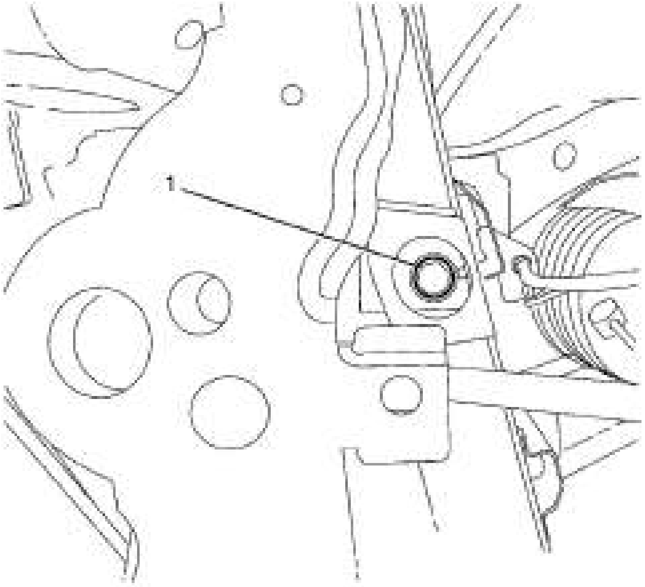


89. Remove the subframe to body rear retaining bolts (1).



Important: Only right side depicted in graphic, left side similar.

90. Remove the subframe to body front retaining bolts (1).

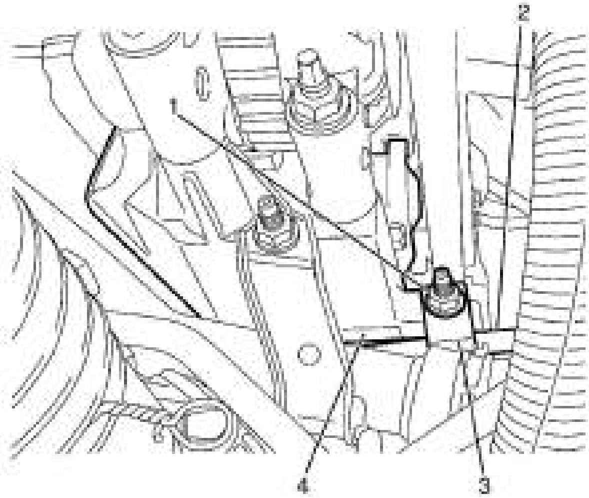


Important: Only right side depicted in graphic, left side similar.

91. Remove the subframe to body retaining bolts (1).

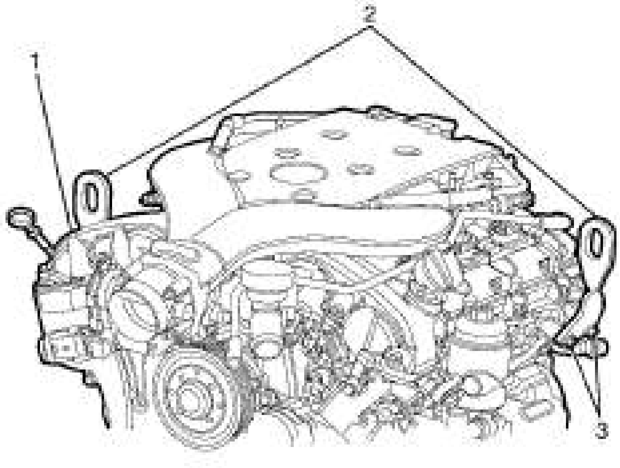
Important: Make sure that all the hoses, wires, pipes and front struts clear the vehicle during the removal process.

92. With the aid of an assistant, lower the table and/or raise the vehicle to remove the engine, transmission, front suspension and subframe assembly from the vehicle.
93. Remove the engine and transmission wiring harness and related components. Refer to Engine Wiring Harness Assembly Removal .



94. Remove the transmission cooler line clamp to alternator mounting bracket retaining nut (1).

95. Remove the transmission cooler line clamp (3) and transmission cooler lines (2) from the alternator mounting bracket (4).



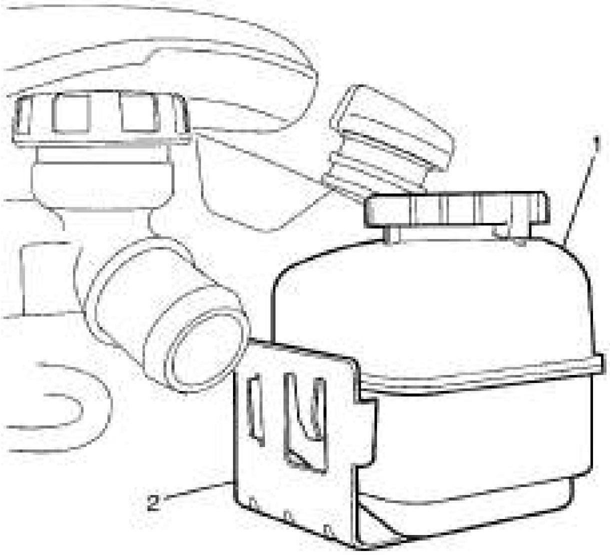
96. Position the EN 46114 (2) on the engine (1).

    Notice: Refer to Fastener Notice in the Preface section.

97. Install the EN 46114 to cylinder head retaining bolts (3).

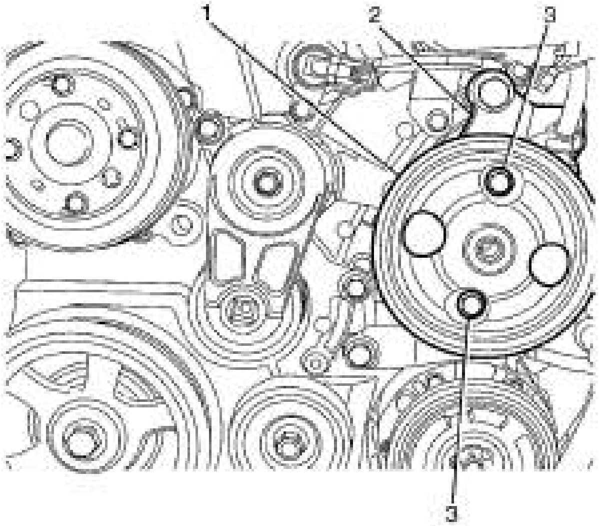
    Tighten
    Tighten the bolts to 50 N·m (36 lb ft).

98. Connect a floor crane to the engine lift brackets and raise the floor crane to partially support the engine.
99. Position a second powertrain lift table below the transmission.
100. Remove the transmission. Refer to Transmission Replacement in Automatic Transmission -- 4L60-E/4L65-E/4L70-E or Transmission Replacement in Automatic Transmission -- 5L40-E/5L50-E.
101. Remove the engine flywheel. Refer to Engine Flywheel Removal .
102. Remove the catalytic converters. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side .
103. Remove the drive belt. Refer to Drive Belt Replacement .



Important: The locking tang on the power steering reservoir bracket (2) must be released before removing the power steering reservoir (1). Release the locking tang on the power steering reservoir bracket (2) with a suitable tool.

104. Separate power steering fluid reservoir (1) from the power steering fluid reservoir bracket (2).



Important: DO NOT disconnect the power steering pipes/hoses.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

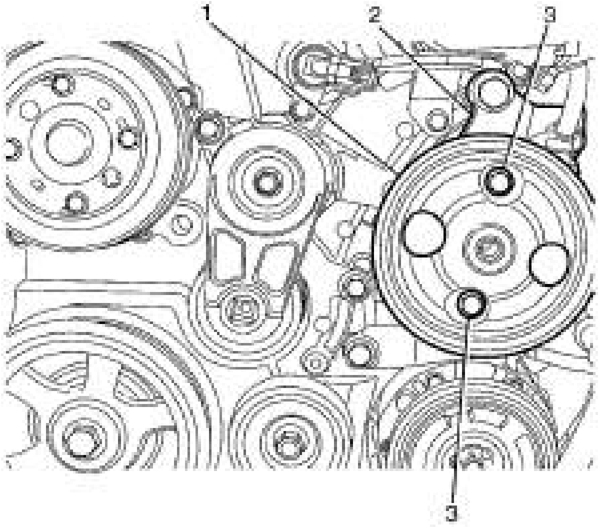
Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

105. Remove the power steering pump to power steering pump bracket retaining bolts (3).
    - Discard the bolts.
    - Clean the bolt hole.
106. Remove the power steering pump (1) from the power steering pump bracket (2) position the power steering pump aside.
107. Remove the A/C compressor. Refer to Air Conditioning Compressor Replacement .
108. Remove the A/C compressor mounting bracket. Refer to Compressor Mounting Bracket Replacement .
109. Remove the alternator. Refer to Generator Replacement .
110. Remove the alternator bracket. Refer to Generator Bracket Replacement .
111. Attach a suitable lifting chain and hooks to the 2 EN 46114 .
112. Using a suitable lifting crane, slightly raise the engine to clear the engine mount stud.
113. Remove the engine mount brackets with the engine mounts. Refer to Engine Mount Bracket Replacement - Left Side and Engine Mount Bracket Replacement - Right Side .
114. Remove the engine from the subframe

    If required mount the engine on a suitable engine stand.

Installation Procedure

1. Use a floor crane in order to install the engine to the frame.
2. Install the engine mount brackets with the engine mounts. Refer to Engine Mount Bracket Replacement - Left Side and Engine Mount Bracket Replacement - Right Side .
3. Raise the floor crane to partially support the engine
4. Install the alternator bracket. Refer to Generator Bracket Replacement .
5. Install the alternator. Refer to Generator Replacement .
6. Install the A/C compressor mounting bracket. Refer to Compressor Mounting Bracket Replacement .
7. Install the A/C compressor. Refer to Air Conditioning Compressor Replacement .

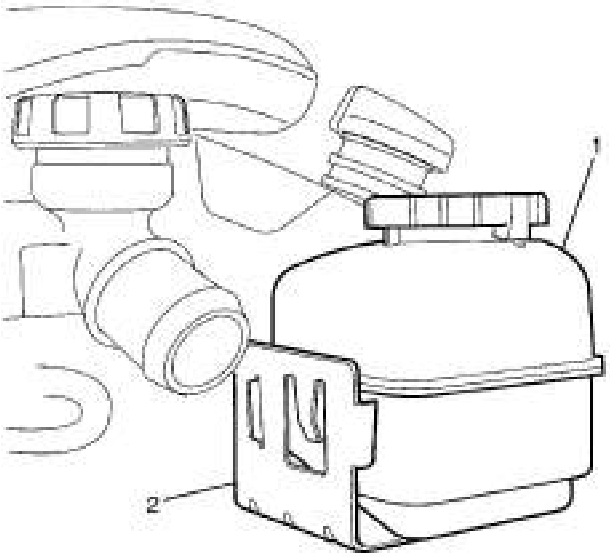


8. Install the power steering pump (1) to the power steering pump bracket (2).

Notice: Refer to Fastener Notice in the Preface section.

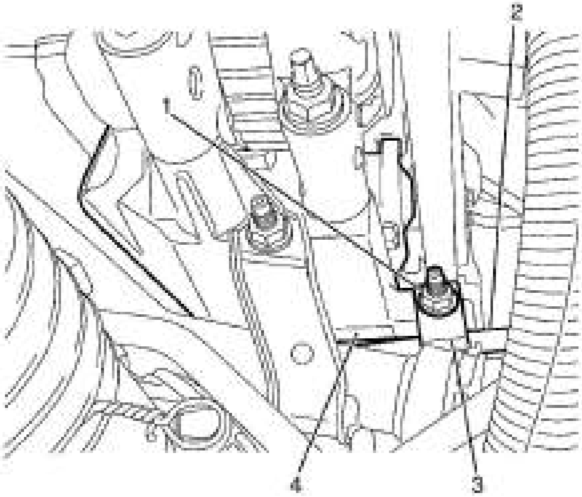
9. Install the NEW power steering pump to power steering pump bracket retaining bolts (3).

Tighten
Tighten the bolts to 27 N·m (22 lb ft).



Important: Make sure the power steering reservoir (2) and the power steering reservoir bracket locking tang (1) are engaged to avoid an induced rattle condition.

10. Install the power steering fluid reservoir to the power steering fluid reservoir bracket.
11. Install the drive belt. Refer to Drive Belt Replacement .
12. Install the catalytic converters. Refer to Catalytic Converter Replacement - Left Side and Catalytic Converter Replacement - Right Side .
13. Install the flywheel. Refer to Engine Flywheel Removal .
14. Install the transmission. Refer to Transmission Replacement in Automatic Transmission -- 4L60-E/4L65-E/4L70-E or Transmission Replacement in Automatic Transmission -- 5L40-E/5L50-E.



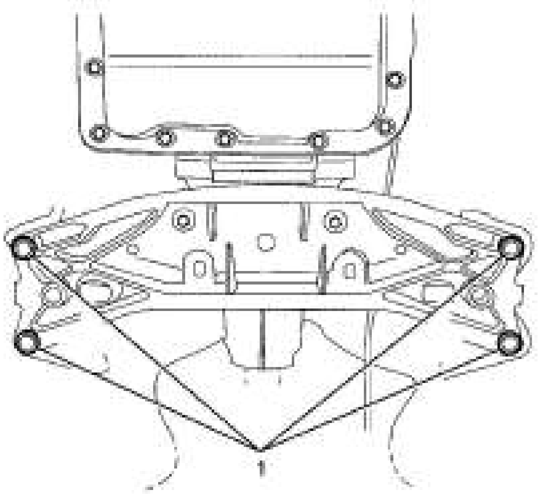
15. Install the transmission cooler line clamp (3) and transmission cooler lines (2) to the alternator mounting bracket (4).
16. Install the transmission cooler line clamp to alternator mounting bracket retaining nut (1).

    Tighten
    Tighten the nut to 22 N·m (16 lb ft).

17. Install the engine and transmission wiring harness and related components. Refer to Engine Wiring Harness Assembly Removal .

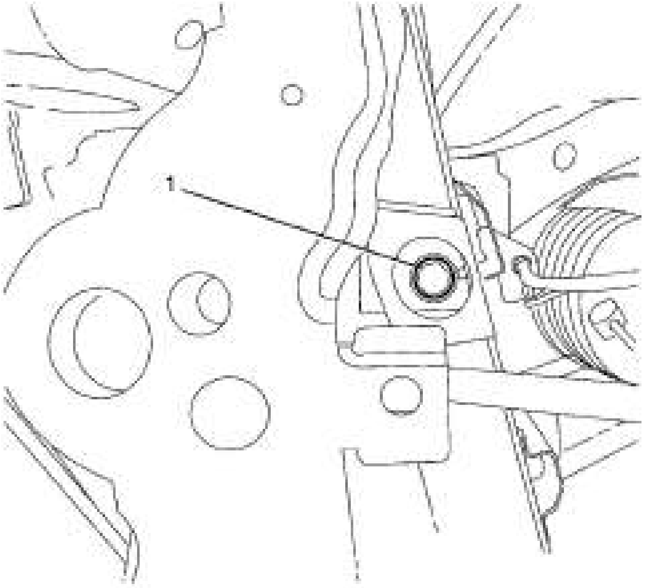
    Important: Make sure that all the hoses, wires, pipes and shock modules clear the vehicle during the installation process.

18. With the aid of an assistant, raise the table and/or lower the vehicle to install the engine, transmission, front suspension and subframe assembly to the vehicle.



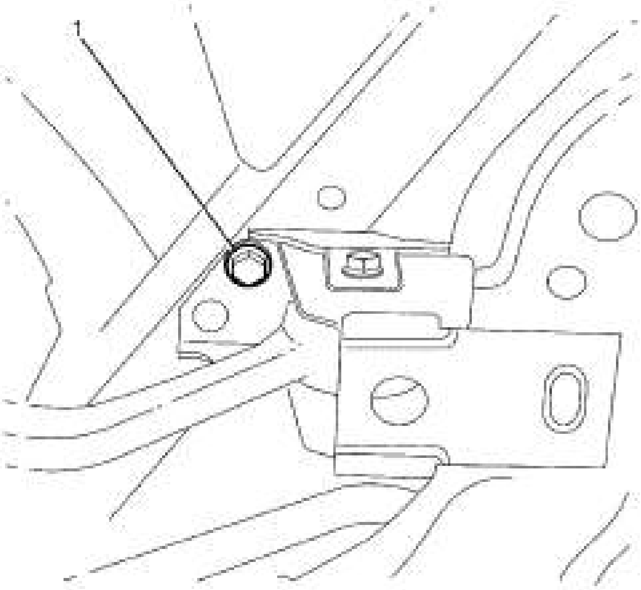
19. Install the transmission support to body retaining bolts (1).

    Tighten
    Tighten the bolts to 58 N·m (43 lb ft).



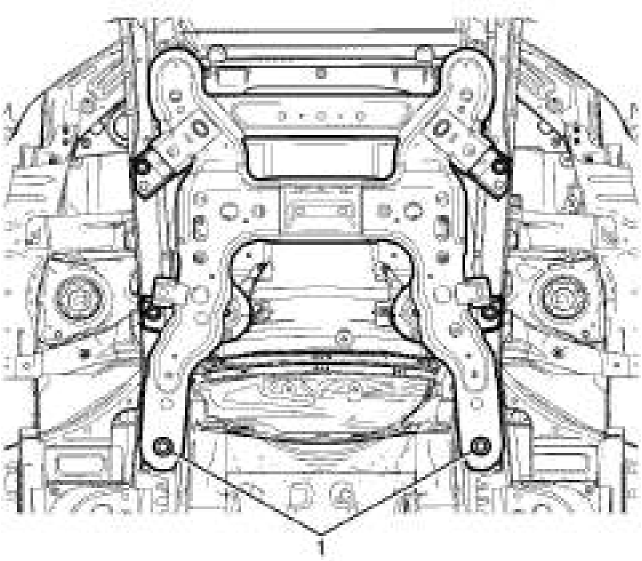
20. Install the subframe to body retaining bolts (1).

    Tighten
    Tighten the bolts to 160 N·m (118 lb ft).



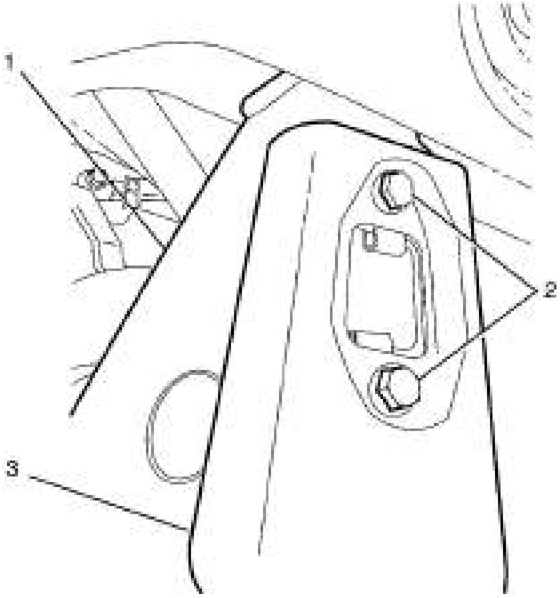
21. Install the subframe to body front retaining bolts (1).

Tighten
Tighten the bolts to 160 N·m (118 lb ft).



22. Install the subframe to body rear retaining bolts (1).

Tighten
Tighten the bolts to 240 N·m (177 lb ft).

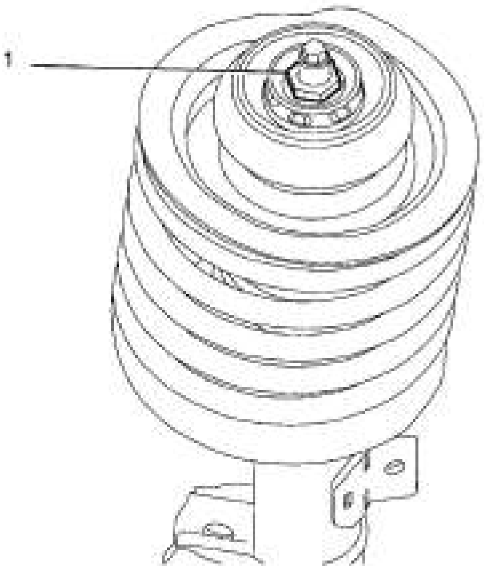


23. Install the subframe reinforcement plate (3) to the subframe (1).
24. Install the subframe reinforcement plate to subframe retaining bolts (2).

Tighten
Tighten the bolts to 17 N·m (13 lb ft).

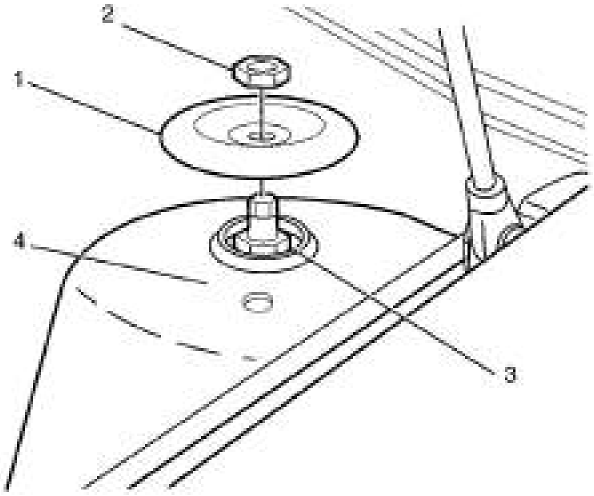
25. Lower the lift table and/or raise the vehicle to remove the support from the frame, engine and transmission.
26. Remove the powertrain and/or engine lift table from the frame, engine and transmission.
27. Partially lower the vehicle.

Notice: Refer to Fastener Notice in the Preface section.



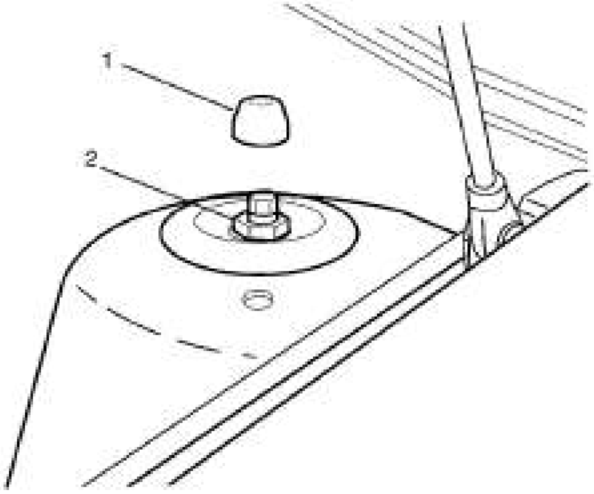
Important: The strut assembly retaining nut (1) must be checked for correct torque before installing the strut assembly into the vehicle. The strut assembly retaining nut torque must be 75 N·m (55 lb ft).

28. Check the torque of the strut assembly retaining nut (1), correct if necessary.

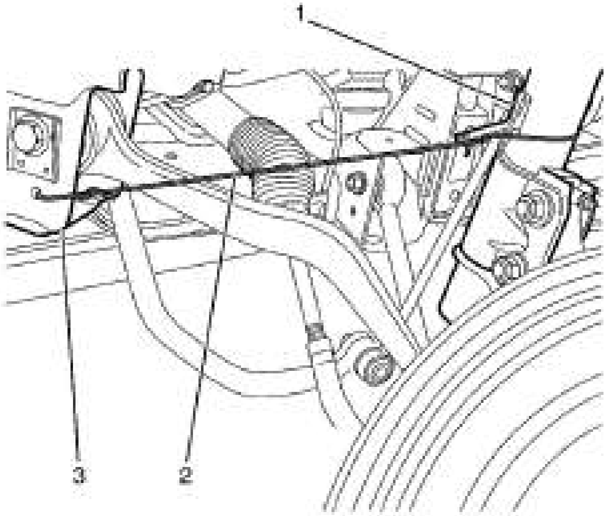


29. Install the strut assembly (3) to the vehicle (4).
30. Install strut assembly to body retaining plate (1).
31. Tighten the NEW strut assembly to body retaining nut (2).

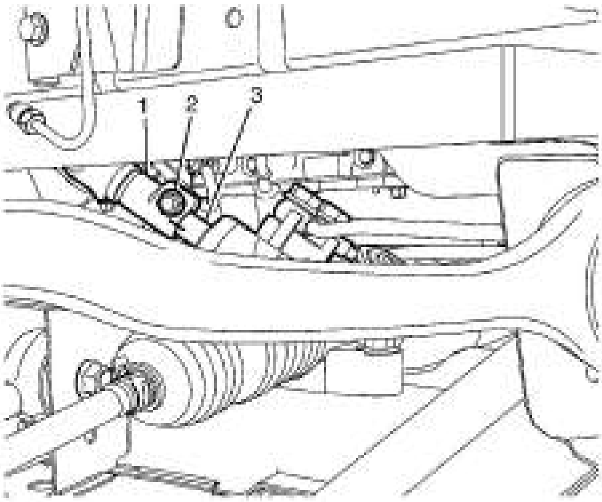
    Tighten
    Tighten the nut to 55 N·m (40 lb ft).



32. Install the dust cover (1) to the strut assembly to body retaining nut (2).
33. Partially raise the vehicle.



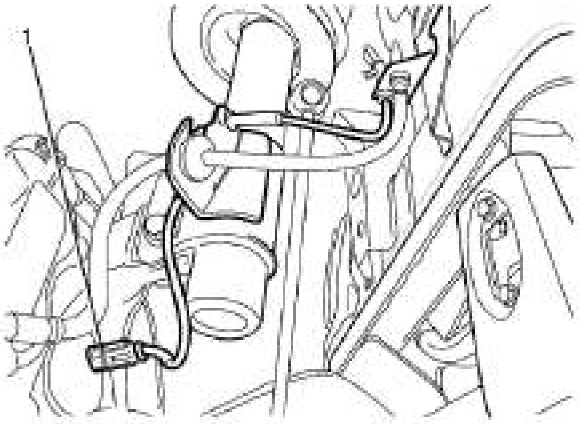
34. Remove the heavy mechanics wire or equivalent (2) retaining the strut assembly (1) to the subframe (3).



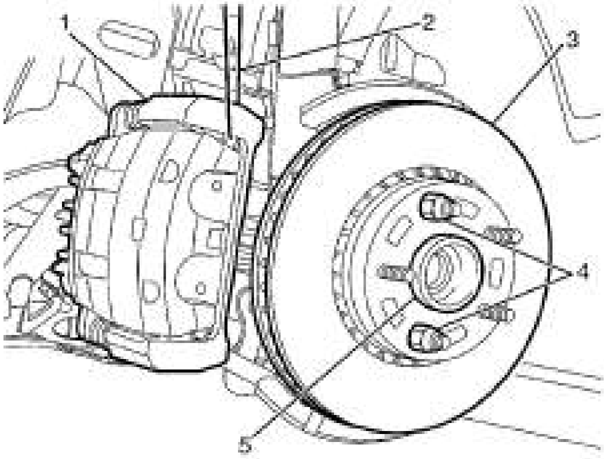
Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

35. Connect the intermediate steering shaft (1) to the pinion shaft (3).
36. Install NEW the intermediate steering shaft to pinion shaft retaining bolt (2).

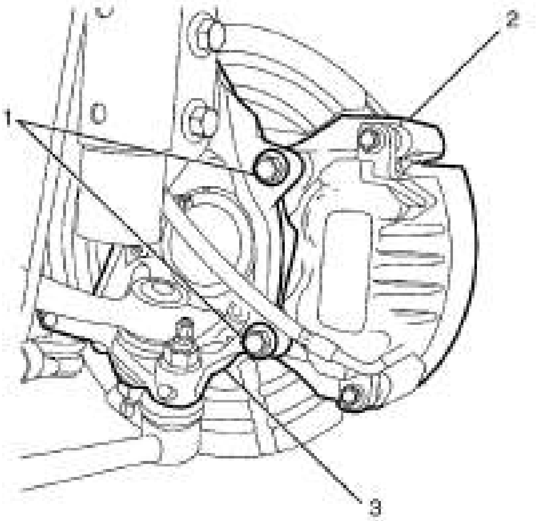
Tighten
Tighten the bolt to 25 N·m (18 lb ft).



37. Connect the wheel speed sensor jumper harness electrical connector (1).



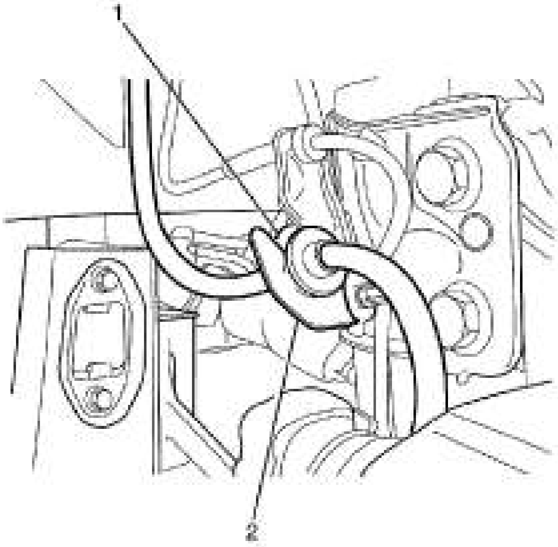
38. Remove the heavy mechanic's wire, or equivalent support (2) from the brake caliper (1).
39. Remove the wheel nuts (4) retaining the brake disc (3) to the hub (5).



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

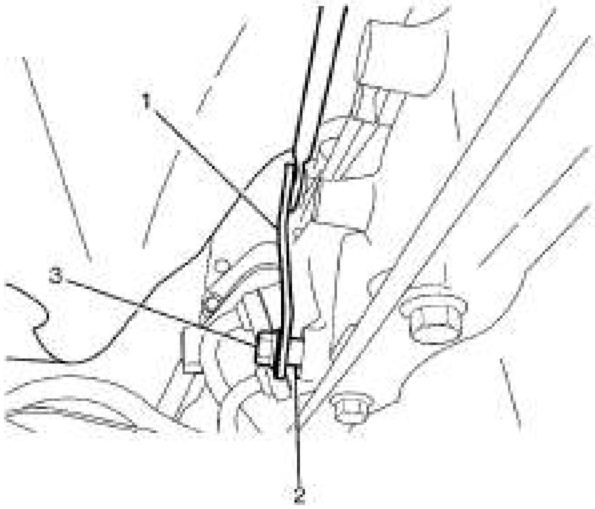
40. Install the brake caliper assembly (2) to the steering knuckle (3).
41. Install the NEW brake caliper anchor plate to knuckle retaining bolts (1).

Tighten
Tighten to 60 N·m +120° (44 lb in +120°).



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

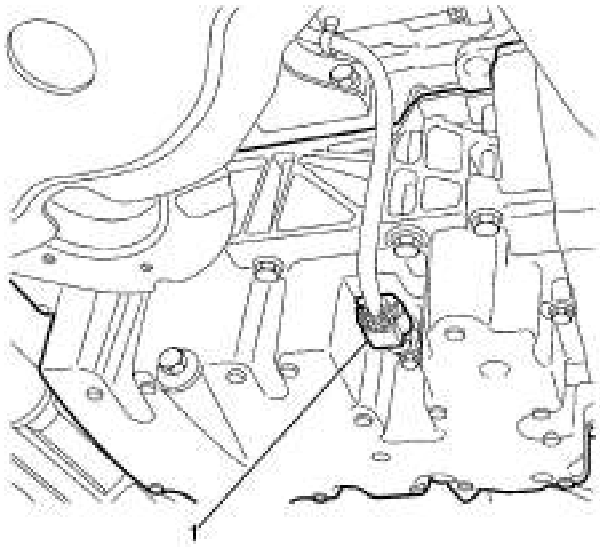
42. Attach the brake hose (1) to the strut mounted brake hose retaining bracket (2).
43. Install the front wheels. Refer to Tire and Wheel Removal and Installation .



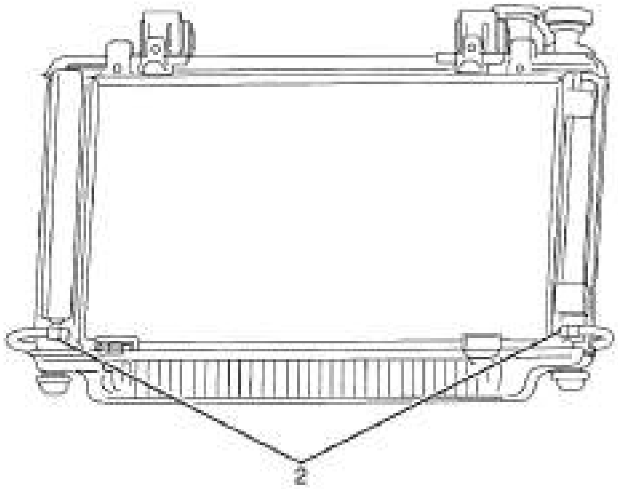
44. Install the shift selector linkage rod (1) to the shift selector shaft (2).
45. Install the shift selector linkage rod to shift selector shaft retaining nut (3).

Tighten
Tighten the nut to 9 N·m (80 lb in).

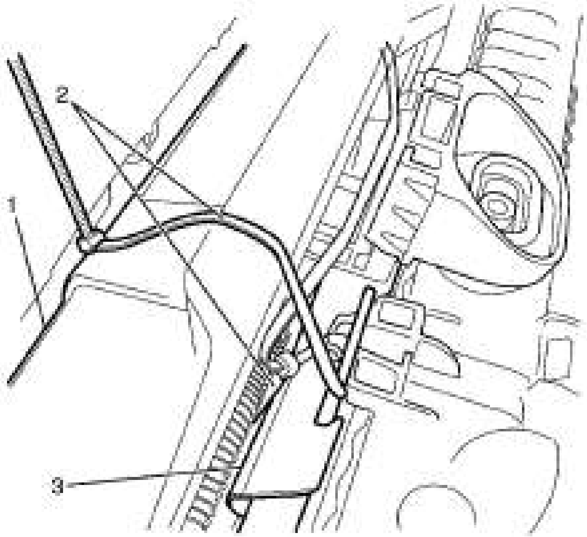
46. Install the starter motor. Refer to Starter Motor Replacement .
47. Install the propeller shaft. Refer to Propeller Shaft Replacement .
48. Install the centre exhaust heat shield. Refer to Exhaust Heat Shield Replacement - Center .
49. Install the Exhaust system. Refer to Exhaust System Replacement .



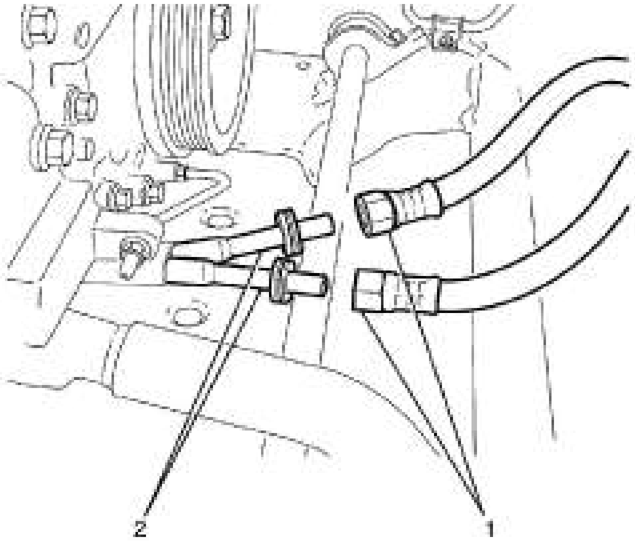
50. Connect the low oil level sensor electrical connector (1).



51. Remove the plug or cap at the power steering cooler hose (1) ends.
52. Connect the power steering cooler hoses (1).
53. Remove the plug or cap from the cooling system hoses and inlets.
54. Connect the radiator inlet hose. Refer to Radiator Inlet Hose Replacement .
55. Install the Engine Splash Shield. Refer to Engine Splash Shield Replacement .
56. Install the front air deflector. Refer to Front Air Deflector Replacement .
57. Lower the vehicle.



58. Remove the zip ties (2) or equivalent securing the radiator and condenser assembly (3) to the front end assembly (1).



Important: The AU-525 is not required for installation.

59. Remove the clean lint free cloth at the transmission cooler lines (2) and the flexible hoses (1).

Important: The flexible hoses are not serviced separately. Therefore if the hose's require replacement, then the hose and radiator to hose cooler hose assembly must be fitted.

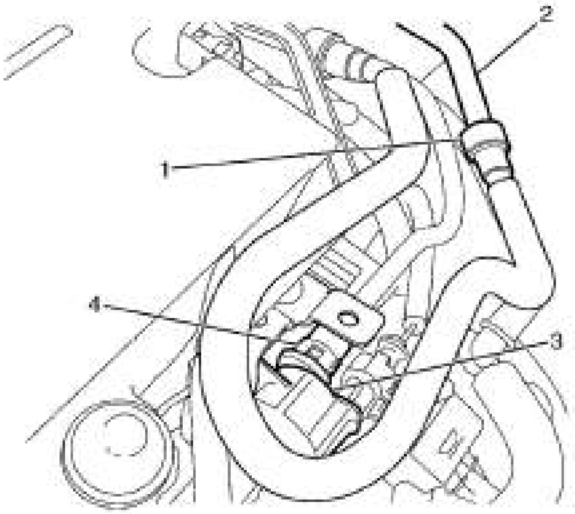
60. Align both flexible hose's with both steel cooler lines.

Important: Listen for an audible click to confirm fitting.

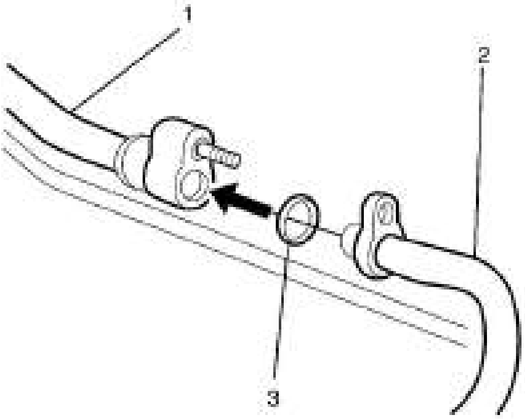
61. Hold the cooler line (2) and connect the flexible hose (1) by pushing together. Repeat procedure for other hose.

Important: When adding or changing transmission fluid use only recommended automatic transmission fluid.

62. Check and top up transmission fluid level if required.

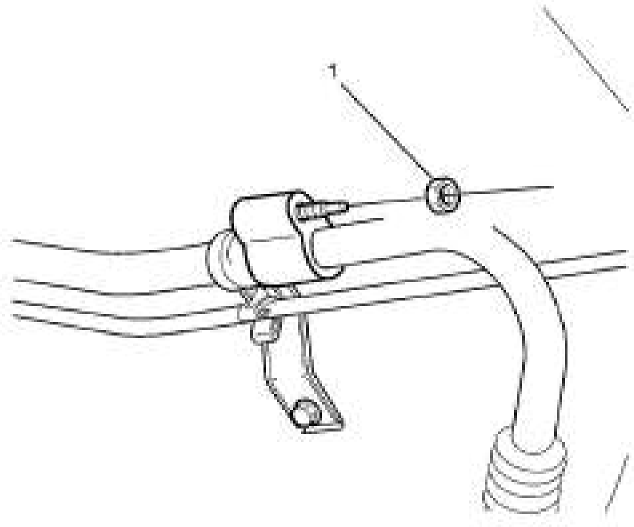


63. Remove the plug or cap at the fuel feed hose (1) and fuel feed pipe (2) ends.
64. Connect the fuel feed hose (1) to the fuel feed pipe (2). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .
65. Remove the plug or cap at the EVAP purge line (4) and the purge solenoid (3) ends.
66. Connect the EVAP purge line (4) to the purge solenoid (3). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .



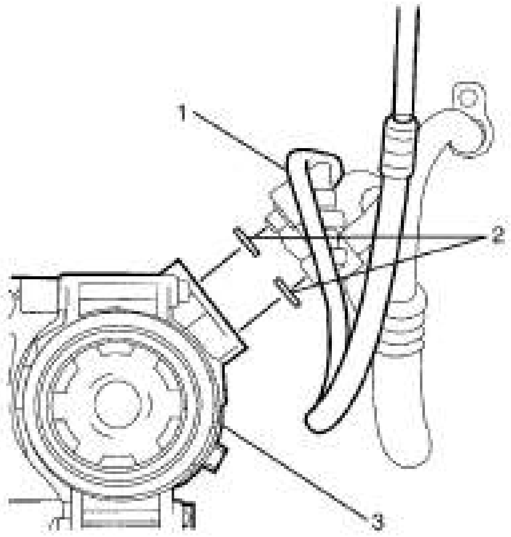
Important: DO NOT coat the new sealing washer with oil. They must be fitted dry. The use of mineral oil will render the washer useless, as the washer WILL swell causing refrigerant to leak out.

67. Install a NEW sealing washer (3) to suction pipe joint.
68. Position the upper suction pipe (1) to the lower suction pipe (2).



69. Install the A/C suction pipe pad to A/C suction pipe retaining nut (1).

Tighten
Tighten the nut to 22 N·m(16 lb ft).

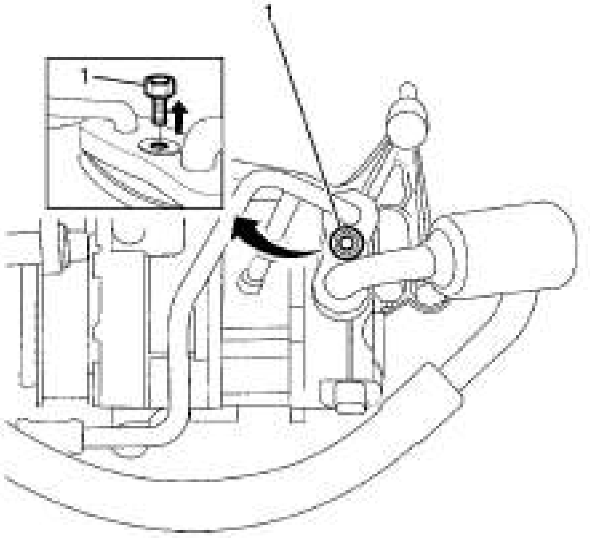


70. Remove the plug or cap at the A/C suction/discharge pipe (1) ends and the compressor (2) ports.

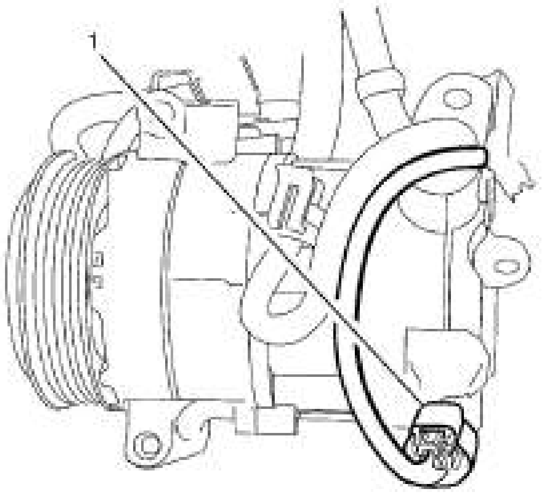
Important: The A/C sealing O-rings must be fitted dry. DO NOT lubricate the A/C sealing O-rings.

71. Fit the NEW A/C suction/discharge pipe sealing O-ring (2) to the suction pipe.

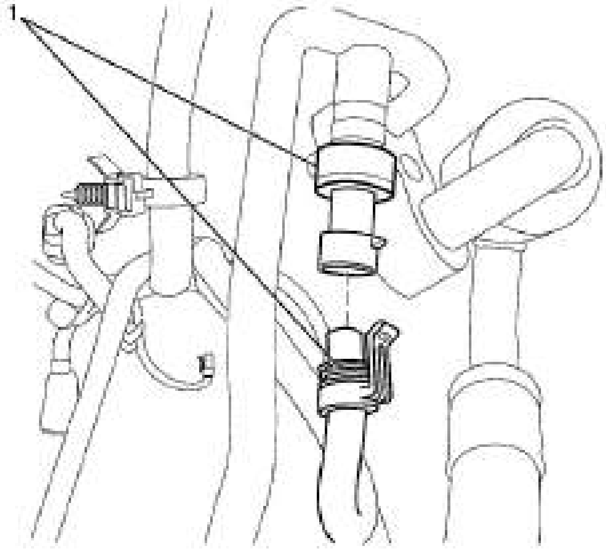
72. Connect the A/C suction/discharge line pad (1) to the A/C compressor (2).



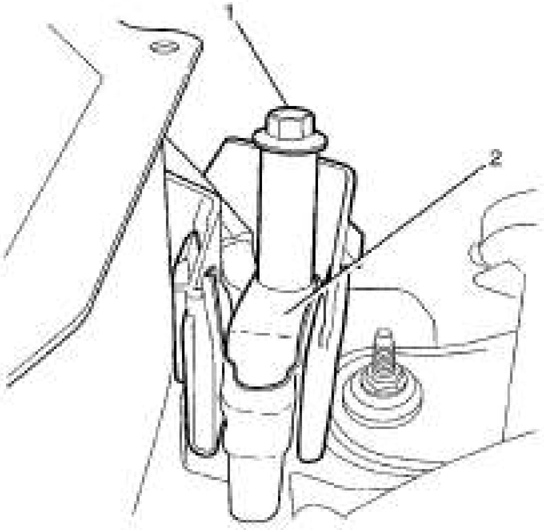
73. Install the suction/discharge line pad to A/C compressor retaining nut (1).



74. Connect the A/C compressor electrical connector (1).

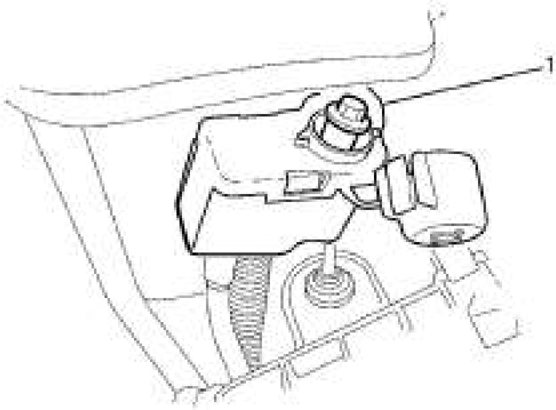


75. Connect the A/C pressure transducer electrical connector (1).



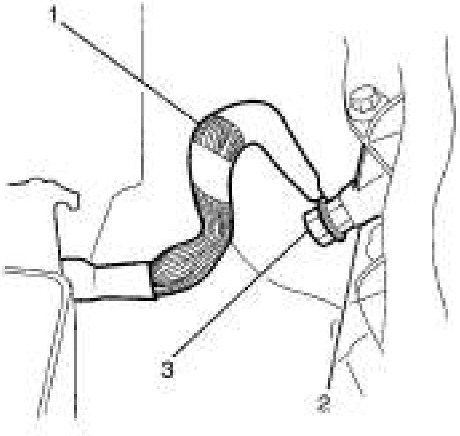
76. Install the wiring harness (2).
77. Install the remote battery positive post to wiring harness retaining bolt (1).

Tighten
Tighten the bolt to 15 N·m (11 lb ft).



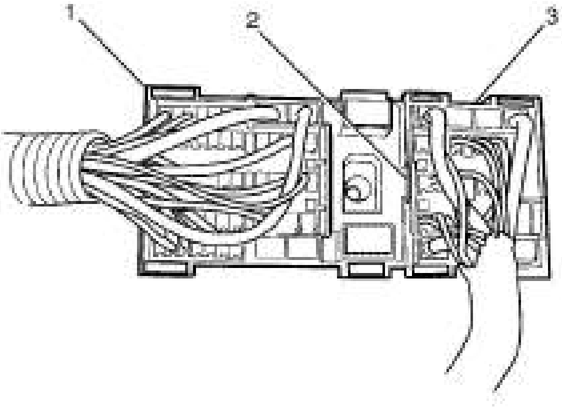
Important: Make sure the clips on the remote battery positive post cover (1) are engaged to avoid an induced rattle condition.

78. Install the remote battery positive post cover (1).



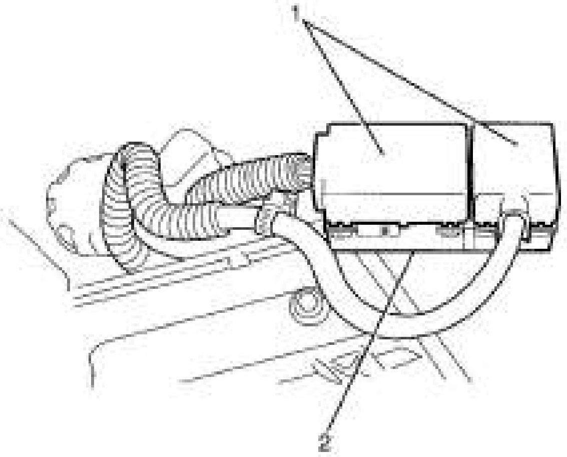
79. Connect the vehicle body ground cable (1) to the cylinder head (2).
80. Install the vehicle body ground cable to the cylinder head retaining bolt (3)

Tighten
Tighten the bolt to 10 N·m(89 lb in).

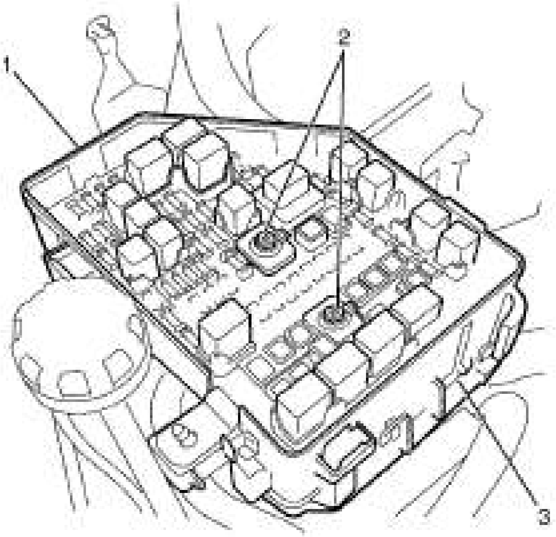


Important: Listen for a audible click from the locking tang (2) to confirm fitting.

81. Slide the engine connector (3) into the body harness connector (1) to join.



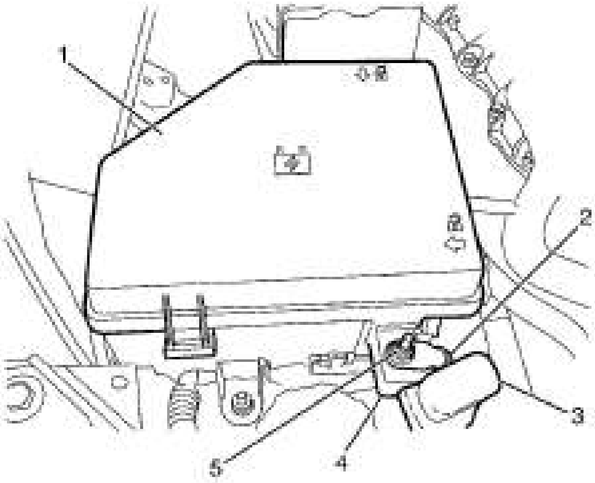
82. Attach the protector (1) to the base of the under hood BEC connector (2).



83. Install the upper under hood BEC plate (1) to the lower under hood BEC plate (3).

Important: The under hood BEC upper plate to lower plate retaining bolts (2) DO NOT have a torque specification. Listen for an audible clicking sound whilst tightening the under hood BEC upper plate to lower plate retaining bolts (2) to confirm correct fitting.

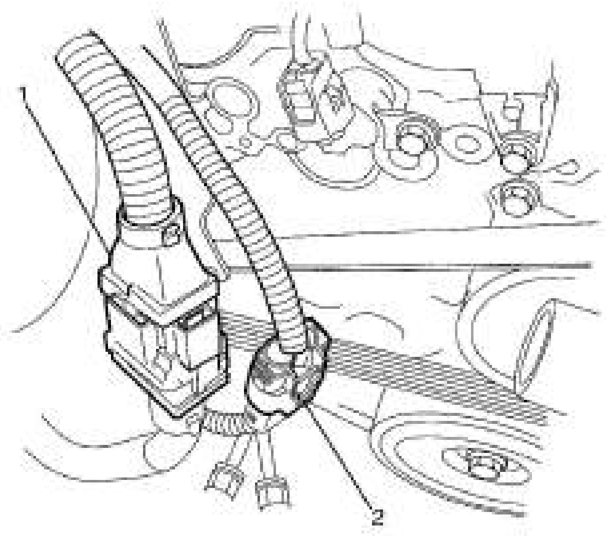
84. Install the under hood BEC upper plate to lower plate retaining bolts (2).



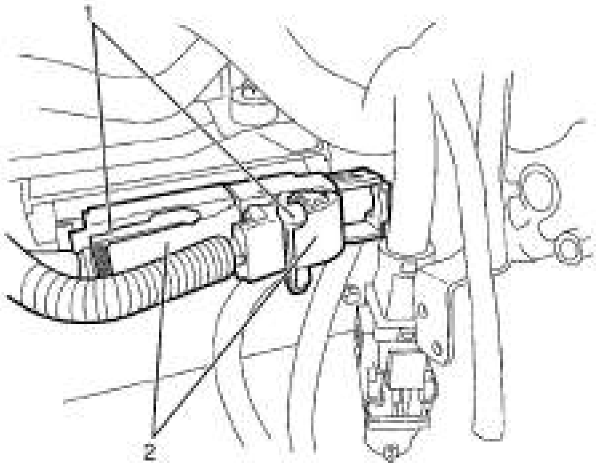
85. Connect the positive cable (2) to the upper under hood BEC plate (4).
86. Install the positive cable to under hood BEC plate retaining bolt (5).

Tighten
Tighten the bolt to 10 N·m(89 lb ft).

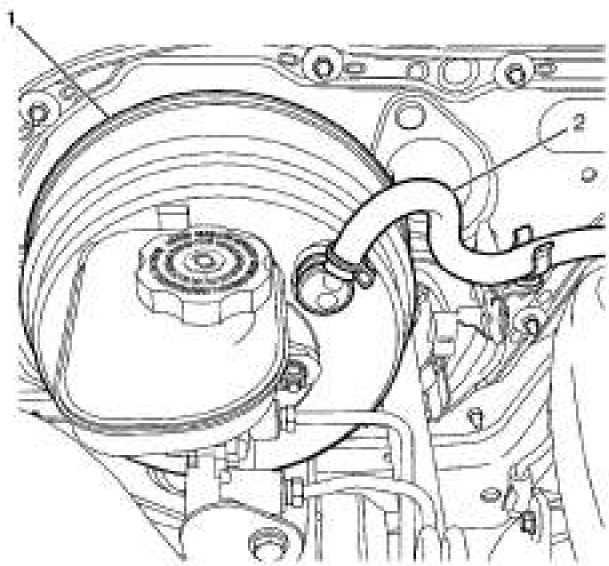
87. Install the positive cable protective cover (3).
88. Install the under hood body electrical centre (BEC) lid (1).



89. Connect the 56 pin engine wiring harness to main wiring harness electrical connector (1).
90. Connect the 2 pin engine wiring harness to main wiring harness electrical connector (2).

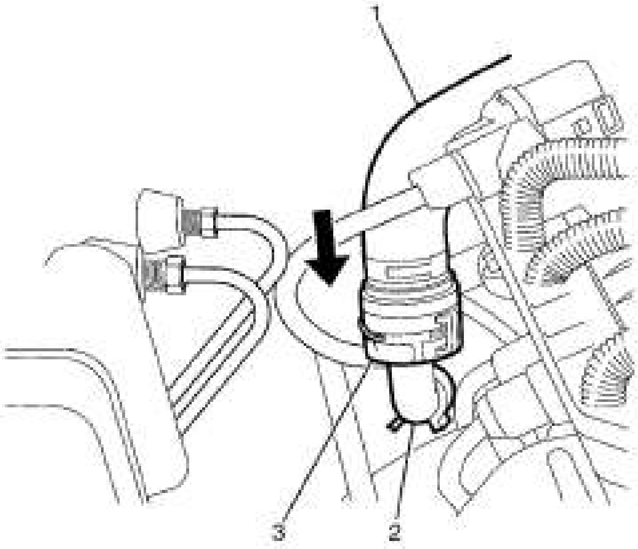


91. Connect ECM electrical connectors (2).
92. Rotate the engine control module (ECM) electrical connector levers (1) to the locked position.



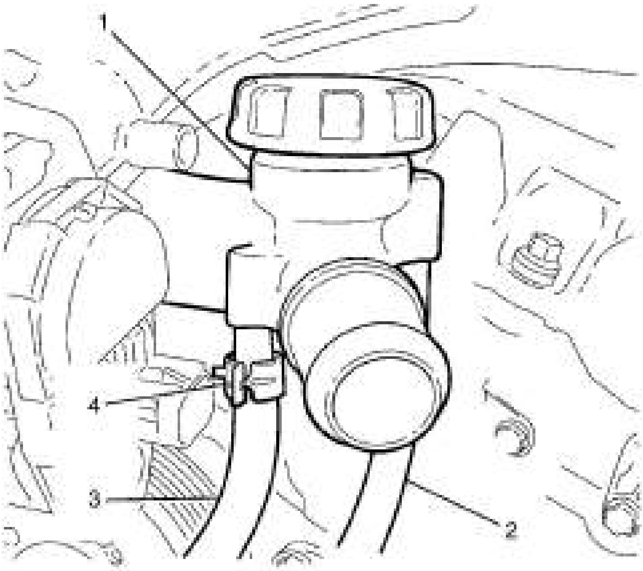
93. Connect the vacuum hose and the vacuum brake booster check valve (2) from vacuum brake booster (1).

Caution: Refer to Installing Hoses without Twists or Bends Notice in the Preface section.



Important: Listen for a audible click to confirm fitting in two places

94. Attach the heater hose (1) quick connect fitting (3) by pushing the hose onto the heater pipe (2).



95. Remove the plug or cap at the cooling system hoses and inlets
96. Install the coolant bleed hose (3) to the outlet housing (1).
97. Compress the coolant bleed hose retaining clamp (4) and position back to its original location on the coolant bleed hose (3).
98. Connect the coolant recovery hose (2) from the outlet housing (1).
99. Install the radiator outlet hose. Refer to Radiator Outlet Hose Replacement .
100. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
101. Refill the cooling system. Refer to Cooling System Draining and Filling .
102. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
103. Recharge the air conditioning (A/C) system. Refer to Refrigerant Recovery and Recharging .
104. Install the radiator air intake baffle. Refer to Radiator Air Upper Baffle and Deflector Replacement .
105. Install the engine covers. Refer to Engine Cover Replacement .
106. Disable the ignition system.
107. Crank the engine several times. Listen for any unusual noises or evidence that parts are binding.
108. Enable the ignition system.
109. Start the engine and listen for unusual noises.
110. Check the vehicle oil pressure gauge and confirm that the engine has acceptable oil pressure.

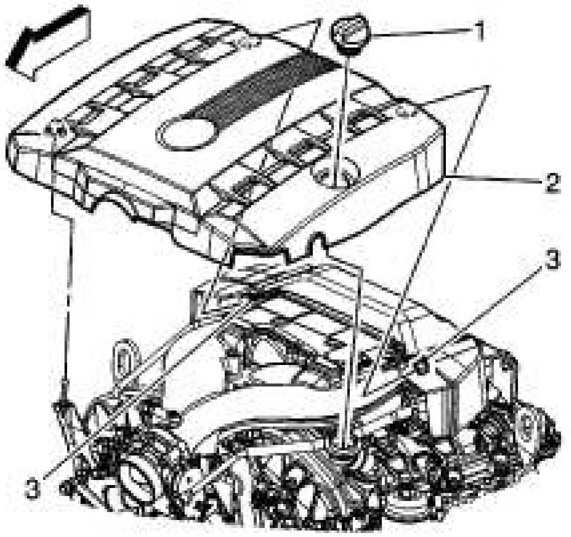
     If necessary, install an oil pressure gauge and measure the engine oil pressure.

111. Run the engine speed at about 1,000 RPM until the engine has reached normal operating temperature.
112. Listen for sticking stationary hydraulic lash adjuster, (SHLAs) (valve lifters) and other unusual noises.
113. Inspect for fuel, oil, and/or other coolant leaks while the engine is running.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1958267

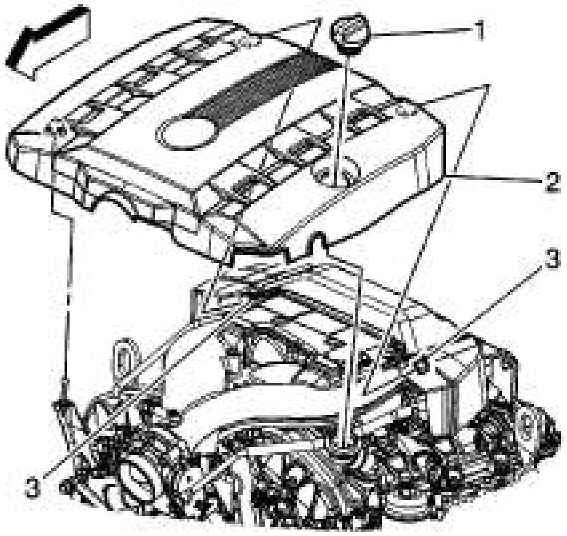
Fuel Injector Sight Shield Replacement (LLT)

Removal Procedure



1. Remove the cross car brace, if necessary. Refer to Cross Vehicle Brace Replacement .
2. Remove the oil fill cap (1).
3. Disengage the cover/shield (2) from the ball studs by pulling up firmly on the right and left front of the engine cover.
4. Pull the engine cover/sight shield forward to remove from the rear tabs (3).
5. Remove the engine cover/sight shield .
6. Remove the front compartment sight shield, if necessary. Refer to Front Compartment Sight Shields Replacement .

Installation Procedure

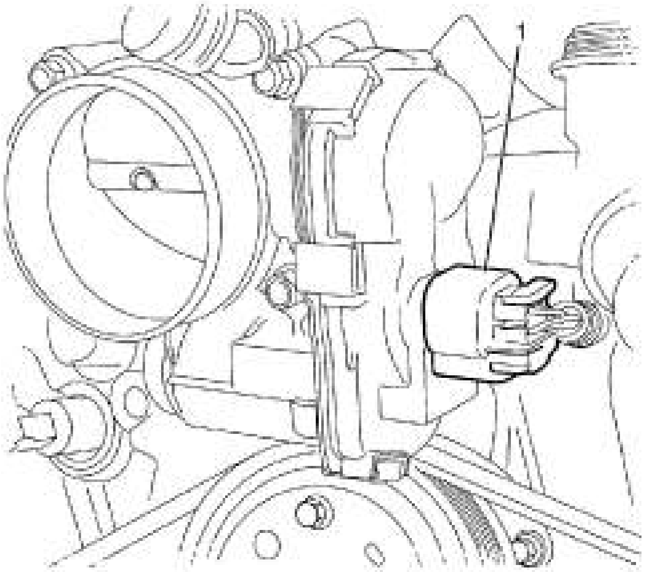


1. Install the front compartment sight shield, if necessary. Refer to Front Compartment Sight Shields Replacement .
2. Raise the front edge of the cover (2) while inserting the rear tabs (3).
3. Lower the front edge of the cover and slide cover rearward so that the rear tabs slide under the retainers.
4. Align the cover over the oil fill tube.
5. Press the cover down firmly on the ball stud at the right front corner.
6. Install the oil fill cap (1).
7. Install the cross car brace, if necessary. Refer to Cross Vehicle Brace Replacement .

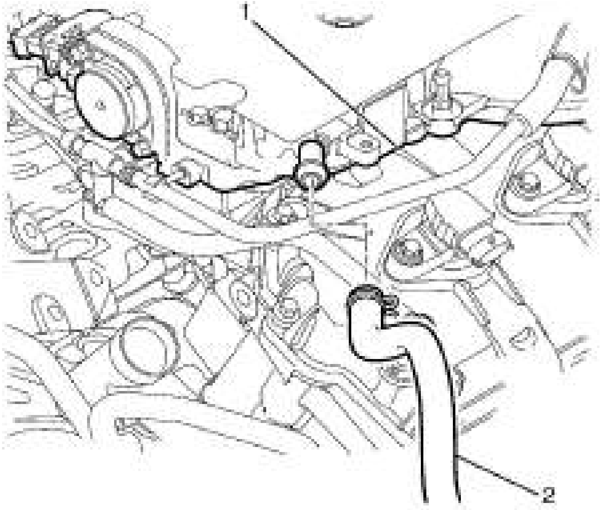
Lower Intake Manifold Replacement

Caution: Refer to Battery Disconnect Caution in the Preface section.

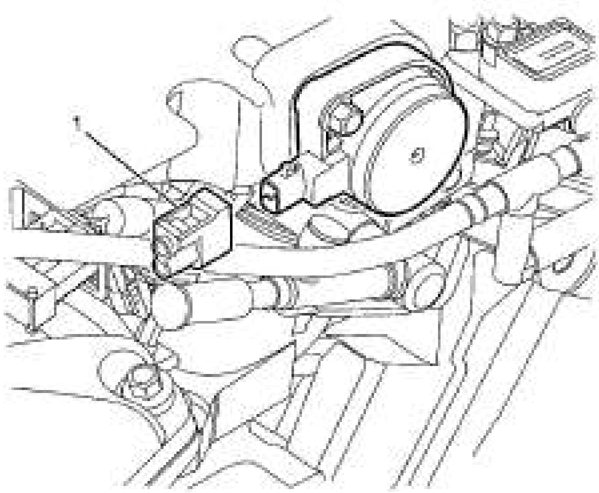
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the engine covers. Refer to Engine Cover Replacement.
3. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.



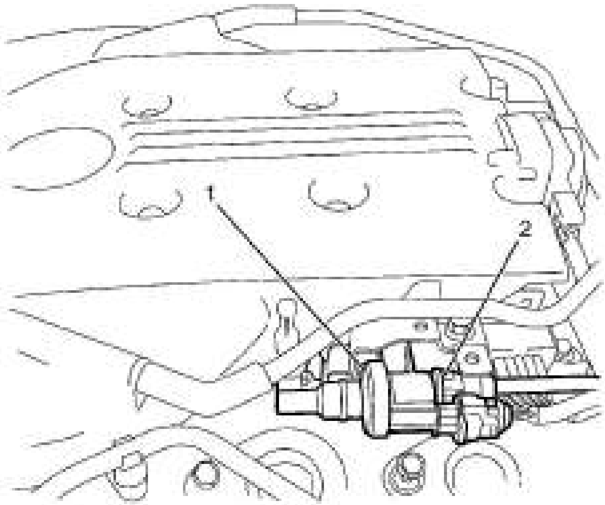
4. Disconnect the throttle body electrical connector (1).



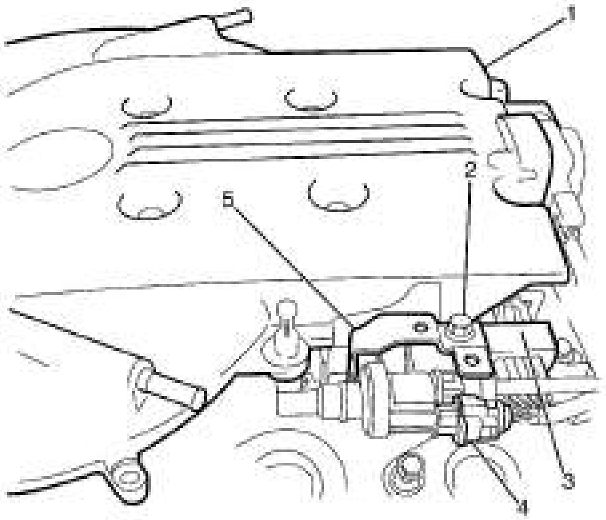
5. Disconnect the brake booster vacuum hose (2) from the intake manifold (1).



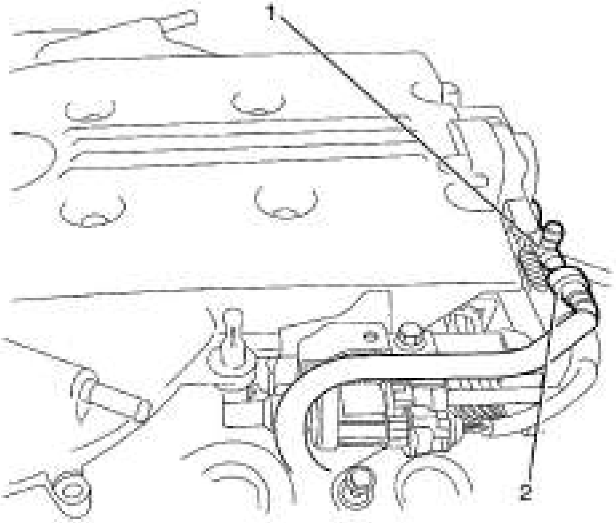
6. Disconnect the Inlet Manifold Runner Control (IMRC) solenoid connector (1).



7. Disconnect the evaporative emission (EVAP) purge line (1) from the purge solenoid (2). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.
8. Plug or cap the (EVAP) purge line (1) and the purge solenoid (2) ends.
9. Remove the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement.



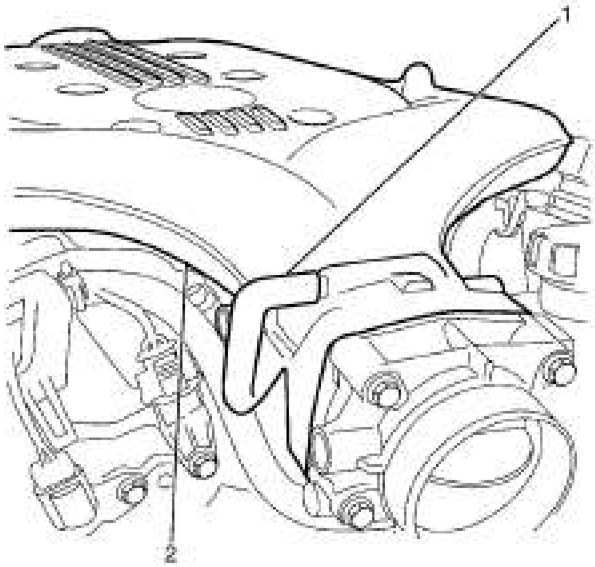
10. Disconnect the EVAP valve electrical connector (4)
11. Disconnect the fuel injector harness electrical connector (3)
12. Remove the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).
13. Reposition the fuel injector harness electrical connector/EVAP valve mounting bracket (5) away from the intake manifold (1).



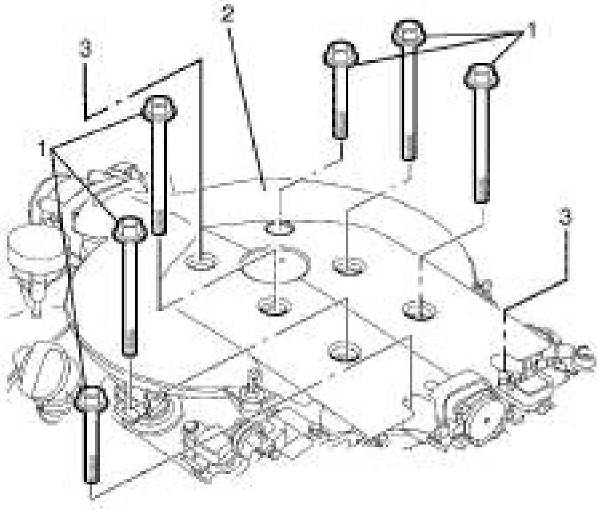
14. Disconnect the fuel feed pipe (2) from the fuel rail (1). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.

    Important: Plug or cap the fuel feed pipe (2) and fuel rail (1) ends to prevent fuel leaks and/or contamination.

15. Plug or cap the fuel feed pipe (2) and fuel rail (1) ends.



16. Disconnect the EVAP line (1) from the intake manifold (2).



Important:

- DO NOT remove the upper intake manifold to lower intake manifold retaining bolts (3).
- DO NOT kink or damage the fuel pipe.

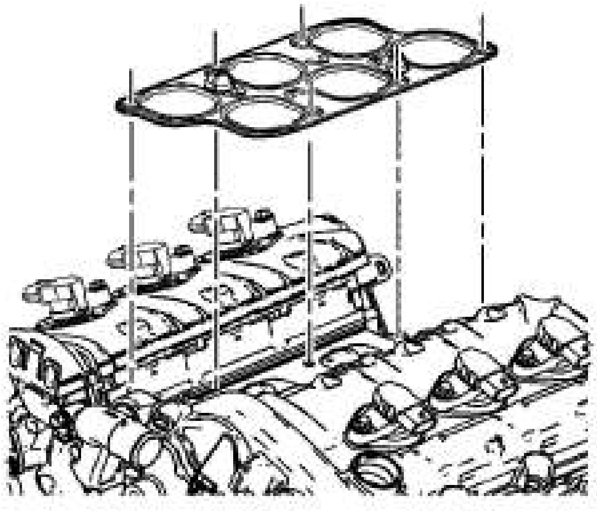
17. Remove the intake manifold to cylinder head retaining bolts (1).
18. Remove the intake manifold assembly (2).

Important: The cylinder heads and engine valley must be plugged with a clean lint free cloth to prevent foreign matter entry into the engine.

19. Plug the cylinder heads and engine valley with a clean lint free cloth.
20. Disassemble the intake manifold as to replace the lower intake manifold. Refer to Intake Manifold Disassemble.
21. Clean and inspect the intake manifold and the sealing surfaces. Refer to Intake Manifold Cleaning and Inspection.

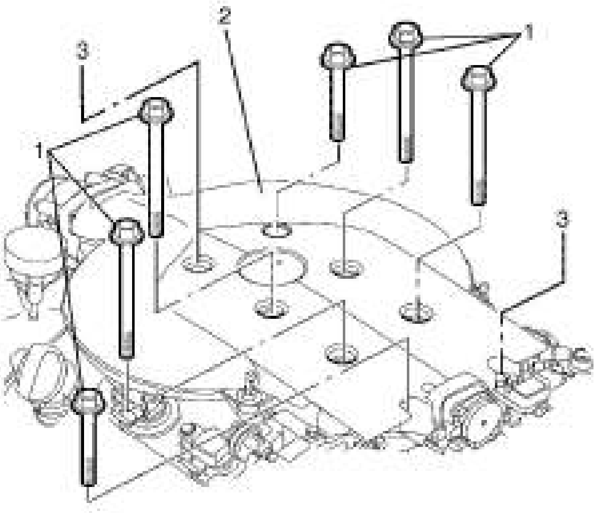
Installation Procedure

1. Assemble the intake manifold as necessary. Refer to Intake Manifold Assemble.
2. Remove the clean lint free cloth from the cylinder heads and engine valley.



Important: Inspect and replace the lower intake manifold gasket only if the gasket is worn or damaged.

3. Install the lower intake manifold gasket.



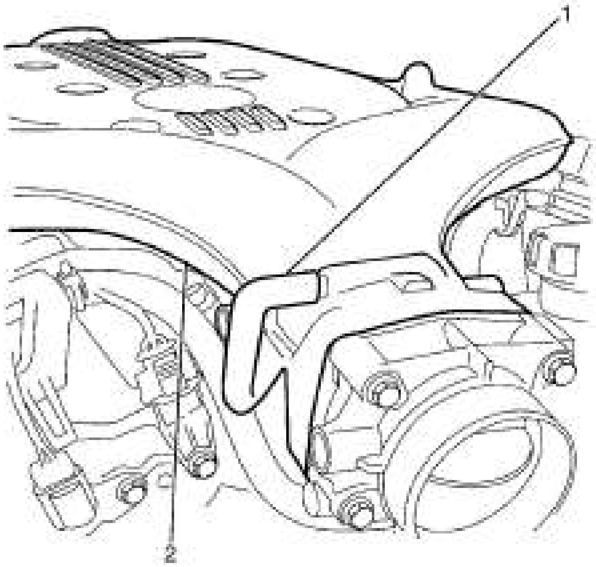
4. Install the intake manifold assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.

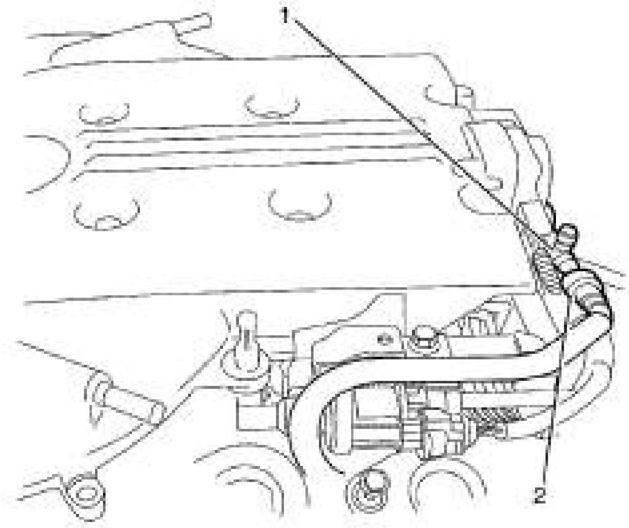
   Important: Tighten the intake manifold to cylinder head retaining bolts (1) in a circular pattern starting at the center (long bolts) and moving outward.

5. Install the intake manifold to cylinder head retaining bolts (1).

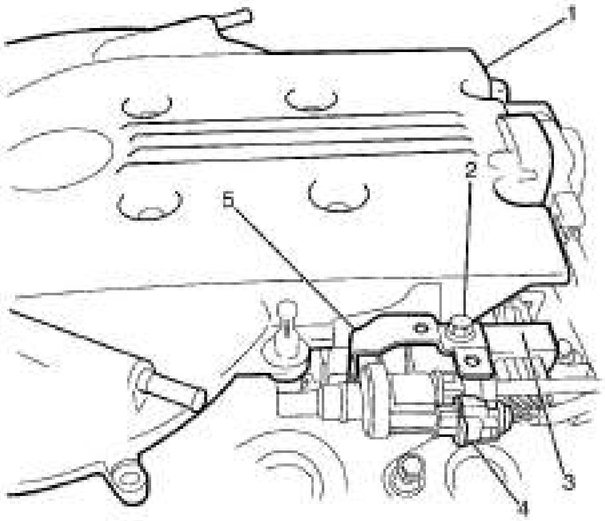
   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).



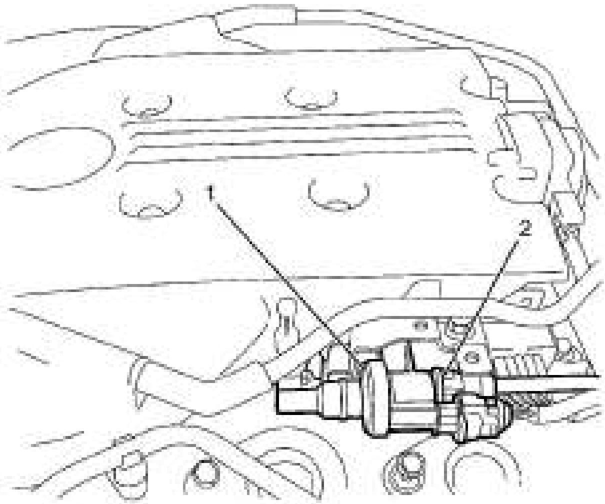
6. Connect the EVAP line (1) to the intake manifold (2).



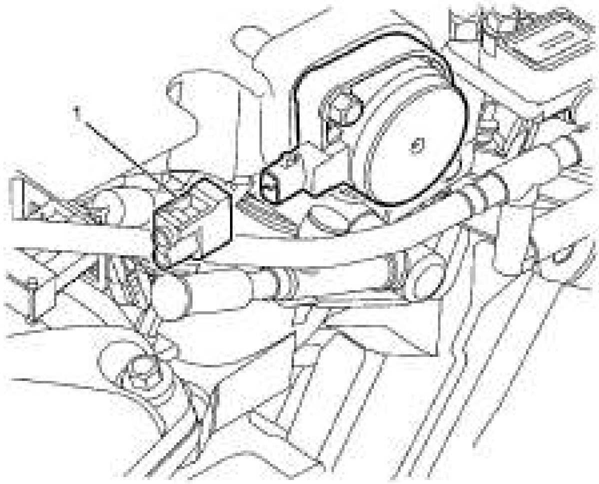
7. Remove the plug or cap at the fuel feed pipe (1) and fuel rail (2) ends
8. Connect the fuel feed pipe (1) to the fuel rail (2). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



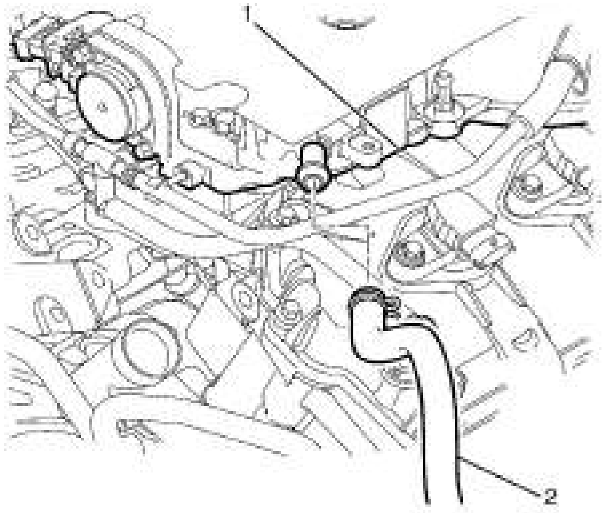
9. Install the fuel injector harness electrical connector/EVAP valve mounting bracket (5) to the intake manifold (1).
10. Install the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).
11. Connect the fuel injector harness electrical connector (3)
12. Connect the EVAP valve electrical connector (4)
13. Install the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement.



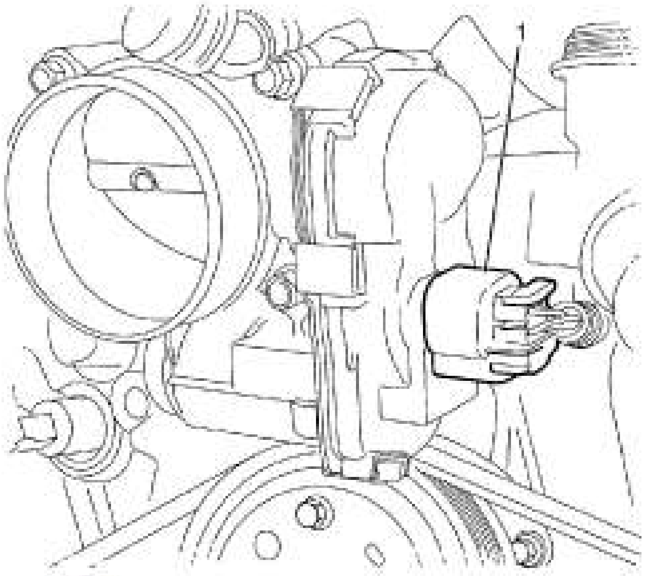
14. Remove the plug or cap from the (EVAP) purge line (2) and the purge solenoid (1) ends.
15. Connect the evaporative emission (EVAP) purge line (2) from the purge solenoid (1). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service.



16. Connect the Inlet Manifold Runner Control (IMRC) electrical connector (1).



17. Connect the brake booster vacuum hose (2) to the intake manifold (1).



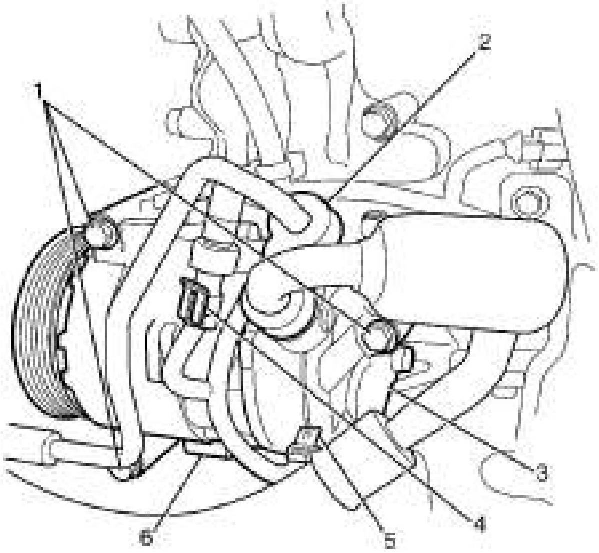
18. Connect the throttle body electrical connector (1).
19. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement.
20. Install the engine covers. Refer to Engine Cover Replacement.
21. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 2037284

Oil Filter Adapter Replacement

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the oil filter. Refer to Engine Oil and Oil Filter Replacement.
3. Remove the drive belt. Refer to Drive Belt Replacement.



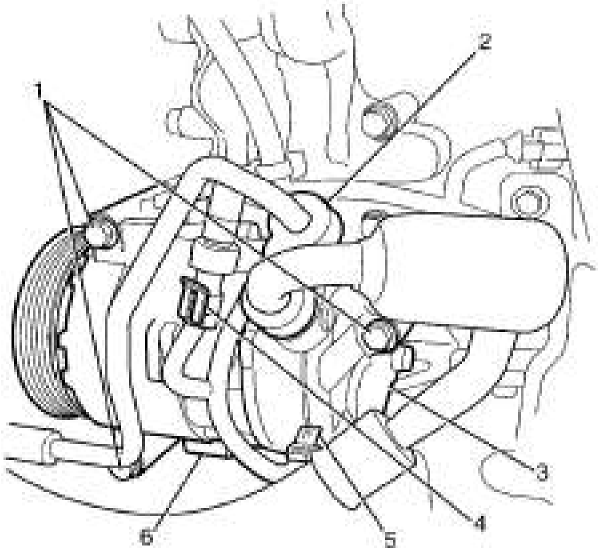
4. Disconnect the A/C pressure transducer electrical connector (4).
5. Disconnect the A/C compressor electrical connector (5).

Important: DO NOT disconnect the A/C pipes (2) from the A/C compressor (6).

6. Remove the A/C compressor to A/C compressor/power steering pump mounting bracket retaining bolts (1).
7. Secure and reposition the A/C compressor (6) away from the A/C compressor mounting bracket (3) in order to gain access to the oil filter adapter to cylinder block retaining bolts..
8. Remove the oil filter adapter. Refer to Oil Filter Adapter Removal.

Installation Procedure

1. Install the oil filter adapter. Refer to Oil Filter Adapter Installation.



Important: Make sure the A/C pipes (2) are not twisted or kinked upon compressor installation.

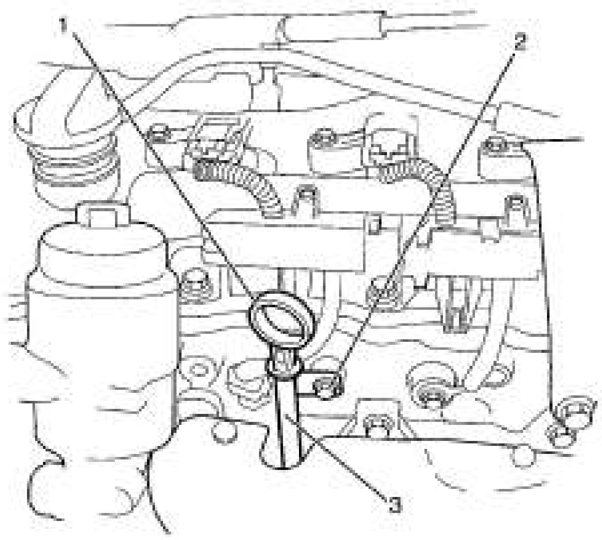
2. Install the A/C compressor (6) with the A/C pipes (2) to the A/C compressor mounting bracket (3).
3. Install the A/C compressor to A/C compressor mounting bracket retaining bolts (1).
4. Connect the A/C pressure transducer electrical connector (4).
5. Connect the A/C compressor electrical connector (5).
6. Install the drive belt. Refer to Drive Belt Replacement.
7. Install the oil filter. Refer to Engine Oil and Oil Filter Replacement.
8. Install the engine covers. Refer to Engine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1977516**

Oil Level Indicator Tube Replacement

Removal Procedure

1. Turn the ignition OFF.

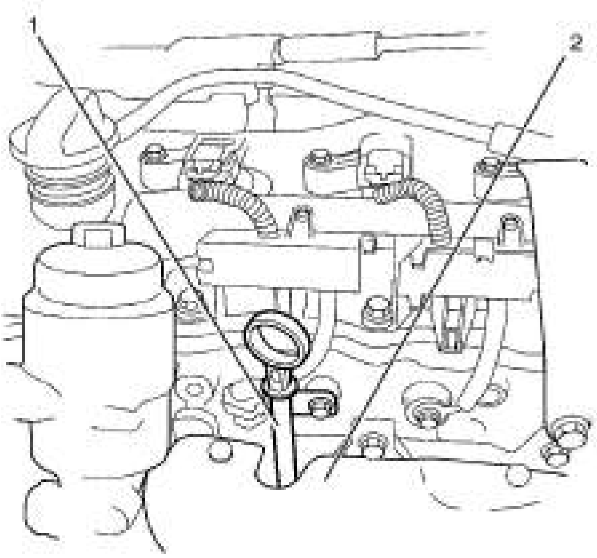


2. Remove the oil level indicator tube bracket to cylinder head retaining bolt (2).
3. Remove the oil level indicator (1) from the oil level indicator tube (3).

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the knock sensor. Refer to Knock Sensor Replacement - Bank 2.
6. Lower the vehicle.



7. Remove the oil level indicator tube (1) up through the exhaust manifold (2).
8. If you are replacing only the oil level indicator tube seal, remove and discard the old seal.

Installation Procedure

1. Install the oil level indicator and tube. Refer to Oil Level Indicator and Tube Installation.

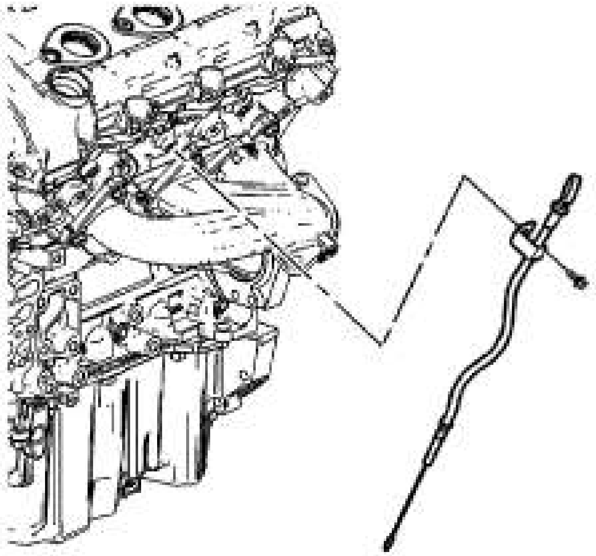
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Install the knock sensor. Refer to Knock Sensor Replacement - Bank 2.
4. Lower the vehicle.

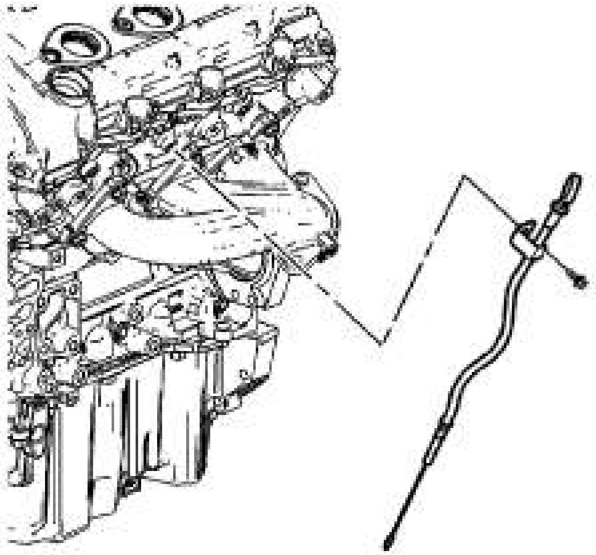
Oil Level Indicator Tube Replacement (LLT)

Removal Procedure



1. Remove the front compartment sight shield as necessary. Refer to Front Compartment Sight Shields Replacement .
2. Remove the oil level indicator from the oil level indicator tube.
3. Remove the oil level indicator tube bolt.
4. Remove the engine splash shield. Refer to Engine Splash Shield Replacement.
5. Lower the vehicle.
6. Remove the oil level indicator tube up through the exhaust manifold.
7. If you are replacing only the oil level indicator tube seal, remove and discard the old seal.

Installation Procedure



1. Install the oil level indicator and tube. Refer to Oil Level Indicator and Tube Installation.
2. Install the engine splash shield. Refer to Engine Splash Shield Replacement.
3. Lower the vehicle.
4. Install the front compartment sight shield as necessary. Refer to Front Compartment Sight Shields Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977630

Oil Pan Replacement (RHD)

Removal Procedure

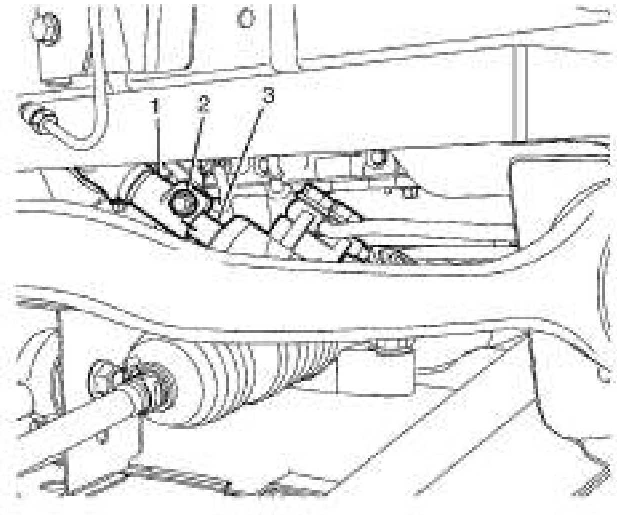
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Drain the engine oil. Refer to Engine Oil and Oil Filter Replacement .
4. Remove the engine splash shield. Refer to Engine Splash Shield Replacement .
5. Remove the front air deflector. Refer to Front Air Deflector Replacement .



Important: Observing the orientation of the intermediate steering shaft (1) with reference to the pinion shaft (3) will minimise the potential of incorrect steering column assembly alignment.

Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

6. Mark the intermediate steering shaft (1) in relation to the pinion shaft (3) and discard.

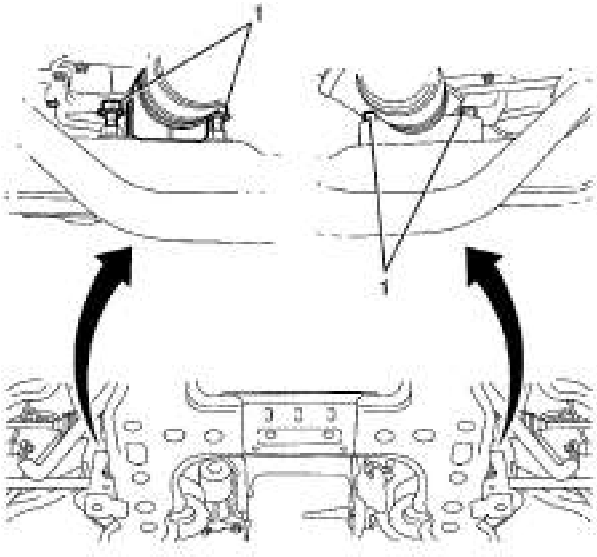
   Discard the bolt.

7. Remove the intermediate steering shaft to pinion shaft retaining bolt (2).

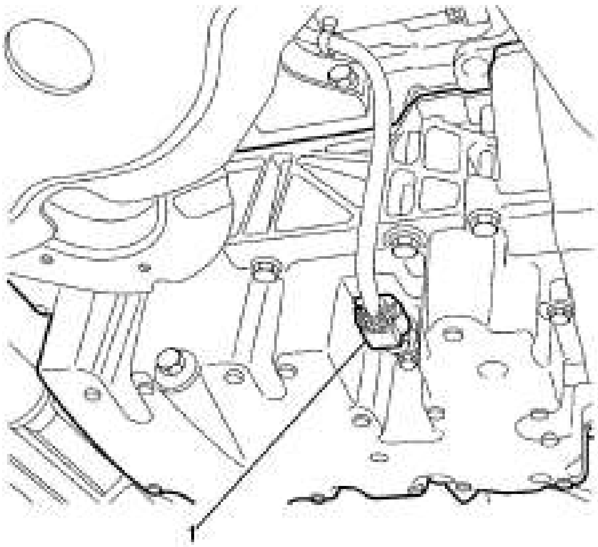
Important: Make sure the bolt hole is thoroughly cleaned and all micro-encapsulated thread sealant is removed.

8. Disconnect the intermediate shaft (2) from the pinion shaft (3).

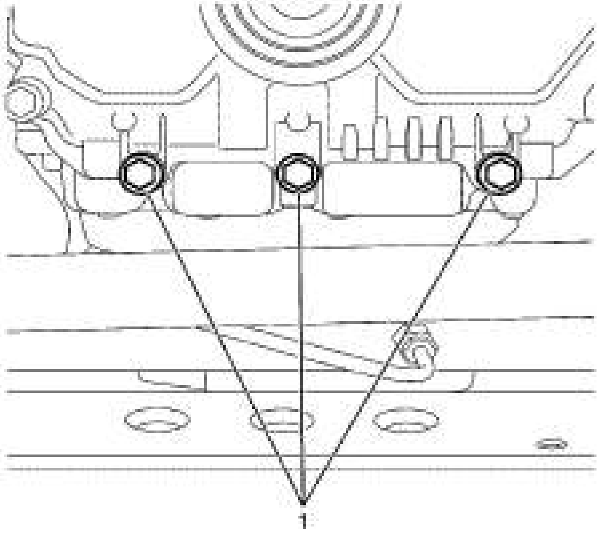
   Clean the bolt hole.



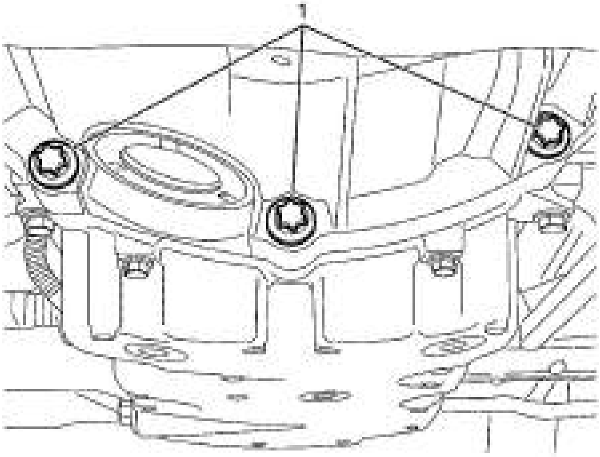
9. Remove the steering gear to subframe retaining bolts (1).
10. Slide the steering gear forward to gain full access to the sump.



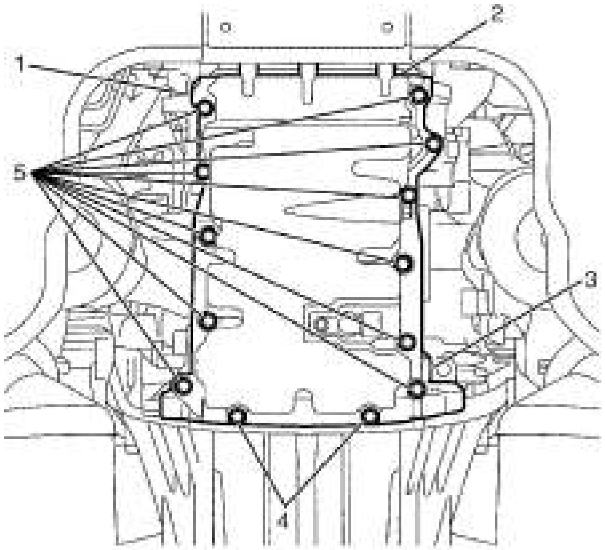
11. Disconnect the oil level/temperature sensor electrical connector (1).



12. Remove the front cover to oil pan retaining bolts (1).



13. Remove the transmission to oil pan retaining bolts (1).



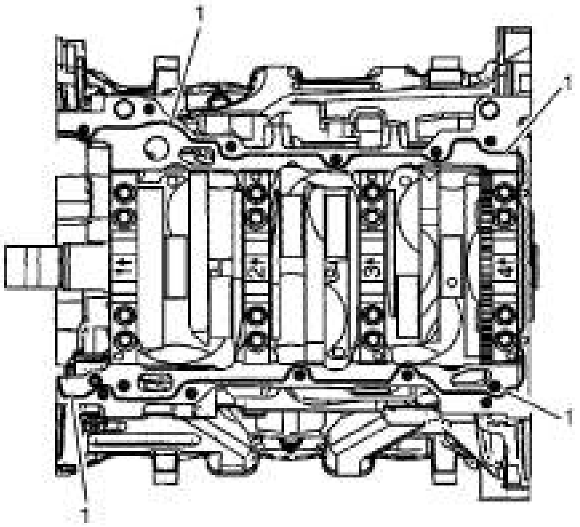
14. Remove the M6 rear oil pan to ccrankshaft rear oil seal housing retaining bolts (4).
15. Remove the M8 oil pan to cylinder block retaining bolts (5).

Important: Using the pry points (1 and 3) to shear the RTV sealant.

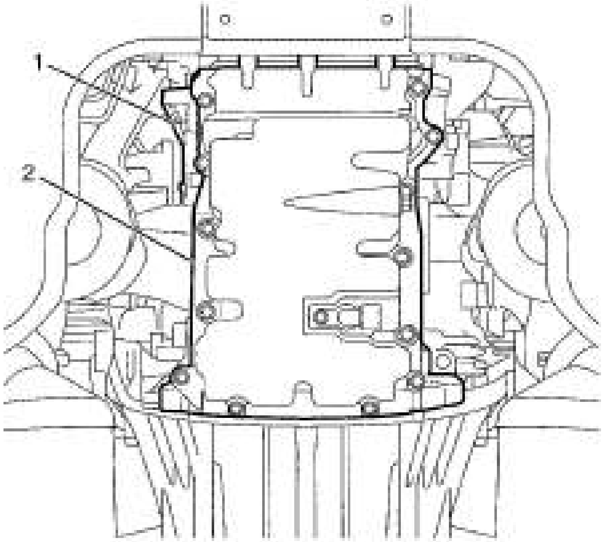
16. Remove the oil pan (2) from the cylinder block.
17. Perform the following steps as necessary.
    - Disassemble the oil pan. Refer to Oil Pan Disassemble .
    - Clean and inspect the oil pan. Refer to Oil Pan Cleaning and Inspection .

Installation Procedure

1. Assemble the oil pan as necessary. Refer to Oil Pan Assemble .

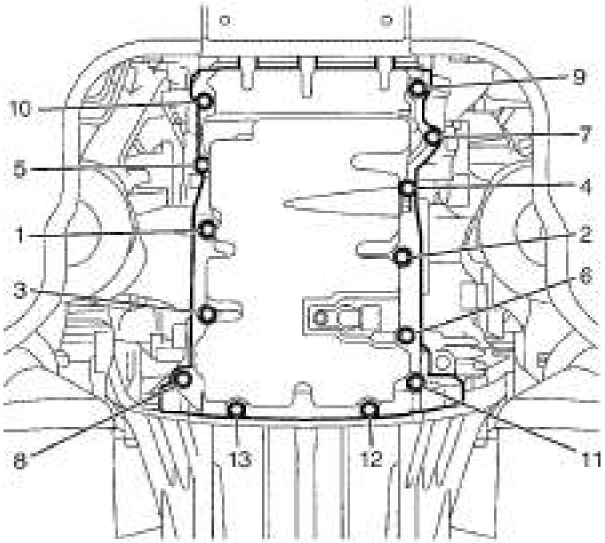


2. Place a three mm (0.118 in) bead of RTV sealant (1) on the block pan rail and the crankshaft rear oil seal housing.



3. Position the oil pan (1) onto the engine block (2).

Notice: Refer to Fastener Notice in the Preface section.

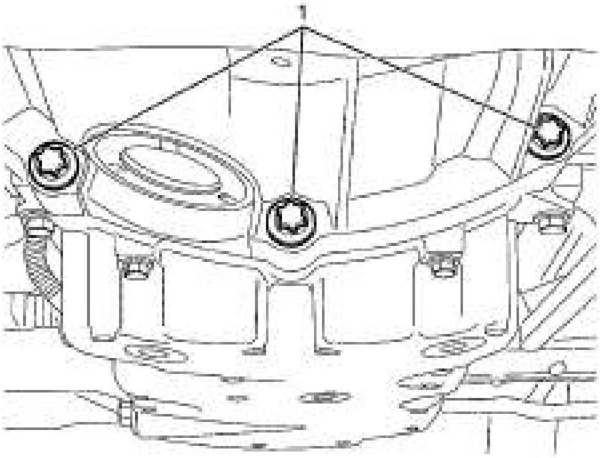


4. Install the M8 oil pan to cylinder block retaining bolts (1-11).
5. Install the M6 oil pan to crankshaft rear oil seal housing retaining bolts (12, 13).

Tighten
Tighten the M6 bolts (12, 13) to 10 N·m (89 lb in).

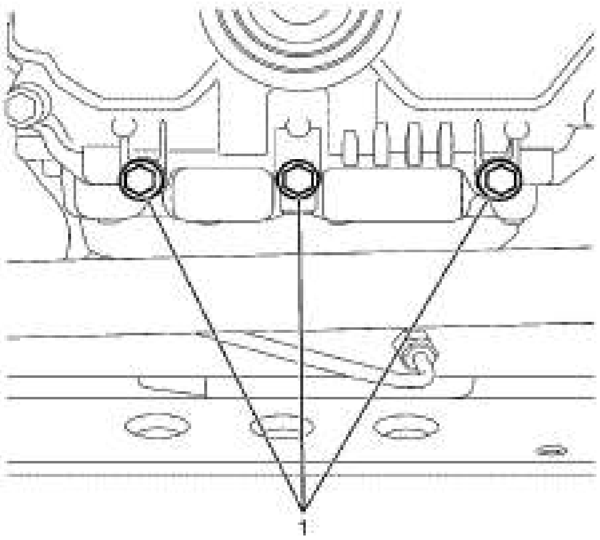
6. Tighten the M8 oil pan to cylinder block retaining bolts (1-11) and M6 oil pan to crankshaft rear oil seal housing retaining bolts (12, 13) in the sequence shown.

   Tighten
   Tighten the M8 bolts (1-11) to 23 N·m (17 lb ft).



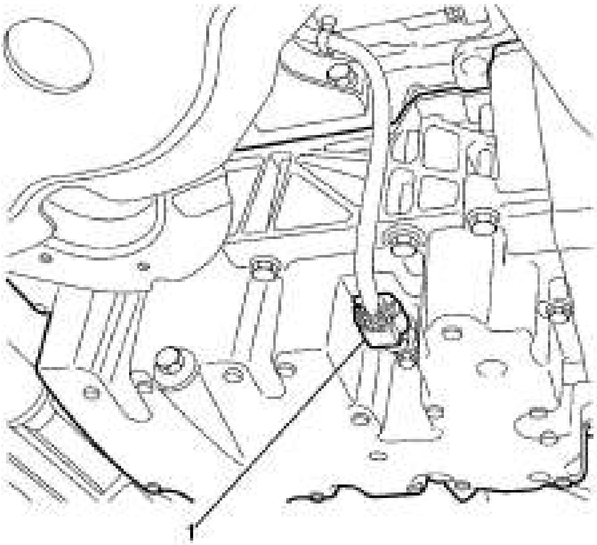
7. Install the transmission to oil pan retaining bolts (1).

   Tighten
   Tighten the bolts to 48 N·m (17 lb ft).

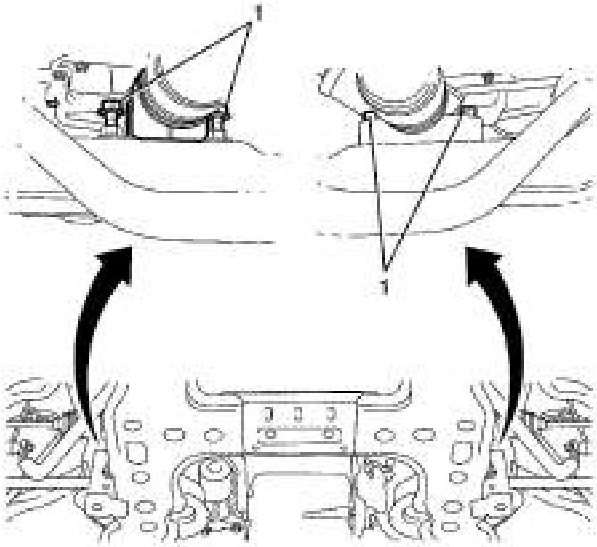


8. Install the front cover to oil pan retaining bolts (1).

   Tighten
   Tighten the bolts to 23 N·m (17 lb ft).

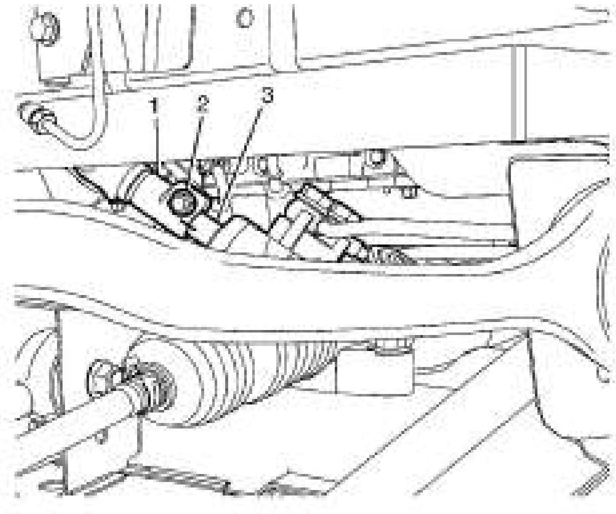


9. Connect the oil level/temperature sensor electrical connector (1) to the oil level/temperature sensor.
10. Position the steering gear in the correct location.



11. Install the steering gear to subframe retaining bolts (1).

Tighten
Tighten the Bolts to 65 N·m (48 lb ft).



Important: The intermediate steering shaft and pinion shaft splines must be installed in the position recorded during removal and aligned with the marks previously made.

12. Connect the intermediate steering shaft (1) to the pinion shaft (3).
13. Install the NEW intermediate steering shaft to pinion shaft retaining bolt (2).

    Tighten
    Tighten the bolt to 25 N·m (16 lb ft).

14. Install the engine splash shield. Refer to Engine Splash Shield Replacement .
15. Install the front air deflector. Refer to Front Air Deflector Replacement .
16. Lower the vehicle to the ground
17. Fill the engine with new engine oil. Refer to Engine Oil and Oil Filter Replacement .
18. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

Oil Pump Replacement

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.

   Important: DO NOT remove the left bank idler sprocket.

4. Remove the primary timing chain. Refer to Primary Camshaft Intermediate Drive Chain Removal.
5. Remove the crankshaft sprocket. Refer to Crankshaft Sprocket Removal.
6. Remove the oil pump bolts and the oil pump. Refer to Oil Pump Removal.
7. Perform the following steps as necessary:
   - Disassemble the oil pump. Refer to Oil Pump Disassemble.
   - Clean and inspect the oil pump. Refer to Oil Pump Disassemble.

Installation Procedure

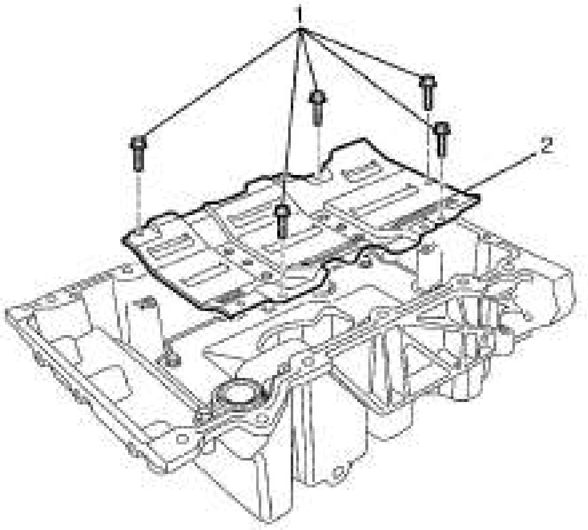
1. Assemble the oil pump as necessary. Refer to Oil Pump Assemble.
2. Install the oil pump. Refer to Oil Pump Installation.
3. Install the crankshaft sprocket. Refer to Crankshaft Sprocket Installation.
4. Install the primary timing chain. Refer to Primary Camshaft Intermediate Drive Chain Installation.
5. Install the spark plugs. Refer to Spark Plug Replacement.
6. Install the engine front cover. Refer to Engine Front Cover Replacement.
7. Install the engine covers. Refer to Engine Cover Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995149**

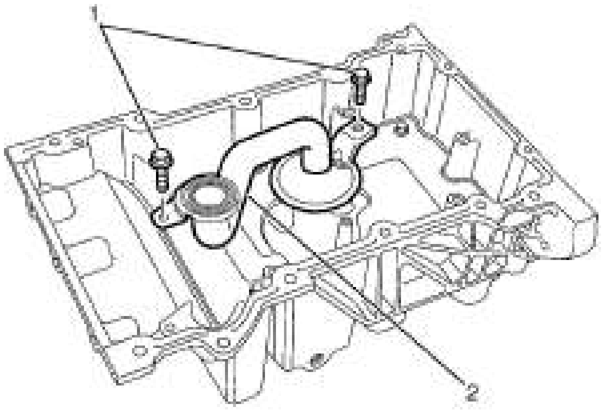
Oil Pump Suction Pipe and Screen Assembly Replacement

Removal Procedure

1. Remove the oil pan. Refer to Oil Pan Replacement.

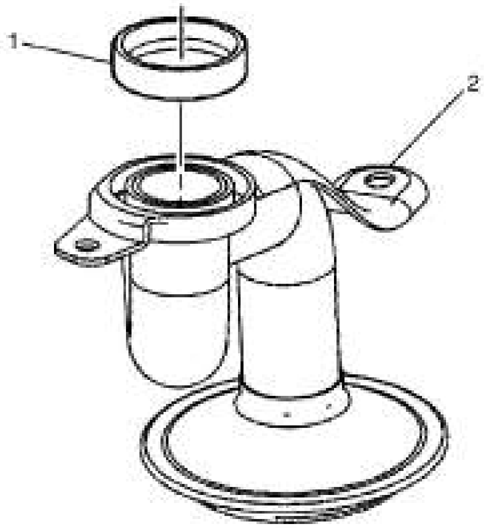


2. Remove the oil pan scraper bolts (1).
3. Remove the oil pan scraper (2).



4. Remove the oil suction pipe to oil pan retaining bolts (1).

5. Remove the oil suction pipe (2).

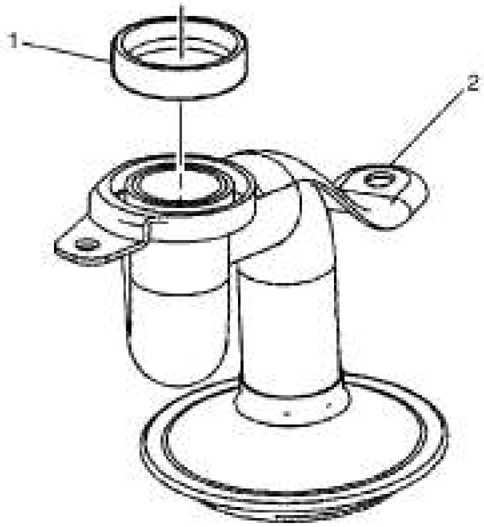


Important: The oil suction pipe seal (1) is a single use component and must be discarded whenever the oil suction pipe (2) is removed.

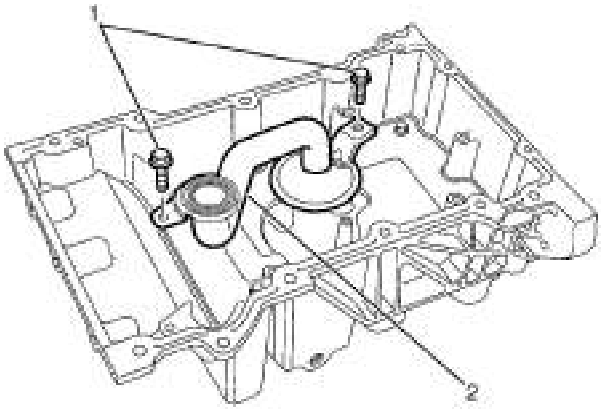
6. Remove the oil suction pipe seal (1) from the oil suction pipe (2).

   Discard the oil suction pipe seal (1).

Installation Procedure



1. Install a NEW oil suction pipe seal (1) onto the oil suction pipe (2).

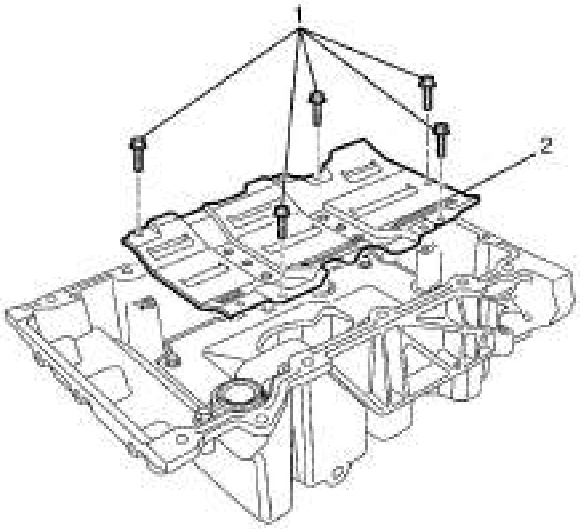


2. Install the oil suction pipe (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the oil suction pipe to oil pan retaining bolts (1).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



4. Install the oil pan scraper (2).
5. Install the oil pan scraper to oil pan retaining bolts (1).

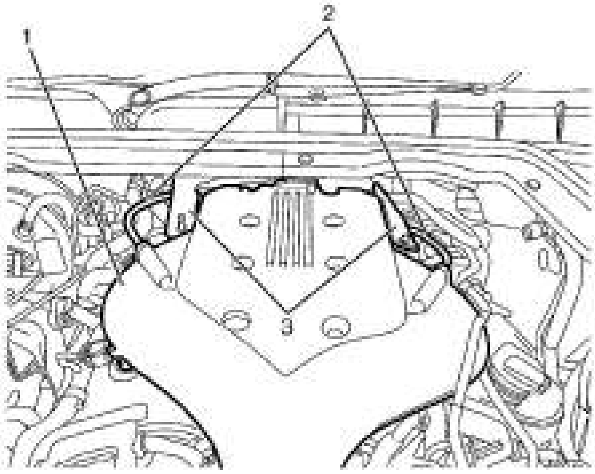
Tighten
Tighten the oil pan scraper bolts to 10 N·m (89 lb in).

6. Install the oil pan. Refer to Oil Pan Replacement.

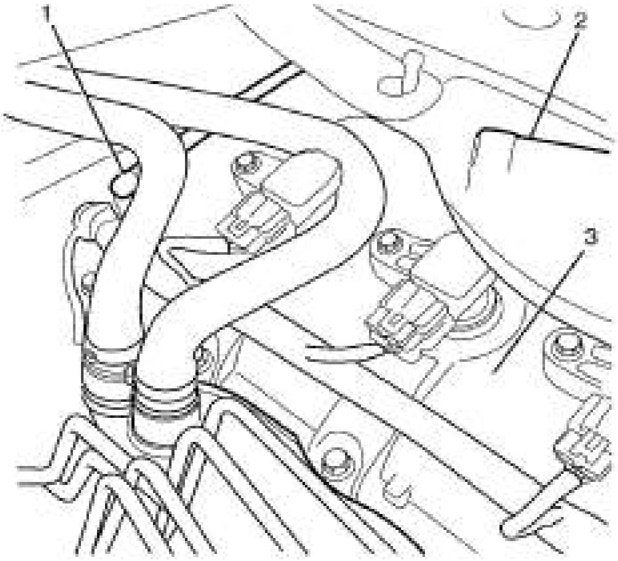
Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (RHD)

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.



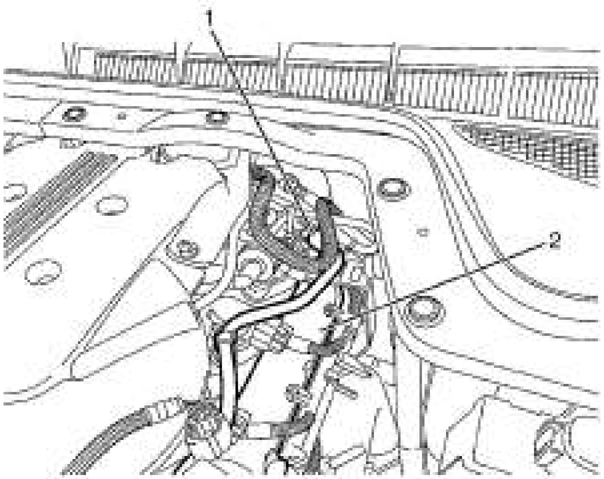
2. Detach and reposition the noise insulation panel (3) from the engine cover ball studs on the intake manifold assembly (1).
3. Disconnect the PCV tube (2) from both sides of the upper intake manifold assembly (1).



4. Disconnect the PCV tube (1) from the right camshaft cover (3).

   Important: Install a rubber cap or plug to the right hand camshaft cover (3) to prevent dust and dirt entry.

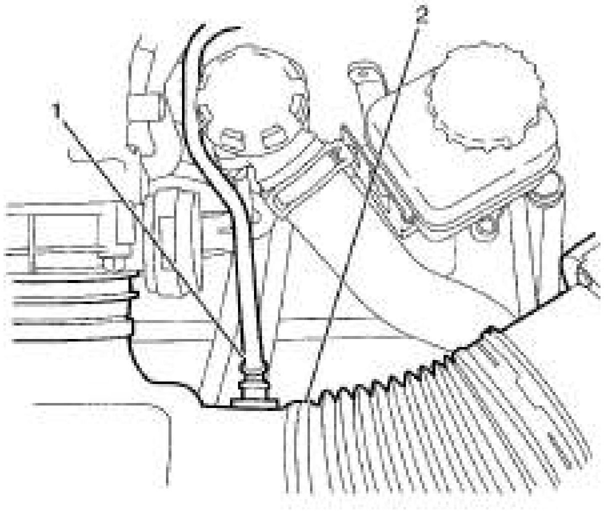
5. Plug the right hand camshaft cover (3).
6. Remove the PCV tube (1) from the intake manifold assembly (2).



7. Disconnect the PCV tube (1) from the left hand camshaft cover (2).

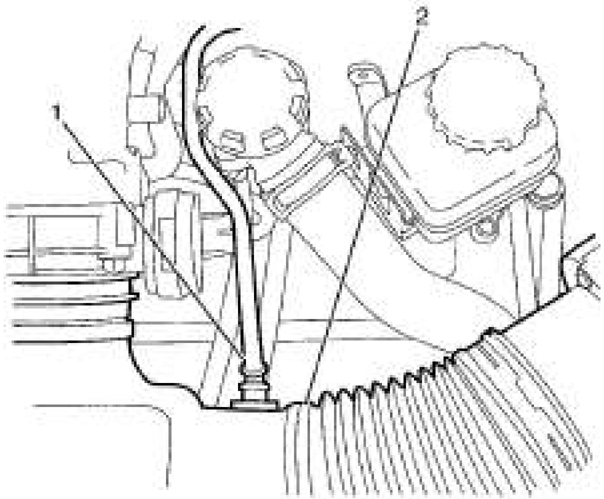
   Important: Install a rubber cap or plug to the left hand camshaft cover (2) to prevent dust and dirt entry.

8. Plug the left hand camshaft cover (2).

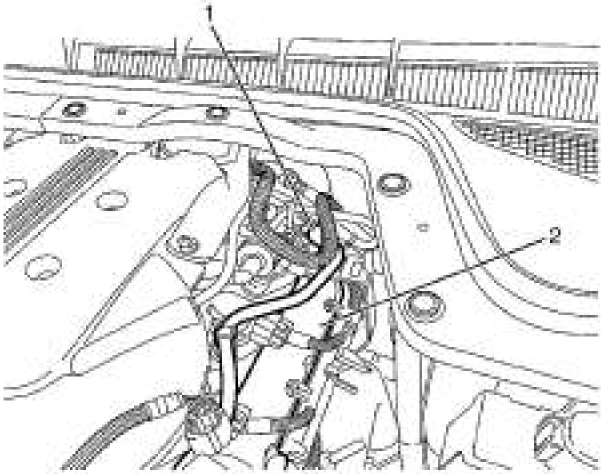


9. Disconnect the PCV tube (1) from the air intake assembly (2).

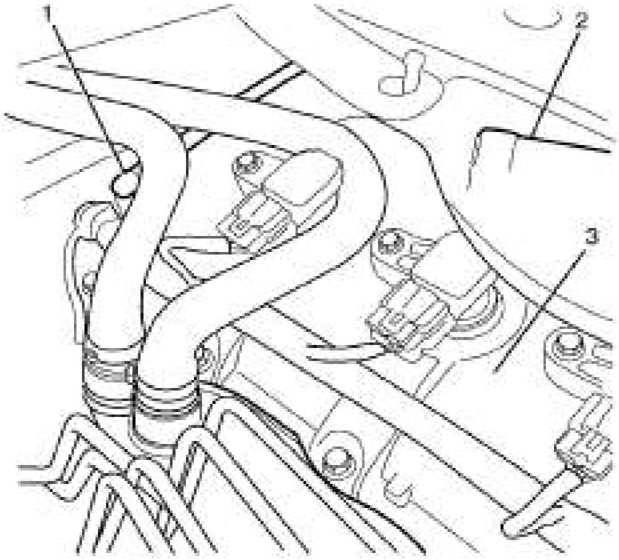
Installation Procedure



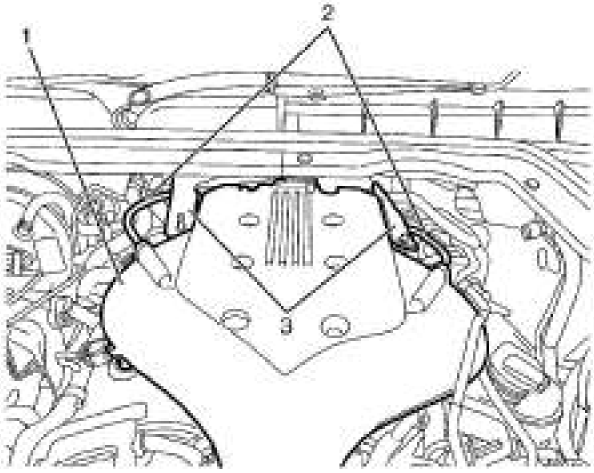
1. Connect the PCV tube (1) to the air intake assembly (2).



2. Remove the plug from the left hand camshaft cover (2).
3. Connect the PCV tube (1) to the left hand camshaft cover (2).



4. Install the PCV tube (1) to the intake manifold assembly (2).
5. Remove the plug from the right hand camshaft cover (3).
6. Connect the PCV tube (1) to the right camshaft cover (3).

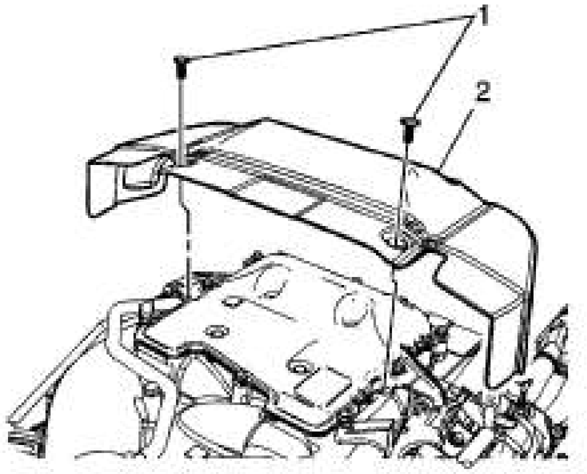


7. Connect the PCV tube (3) from both sides of the upper intake manifold assembly (2).
8. Attach the noise insulation panel (1) to the engine cover ball studs on the intake manifold assembly (2).
9. Install the engine covers. Refer to Engine Cover Replacement.

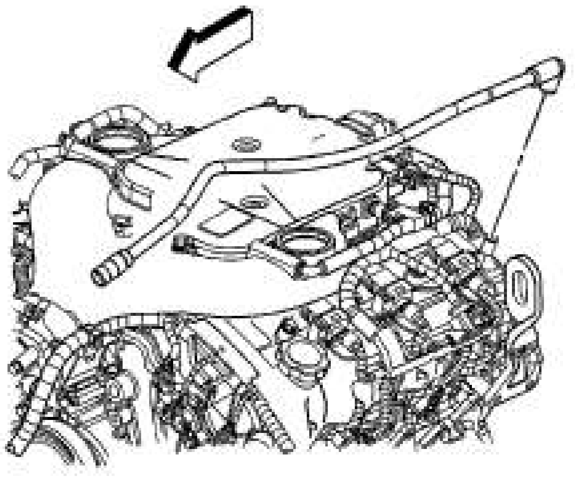
2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | Document ID: 1977762

Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LLT)

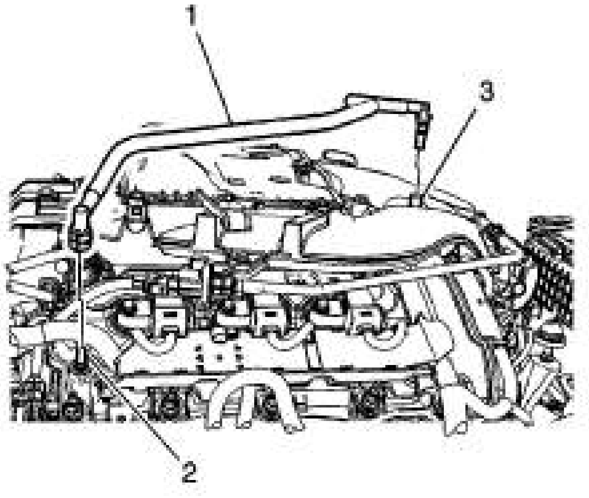
Removal Procedure



1. Remove the fuel injector sight shield. Refer to Fuel Injector Sight Shield Replacement .
2. Remove two intake manifold insulator retaining pins (1)
3. Remove the intake manifold insulator (2)

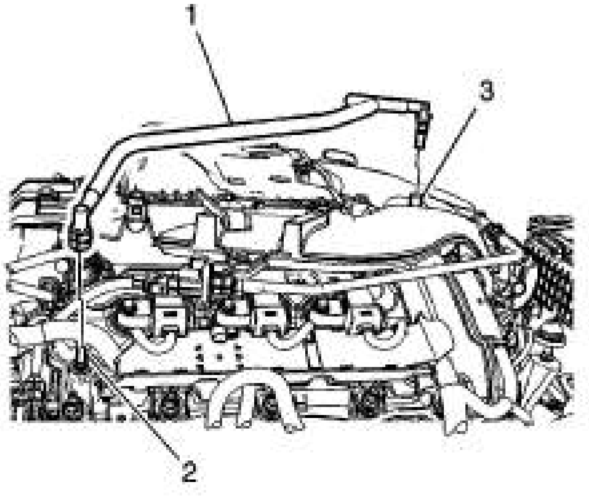


4. Remove the positive crankcase ventilation (PCV) fresh air tube from the left camshaft cover.
5. Remove the PCV fresh air tube from the air inlet.

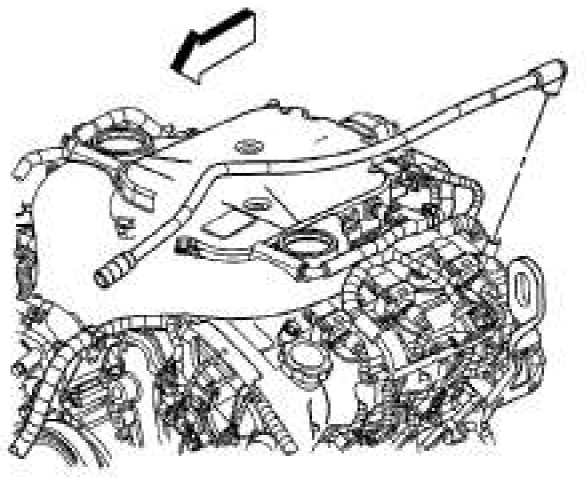


6. Remove the PCV dirty air tube (1) from the right camshaft cover (2).
7. Remove the PCV dirty air tube (1) from the intake manifold (3).

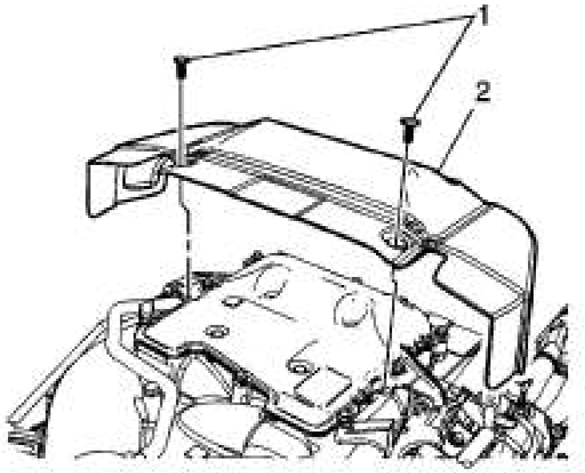
Installation Procedure



1. Install the PCV dirty air tube (1) to the intake manifold (3).
2. Install the PCV dirty air tube (1) to the right camshaft cover (2).



3. Install the PCV fresh air tube to the air inlet.
4. Install the PCV fresh air tube to the left camshaft cover.



5. Install the intake manifold insulator (2)
6. Install two intake manifold insulator retaining pins (1)
7. Install the fuel injector sight shield. Refer to Fuel Injector Sight Shield Replacement .

Primary Camshaft Drive Chain Guide Replacement - Lower

The primary camshaft drive chain guide is not serviceable separately. If the guide is worn or damaged, the guide must be replaced with the oil pump.

Primary Camshaft Drive Chain Guide Replacement - Upper

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
5. Remove the primary upper camshaft drive chain guide. Refer to Primary Timing Chain Guide Removal - Upper.

Installation Procedure

1. Install the primary upper camshaft drive chain guide. Refer to Primary Timing Chain Guide Installation - Upper.
2. Install the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
3. Install the spark plugs. Refer to Spark Plug Replacement.
4. Install the engine front cover. Refer to Engine Front Cover Replacement.
5. Install the engine covers. Refer to Engine Cover Replacement.

Primary Camshaft Drive Chain Tensioner Replacement

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.

Important: If the entire camshaft timing system is not in Stage 2, refer to Camshaft Timing Drive Chain Alignment Diagram, mark the timing chain and sprockets in order to ensure correct reassembly.

4. Remove the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.

Installation Procedure

1. Install the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
2. Install the spark plugs. Refer to Spark Plug Replacement.
3. Install the engine front cover. Refer to Engine Front Cover Replacement.
4. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Guide Replacement - Left Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Left Side.
5. Remove the left bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Removal - Left Side.

Installation Procedure

1. Install the left bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Installation - Left Side.
2. Install the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Installation - Left Side.
3. Install the spark plugs. Refer to Spark Plug Replacement.
4. Install the engine front cover. Refer to Engine Front Cover Replacement.
5. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Guide Replacement - Right Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
5. Remove the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Removal - Right Side.

Installation Procedure

1. Install the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Installation - Right Side.
2. Install the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
3. Install the spark plugs. Refer to Spark Plug Replacement.
4. Install the engine front cover. Refer to Engine Front Cover Replacement.
5. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Replacement - Left Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
5. Remove the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Removal - Right Side.
6. Remove the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Removal - Right Side.
7. Remove the right bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Removal - Right Side.
8. Remove the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
9. Remove the primary upper camshaft drive chain guide. Refer to Primary Timing Chain Guide Removal - Upper.
10. Remove the primary camshaft drive chain. Refer to Primary Camshaft Intermediate Drive Chain Removal.
11. Remove the right bank camshaft intermediate drive chain idler. Refer to Camshaft Intermediate Drive Chain Idler Removal - Right Side.
12. Remove the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Left Side.
13. Remove the left bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Removal - Left Side.
14. Remove the left bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Removal - Left Side.
15. Remove the left bank camshaft intermediate drive chain idler. Refer to Camshaft Intermediate Drive Chain Idler Removal - Left Side.
16. Remove the left bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Removal - Left Side.
17. Clean and inspect all of the camshaft timing drive components. Refer to Camshaft Timing Drive Components Cleaning and Inspection.

Installation Procedure

1. Install the left bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Installation - Left Side.
2. Install the left bank camshaft intermediate drive chain idler. Refer to Camshaft Intermediate Drive Chain Idler Installation - Left Side.
3. Install the left bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Installation - Left Side.
4. Install the left bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Installation - Left Side.
5. Install the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Installation - Left Side.
6. Install the right bank camshaft intermediate drive chain idler. Refer to Camshaft

Intermediate Drive Chain Idler Installation - Right Side.

7. Install the primary camshaft drive chain. Refer to Primary Camshaft Intermediate Drive Chain Installation.
8. Install the primary upper camshaft drive chain guide. Refer to Primary Timing Chain Guide Installation - Upper.
9. Install the primary camshaft drive chain tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
10. Install the right bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Installation - Right Side.
11. Install the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Installation - Right Side.
12. Install the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
13. Install the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
14. Install the spark plugs. Refer to Spark Plug Replacement.
15. Install the engine front cover. Refer to Engine Front Cover Replacement.
16. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Replacement - Right Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
5. Remove the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Removal - Right Side.
6. Remove the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Removal - Right Side.
7. Remove the right bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Removal - Right Side.

Installation Procedure

1. Install the right bank secondary camshaft drive chain. Refer to Secondary Camshaft Drive Chain Installation - Right Side.
2. Install the right bank secondary camshaft drive chain guide. Refer to Secondary Camshaft Drive Chain Guide Installation - Right Side.
3. Install the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
4. Install the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
5. Install the spark plugs. Refer to Spark Plug Replacement.
6. Install the engine front cover. Refer to Engine Front Cover Replacement.
7. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Shoe Replacement - Left Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the left bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Removal - Left Side.

Installation Procedure

1. Install the left bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Installation - Left Side.
2. Install the spark plugs. Refer to Spark Plug Replacement.
3. Install the engine front cover. Refer to Engine Front Cover Replacement.
4. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Shoe Replacement - Right Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
5. Remove the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Removal - Right Side.

Installation Procedure

1. Install the right bank secondary camshaft drive chain shoe. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
2. Install the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.
3. Install the spark plugs. Refer to Spark Plug Replacement.
4. Install the engine front cover. Refer to Engine Front Cover Replacement.
5. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Tensioner Replacement - Left Side

Removal Procedure

1. Remove the engine covers. Refer to Engine Cover Replacement.
2. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
3. Remove the engine front cover. Refer to Engine Front Cover Replacement.
4. Remove the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Left Side.

Installation Procedure

1. Install the left bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Installation - Left Side.
2. Install the spark plugs. Refer to Spark Plug Replacement.
3. Install the engine front cover. Refer to Engine Front Cover Replacement.
4. Install the engine covers. Refer to Engine Cover Replacement.

Secondary Camshaft Drive Chain Tensioner Replacement - Right Side

Removal Procedure

1. Remove the spark plugs in order to ease crankshaft/engine rotation. Refer to Spark Plug Replacement.
2. Remove the engine front cover. Refer to Engine Front Cover Replacement.
3. Remove the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Removal - Right Side.

Installation Procedure

1. Install the right bank secondary camshaft drive chain tensioner. Refer to Secondary Camshaft Drive Chain Shoe Installation - Right Side.
2. Install the spark plugs. Refer to Spark Plug Replacement.
3. Install the engine front cover. Refer to Engine Front Cover Replacement.
4. Install the engine covers. Refer to Engine Cover Replacement.

Setting Camshaft Timing

Important: Setting the camshaft timing is necessary whenever the camshaft drive system has been disturbed such that the relationship between any chain and sprocket has been lost. Even when only one sprocket is involved, multiple crankshaft rotations will not produce conditions where correct timing can be confirmed.

If necessary, follow the left bank secondary camshaft drive chain replacement procedures to reset the camshaft timing. Refer to Secondary Camshaft Drive Chain Replacement - Left Side .

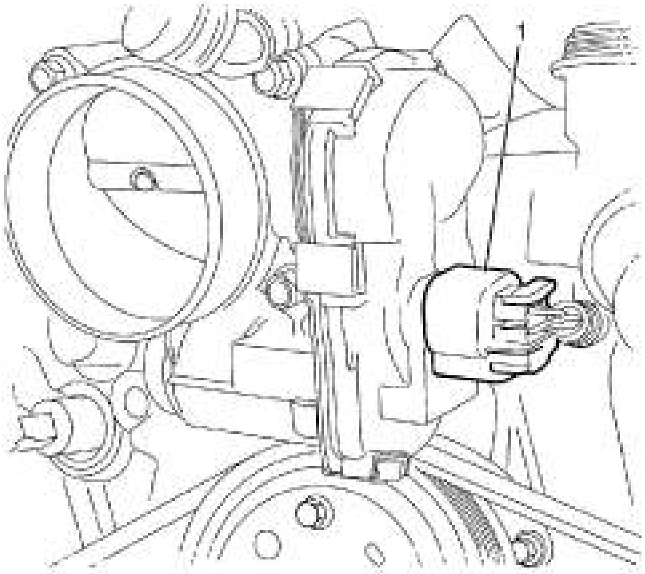
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 1995097**

Upper Intake Manifold Replacement

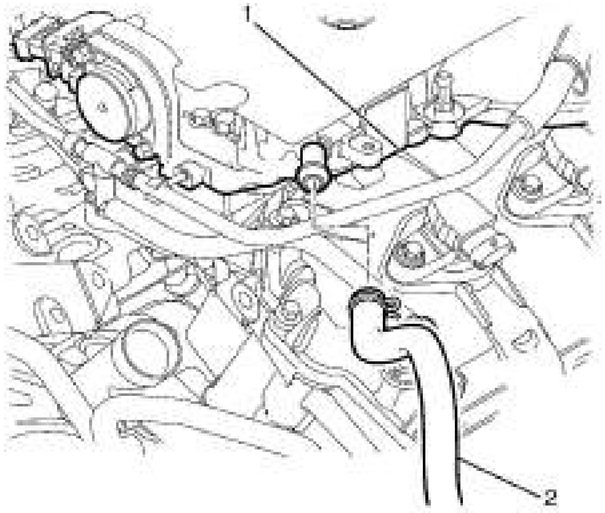
Removal Procedure

> **Caution:** Refer to Battery Disconnect Caution in the Preface section.

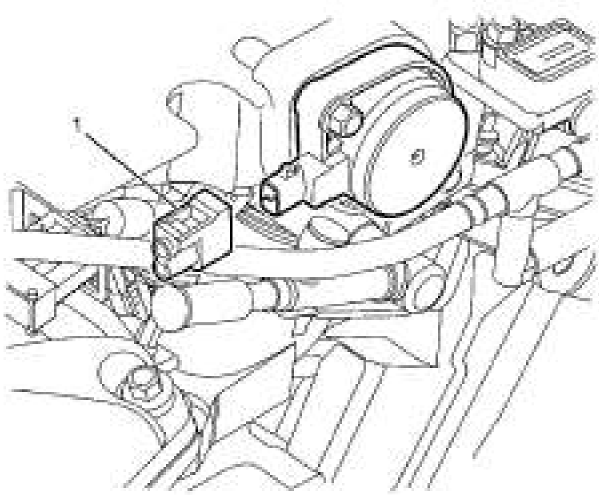
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the engine covers. Refer to Engine Cover Replacement .
3. Remove the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .



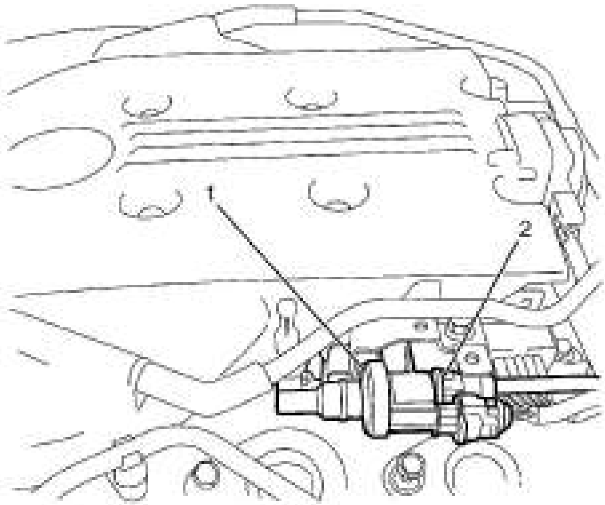
4. Disconnect the throttle body electrical connector (1).



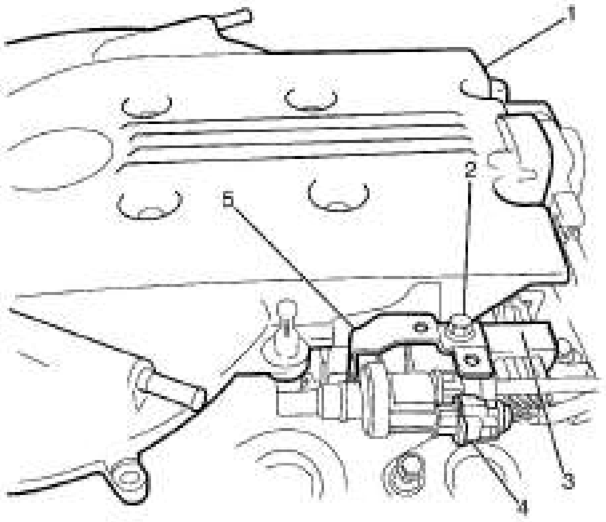
5. Disconnect the brake booster vacuum hose (2) from the intake manifold (1).



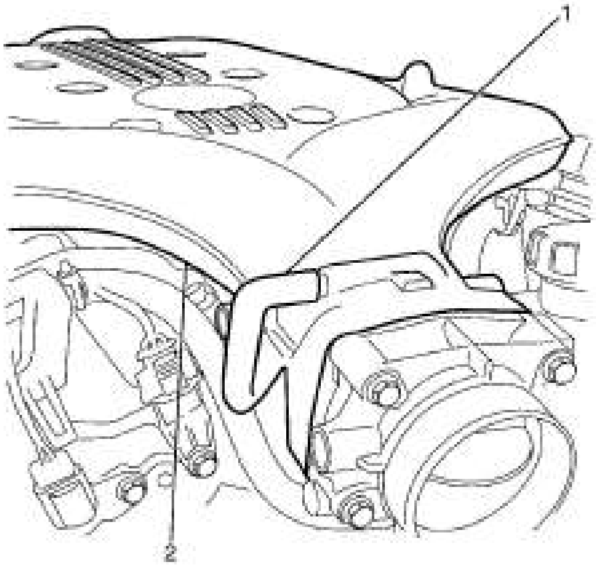
6. Disconnect the Inlet Manifold Runner Control (IMRC) electrical connector (1).



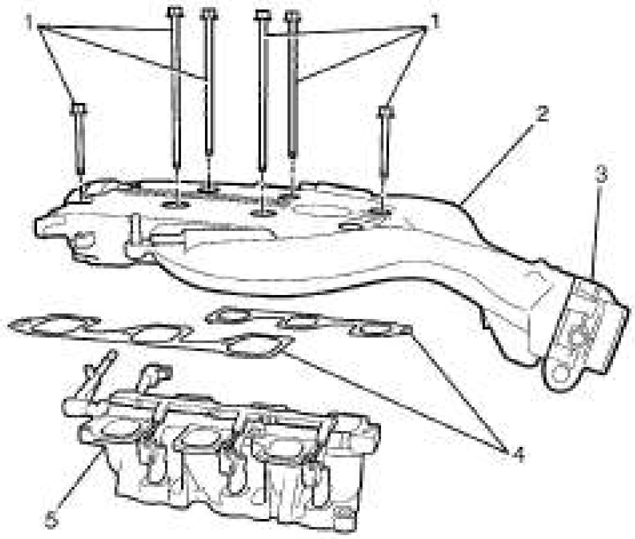
7. Disconnect the evaporative emission (EVAP) purge line (1) from the purge solenoid (2). Refer to Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .
8. Plug or cap the (EVAP) purge line (1) and the purge solenoid (2) ends.
9. Remove the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement .



10. Disconnect the EVAP valve electrical connector (4)
11. Disconnect the fuel injector harness electrical connector (3)
12. Remove the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).
13. Reposition the fuel injector harness electrical connector/EVAP valve mounting bracket (5) away from the intake manifold (1).



14. Disconnect the EVAP hose (1) from the intake manifold (2).



15. Remove the upper intake manifold bolts (1).
16. Remove the upper intake manifold (2) and the throttle body (3) as an assembly.

    Important: The upper intake manifold gaskets (4) must be discarded after removal.

17. Remove the upper intake manifold gaskets (4).

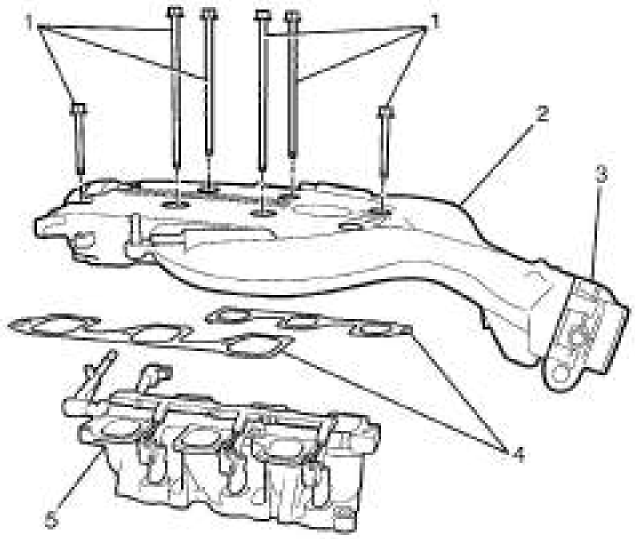
    Discard the gaskets

    Important: The lower intake manifold (5) must be plugged with a clean lint free cloth to prevent foreign matter entry into the engine.

18. Plug the lower intake manifold (5) with a clean lint free cloth.
19. If the upper intake manifold is being replaced, disassemble the intake manifold. Refer to Intake Manifold Disassemble .
20. Clean and inspect the intake manifold. Refer to Intake Manifold Cleaning and Inspection .

Installation Procedure

1. If the upper intake manifold is being replaced, assemble the intake manifold. Refer to Intake Manifold Assemble .



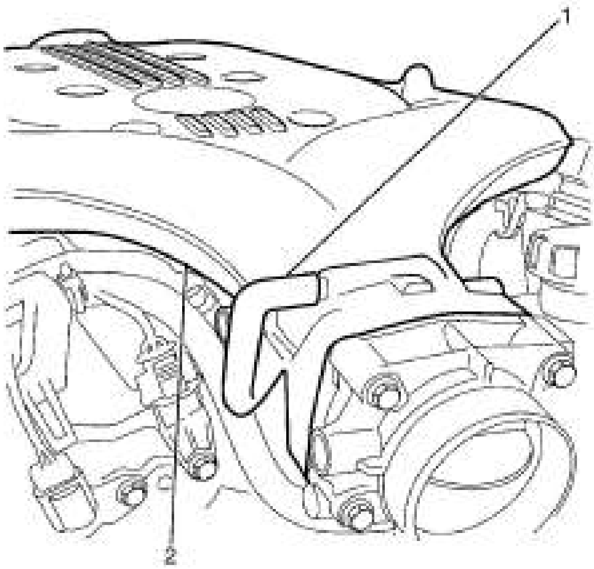
2. Remove the clean lint free cloth from the lower intake manifold (5)
3. Install NEW upper intake manifold gaskets (4).
4. Install the upper intake manifold (2) and the throttle body (3) as an assembly.

   Notice: Refer to Fastener Notice in the Preface section.

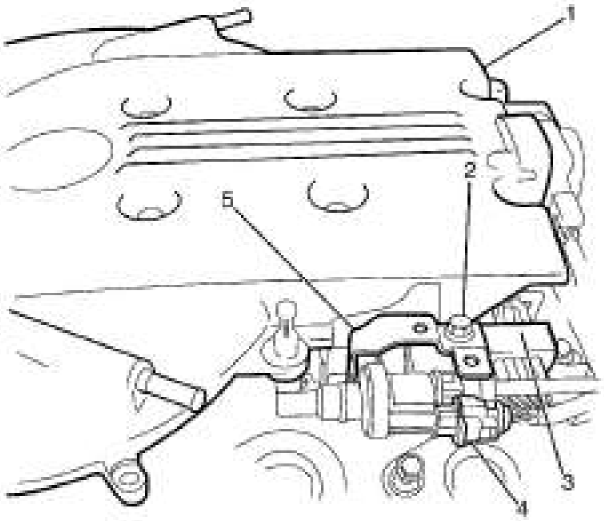
   Important: Tighten the intake manifold bolts (1) in a circular pattern starting at the center (long bolts) and moving outward.

5. Install the upper intake manifold bolts (1).

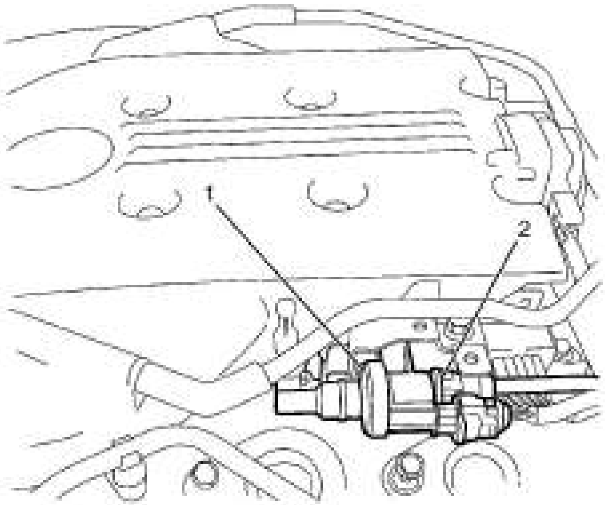
   Tighten
   Tighten the upper intake manifold bolts to 23 N·m (17 lb ft).



6. Connect the EVAP line (1) to the intake manifold (2).

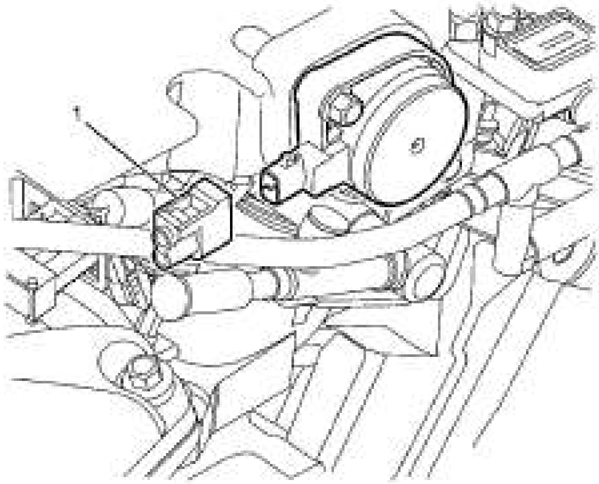


7. Install the fuel injector harness electrical connector/EVAP valve mounting bracket (5) to the intake manifold (1).
8. Install the fuel injector harness electrical connector/EVAP valve mounting bracket to intake manifold retaining bolt (2).
9. Connect the fuel injector harness electrical connector (3)
10. Connect the EVAP valve electrical connector (4)
11. Install the PCV tube and PCV fresh air tubes. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement .

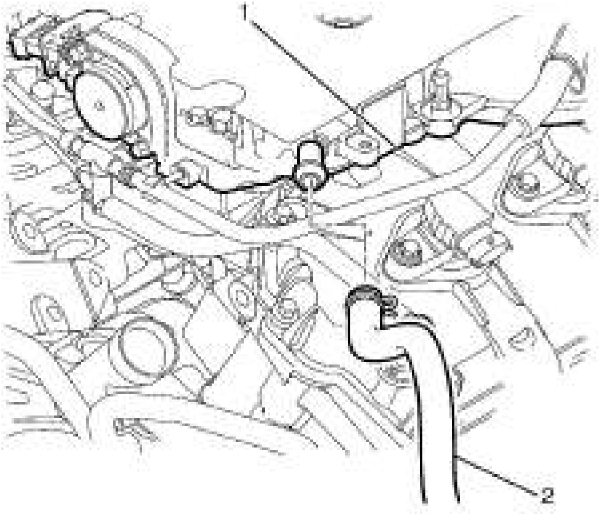


12. Remove the plug or cap from the (EVAP) purge line (1) and the purge solenoid (2) ends.
13. Connect the evaporative emission (EVAP) purge line (1) from the purge solenoid (2). Refer to

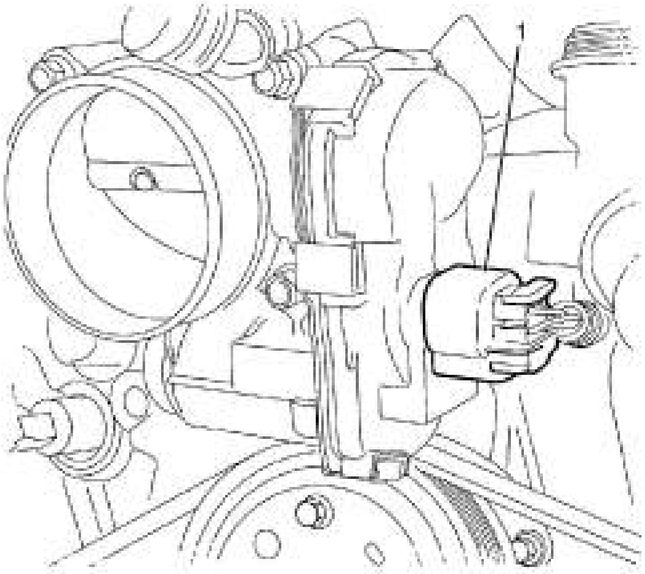
Metal Collar Quick Connect Fitting Service or Plastic Collar Quick Connect Fitting Service .



14. Connect the Inlet Manifold Runner Control (IMRC) electrical connector (1).



15. Connect the brake booster vacuum hose (2) to the intake manifold (1).



16. Connect the throttle body electrical connector (1).
17. Install the air intake duct. Refer to Air Cleaner Inlet Duct Replacement .
18. Install the engine covers. Refer to Engine Cover Replacement .
19. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

Valve Lifter Replacement - Left Side

Removal Procedure

1. Remove the applicable camshaft(s). Camshaft Replacement - Left Side.
2. Remove the rocker arms. Refer to Valve Rocker Arm Removal - Left Side.
3. Remove the lifters. Refer to Valve Lifter Removal - Left Side.
4. Clean and inspect the camshaft(s), rocker arm(s) and lifter(s). Repair or replace as necessary. Refer to Camshaft Cleaning and Inspection and Valve Rocker Arm Cleaning and Inspection and Valve Lifters Cleaning and Inspection.

Installation Procedure

1. Install the lifters. Refer to Valve Lifter Installation - Left Side.
2. Install the rocker arms. Refer to Valve Rocker Arm Installation - Left Side.
3. Install the applicable camshaft(s). Refer to Camshaft Replacement - Left Side.

Valve Lifter Replacement - Right Side

Removal Procedure

1. Remove the applicable camshaft(s). Refer to Camshaft Replacement - Right Side.
2. Remove the rocker arms. Refer to Valve Rocker Arm Removal - Right Side.
3. Remove the lifters. Refer to Valve Lifter Removal - Right Side.
4. Clean and inspect the camshaft(s), rocker arm(s) and lifter(s). Repair or replace as necessary. Refer to Camshaft Cleaning and Inspection and Valve Rocker Arm Cleaning and Inspection and Valve Lifters Cleaning and Inspection.

Installation Procedure

1. Install the lifters. Refer to Valve Lifter Installation - Right Side.
2. Install the rocker arms. Refer to Valve Rocker Arm Installation - Right Side.
3. Install the applicable camshaft(s). Refer to Camshaft Installation - Right Side.

Valve Rocker Arm Replacement - Left Side

Removal Procedure

1. Remove the applicable camshaft(s). Refer to Camshaft Replacement - Left Side.
2. Remove the rocker arms. Refer to Valve Rocker Arm Removal - Left Side.
3. Clean and inspect the camshaft(s) and the rocker arm(s). Repair or replace as necessary. Refer to Camshaft Cleaning and Inspection and Valve Lifters Cleaning and Inspection.

Installation Procedure

1. Install the rocker arms. Refer to Valve Rocker Arm Installation - Left Side.
2. Install the applicable camshaft(s). Refer to Camshaft Replacement - Left Side.

Valve Rocker Arm Replacement - Right Side

Removal Procedure

1. Remove the applicable camshaft(s). Refer to Camshaft Replacement - Right Side.
2. Remove the rocker arms. Refer to Valve Rocker Arm Removal - Right Side.
3. Clean and inspect the camshaft(s) and the rocker arm(s). Repair or replace as necessary. Refer to Camshaft Cleaning and Inspection and Valve Lifters Cleaning and Inspection.

Installation Procedure

1. Install the rocker arms. Refer to Valve Rocker Arm Installation - Right Side.
2. Install the applicable camshaft(s). Refer to Camshaft Installation - Right Side.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 2037592**

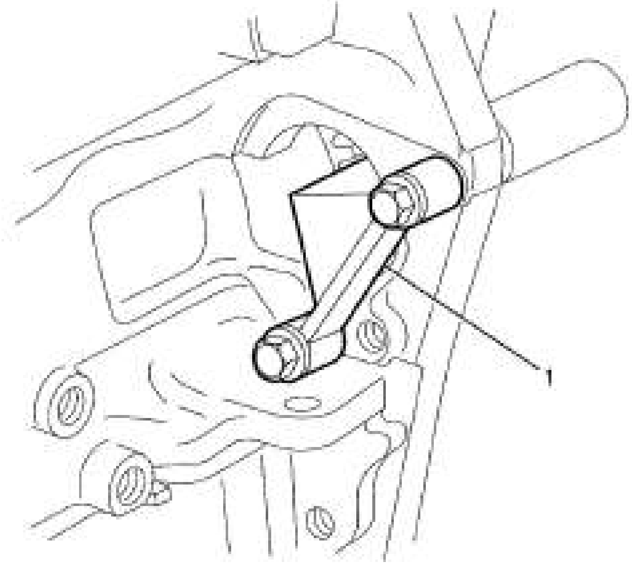
Valve Stem Oil Seal and Valve Spring Replacement - Left Side

Tools Required

- EN 46106 Flywheel Holding Tool
- EN 46110 On-Vehicle Valve Spring Compressor
- EN 46116 Valve Stem Seal Remover/Installer
- J 39313 Spark Plug Port Adapter
- EN 46117 Valve Collet Remover/Installer

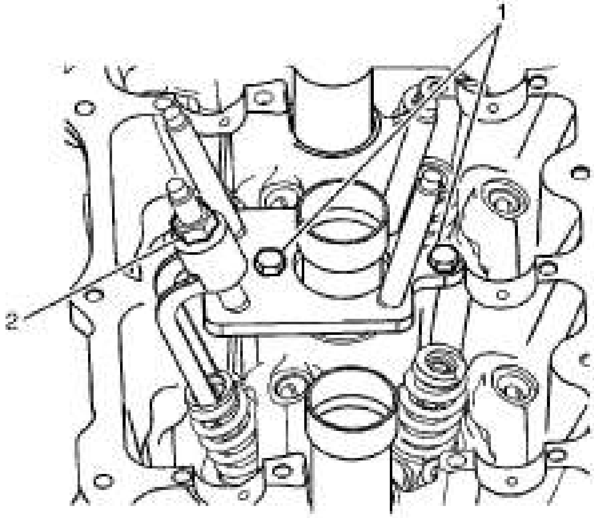
Removal Procedure

1. Remove the starter motor. Refer to Starter Motor Replacement.

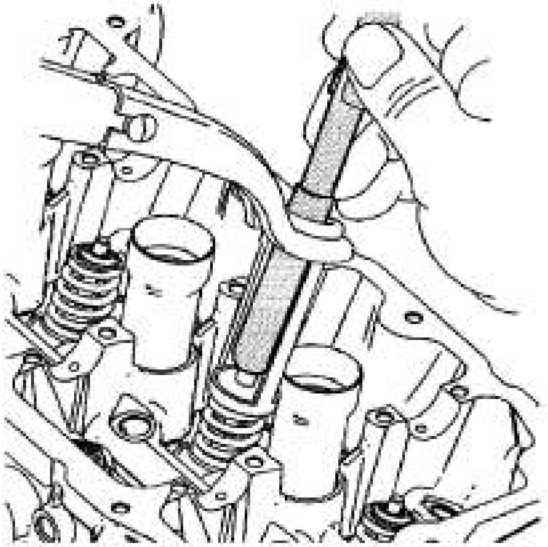


Important: If the EN 46106 (1) is not installed, the crankshaft may rotate. If the crankshaft rotates, disassembly and reassembly of the entire camshaft timing system may be required.

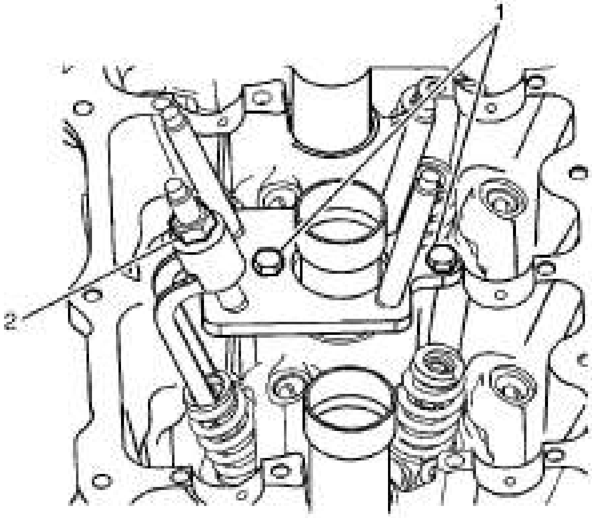
2. Install the EN 46106 (1) in order to prevent crankshaft rotation.
3. Remove the camshafts and rocker arms. Refer to Camshaft Replacement - Left Side.
4. Remove the spark plug from the applicable cylinder. Refer to Spark Plug Replacement.
5. Install the J 39313 to the applicable cylinder.
6. Connect the J 39313 to a compressed air source.
7. Install the EN 46110 above the applicable cylinder.



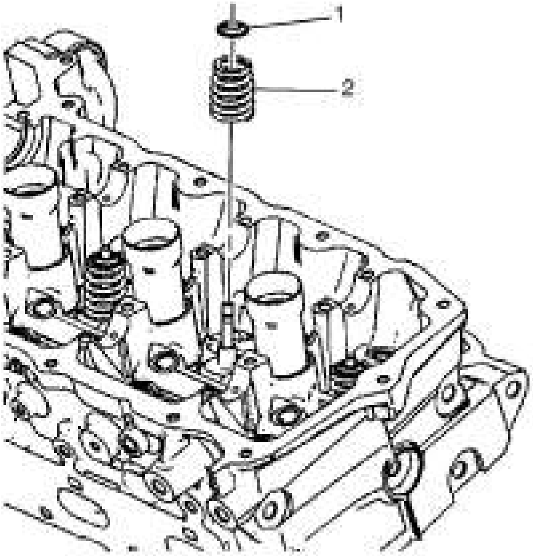
8. Install the EN 46110 to cylinder head retaining bolts (1)
9. Tighten the EN 46110 valve spring compressor nut (2).



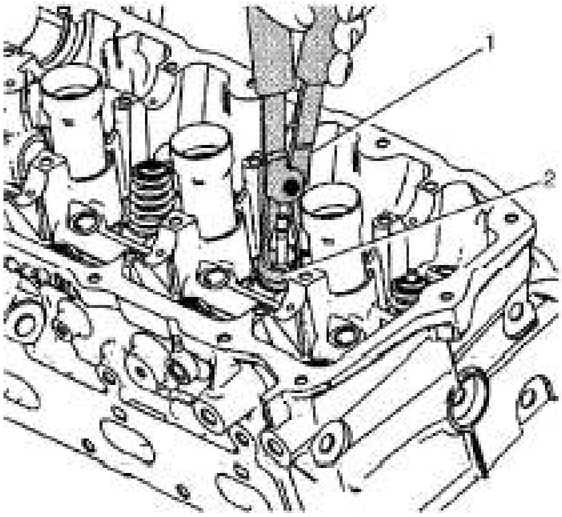
10. Remove the valve collets using the EN 46117 .



11. Loosen the EN 46110 valve spring compressor nut (2).
12. Remove the EN 46110 to cylinder head retaining bolts (1).
13. Remove the EN 46110 .



14. Remove the valve spring retainer (1).
15. Remove the valve spring (2).



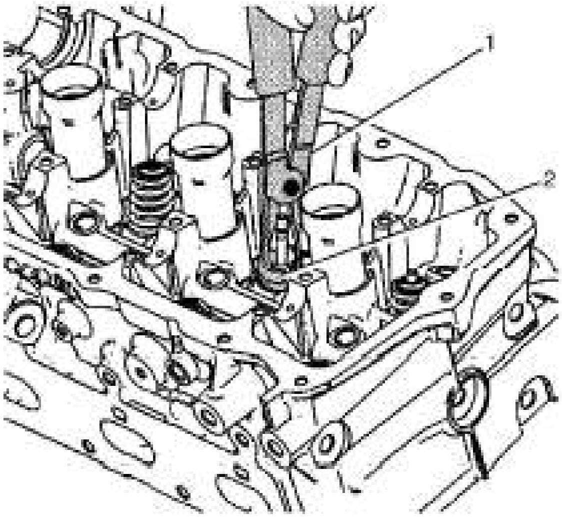
Important: NEVER reuse a valve stem oil seal.

16. Remove the valve stem oil seal (2) using the EN 46116 (1).

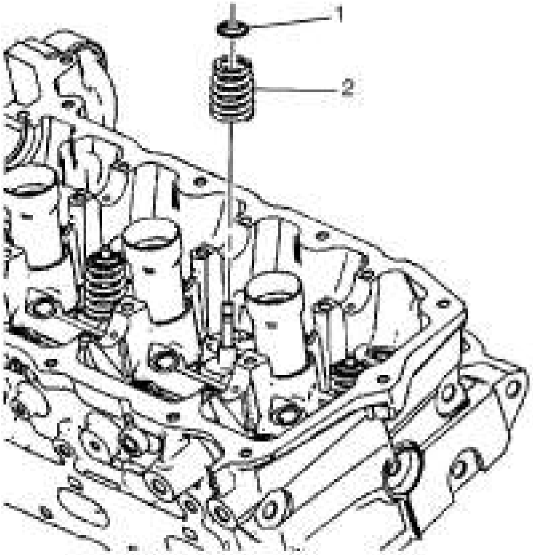
    Discard the valve stem oil seals.

17. Repeat these procedures for the remaining valves.

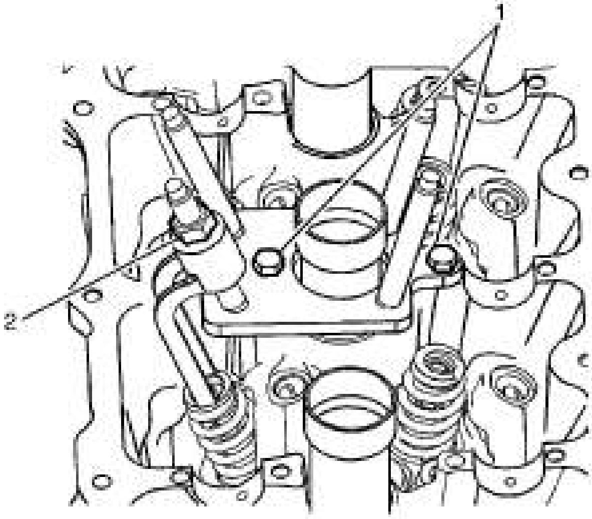
Installation Procedure



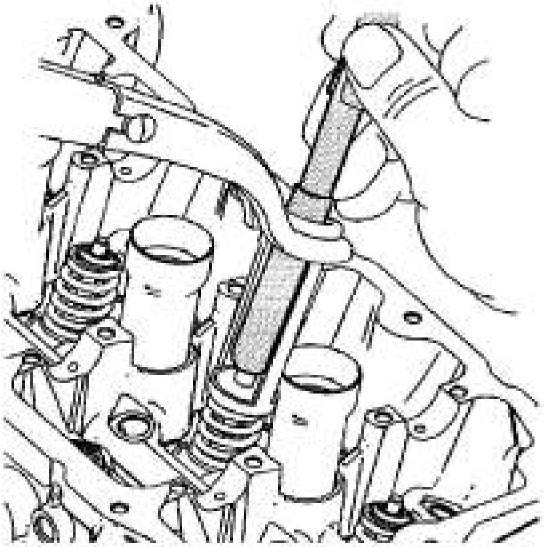
1. Use the EN 46116 (1) in order to install the NEW valve stem seal (2).



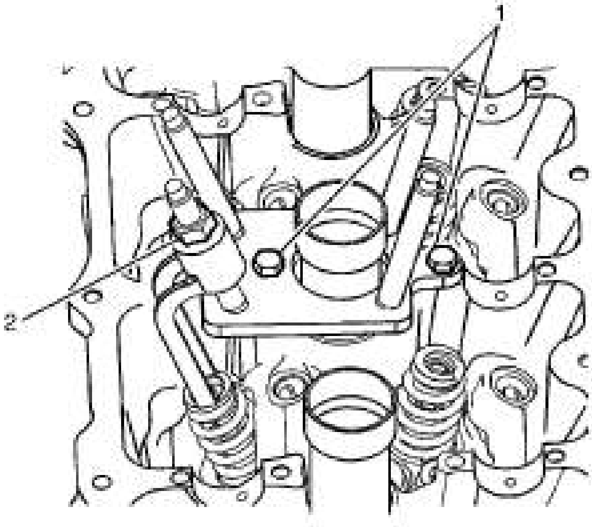
2. Install the valve spring (2).
3. Install the valve spring retainer (1).



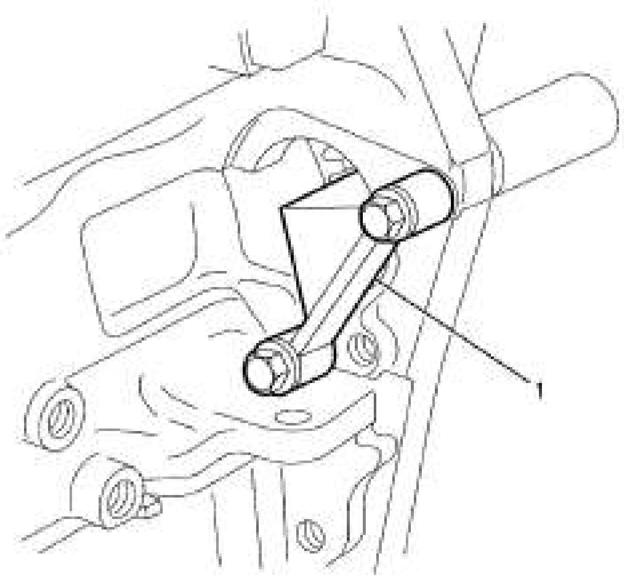
4. Install the EN 46110 above the applicable valve spring.
5. Install the EN 46110 to cylinder head retaining bolts (1)
6. Tighten the EN 46110 valve spring compressor nut (2).



7. Install the valve collets using the EN 46117 (1).



8. Loosen the EN 46110 valve spring compressor nut (2).
9. Remove the EN 46110 to cylinder head retaining bolts (1).
10. Remove the EN 46110
11. Disconnect the J 39313 from the compressed air source.
12. Remove the J 39313 .
13. Install the spark plugs. Refer to Spark Plug Replacement.
14. Install the rocker arms and camshafts. Refer to Camshaft Replacement - Left Side.



15. Remove the EN 46106 (1).
16. Install the starter motor. Refer to Starter Motor Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - On Vehicle | **Document ID: 2037591**

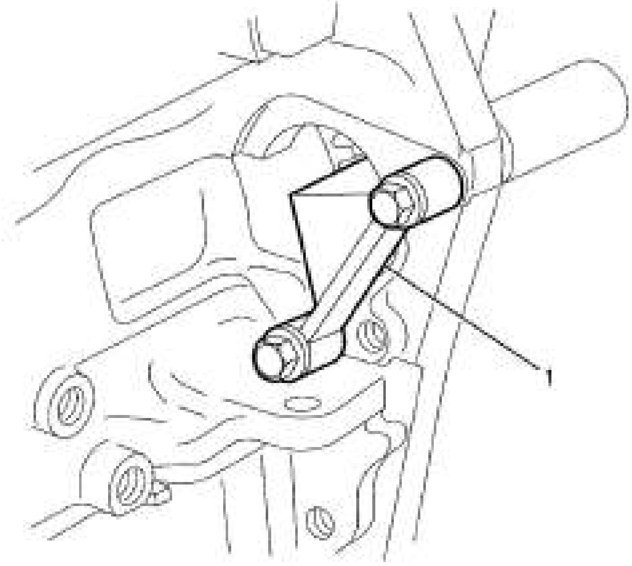
Valve Stem Oil Seal and Valve Spring Replacement - Right Side

Tools Required

- EN 46106 6 Flywheel Holding Tool
- EN 46110 On-Vehicle Valve Spring Compressor
- EN 46116 Valve Stem Seal Remover/Installer
- J 39313 Spark Plug Port Adapter
- EN 46117 Valve Collet Remover/Installer

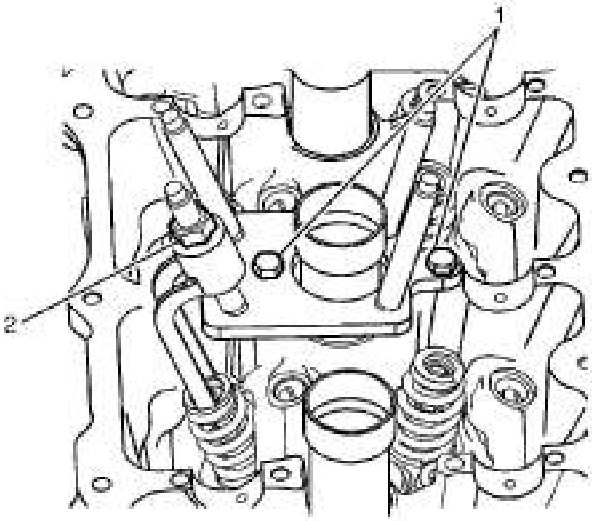
Removal Procedure

1. Remove the starter motor. Refer to Starter Motor Replacement.

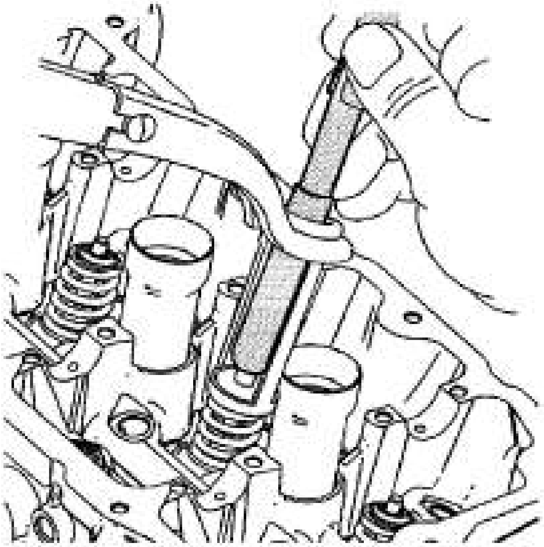


Important: If the EN 46106 is not installed, the crankshaft may rotate. If the crankshaft rotates, disassembly and reassembly of the entire camshaft timing system may be required.

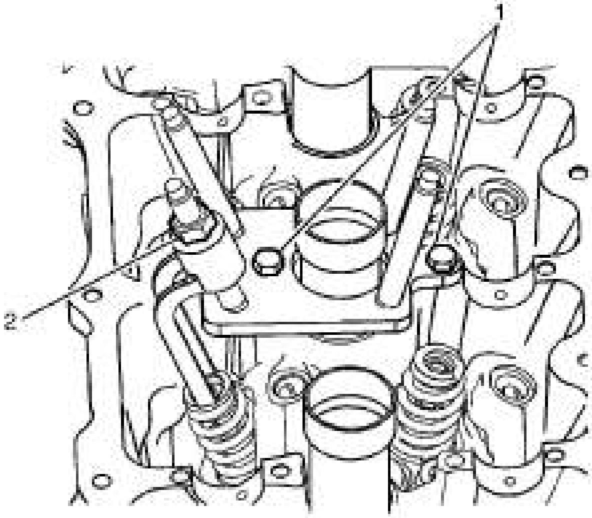
2. Install the EN 46106 (1).
3. Remove the camshafts and rocker arms. Refer to Camshaft Replacement - Left Side.
4. Remove the spark plug from the applicable cylinder. Refer to Spark Plug Replacement.
5. Install the J 39313 to the applicable cylinder.
6. Connect the J 39313 to a compressed air source.
7. Install the EN 46110 above the applicable cylinder.



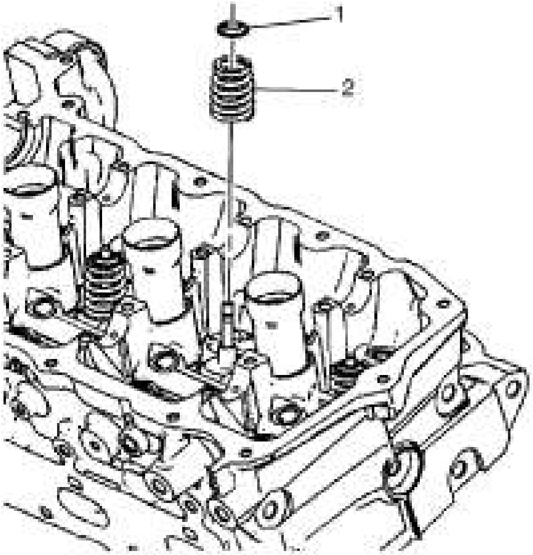
8. Install the EN 46110 to cylinder head retaining bolts (1)
9. Tighten the EN 46110 valve spring compressor nut (2).



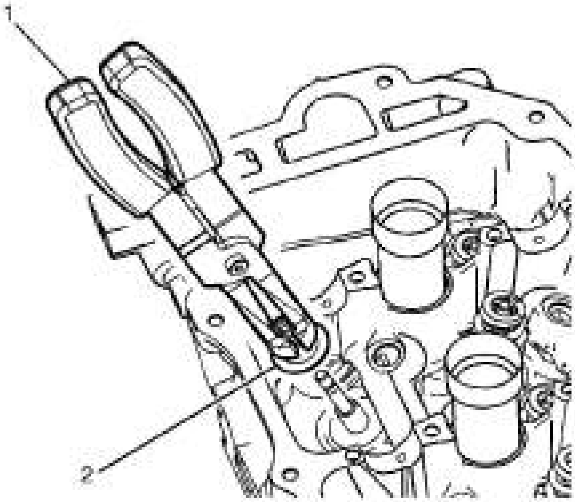
10. Remove the valve collets using the EN 46117 .



11. Loosen the EN 46110 valve spring compressor nut (2).
12. Remove the EN 46110 to cylinder head retaining bolts (1).
13. Remove the EN 46110 .

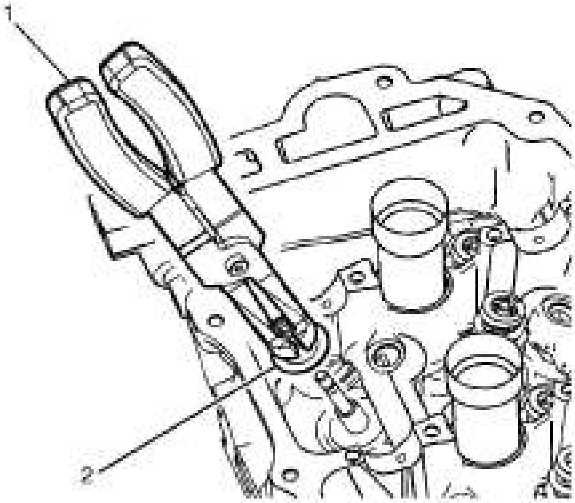


14. Remove the valve spring retainer (1).
15. Remove the valve spring (2).

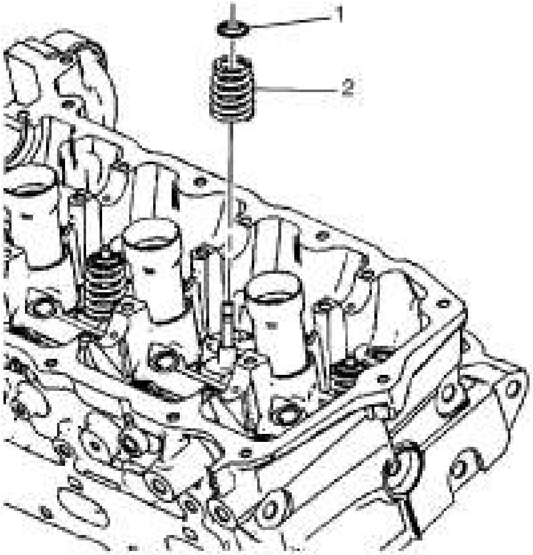


16. Use the EN 46116 (1) in order to remove the valve stem seal (2).

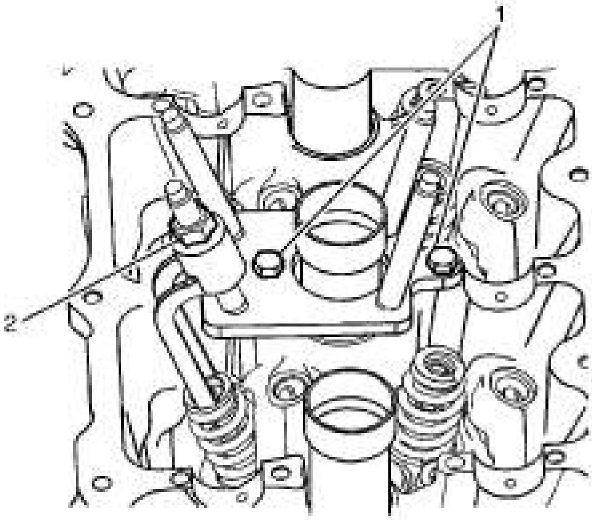
Installation Procedure



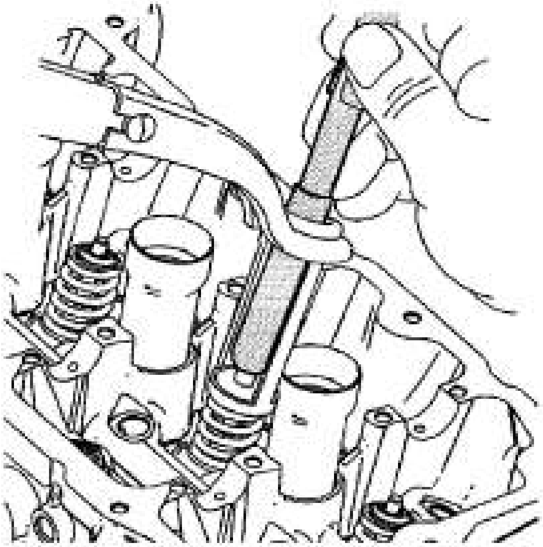
1. Use the EN 46116 (1) in order to install the valve stem seal (2).



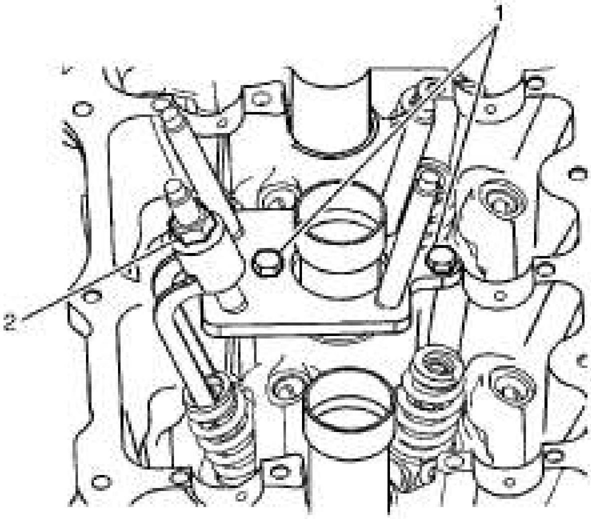
2. Install the valve spring (2).
3. Install the valve spring retainer (1).



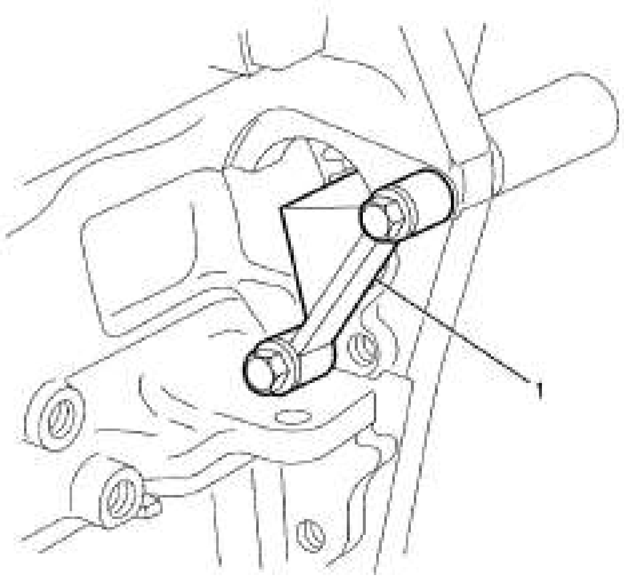
4. Install the EN 46110 above the applicable valve spring.
5. Install the EN 46110 to cylinder head retaining bolts (1)
6. Tighten the EN 46110 valve spring compressor nut (2).



7. Install the valve collets using the EN 46117 .



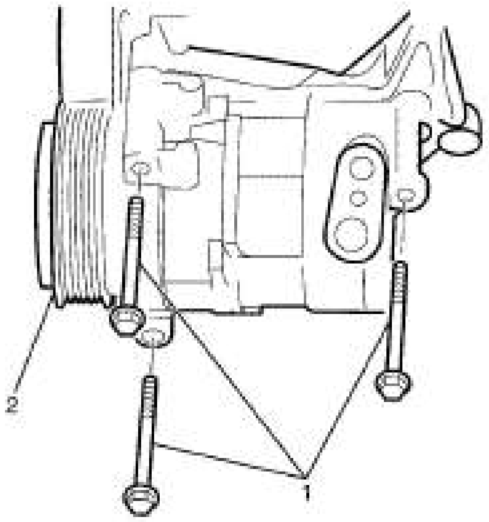
8. Loosen the EN 46110 valve spring compressor nut (2).
9. Remove the EN 46110 to cylinder head retaining bolts (1).
10. Remove the EN 46110 .
11. Disconnect the J 39313 from the compressed air source.
12. Remove the J 39313 .
13. Install the spark plugs. Refer to Spark Plug Replacement.
14. Install the rocker arms and camshafts. Refer to Camshaft Replacement - Left Side.



15. Remove the EN 46106 (1).
16. Install the starter motor. Refer to Starter Motor Replacement.

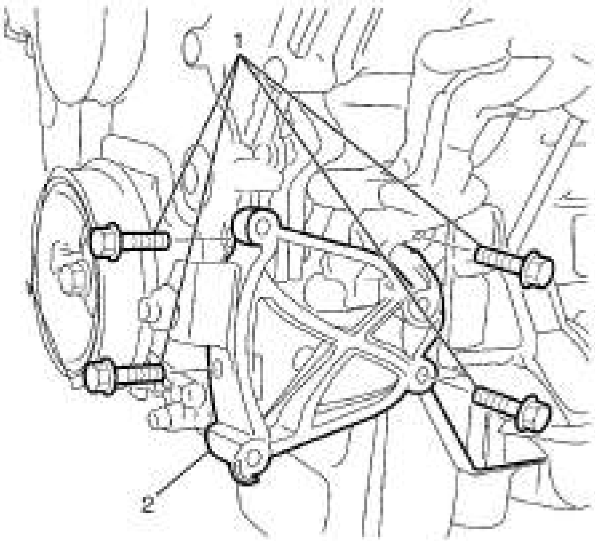
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977569**

Air Conditioning (A/C) Compressor Removal



Important: The compressor must be supported before removing the compressor to compressor mounting bracket retaining bolts (1).

1. Remove the compressor to compressor mounting bracket retaining bolts (1).
2. Remove the compressor (2) by sliding forwards and upwards.

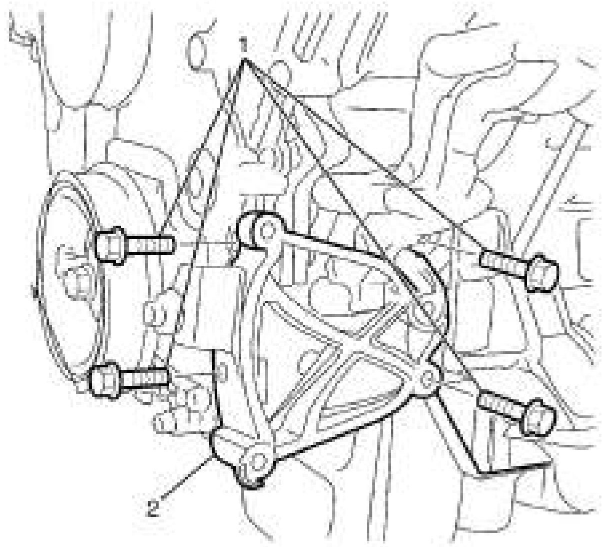


3. Remove the compressor mounting bracket to engine retaining bolts (1).

4. Remove the compressor mounting bracket (2).

Air Conditioning (A/C) Compressor Installation

Important: Follow the procedure sequence in order to prevent drive belt mis-alignment and/or possible damage/distortion to the components.



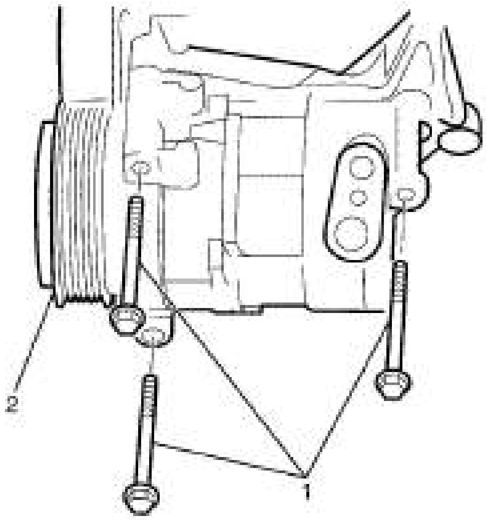
1. Install the A/C compressor bracket (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the A/C compressor bracket to cylinder block retaining bolts (1).

   Tighten
   Tighten the bolt to 58 N·m (42 lb ft).

3. If you are replacing the compressor, balance the compressor oil. Refer to Air Conditioning Compressor Oil Balancing.



4. Install the A/C compressor (2).
5. Install the A/C compressor to A/C compressor bracket retaining bolts (1).

   Tighten
   Tighten the nuts to 22 N·m (16 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977540**

Camshaft Cleaning and Inspection

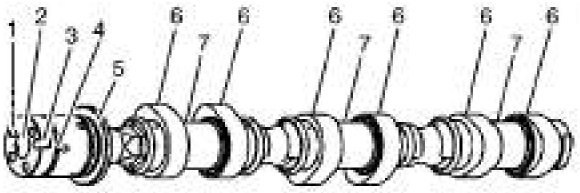
Cleaning Procedure

1. Clean the camshaft in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

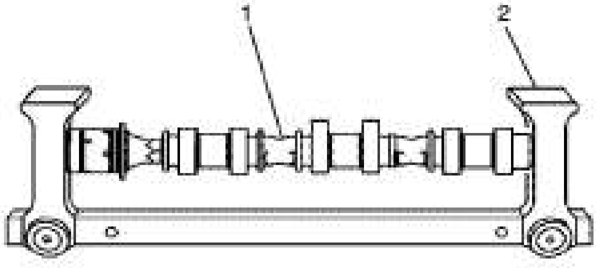
2. Dry the camshaft with compressed air.

Visual Inspection

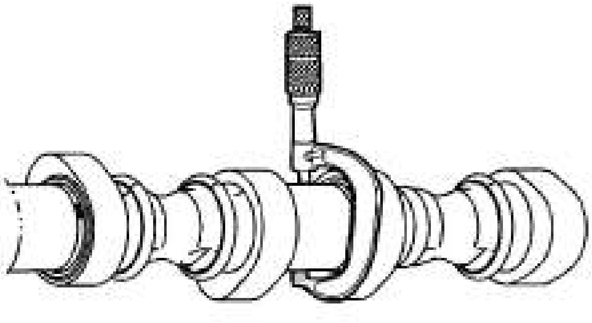


1. Inspect the camshaft oil feed holes (1) to the camshaft position actuator for dirt, debris or blockage.
2. Inspect the threaded hole (2) for damage.
3. Inspect the camshaft position actuator locating notch (3) for damage or wear.
4. Inspect the camshaft sealing grooves (4) for damage.
5. Inspect the camshaft thrust surface (5) for damage.
6. Inspect the camshaft lobes (6) and journals (7) for the following conditions:
   - Scoring or pitting above acceptable tolerances
   - Discoloration from overheating
   - Deformation from wear above acceptable tolerances, especially the camshaft lobes
7. If any of the above conditions exist on the camshaft, replace the camshaft.

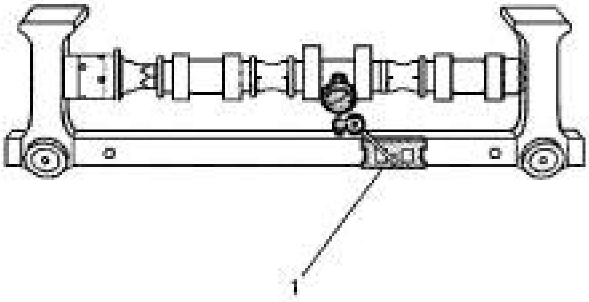
Camshaft Measurement



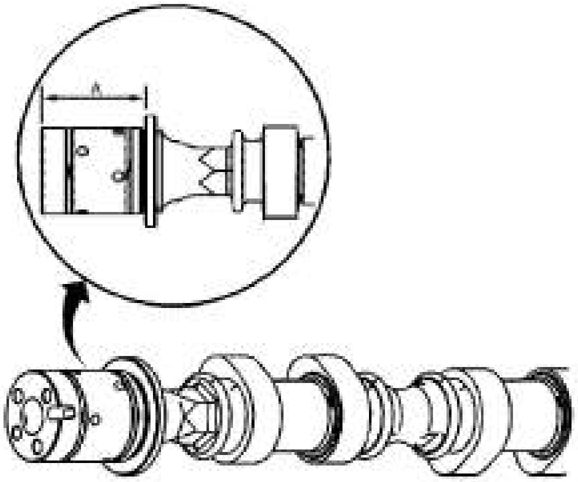
1. With the camshaft (1) in a suitable fixture (2), measure the camshaft (1) for wear.



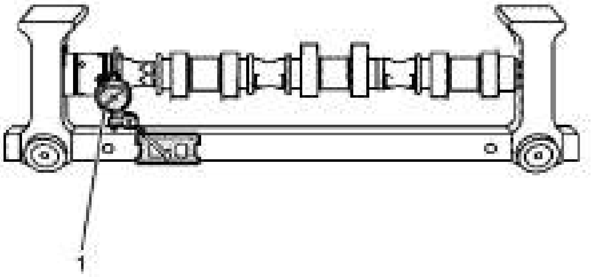
2. Measure and record the camshaft journals (2) for diameter and out-of-round using an outside micrometer (1). Refer to Engine Mechanical Specifications .
   - If the diameter is smaller than specifications, replace the camshaft.
   - If the out-of-round exceeds specifications, replace the camshaft.



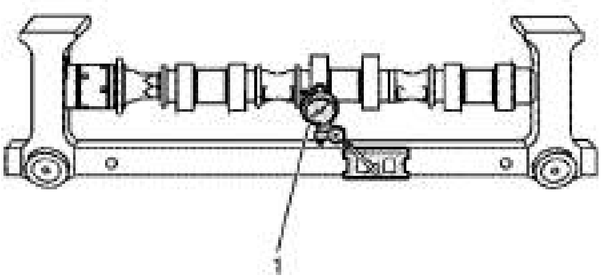
3. Measure and record the camshaft runout using a dial indicator (1). Refer to Engine Mechanical Specifications .



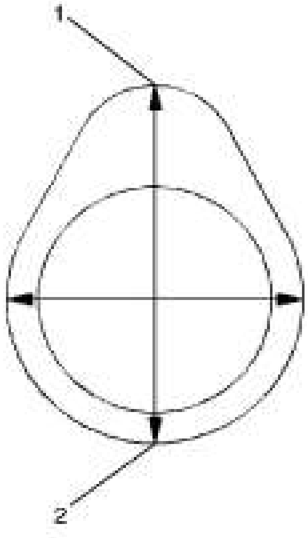
4. Measure the camshaft thrust width (A) for wear using a depth micrometer. Refer to Engine Mechanical Specifications .



5. Measure the camshaft thrust wall surface for runout using a dial indicator (1). Refer to Engine Mechanical Specifications .
6. If the camshaft is damaged or worn beyond specifications, replace the camshaft. No machining of the camshaft is allowed.



7. Measure the camshaft lobes for wear using a dial indicator (1).

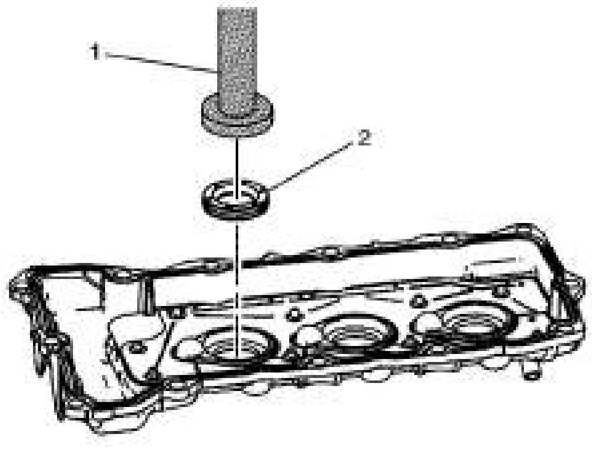


8. Place the dial indicator with the indicator tip on the base circle (2) of the camshaft lobe.
    1. Place the dial indicator at zero.
    2. Rotate the camshaft until the indicator tip is at the highest point (1) on the lobe. This reading is the lift of the camshaft lobe. Refer to Engine Mechanical Specifications .
    3. If the indicated measurement is significantly lower than these specifications, replace the camshaft or engine performance will be reduced.

Camshaft Cover Assemble

Tools Required

J 24254 Oil Seal Installer



Install the NEW ignition coil seals (2) using the J 24254 (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977673**

Camshaft Cover Cleaning and Inspection

Cleaning Procedure

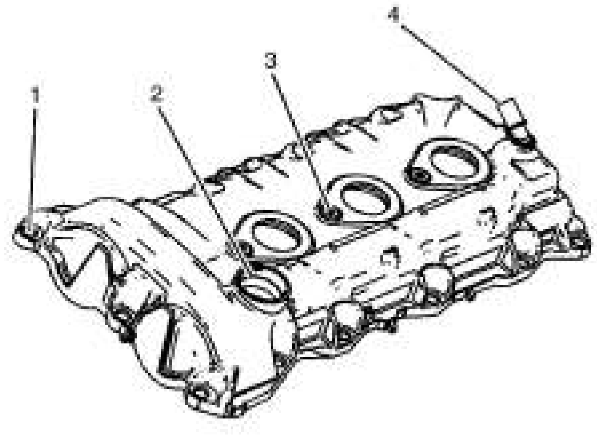
1. Clean the camshaft covers in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

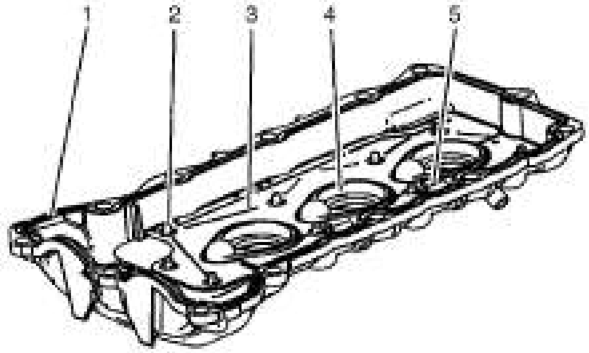
2. Dry the camshaft covers with compressed air.

Inspection Procedure

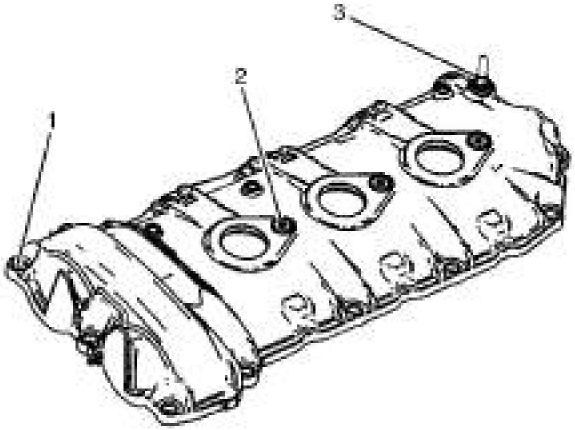
1. Inspect each camshaft cover for the dents or damage to the exterior. A dented or damaged camshaft cover may:
   - Leak engine oil.
   - Effect crankcase ventilation.
   - Interfere with the camshafts.
   - Interfere with the ignition coil sealing.
   - Allow water or condensation to enter the engine.



2. Inspect the exterior of the left camshaft cover for the following conditions:
   - Damage to the camshaft cover bolt holes (1).
   - Damage to the oil fill hole (2).
   - Damage to the mounting holes (3) for the ignition coil assembly.
   - Damage to the Positive Crankcase Ventilation (PCV) hose connector (4) -- A damaged PCV hose connector is replaceable.

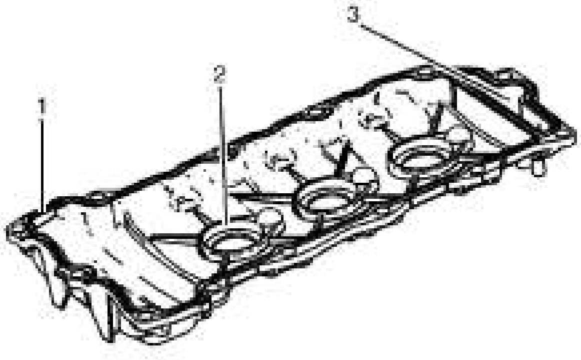


3. Inspect the interior of the left camshaft cover for the following conditions:
   - Gouges or damage to the camshaft cover sealing groove (1).
   - Damaged, loose or missing baffle fasteners (2).
   - Damaged, loose or missing baffle (3).
   - Gouges or damage to the ignition coil seal bore (4).
   - Restrictions to the ventilation system (5).



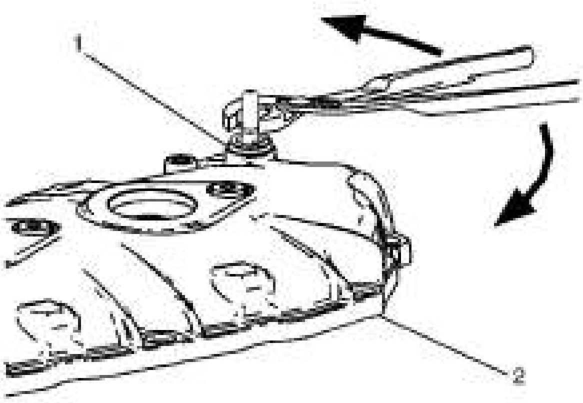
4. Inspect the exterior of the right camshaft cover for the following conditions:
   - Damage to the camshaft cover bolt holes (1).
   - Damage to the mounting holes (2) for the ignition coil assembly.
   - Damage to the PCV orifice (3) -- A damaged PCV orifice can be replaced. Refer to PCV

Orifice Replacement.



5. Inspect the interior of the right camshaft cover for the following conditions:
    - Gouges or damage to the camshaft cover sealing groove (1).
    - Gouges or damage to the ignition coil seal bore (2).
    - Restrictions to the ventilation system (3).
6. Repair or replace the camshaft cover or covers as necessary.

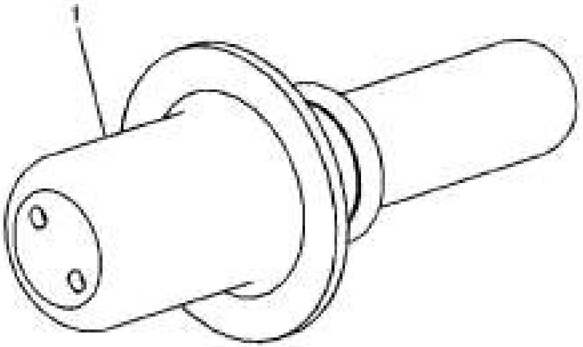
PCV Orifice Replacement



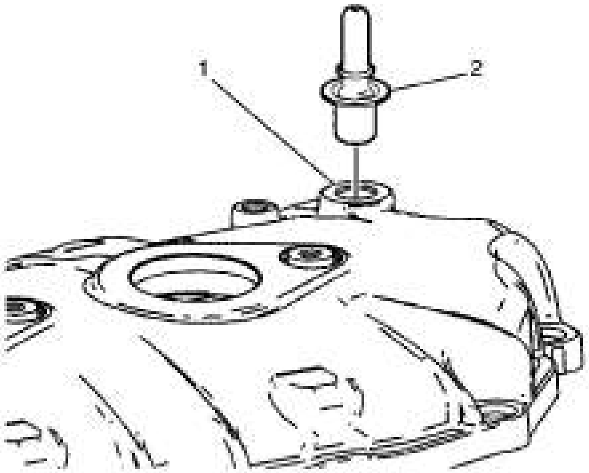
Important: If the PCV orifice is damaged or plugged and cannot be cleaned out, the PCV orifice can be replaced.

Important: Remove the PCV orifice (1) by griping the neck of the PCV orifice (1) with pliers and twisting and pulling out of the right camshaft cover (2).

1. Remove the PCV orifice (1) from the right camshaft cover (2).

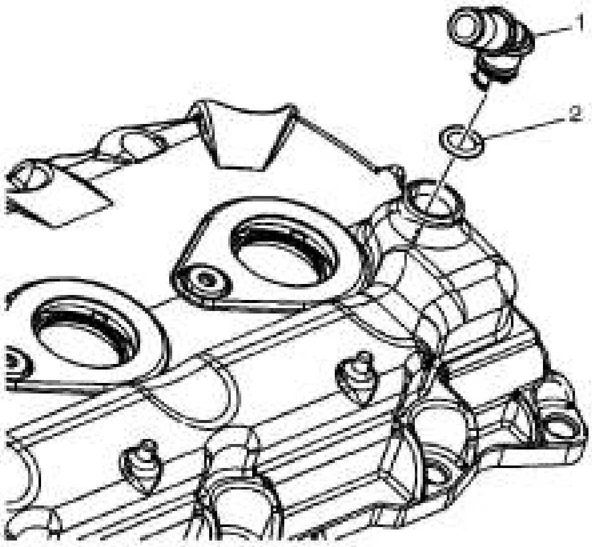


2. Apply a Holden approved sealant to the NEW PCV orifice (1).



3. Install the NEW PCV orifice (2) into the right camshaft cover (1). After insertion, twist the PCV orifice (2) in order to address any vertical leak paths in the sealant.

PCV Fitting Replacement

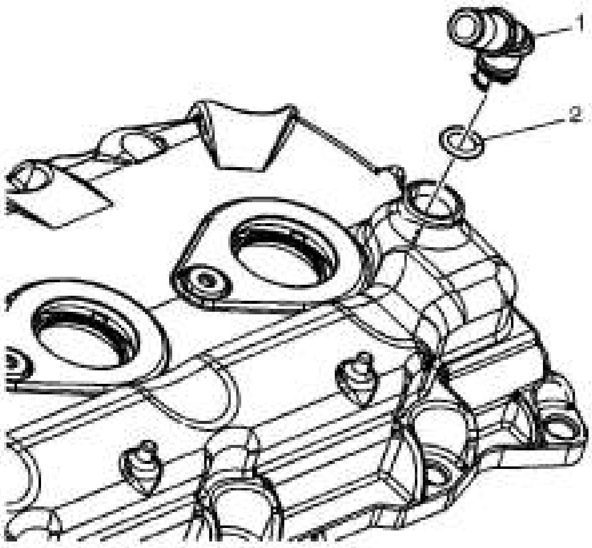


Important: If the PCV fitting (1) is damaged or plugged and cannot be cleaned out, the PCV fitting (1) can be replaced.

Important: The PCV fitting O-ring (2) is a single use component and must be discarded whenever the PCV fitting (1) is removed.

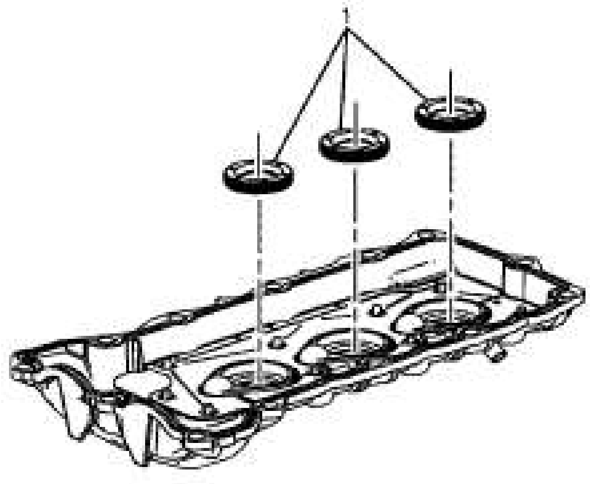
1. Remove the PCV fitting (1).

   Discard the PCV fitting O-ring (2).



2. Install the NEW PCV fitting (1) with a NEW PCV fitting O-ring (2).

Camshaft Cover Disassemble



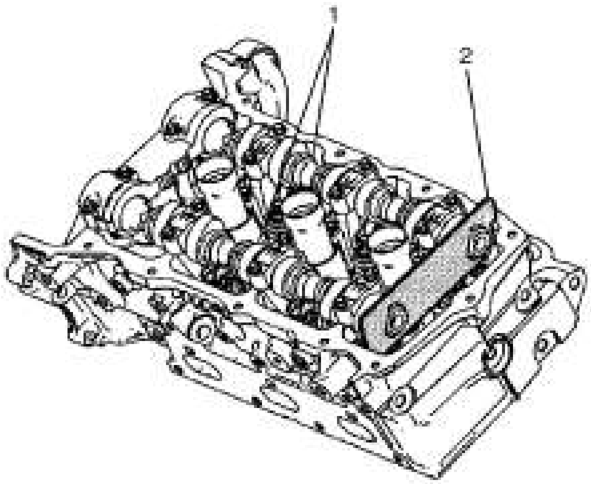
Remove and discard the ignition coil seals (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995376**

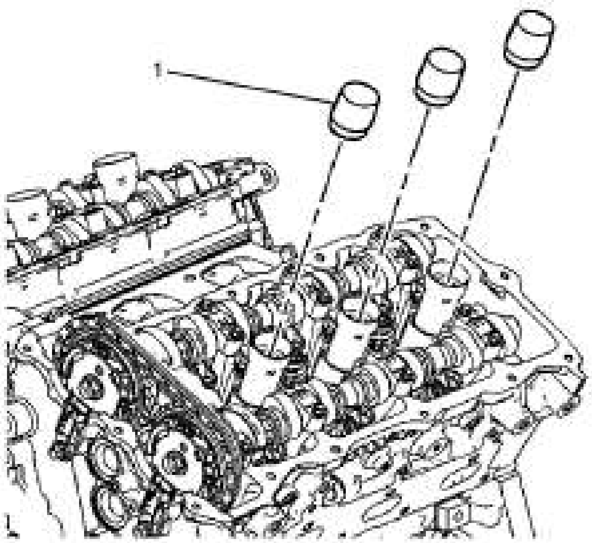
Camshaft Cover Installation - Left Side

Tools Required

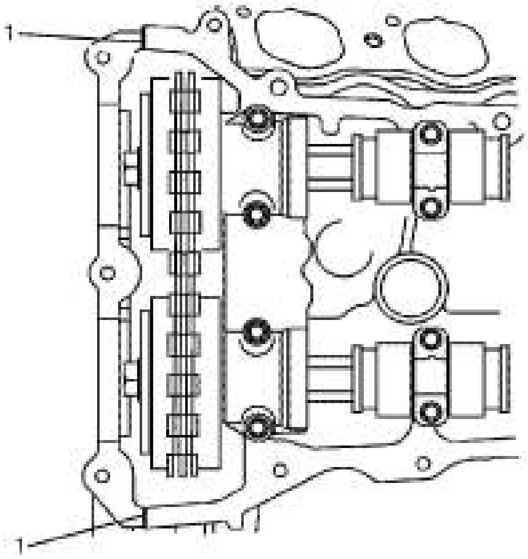
- EN 46101 Spark Plug Tube Seal Guide
- EN 46105 Camshaft Locking Tools



1. Remove the EN 46105 (2) from the rear of the left hand camshafts (1).

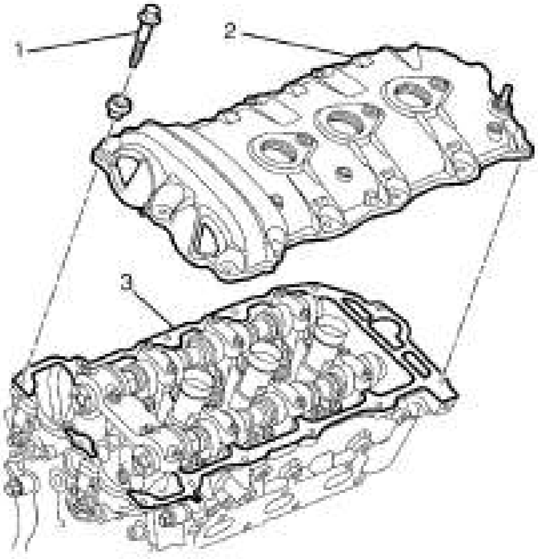


2. Install the EN 46101 (1) onto the spark plug tubes of the left cylinder head.
3. Install the camshaft cover bolt grommets prior to installing the camshaft cover bolts.
4. Wipe the camshaft cover sealing surface on the left cylinder head with a clean, lint-free cloth.



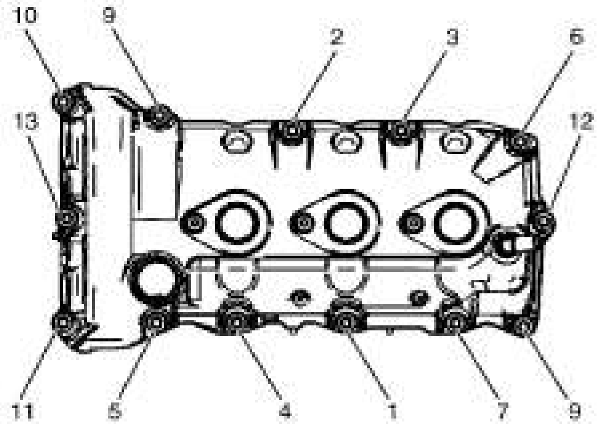
Important: Make sure the sealing surfaces of the cylinder head and camshaft cover are clean.

5. Place a 3mm bead of RTV sealant (1) on the join line between the engine front cover and the cylinder head.
6. Install a NEW camshaft cover seal and NEW grommets.



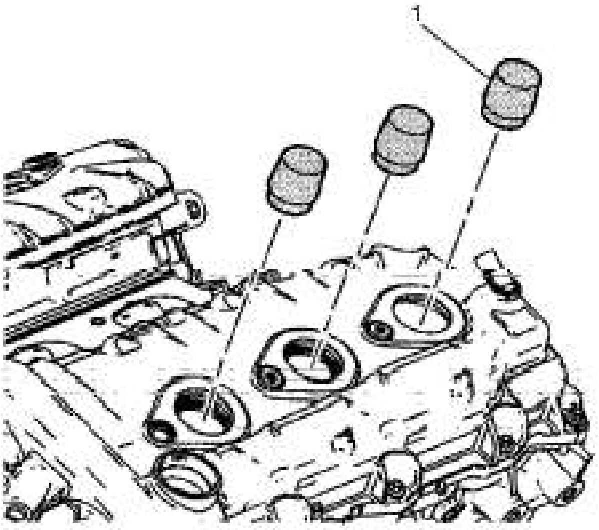
7. Install the camshaft cover (2) from the cylinder head (3).
8. Loosely install the left camshaft cover to cylinder head retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.

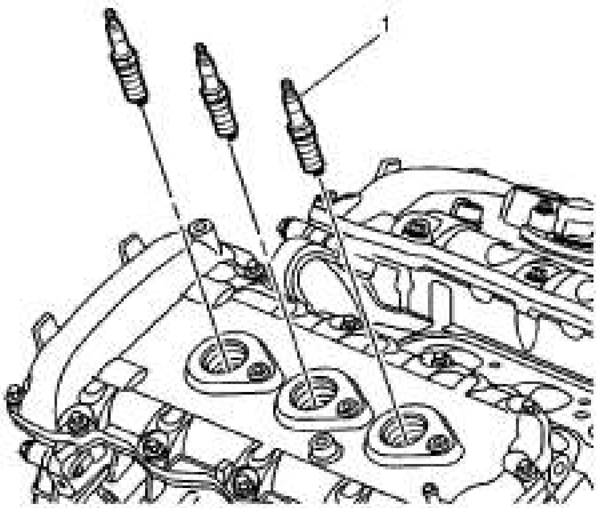


9. Tighten the left camshaft cover to cylinder head retaining bolts in the sequence shown.

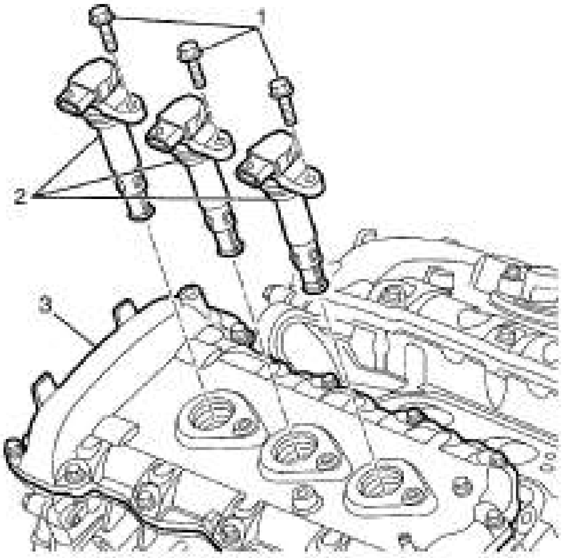
   Tighten
   Tighten the bolts in sequence to 10 N·m (89 lb in).



10. Remove the EN 46101 (1) from the spark plug tubes of the left cylinder head.



11. Install the spark plugs (1).



Important: DO NOT damage the spark plug and/or the seal in the left camshaft cover or an engine misfire condition may result.

12. Install the ignition coils (2) to the camshaft cover (3).
13. Install each ignition coil to camshaft cover retaining bolt (1).

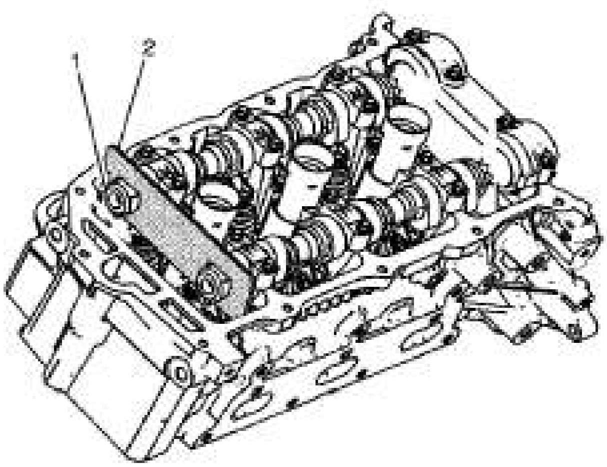
Tighten
Tighten the bolt to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995379**

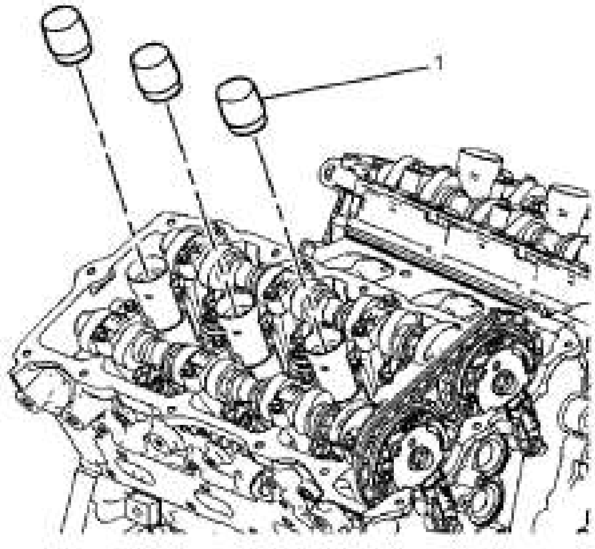
Camshaft Cover Installation - Right Side

Tools Required

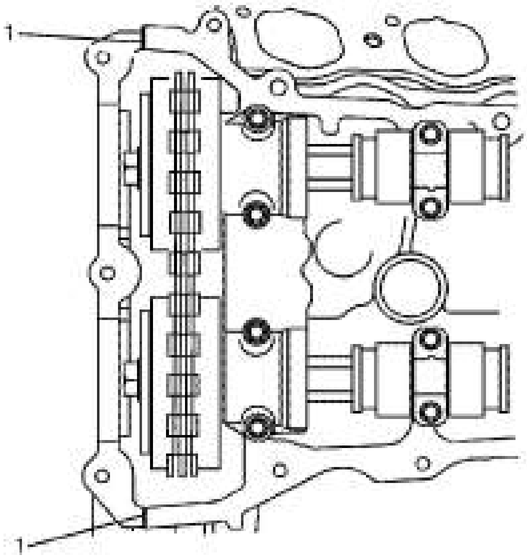
- EN 46101 Spark Plug Tube Seal Guide
- EN 46105 Camshaft Locking Tools



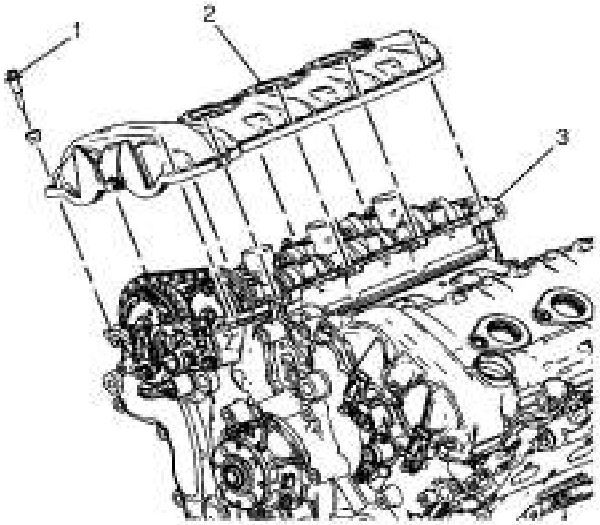
1. Remove the EN 46105 (2) from the rear of the right camshafts (1).



2. Install the EN 46101 (1) onto the spark plug tubes of the right cylinder head.
3. Install the camshaft cover bolt grommets prior to installing the camshaft cover bolts.
4. Wipe the camshaft cover sealing surface on the right cylinder head with a clean, lint-free cloth.

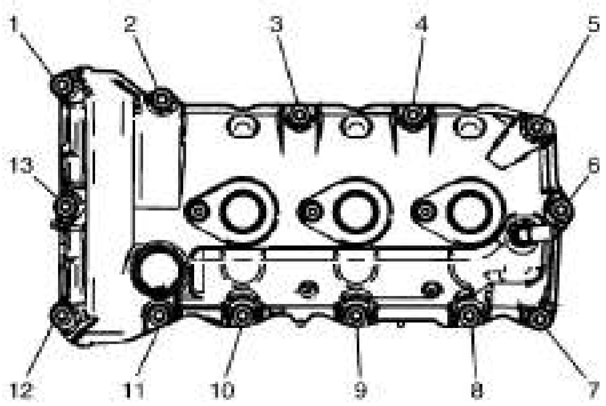


5. Place a bead 8 mm (0.3150 in) in diameter by 4 mm (0.1575 in) in height of RTV sealant on the engine front cover split lines (1).



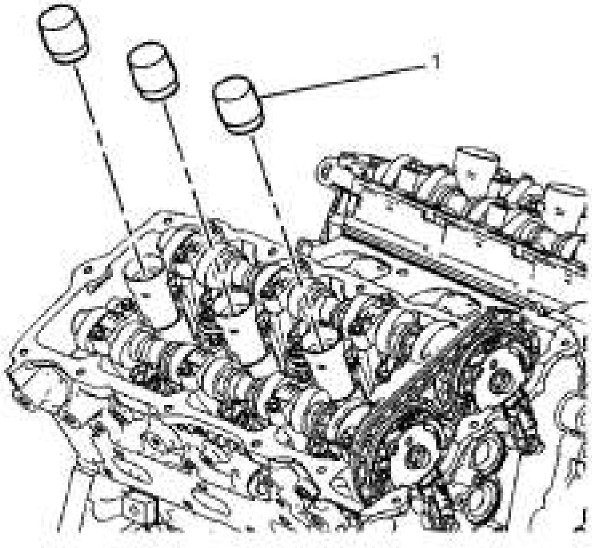
6. Place the right camshaft cover (2) into position onto the right cylinder head (3).
7. Loosely install the right camshaft cover bolts (1).

Notice: Refer to Fastener Notice in the Preface section.

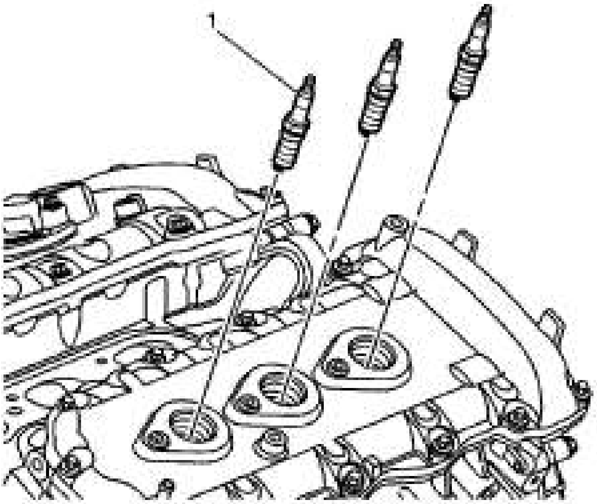


8. Tighten the left camshaft cover to cylinder head retaining bolts in the sequence shown.

   Tighten
   Tighten the bolts in sequence to 10 N·m (89 lb in).

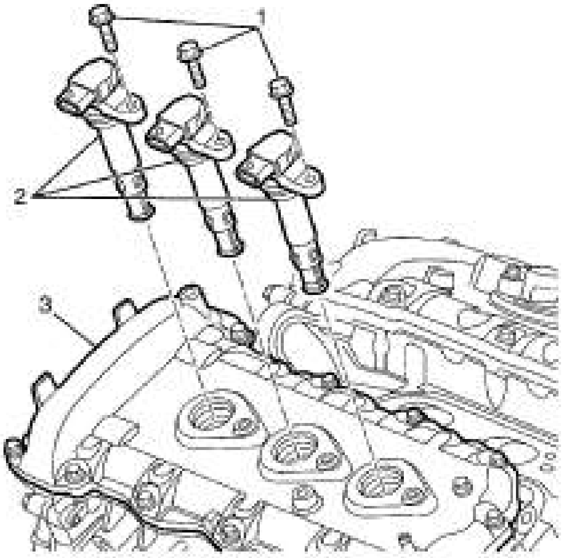


9. Remove the EN 46101 (1) from the spark plug tubes of the right cylinder head.



10. Install the NEW spark plugs (1).

    Tighten
    Tighten the spark plugs to 20 N·m (15 lb ft).



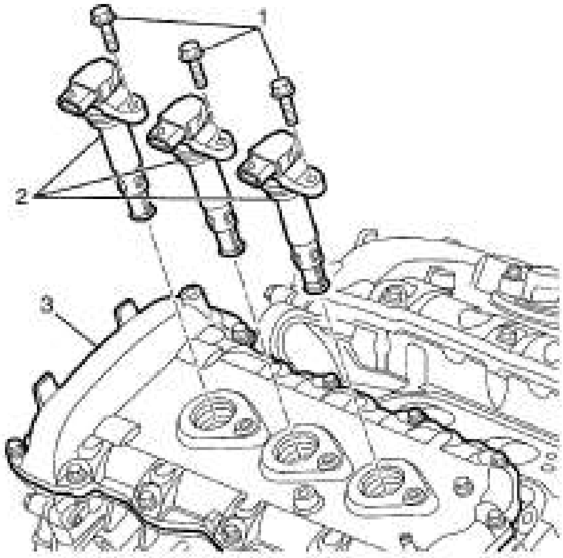
Important: DO NOT damage the spark plug and/or the seal in the left camshaft cover or an engine misfire condition may result.

11. Install the ignition coils (2).
12. Install each ignition coil to camshaft cover retaining bolt (1).

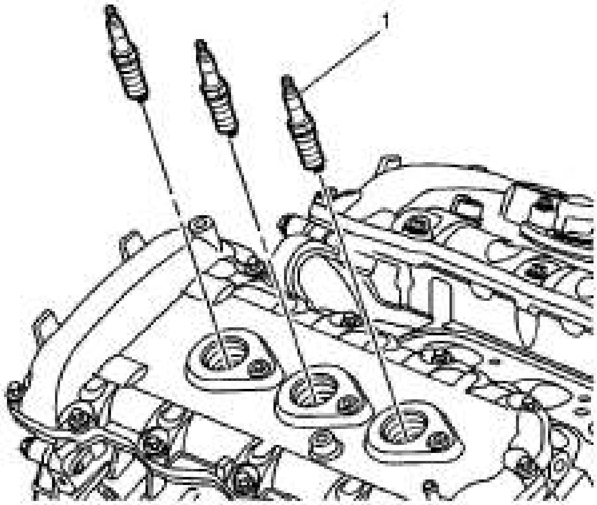
Tighten

Tighten the bolt to 10 N·m (89 lb in).

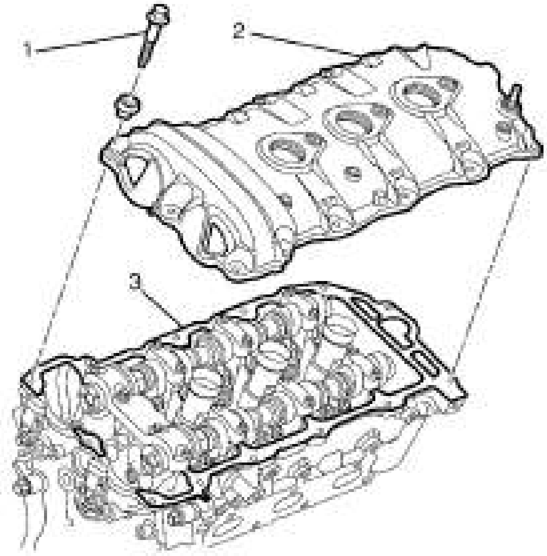
Camshaft Cover Removal - Left Side



1. Remove the ignition coil to camshaft cover retaining bolts (1).
2. Remove the ignition coils (2) from the camshaft cover (3).



3. Remove the spark plugs (1).



4. Remove the camshaft cover to cylinder head retaining bolts (1).
5. Remove the camshaft cover (2) from the cylinder head (3).

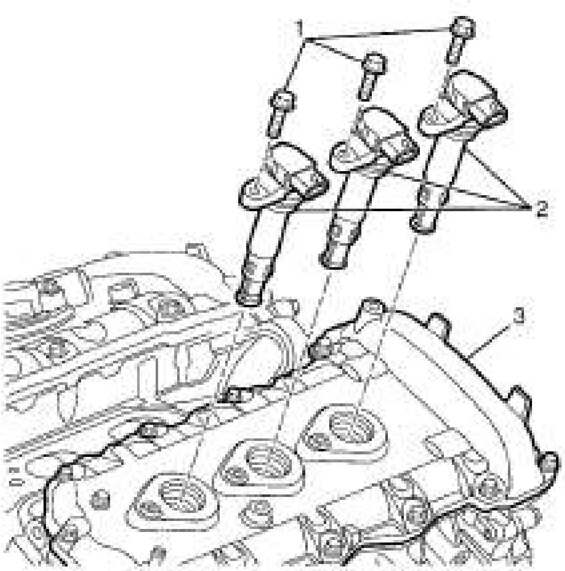
Important: The camshaft cover seal and grommets must be discarded whenever the camshaft cover has been removed from the cylinder head (2).

6. Remove the camshaft cover seal and grommets.

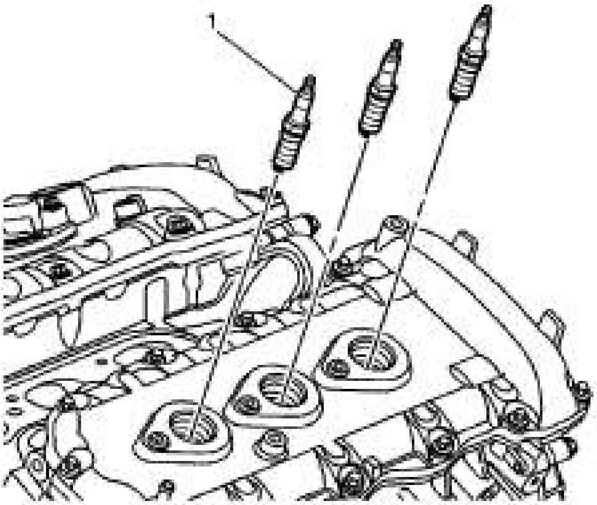
Discard the seal and grommets

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977654**

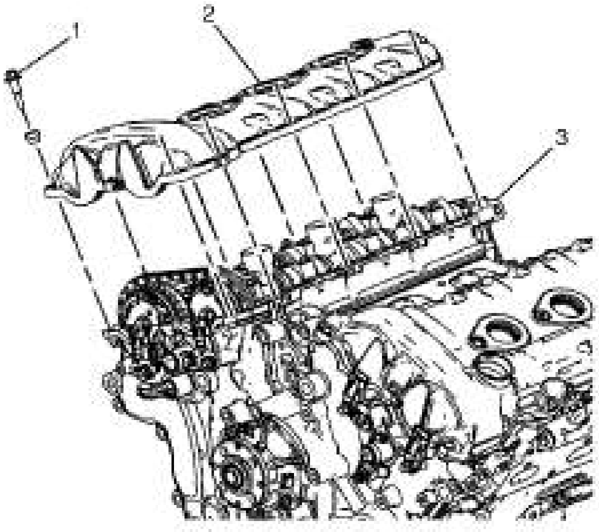
Camshaft Cover Removal - Right Side



1. Remove the ignition coil to camshaft cover retaining bolts (1).
2. Remove the ignition coils (2) from the camshaft cover (3).



3. Remove the spark plugs (1).



4. Remove the camshaft cover to cylinder head retaining bolts (1).
5. Remove the camshaft cover (2) from the cylinder head (3).

   Important: The camshaft cover seal and grommets must be discarded whenever the camshaft cover has been removed from the cylinder head (2).

6. Remove the camshaft cover seal and grommets.

   Discard the seal and grommets

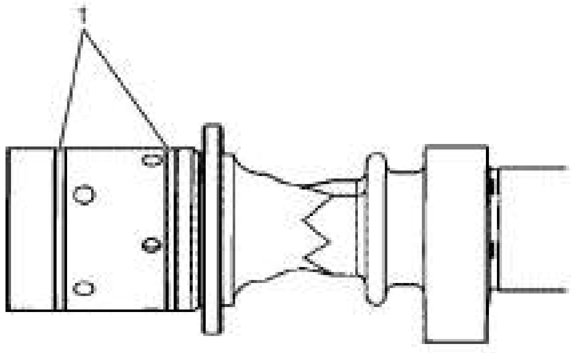
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995360**

Camshaft Installation - Left Side

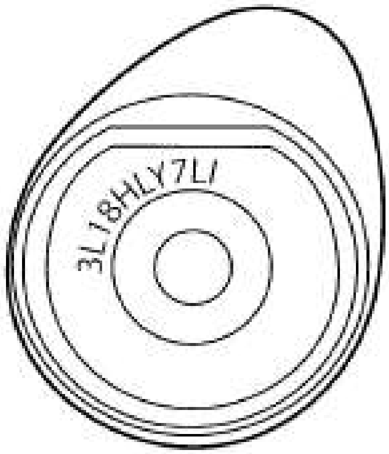
Tools Required

EN 46111 Crankshaft Rotation Socket

1. Ensure that the crankshaft is in the stage one timing drive assembly position using the EN 46111 . Refer to Camshaft Timing Drive Chain Alignment Diagram.



2. Make sure that the camshaft sealing rings (1) are in place in the camshaft grooves.



3. Select the proper camshaft for the particular installation location. ID markings are on the

rear end of each camshaft. The ID markings are defined as follows:

3.1. The first five digits refer to the date and time of production.

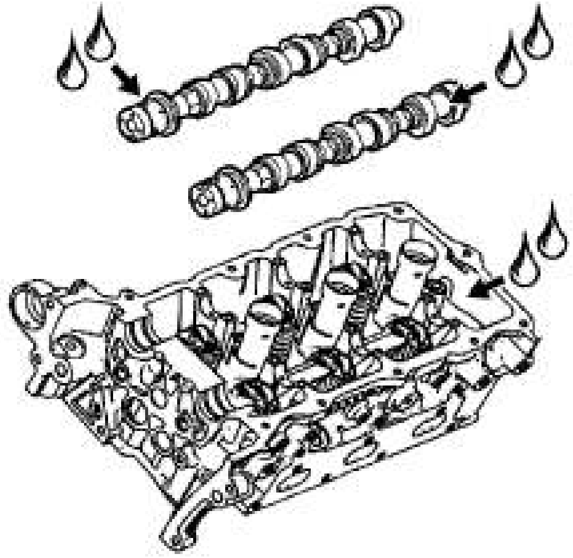
Example: 3L18H.

3.2. Digits 6-9 refer to the production code.

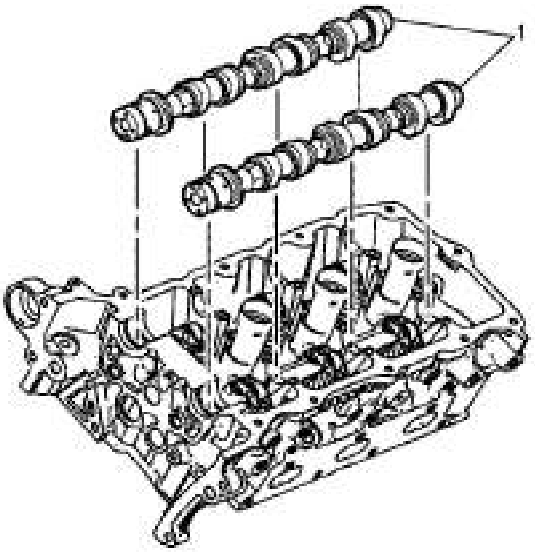
LY7 - High Feature V6

3.3. The last two digits refer to the camshaft position.

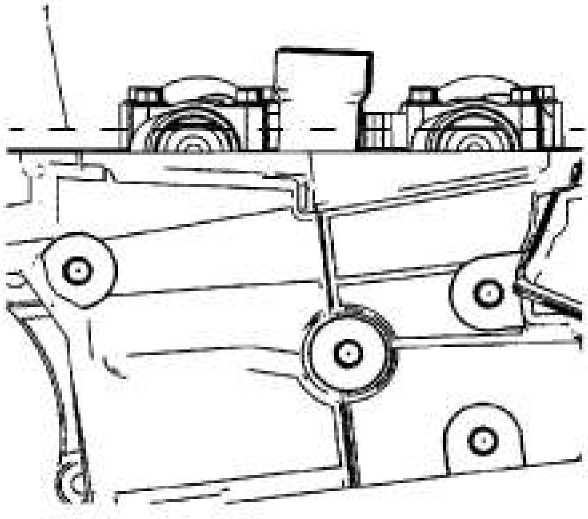
- Example:
- LI - Left Bank Intake
- LE - Left Bank Exhaust
- RI - Right Bank Intake
- RE - Right Bank Exhaust



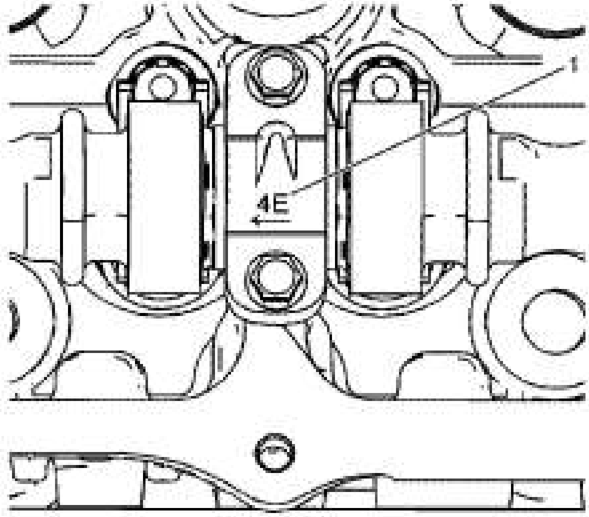
4. Apply a liberal amount of engine oil to the camshaft (1) journals and the left cylinder head (2) camshaft carriers.



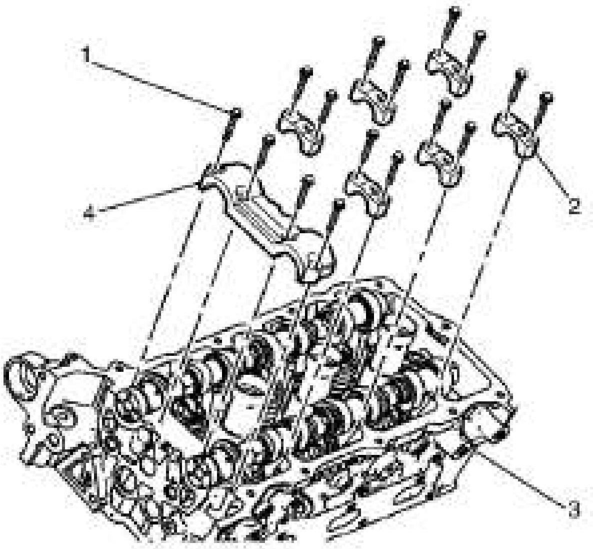
5. Place the camshafts (1) in position in the left cylinder head (2).



6. Position the camshaft lobes in a neutral position with the flats on the back of the camshafts up and parallel (1) with the left cylinder head camshaft cover rail.

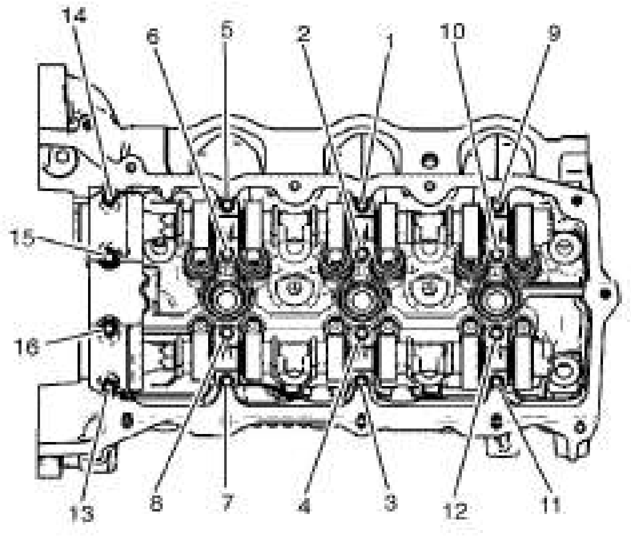


7. Observe the markings on the left cylinder head camshaft bearing caps. Each bearing cap is marked (1) in order to identify its location. The markings have the following meanings:
   - The raised feature must always be oriented toward the center of the cylinder head.
   - The I indicates the intake camshaft.
   - The E indicates the exhaust camshaft.
   - The number 1, 3, 5 indicates the cylinder position from the front of the cylinder block.
8. Apply a liberal amount of engine oil to the camshaft bearing caps.



9. Install the camshaft bearing thrust cap (4) in the first journal of the right cylinder head (3).
10. Install the remaining bearing caps (2) with their orientation mark toward the center of the cylinder head (3).
11. Hand start all the camshaft bearing cap to cylinder head retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.



12. Tighten the camshaft bearing cap to cylinder head retaining bolts in the sequence shown.

    Tighten
    Tighten the bolts in sequence to 10 N·m (89 lb in).

13. Loosen the center intake camshaft bearing cap to cylinder head retaining bolts (1, 2) and the center exhaust camshaft bearing cap to cylinder head retaining bolts (3, 4).
14. Retighten the center camshaft bearing cap to cylinder head retaining bolts (1, 2, 3, 4).

    Tighten
    Retighten the bolts to 10 N·m (89 lb in).

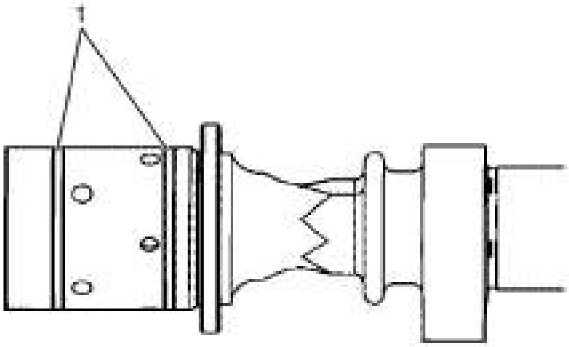
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995357

Camshaft Installation - Right Side

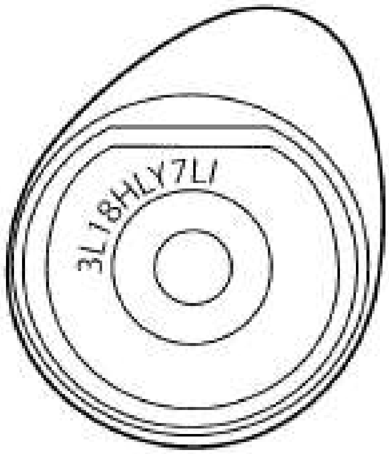
Tools Required

EN 46111 Crankshaft Rotation Socket

1. Ensure that the crankshaft is in the stage one timing drive assembly position using the EN 46111 . Refer to Camshaft Timing Drive Chain Alignment Diagram .



2. Make sure that the camshaft sealing rings (1) are in place in the camshaft grooves.



3. Select the proper camshaft for the particular installation location. ID markings are on the

rear end of each camshaft. The ID markings are defined as follows:

3.1. The first five digits refer to the date and time of production.

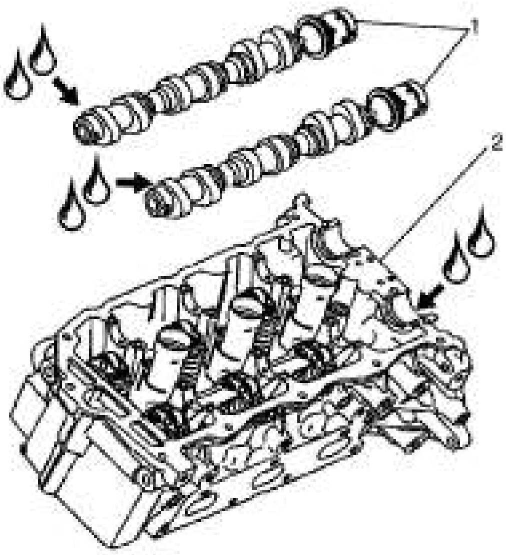
Example: 3L18H.

3.2. Digits 6-9 refer to the production code.

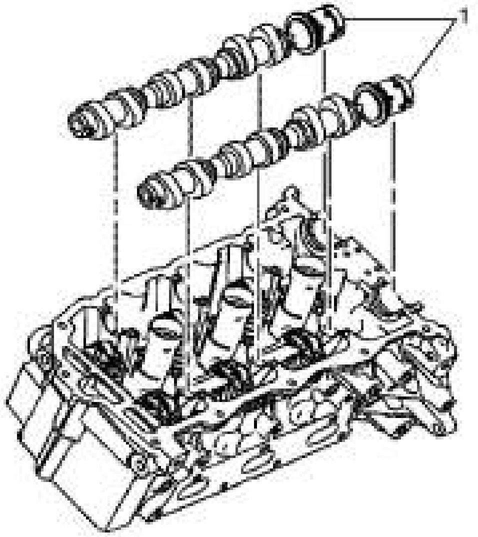
LY7 - High Feature V6

3.3. The last two digits refer to the camshaft position.

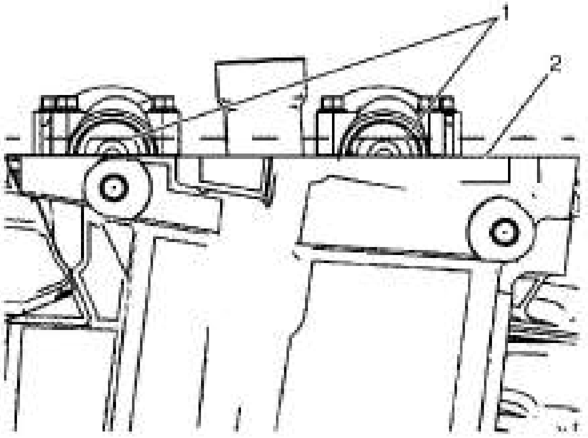
- Example:
- LI - Left Bank Intake
- LE - Left Bank Exhaust
- RI - Right Bank Intake
- RE - Right Bank Exhaust



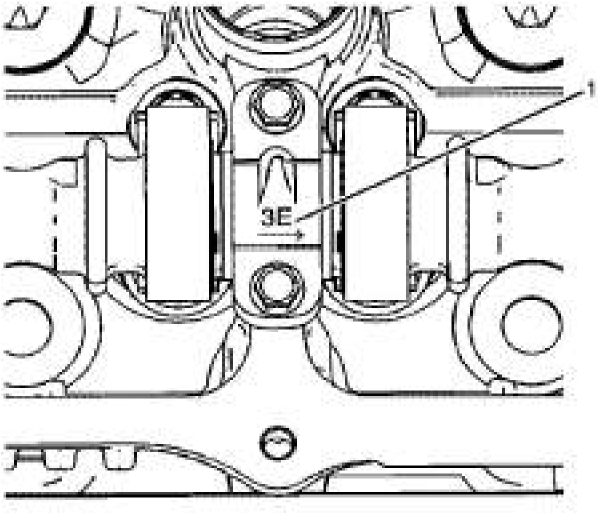
4. Apply a liberal amount of engine oil to the camshaft (1) journals and the right cylinder head (2) camshaft carriers.



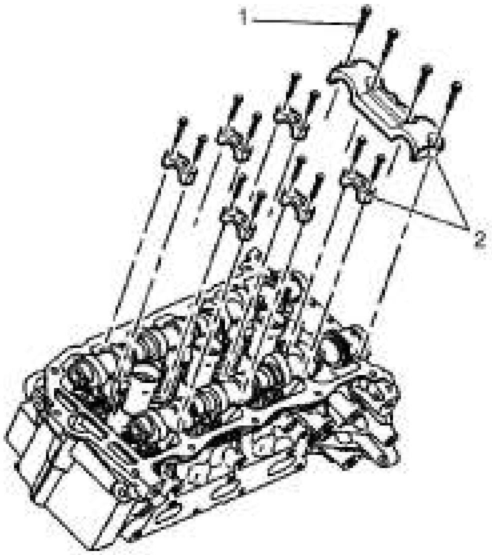
5. Place the camshafts (1) in position in the right cylinder head (2).



6. Position the camshaft lobes in a neutral position with the flats on the back of the camshafts up and parallel (1) with the right cylinder head camshaft cover rail.

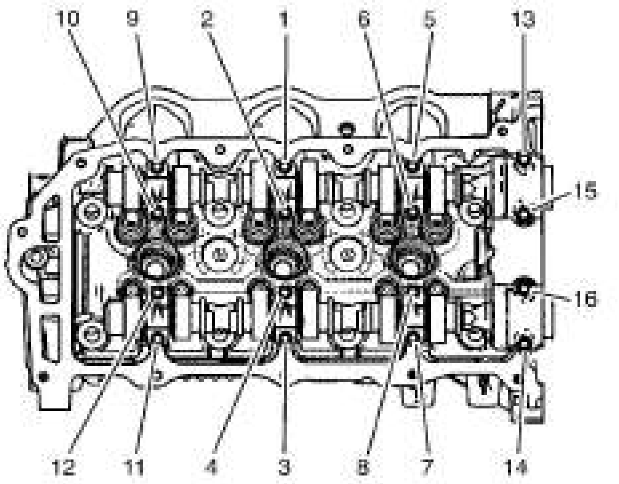


7. Observe the markings on the right cylinder head camshaft bearing caps. Each bearing cap is marked (1) in order to identify its location. The markings have the following meanings:
   - The raised feature must always be oriented toward the center of the cylinder head.
   - The I indicates the intake camshaft.
   - The E indicates the exhaust camshaft.
   - The number 1, 3, 5 indicates the cylinder position from the front of the cylinder block.
8. Apply a liberal amount of engine oil to the camshaft bearing caps.



9. Install the camshaft bearing thrust cap (2) in the first journal of the right cylinder head.
10. Install the remaining bearing caps (2) with their orientation mark toward the center of the cylinder head.
11. Hand start all the camshaft bearing cap to cylinder head retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.



12. Tighten the camshaft bearing cap to cylinder head retaining bolts in the sequence shown.

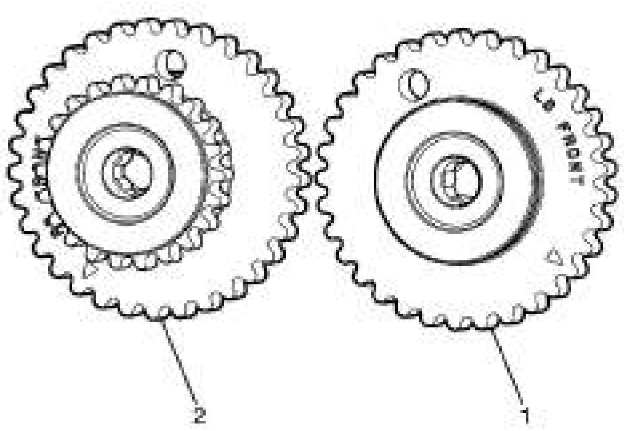
    Tighten
    Tighten the bolts in sequence to 10 N·m (89 lb in).

13. Loosen the center intake camshaft bearing cap to cylinder head retaining bolts (1, 2) and the center exhaust camshaft bearing cap to cylinder head retaining bolts (3, 4).
14. Retighten the center camshaft bearing cap to cylinder head retaining bolts (1, 2, 3, 4).

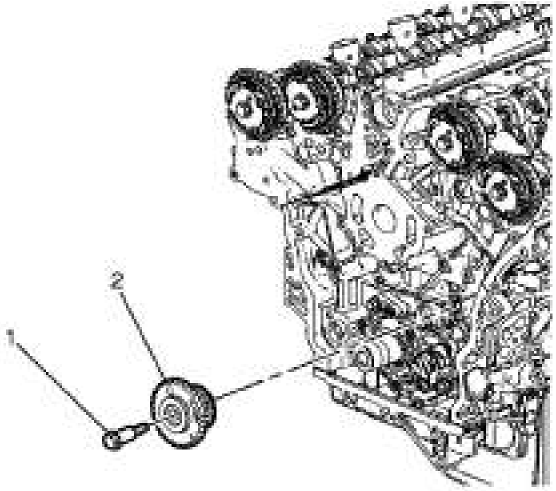
    Tighten
    Retighten the bolts to 10 N·m (89 lb in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1985130**

Camshaft Intermediate Drive Chain Idler Installation - Left Side



1. Make sure that the left camshaft intermediate drive chain idler (1) is being installed. The recessed hub (2) and the larger sprocket of the left camshaft intermediate drive chain idler is installed outward. The raised hub and the smaller sprocket of the left camshaft intermediate drive chain idler is installed towards the cylinder block.



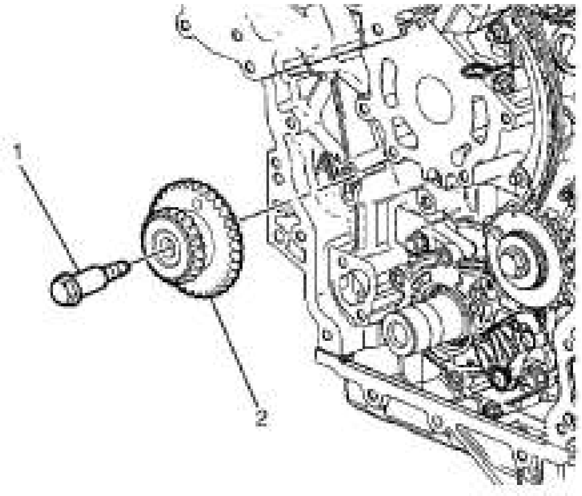
2. Install the left camshaft intermediate drive chain idler (2).

Notice: Refer to Fastener Notice in the Preface section.

3. Install the camshaft intermediate drive chain idler to cylinder block retaining bolt (1).

   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).

Camshaft Intermediate Drive Chain Idler Installation - Right Side



Important: The recessed hub and the smaller sprocket of the right camshaft intermediate drive chain idler (2) is installed outward. The raised hub and the larger sprocket of the right camshaft intermediate drive chain idler (2) is installed towards the block.

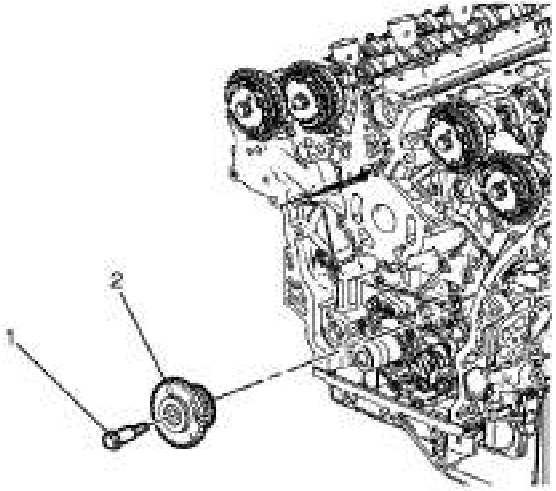
1. Install the right camshaft intermediate drive chain idler (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the camshaft intermediate drive chain idler bolt (1).

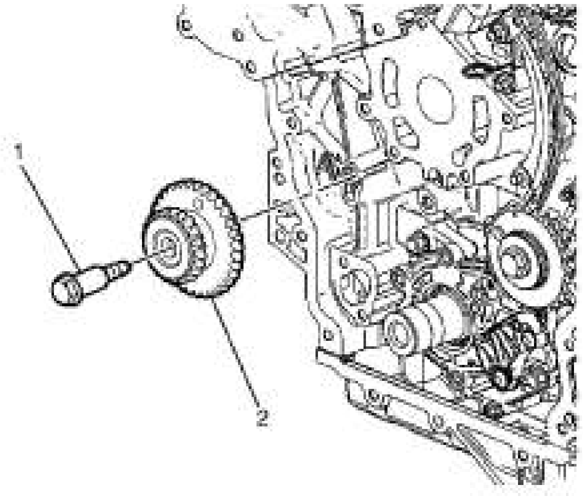
   Tighten
   Tighten the bolt to 58 N·m (43 lb ft).

Camshaft Intermediate Drive Chain Idler Removal - Left Side



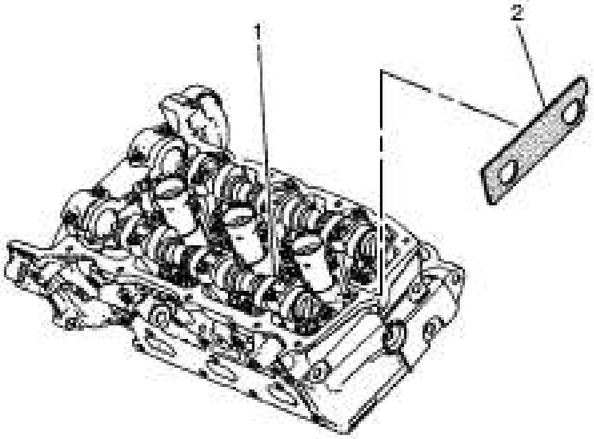
1. Remove the left camshaft intermediate drive chain idler to cylinder block retaining bolt (1).
2. Remove the left camshaft intermediate drive chain idler (2).

Camshaft Intermediate Drive Chain Idler Removal - Right Side



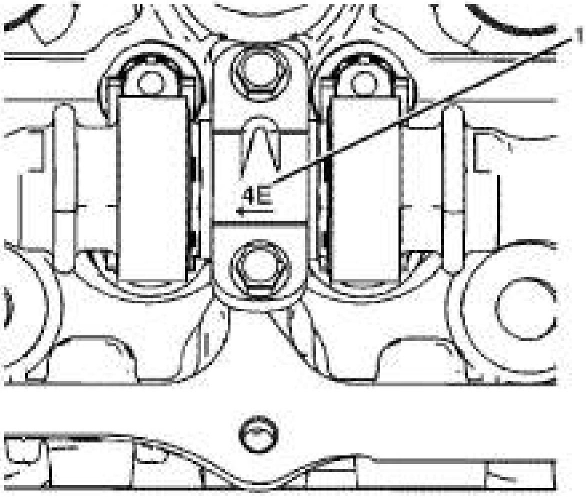
1. Remove the right camshaft intermediate drive chain idler bolt (1).
2. Remove the right camshaft intermediate drive chain idler (2).

Camshaft Removal - Left Side



Important: EN 46105 (2) was installed to the camshafts (1) as part of the left bank cylinder head camshaft position actuator removal procedure.

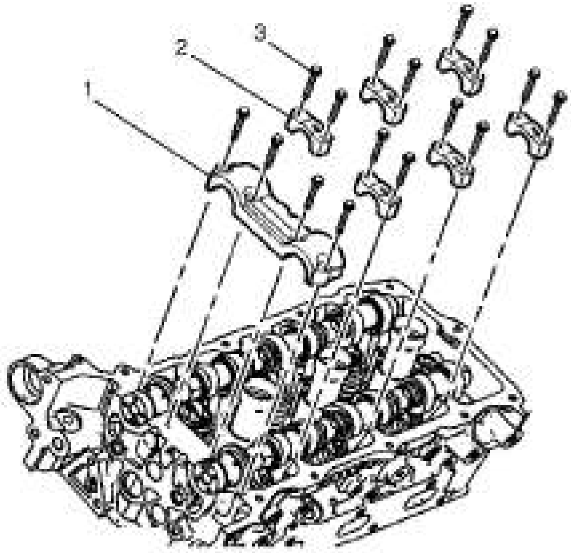
1. Remove the EN 46105 (2) from the left bank camshafts (1).
2. Position the camshaft lobes in a neutral position.



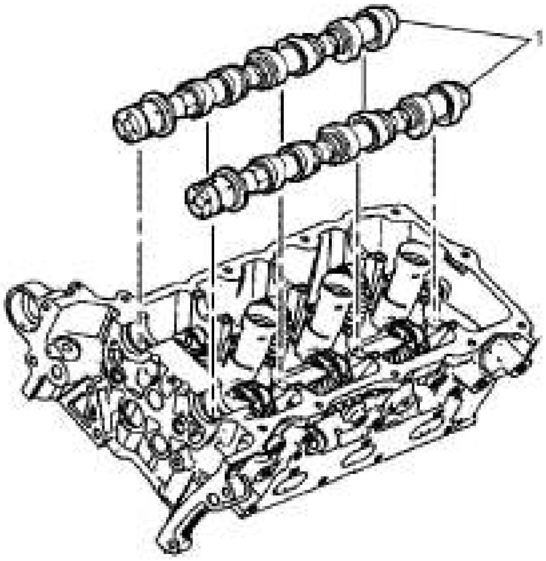
3. Observe the markings (1) on the bearing caps. Each bearing cap is marked in order to

identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the center of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the cylinder block.



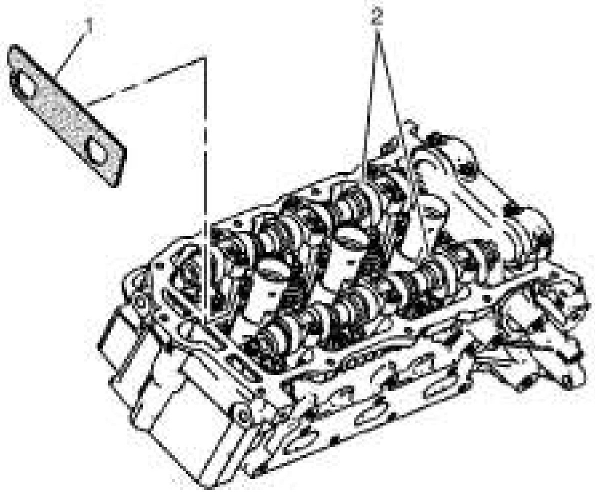
4. Remove the camshaft bearing cap to cylinder head retaining bolts (3).
5. Remove the camshaft bearing caps (1 and 2).



6. Remove the camshafts (1).

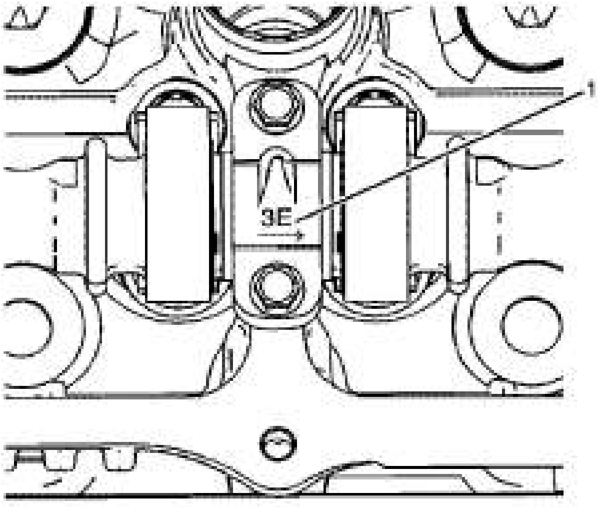
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977598**

Camshaft Removal - Right Side



Important: EN 46105 (1) was installed to the camshafts (2) as part of the right bank cylinder head camshaft position actuator removal procedure.

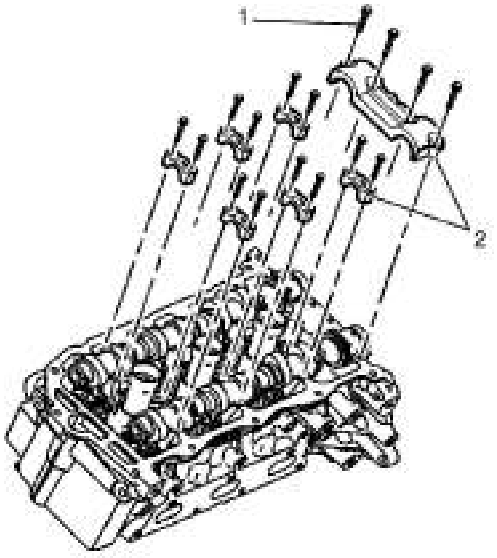
1. Remove the EN 46105 (1) from the right bank camshafts (2).
2. Position the camshaft lobes in a neutral position.



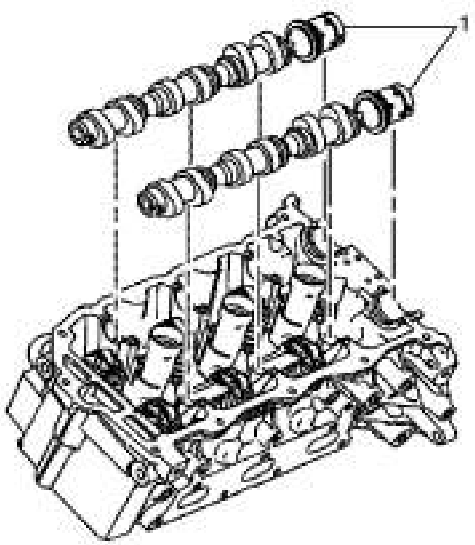
3. Observe the markings (1) on the bearing caps. Each bearing cap is marked in order to

identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the center of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the cylinder block.



4. Remove the camshaft bearing cap to cylinder head retaining bolts (1).
5. Remove the camshaft bearing caps (2).



6. Remove the camshafts (1).

Camshaft Timing Drive Components Cleaning and Inspection

Cleaning Procedure

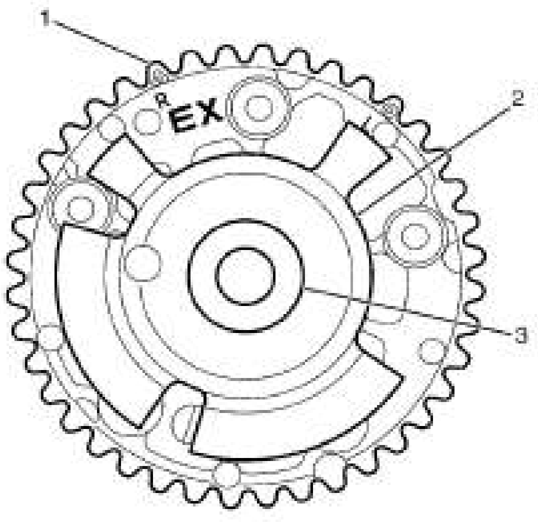
1. Clean all the following components with solvent:
   - Crankshaft sprocket.
   - Primary timing drive chain.
   - Primary timing drive chain shoe.
   - Primary timing drive chain guides.
   - Primary timing drive chain tensioner.
   - Secondary timing drive chains.
   - Secondary timing drive chain shoes.
   - Secondary timing drive chain guides.
   - Secondary timing drive chain tensioners.
   - Timing component fastening bolts.
2. Clean each camshaft position actuator's exterior with solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

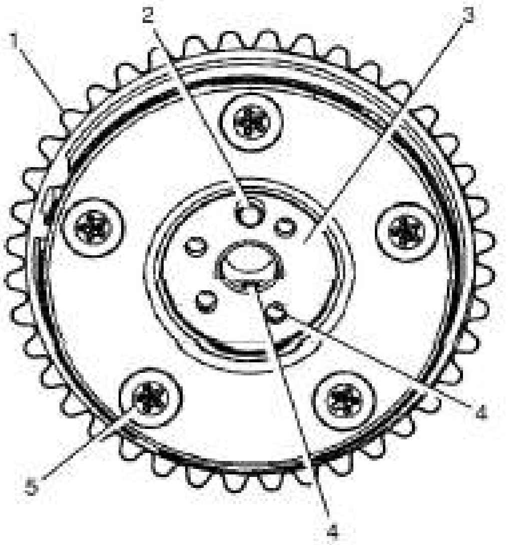
3. Dry the timing components with compressed air.

Visual Inspection

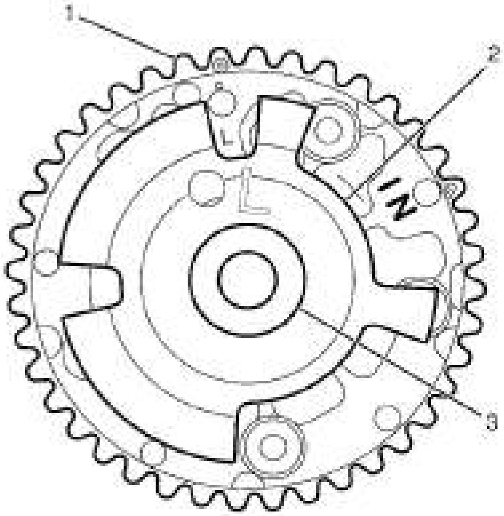
Camshaft Position Actuators (LY7 Engine)



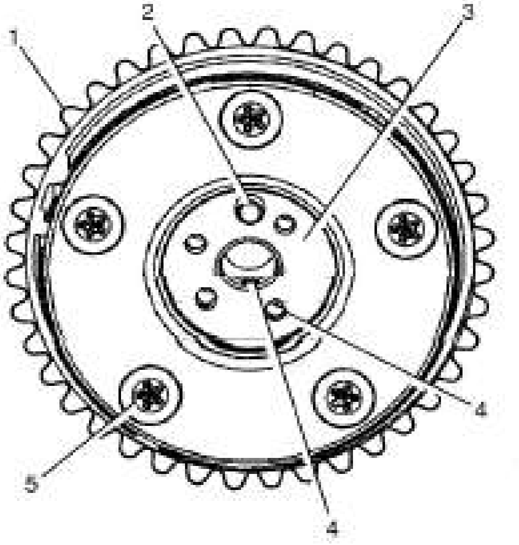
1. Inspect the front of the exhaust camshaft position actuators for the following:
    - Sprocket damage (1).
    - Reluctor/sensor wheel damage (2).
    - Camshaft position actuator to camshaft retaining bolt seating/sealing inner hub flange damage (3).



2. Inspect the back of the exhaust camshaft position actuators for the following:
    - Sprocket damage (1).
    - Camshaft locating pin damage (2).
    - Camshaft seating/sealing inner hub flange damage (3).
    - Blockage to the oil passages (4).
    - Loose or missing housing bolts (5).



3. Inspect the front of the intake camshaft position actuators for the following:
   - Sprocket damage (1).
   - Reluctor/sensor wheel damage (2).
   - Camshaft position actuator oil control valve bolt seating/sealing inner hub flange damage (3).

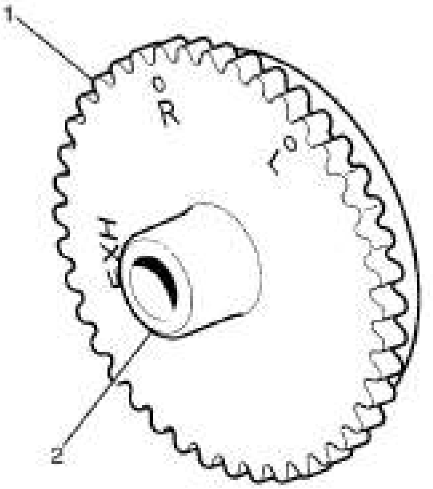


4. Inspect the back of the intake camshaft position actuators for the following:
   - Sprocket damage (1).
   - Camshaft locating pin damage (2).
   - Camshaft seating/sealing inner hub flange damage (3).
   - Blockage to the oil passages (4).

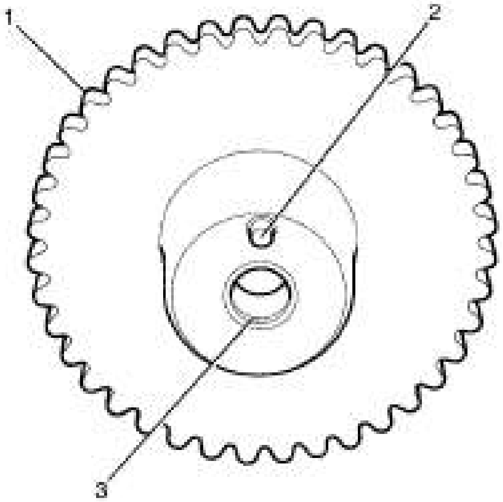
- Loose or missing housing bolts (5).

5. Replace a damaged camshaft position actuator.

Camshaft Position Actuators and Sprockets (LE0 & LW2 Engines)

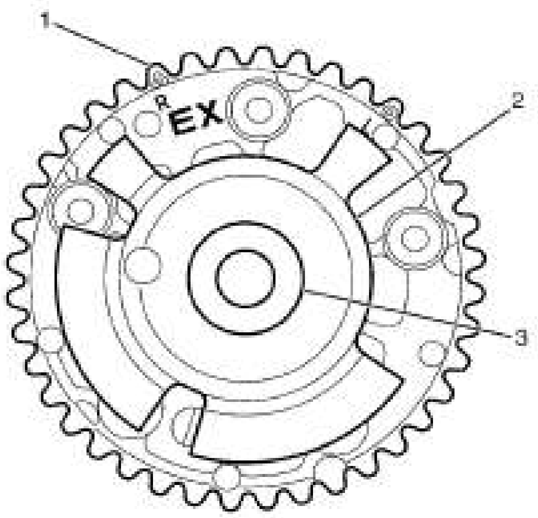


1. Inspect the front of the exhaust camshaft sprockets for the following:
   - Sprocket damage (1).
   - Exhaust camshaft sprocket bolt seating inner hub damage (2).

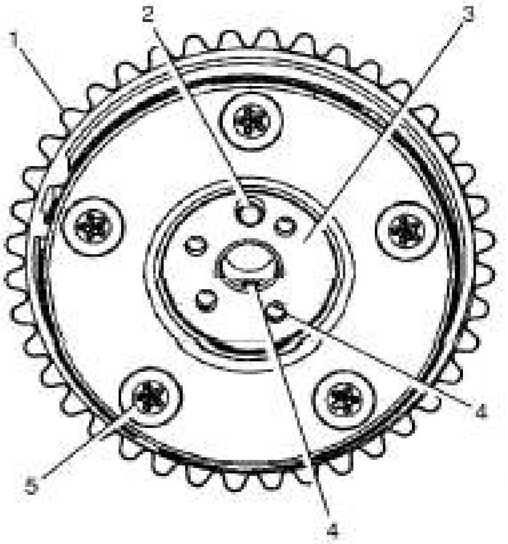


2. Inspect the back of the exhaust camshaft sprockets for the following:
   - Sprocket damage (1).

- Camshaft locating pin damage (2).
- Camshaft seating/ sealing inner hub flange damage (3).



3. Inspect the front of the intake camshaft position actuators for the following:
   - Sprocket damage (1).
   - Reluctor/sensor wheel damage (2).
   - Camshaft position actuator oil control valve bolt seating/sealing inner hub flange damage (3).

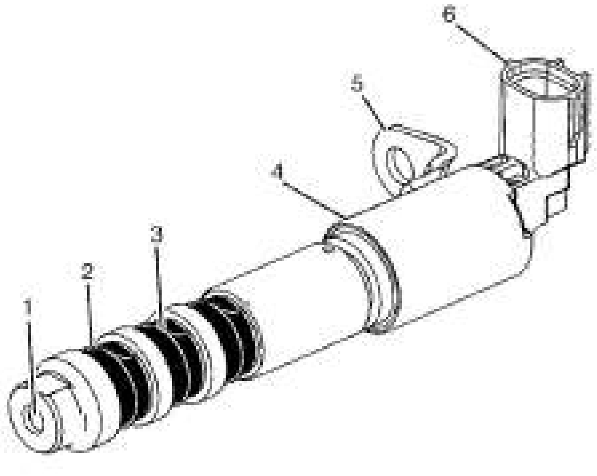


4. Inspect the back of the intake camshaft position actuators for the following:
   - Sprocket damage (1).

- Camshaft locating pin damage (2).
- Camshaft seating/sealing inner hub flange damage (3).
- Blockage to the oil passages (4).
- Loose or missing housing bolts (5).

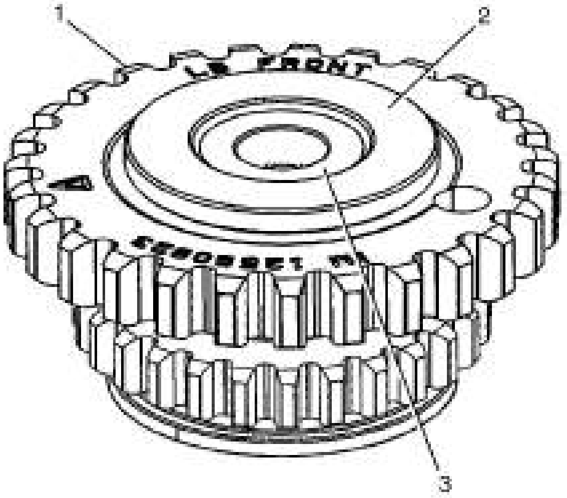
5. Replace a damaged camshaft position actuator.

Camshaft Position Actuator Solenoids

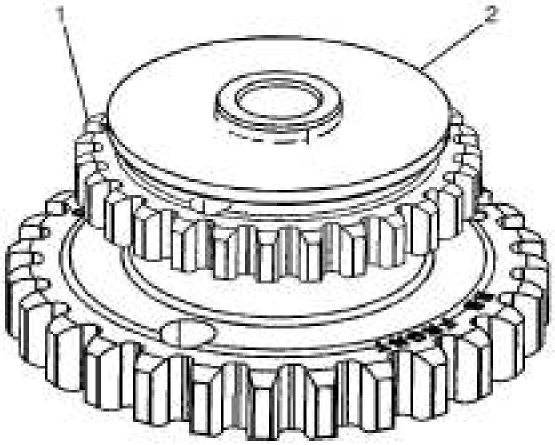


1. Inspect the camshaft position actuator solenoids for the following:
    - Blockage to the oil passage (1).
    - Missing or damaged oil screen clip (2).
    - Blockage or damage to the oil screen (3).
    - Damage to the sealing surface for the camshaft position actuator solenoid oil seal (4).
    - Damage to the bracket (5).
    - Damage to the wiring harness connection and/or terminals (6).
2. Replace a damaged camshaft position actuator solenoid.

Left Intermediate Sprocket

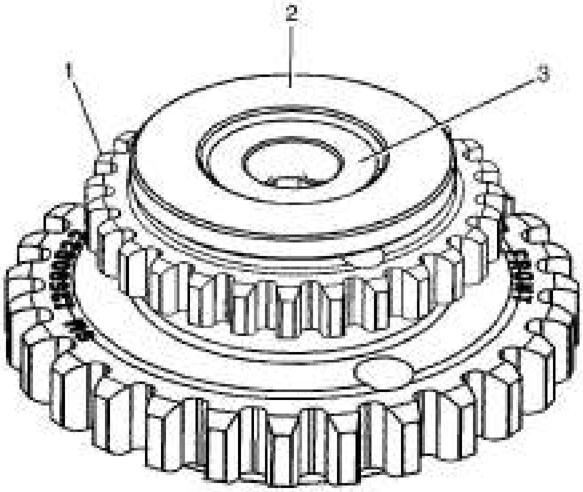


1. Inspect the front of the left intermediate sprocket for the following:
    - Damage to the primary camshaft drive chain sprocket (1).
    - Damage to the hub bearing (2) -- Ensure the hub bearing spins freely. If the hub bearing wobbles, is noisy or feels rough when rotated replace the intermediate sprocket.
    - Damage to the bolt flange seating/sealing surface (3).

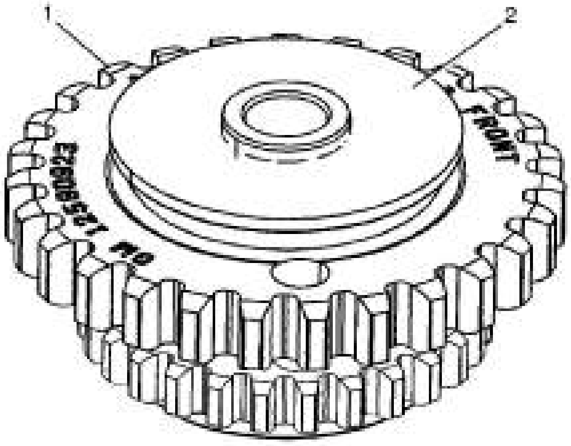


2. Inspect the back of the intermediate sprocket for the following:
    - Damage to the left secondary camshaft drive chain sprocket (1).
    - Damage to the bearing hub-to-engine block sealing surface (2).
3. Replace a damaged left intermediate sprocket.

Right Intermediate Sprocket



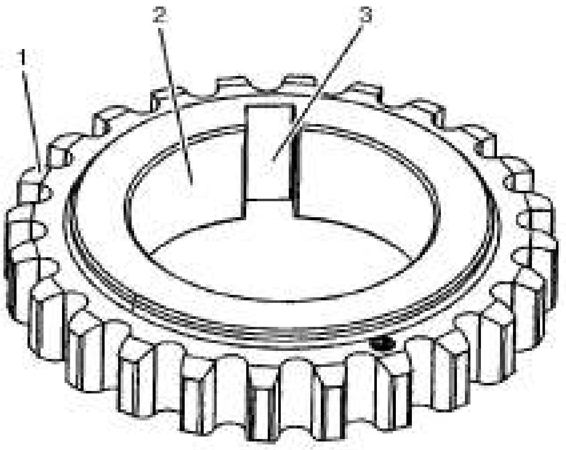
1. Inspect the front of the right intermediate sprocket for the following:
   - Damage to the right secondary camshaft drive chain sprocket (1)
   - Damage to the bearing hub bearing (2) -- Ensure the hub bearing spins freely. If the hub bearing wobbles, is noisy or feels rough when rotated replace the intermediate sprocket.
   - Damage to the bolt flange seating/sealing surface (3)



2. Inspect the back of the right intermediate sprocket for the following:
   - Damage to the primary camshaft drive chain sprocket (1)

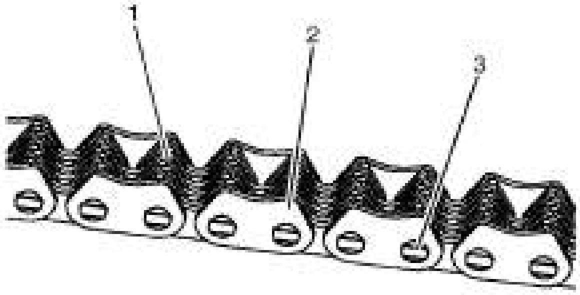
  - Damage to the bearing hub-to-engine block sealing surface (2)
3. Replace a damaged right intermediate sprocket.

Crankshaft Sprocket



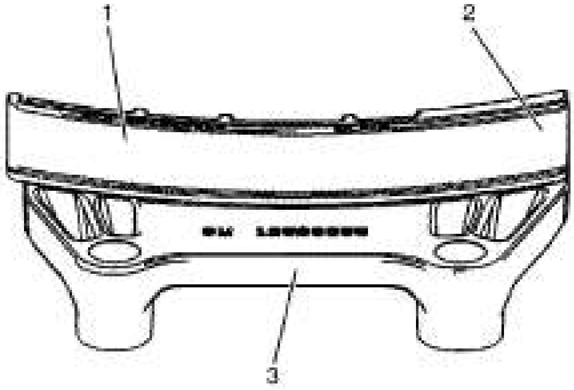
1. Inspect the crankshaft sprocket for the following:
   - Sprocket damage (1)
   - Bore damage (2)
   - Keyway damage (3)
2. Replace a damaged crankshaft sprocket.

Primary and Secondary Timing Chains



1. Inspect the primary and secondary timing chains for the following:
    - Binding or worn links (1)
    - Loose links (2)
    - Loose pins (3)
2. Replace a damaged primary timing chain.

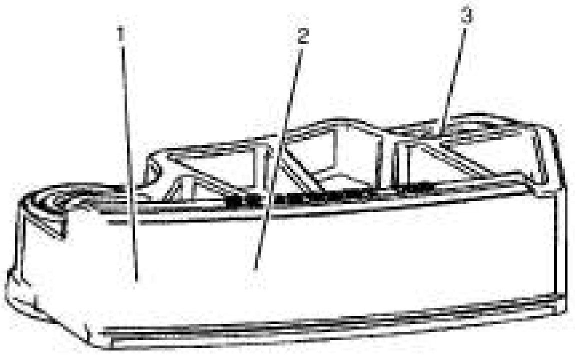
Primary Timing Chain Upper Guide



1. Inspect the primary timing chain upper guide for the following:
    - Worn guide surface (1)

  - Cracked or broken guide surface (2)
  - Cracked or damaged guide base (3)
2. Replace a damaged primary timing chain upper guide.

Primary Timing Chain Lower Guide

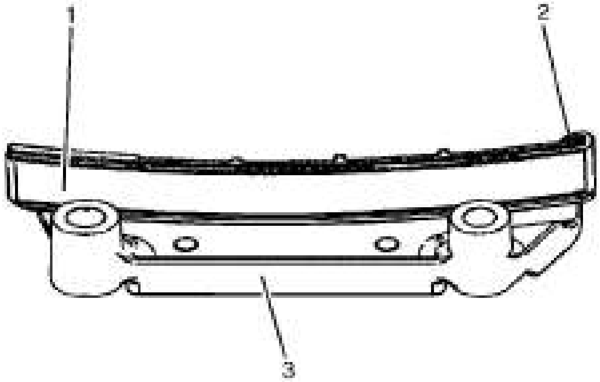


1. Inspect the primary timing chain lower guide for the following:
   - Worn guide surface (1)
   - Cracked or broken guide surface (2)
   - Cracked or damaged guide base (3)

   Important: The primary camshaft drive chain lower guide is not a serviceable component. If the primary camshaft drive chain lower guide is to be reused, the primary camshaft drive chain lower guide is not to be removed from the oil pump cover. If the primary camshaft drive chain lower guide must be replaced, the oil pump must be replaced.

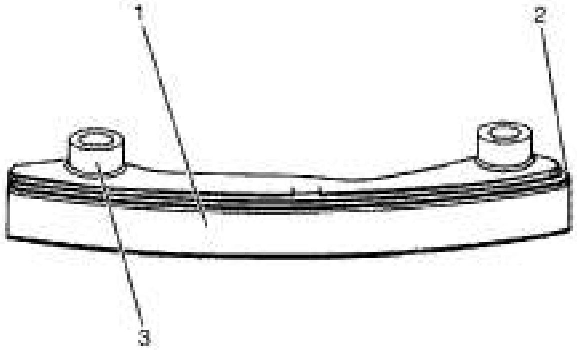
2. Replace a damaged primary timing chain lower guide by replacing the oil pump.

Left Secondary Timing Chain Guide



1. Inspect the left secondary timing chain guide for the following:
   - Worn guide surface (1)
   - Cracked or broken guide surface (2)
   - Cracked or damaged guide base (3)
2. Replace a damaged left secondary timing chain guide.

Right Secondary Timing Chain Guide

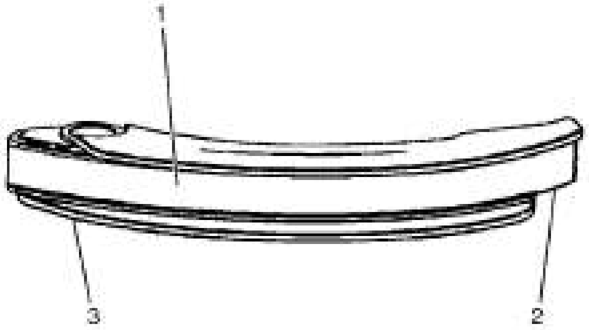


1. Inspect the right secondary timing chain guide for the following:
   - Worn guide surface (1)

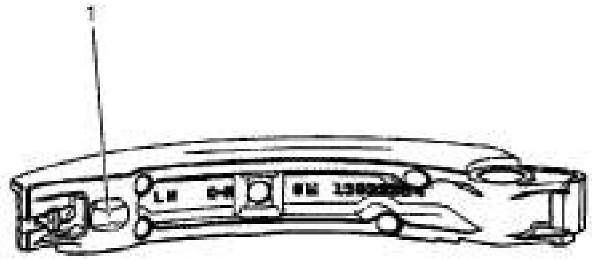
- Cracked or broken guide surface (2)
- Cracked or damaged guide base (3)

2. Replace a damaged right secondary timing chain guide.

Left Secondary Timing Chain Shoe

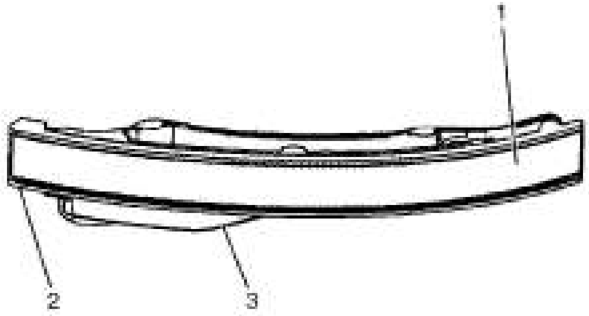


1. Inspect the front of the left secondary timing chain shoe for the following:
   - Worn shoe surface (1)
   - Cracked or broken shoe surface (2)
   - Cracked or damaged shoe (3)

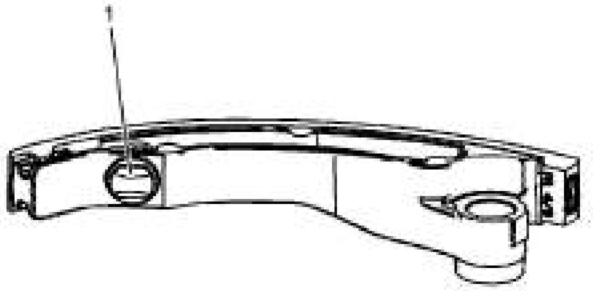


2. Inspect the back of the left secondary timing chain shoe for a damaged, worn or missing left secondary timing chain tensioner contact pad (1).
3. Replace a damaged left secondary timing chain shoe.

Right Secondary Timing Chain Shoe

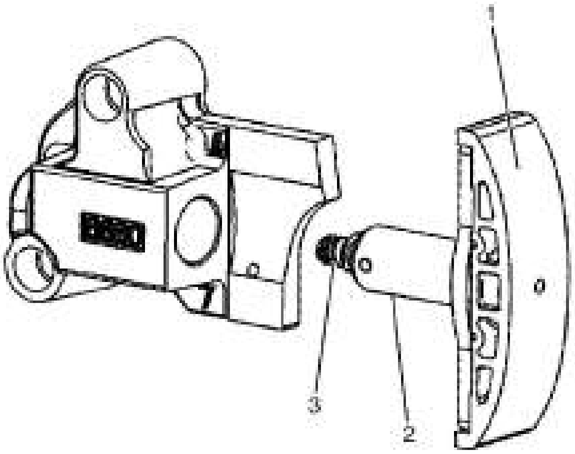


1. Inspect the front of the right secondary timing chain shoe for the following:
   - Worn shoe surface (1)
   - Cracked or broken shoe surface (2)
   - Cracked or damaged shoe (3)



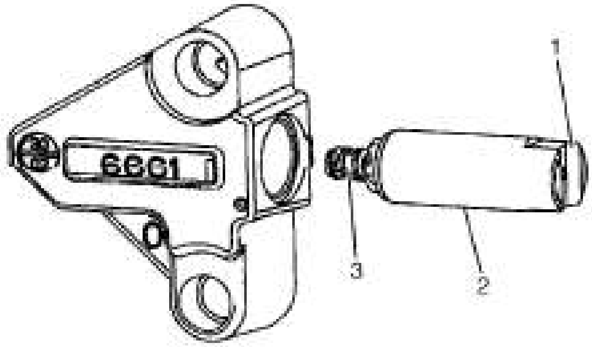
2. Inspect the back of the right secondary timing chain shoe for a damaged, worn or missing right secondary timing chain tensioner contact pad (1).
3. Replace a damaged right secondary timing chain shoe.

Primary Timing Chain Tensioner



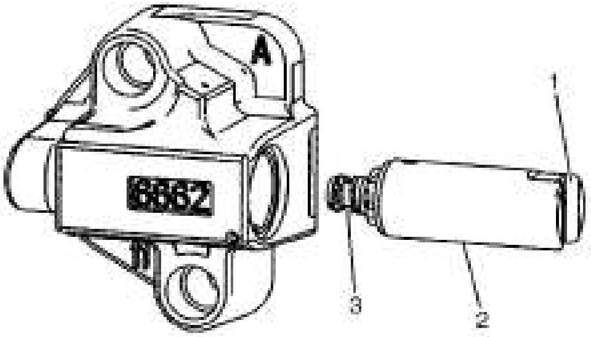
1. Inspect the primary timing chain tensioner for worn primary timing chain tensioner shoe surface (1).
2. Inspect the primary timing chain tensioner for locked or binding timing chain tensioner. Reset the plunger (3) and ensure the plunger moves freely (2) in and out of the body of the tensioner. Refer to Primary Camshaft Intermediate Drive Chain Tensioner Removal.
3. Replace a damaged primary timing chain tensioner.

Left Secondary Timing Chain Tensioner



1. Inspect the left secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1).
2. Inspect the left secondary timing chain tensioner for locked or binding timing chain tensioner. Reset the plunger (3) and ensure the plunger moves freely (2) in and out of the body of the tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Installation - Left Side.
3. Replace a damaged left secondary timing chain tensioner.

Right Secondary Timing Chain Tensioner



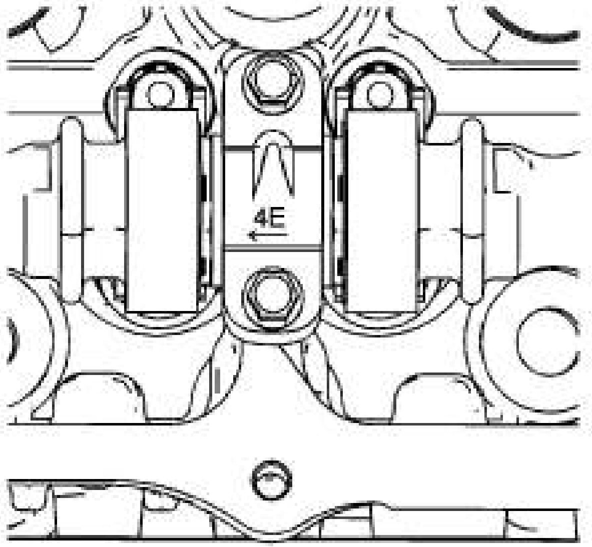
1. Inspect the right secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1).
2. Inspect the right secondary timing chain tensioner for locked or binding timing chain

tensioner. Reset the plunger (3) and ensure the plunger moves freely (2) in and out of the body of the tensioner. Refer to Secondary Camshaft Drive Chain Tensioner Installation - Right Side.

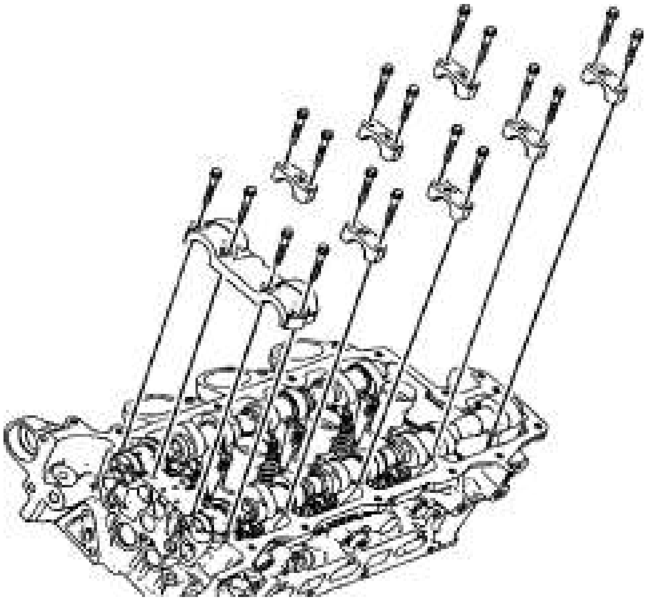
3. Replace a damaged right secondary timing chain tensioner.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1978377**

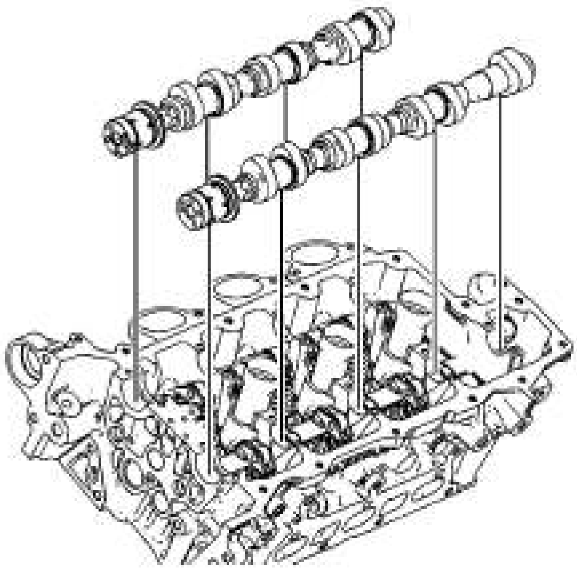
Camshaft Removal - Left Side (LLT)



1. Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
   - The raised feature must always be oriented toward the center of the cylinder head.
   - The I indicates the intake camshaft.
   - The E indicates the exhaust camshaft.
   - The number indicates the journal position from the front of the engine.



2. Remove the camshaft bearing cap bolts.
3. Remove the camshaft bearing caps.

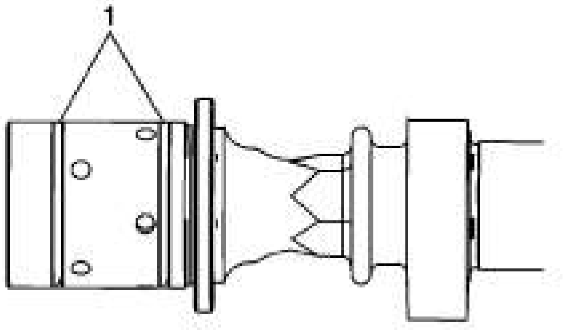


Important: Mark the camshafts upon removal to ensure installation is in the correct position.

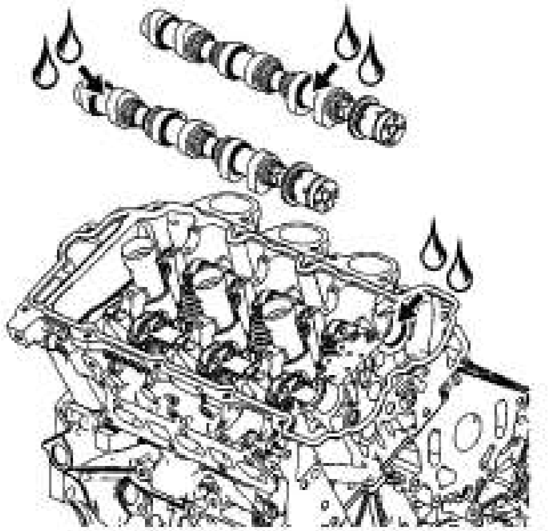
4. Remove the camshafts.
5. Replace the camshaft bearing caps and bolts.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2134558**

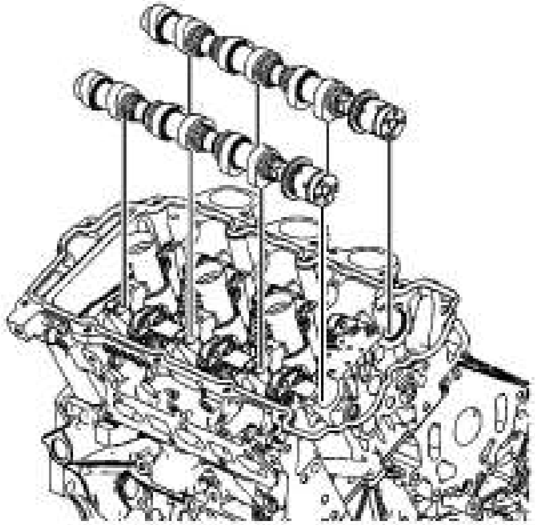
Camshaft Installation - Right Side (LLT)



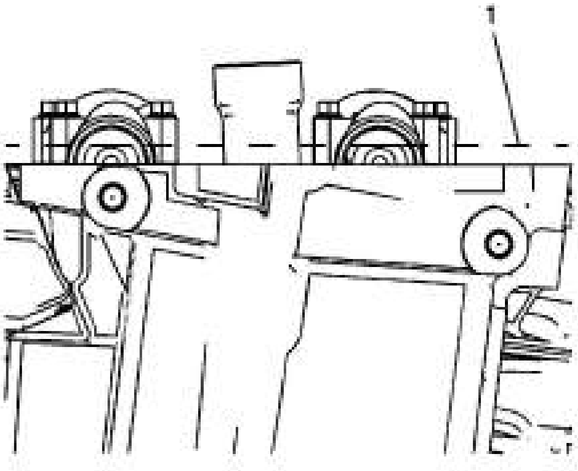
1. Ensure that the camshaft sealing rings (1) are in place in the camshaft grooves. Camshaft sealing rings must be in place below the surface of the camshaft journal in order to avoid being pinched between the cylinder head and the camshaft caps.



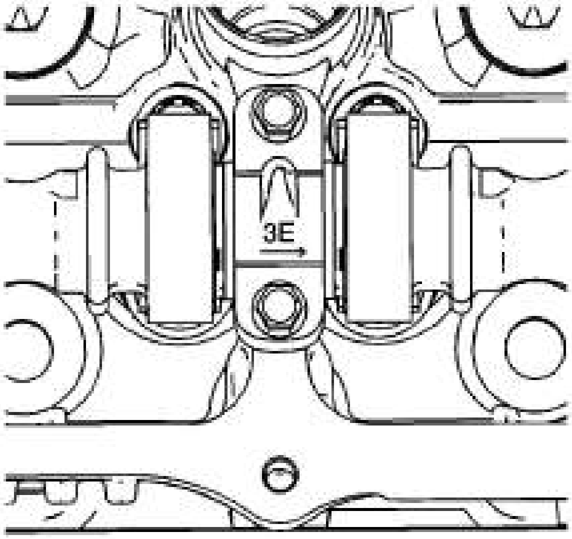
2. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the camshaft journals and the right cylinder head camshaft carriers.



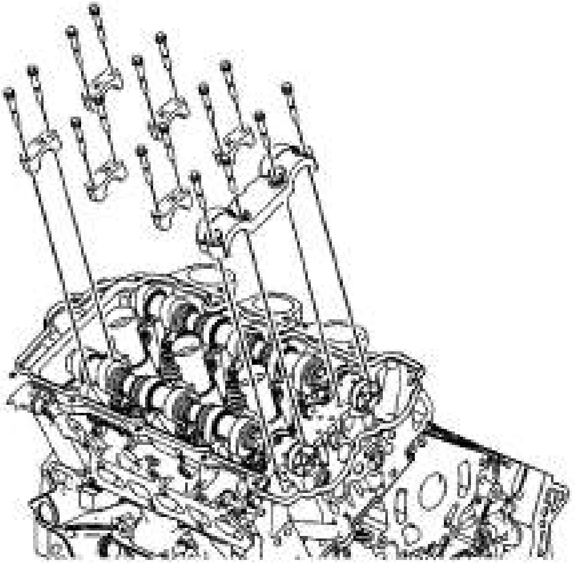
3. Place the right intake and right exhaust camshafts in position in the right cylinder head.



4. Position the camshaft lobes in a neutral position with the flats on the back of the camshafts up and parallel (1) with the right cylinder head camshaft cover rail.

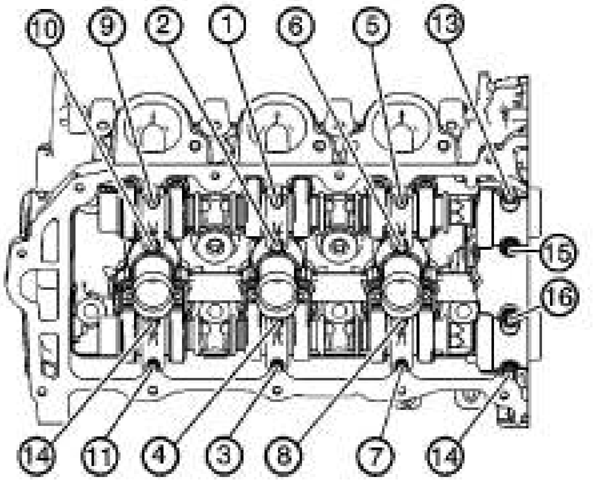


5. Observe the markings on the right cylinder head camshaft bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
   - The raised feature must always be oriented toward the center of the cylinder head.
   - The I indicates the intake camshaft.
   - The E indicates the exhaust camshaft.
   - The number 1, 3, 5 indicates the cylinder position from the front of the engine.
6. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the camshaft bearing caps.



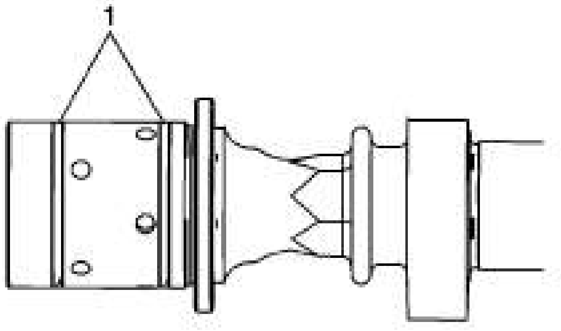
7. Install the camshaft bearing thrust caps in the first journal of the right cylinder head.
8. Install the remaining bearing caps with their orientation mark toward the center of the cylinder head.
9. Hand start all the camshaft bearing cap bolts.

Caution: Refer to Fastener Caution in the Preface section.

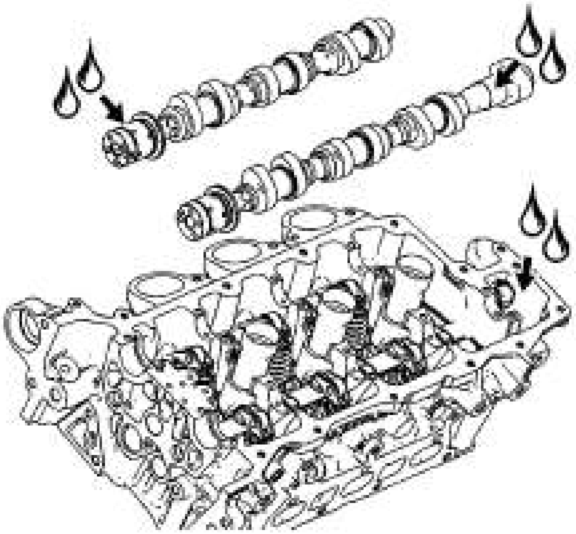


10. Tighten the camshaft bearing cap bolts in the sequence shown and tighten to **10 N·m (89 lb in)**.
11. Loosen the center intake camshaft bearing cap bolts (1, 2) and the center exhaust camshaft bearing cap bolts (3, 4).
12. Retighten the center camshaft bearing cap bolts (1, 2, 3, 4) and retighten the camshaft bearing cap bolts to **10 N·m (89 lb in)**.

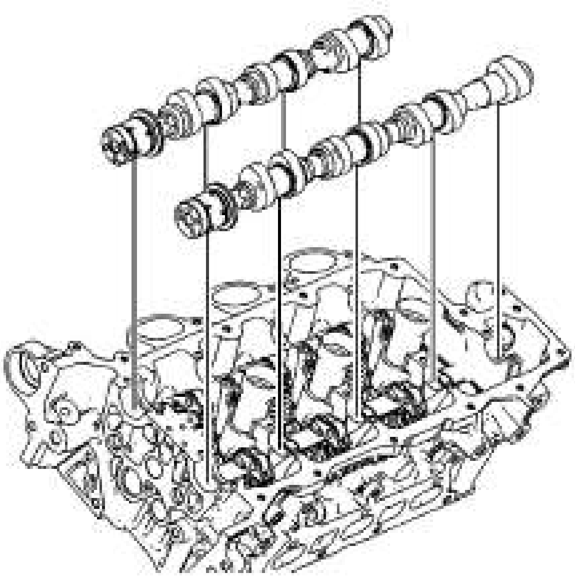
Camshaft Installation - Left Side (LLT)



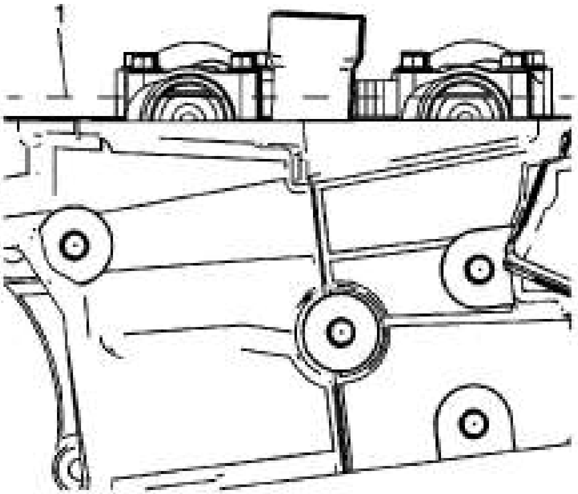
1. Ensure that the camshaft sealing rings (1) are in place in the camshaft grooves. Camshaft sealing rings must be in place below the surface of the camshaft journal in order to avoid being pinched between the cylinder head and the camshaft caps.



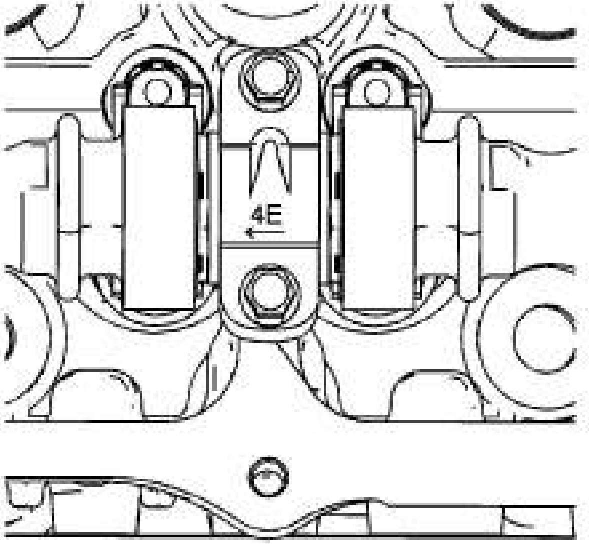
2. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the camshaft journals and the left cylinder head camshaft carriers.



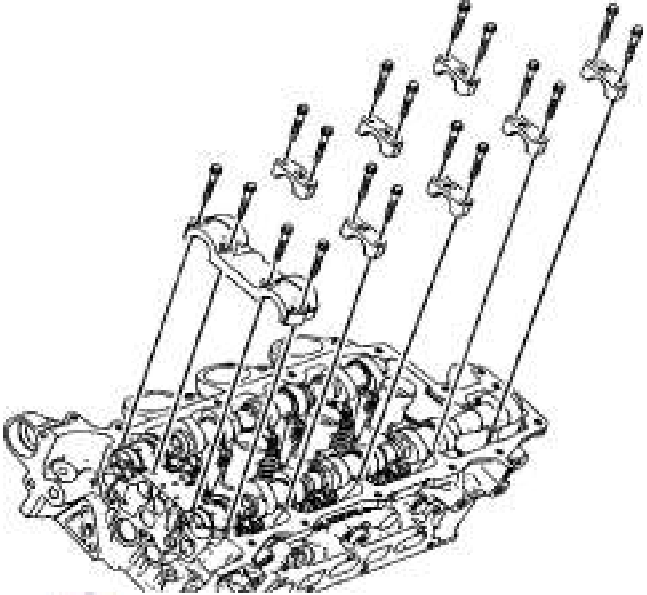
3. Place the left intake and left exhaust camshafts in position in the left cylinder head.



4. Position the camshaft lobes in a neutral position with the flats on the back of the camshafts up and parallel (1) with the left cylinder head camshaft cover rail.

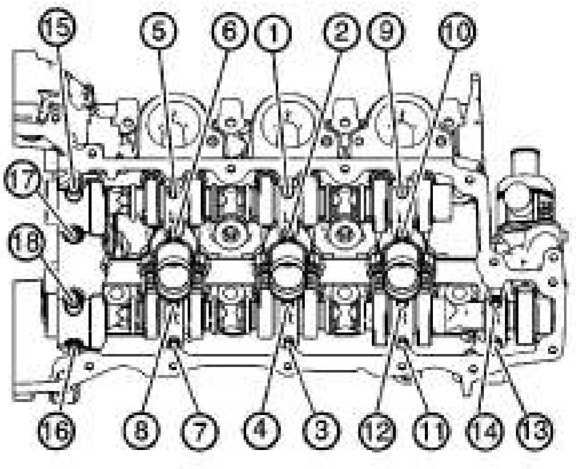


5. Observe the markings on the left cylinder head camshaft bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
   - The raised feature must always be oriented toward the center of the cylinder head.
   - The I indicates the intake camshaft.
   - The E indicates the exhaust camshaft.
   - The number 2, 4, 6 indicates the cylinder position from the front of the engine.
6. Apply a liberal amount of lubricant GM P/N 12345501 (Canadian P/N 992704) or equivalent to the camshaft bearing caps.



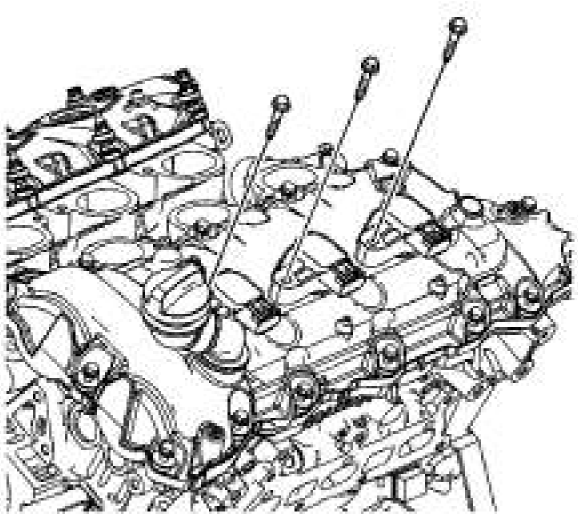
7. Install the camshaft bearing thrust cap in the first journal of the left cylinder head.
8. Install the remaining bearing caps with their orientation mark toward the center of the cylinder head.
9. Hand start all the camshaft bearing cap bolts.

Caution: Refer to Fastener Caution in the Preface section.

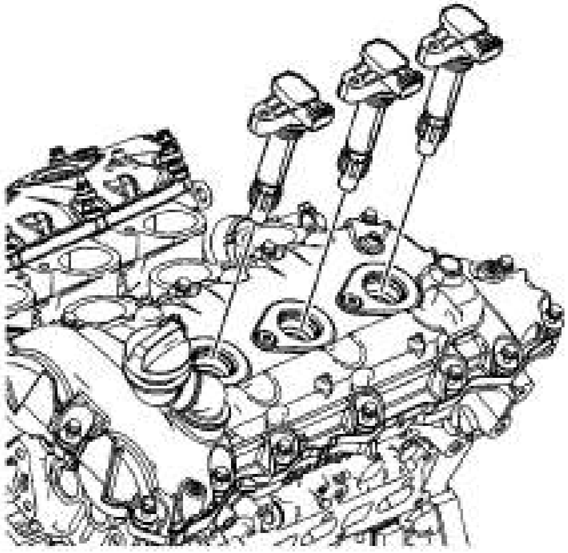


10. Tighten the camshaft bearing cap bolts in the sequence shown and tighten to **10 N·m (89 lb in)**.
11. Loosen the center intake camshaft bearing cap bolts 1, 2 and the center exhaust camshaft bearing cap bolts 3, 4.
12. Retighten the center camshaft bearing cap bolts 1, 2, 3, 4 and retighten the camshaft bearing cap bolts to **10 N·m (89 lb in)**.

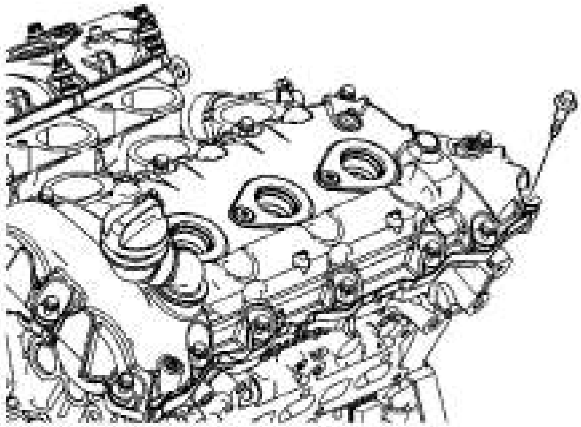
Camshaft Cover Removal - Left Side (LLT)



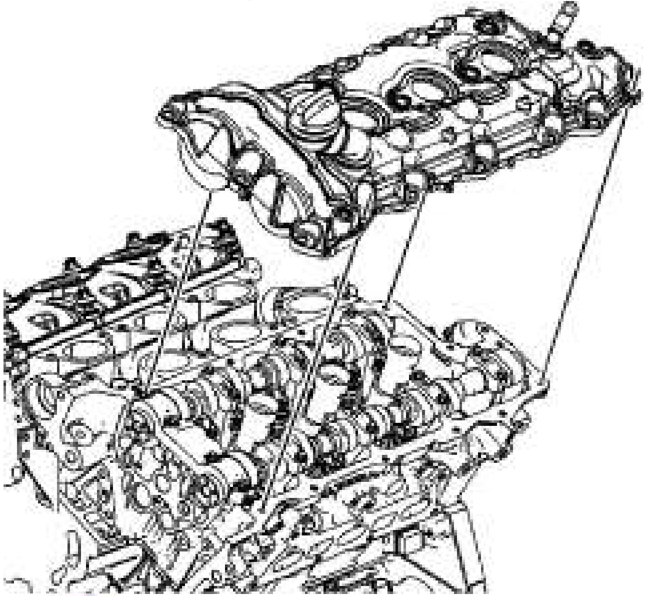
1. Remove the ignition coil bolts.



2. Remove the ignition coils.



3. Remove the left camshaft cover bolts.
4. Remove and discard the camshaft cover grommets and camshaft cover bolts if they are serviced with the grommet.



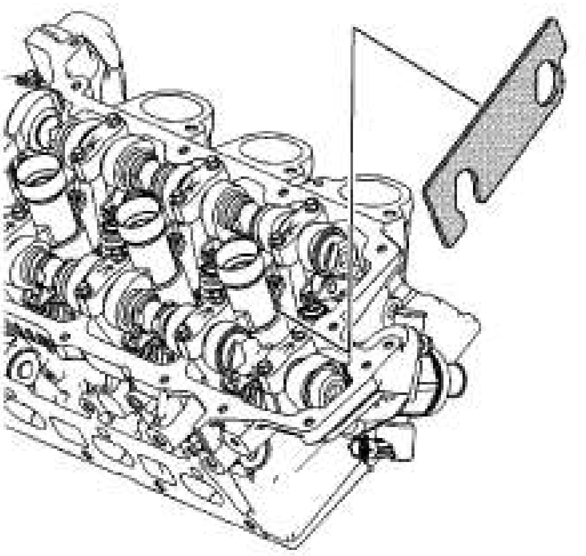
5. Remove the left camshaft cover from the left cylinder head.

Camshaft Cover Installation - Left Side (LLT)

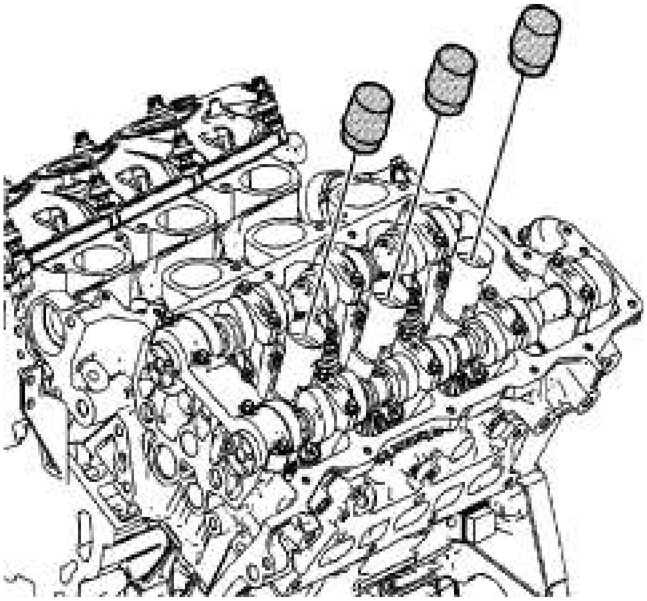
Special Tools

- *EN 46101* Spark Plug Tube Seal Guide
- *EN-48383* Camshaft Retaining Tools

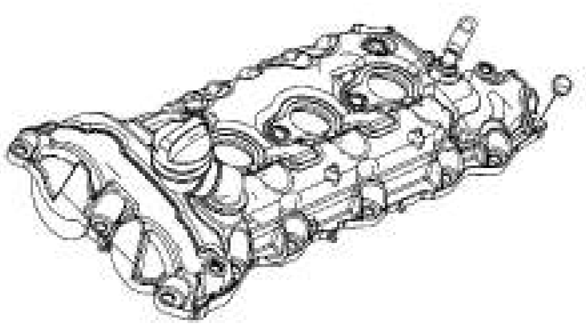
For equivalent regional tools, refer to Special Tools.



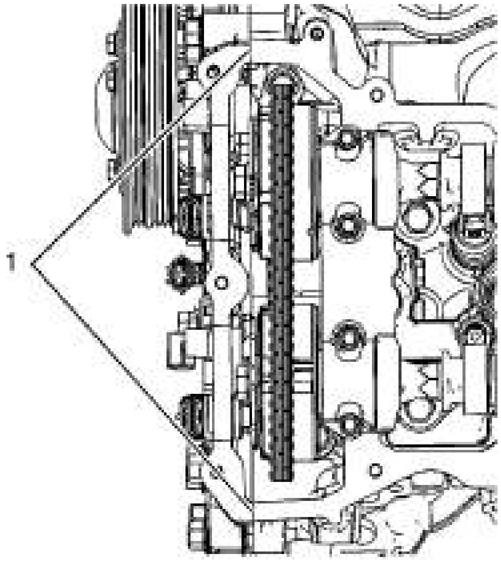
1. Remove the EN 48383-2 from the rear of the left camshafts.



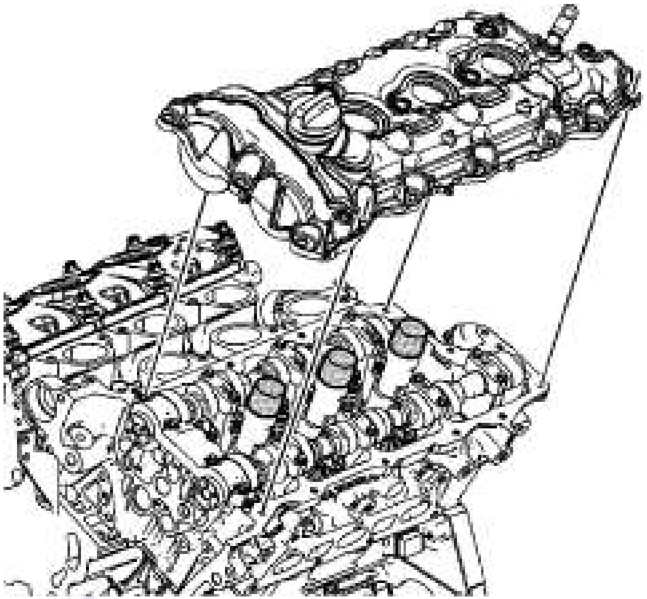
2. Install the *EN 46101* guide onto the spark plug tubes of the left cylinder head.



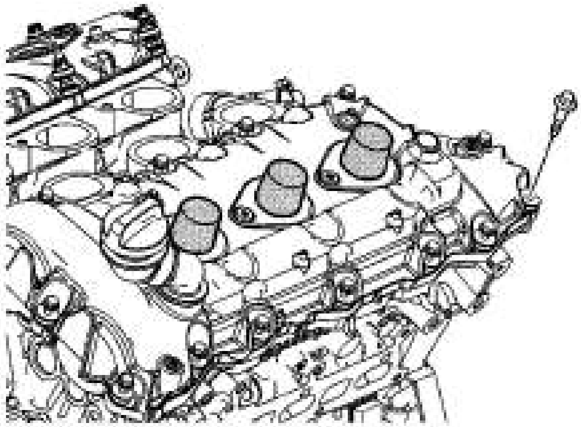
3. Install the NEW camshaft cover bolt grommets prior to installing the camshaft cover bolts.
4. Wipe the camshaft cover sealing surface on the left cylinder head with a clean, lint-free cloth.



5. Place a bead 8 mm (0.3150 in) in diameter by 4 mm (0.1575 in) in height of RTV sealant, GM P/N 12378521 (Canadian P/N 88901148) or equivalent, on the engine front cover split lines (1).

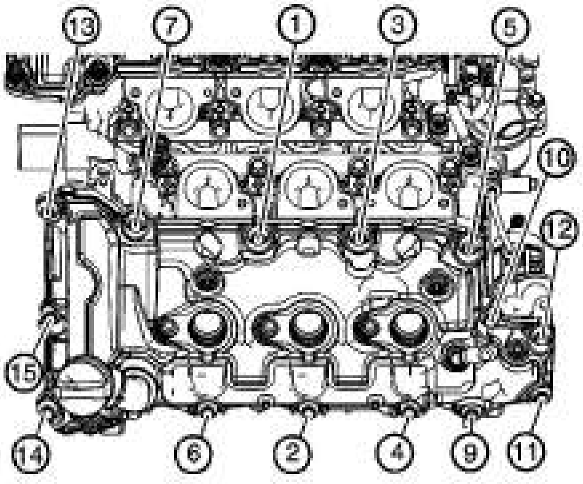


6. Place the left camshaft cover into position onto the left cylinder head.

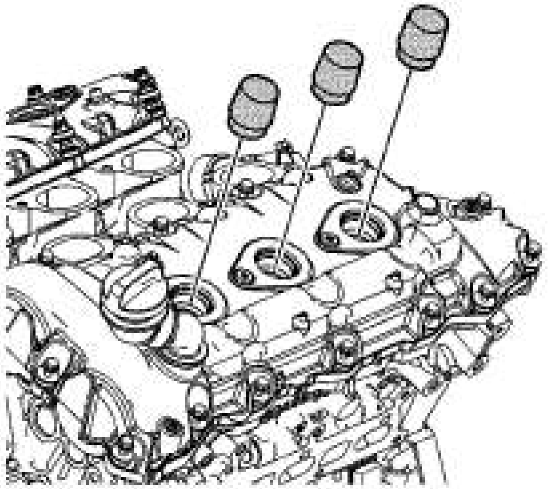


7. Loosely install the left camshaft cover bolts.

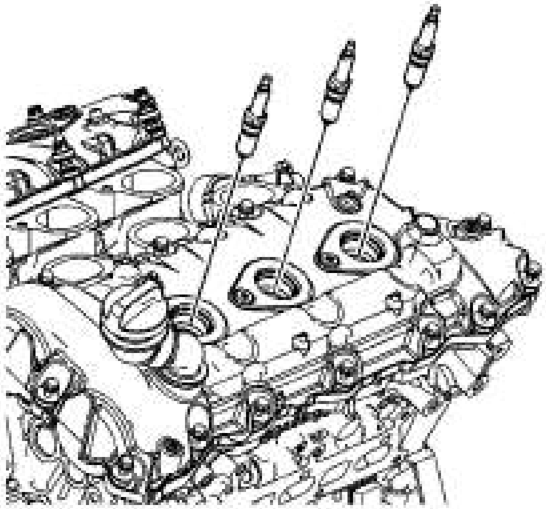
Caution: Refer to Fastener Caution in the Preface section.



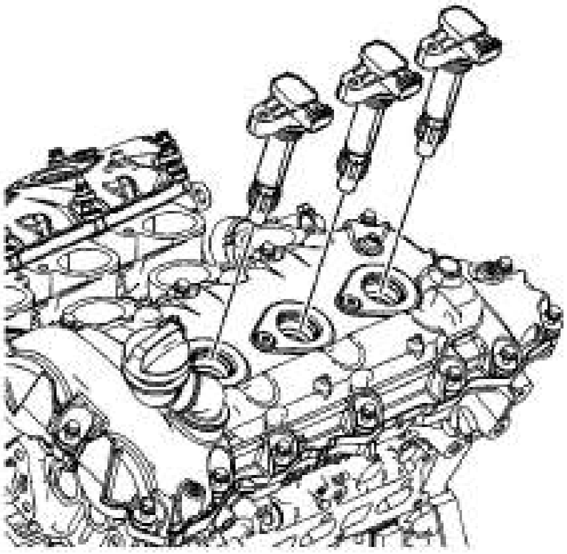
8. Tighten the left camshaft cover bolts in the sequence shown.
    8.1. Tighten the left camshaft cover bolts in the sequence to **10 N·m (89 lb in).**
    8.2. Tighten the left camshaft cover bolts a second pass in the sequence to **10 N·m (89 lb in)**.



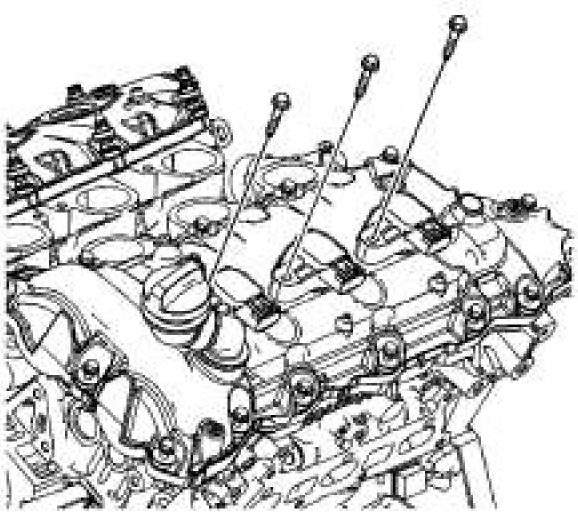
9. Remove the *EN 46101* guide from the spark plug tubes of the left cylinder head.



10. Install the NEW spark plugs into the left cylinder head and tighten to **20 N·m (15 lb ft)**..



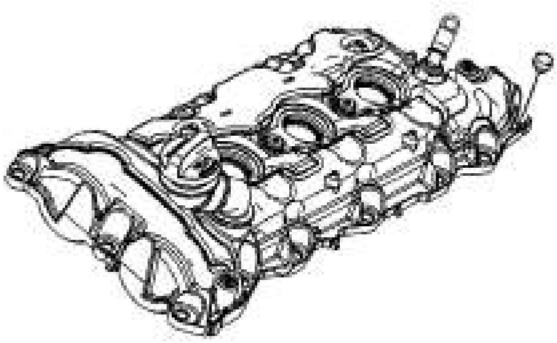
11. Install the ignition coils.



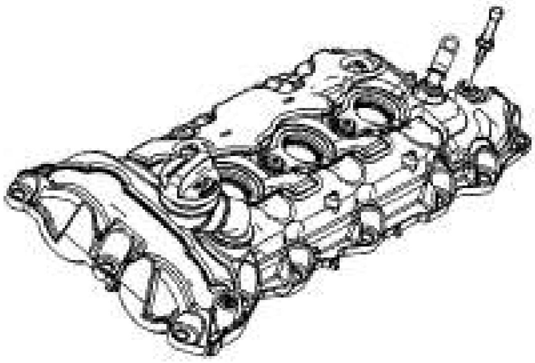
12. Install the ignition coil bolts and tighten to **10 N·m (89 lb in)**.

Camshaft Cover Disassemble (LLT)

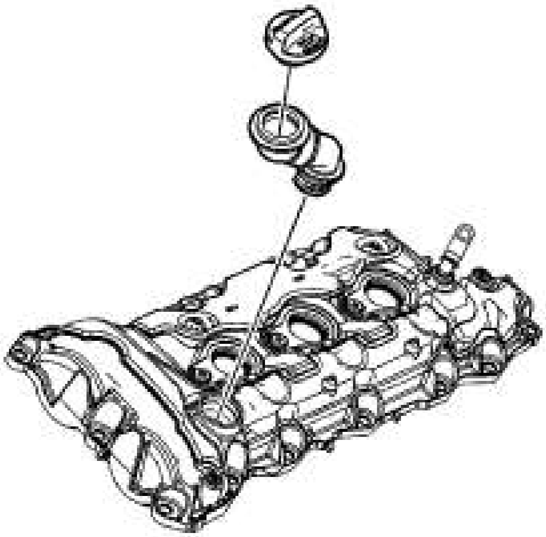
Left Camshaft Cover



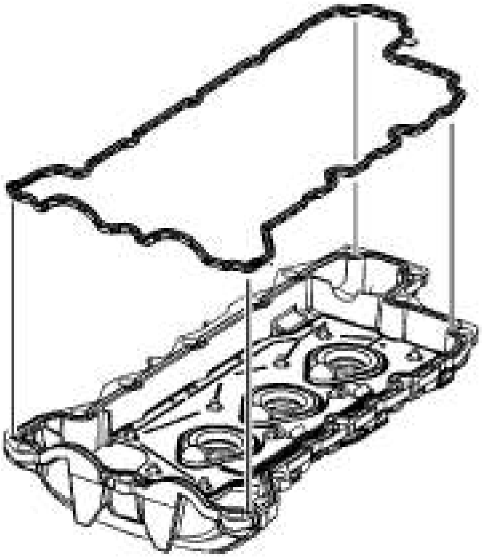
1. Remove and discard the left camshaft cover bolt grommets.



2. Remove the fuel injector sight shield ballstud.

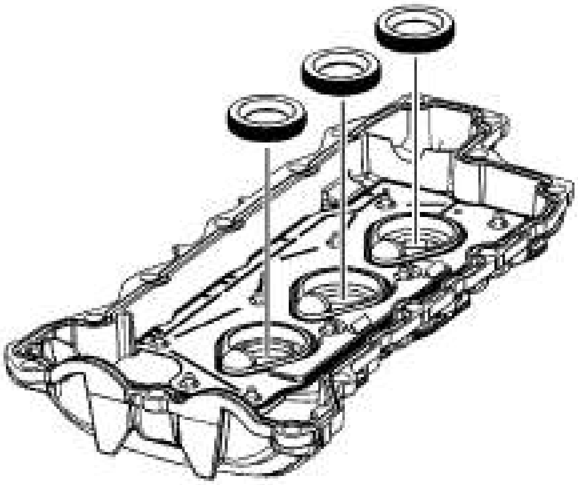


3. Remove the oil fill cap.



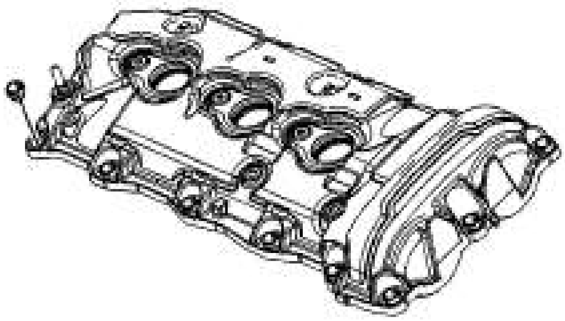
Important: Do not reuse the camshaft cover gasket and spark plug shield tube seals.

4. Remove and discard the left camshaft cover gasket.

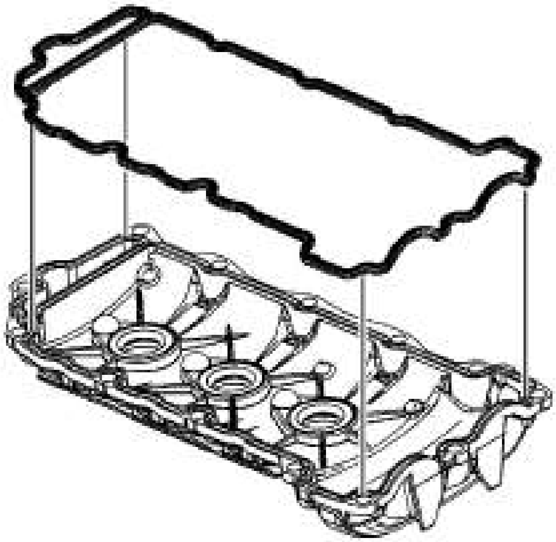


5. Remove and discard the left spark plug shield tube seals.

Right Camshaft Cover

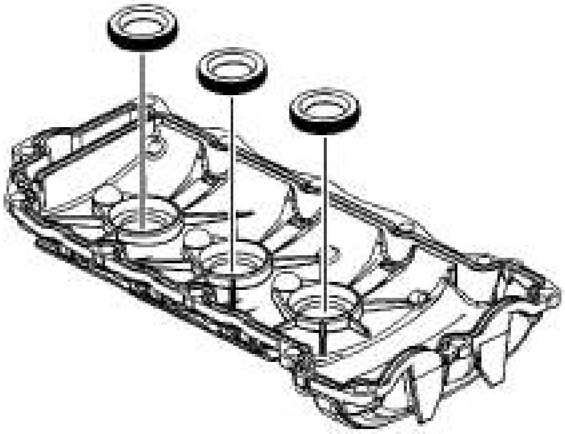


1. Remove and discard the right camshaft cover bolt grommets.



Important: Do not reuse the camshaft cover gasket and spark plug shield tube seals.

2. Remove and discard the right camshaft cover gasket.



3. Remove and discard the right spark plug shield tube seals.

Camshaft Cover Cleaning and Inspection (LLT)

Cleaning Procedure

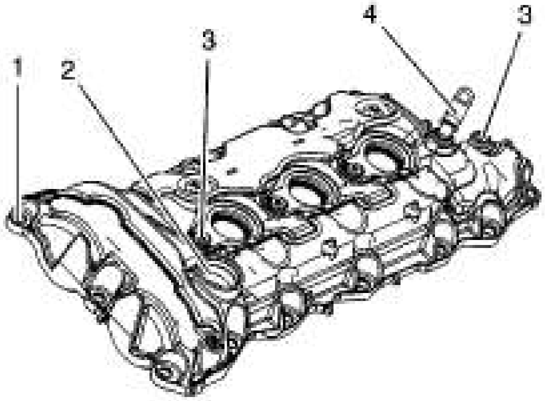
1. Clean the camshaft covers in solvent.

   Warning: Refer to Safety Glasses Warning in the Preface section.

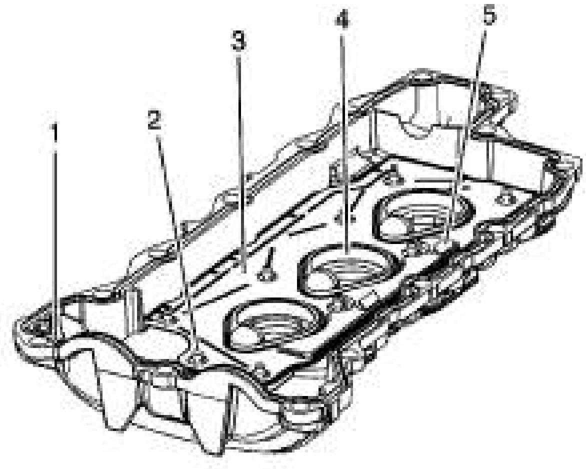
2. Dry the camshaft covers with compressed air.

Inspection Procedure

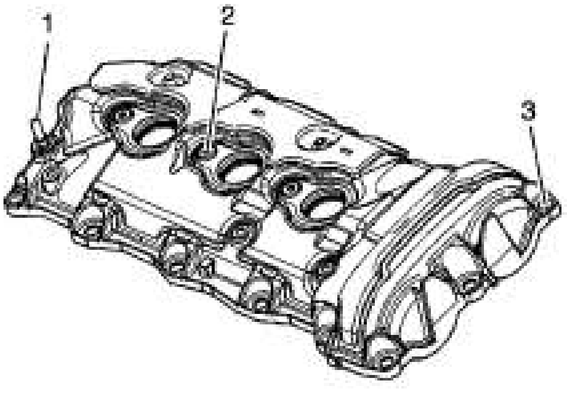
1. Inspect each camshaft cover for the dents or damage to the exterior. A dented or damaged camshaft cover may:
   - Leak engine oil
   - Effect crankcase ventilation
   - Interfere with the camshafts
   - Interfere with the ignition coil sealing
   - Allow water or condensation to enter the engine



2. Inspect the exterior of the left camshaft cover for the following conditions:
   - Damage to the camshaft cover bolt holes (1)
   - Damage to the oil fill hole (2)
   - Damage to the mounting holes (3) for the ignition coil assembly and fuel injector sight shield ballstud.
   - Damage to the positive crankcase ventilation (PCV) hose connector (4)--A damaged PCV hose connector is replaceable.

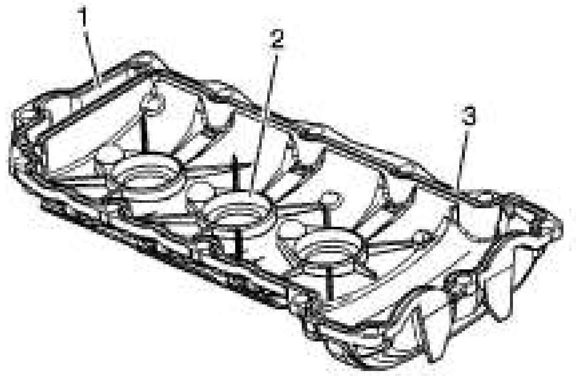


3. Inspect the interior of the left camshaft cover for the following conditions:
   - Gouges or damage to the camshaft cover sealing groove (1)
   - Damaged, loose or missing baffle fasteners (2)
   - Damaged, loose or missing baffle (3)
   - Gouges or damage to the spark plug shield seal bore (4)
   - Restrictions to the ventilation system (5)



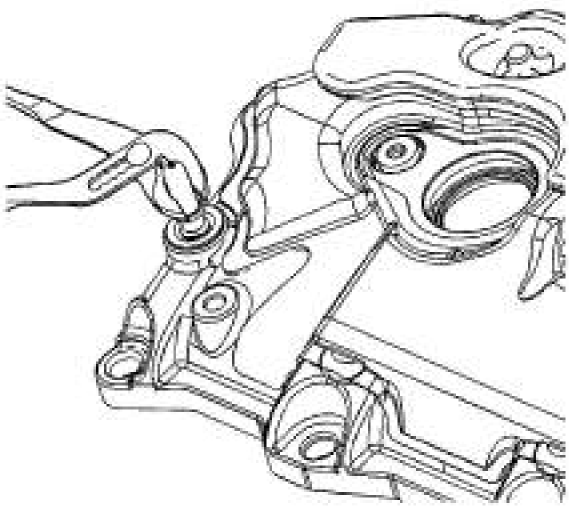
4. Inspect the exterior of the right camshaft cover for the following conditions:
   - Damage to the PCV orifice (1)--A damaged PCV orifice can be replaced. Refer to PCV Orifice Replacement.

- Damage to the mounting holes (2) for the ignition coil assembly
- Damage to the camshaft cover bolt holes (3)



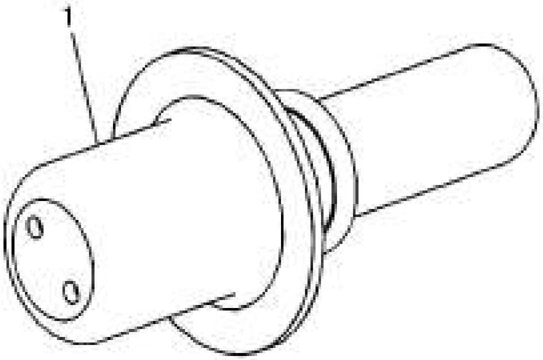
5. Inspect the interior of the right camshaft cover for the following conditions:
    - Restrictions to the ventilation system (1)
    - Gouges or damage to the spark plug shield seal bore (2)
    - Gouges or damage to the camshaft cover sealing groove (3)
6. Repair or replace the camshaft cover or covers as necessary.

PCV Orifice Replacement

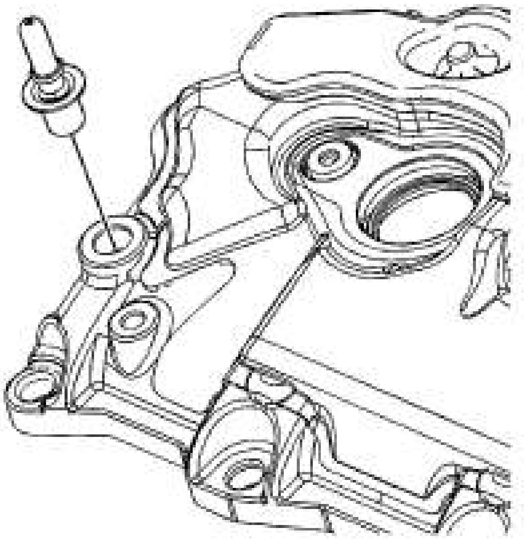


Note: If the PCV orifice is damaged or plugged and cannot be cleaned out, the PCV orifice can be replaced.

1. Remove the old PCV orifice by gripping the neck of the orifice with pliers and twisting and pulling out of the right camshaft cover.

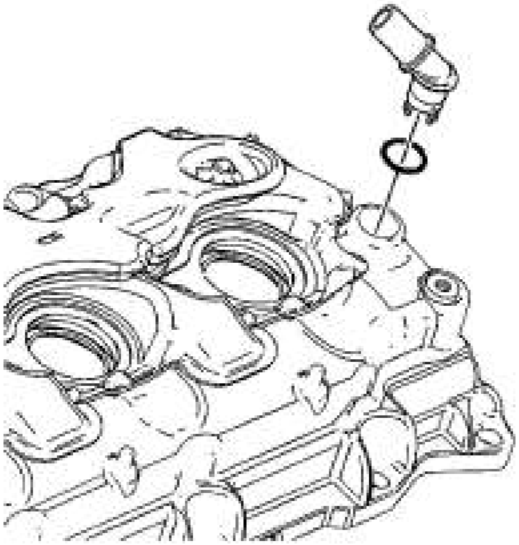


2. Apply sealant GM P/N 12378521 (Canadian P/N 88901148) or equivalent to the NEW PCV orifice (1).



3. Install the NEW PCV orifice into the right camshaft cover. After insertion, twist the PCV orifice in order to eliminate any vertical leak paths in the sealant.

PCV Fitting Replacement



Note: If the PCV fitting is damaged or plugged and cannot be cleaned out, the PCV fitting can be replaced.

1. Remove the old PCV fitting.
2. Install the new PCV fitting with a NEW O-ring.

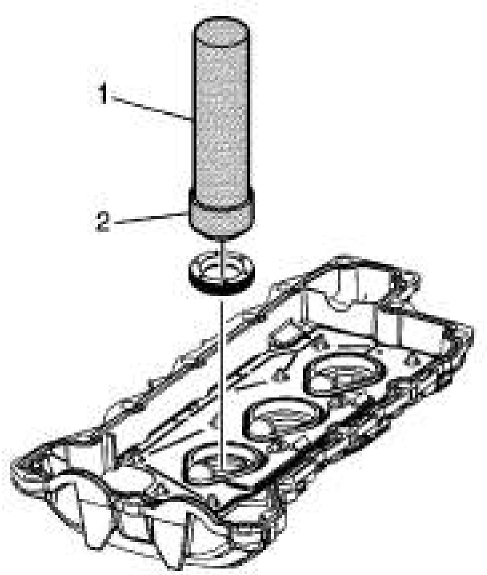
Camshaft Cover Assemble (LLT)

Special Tools

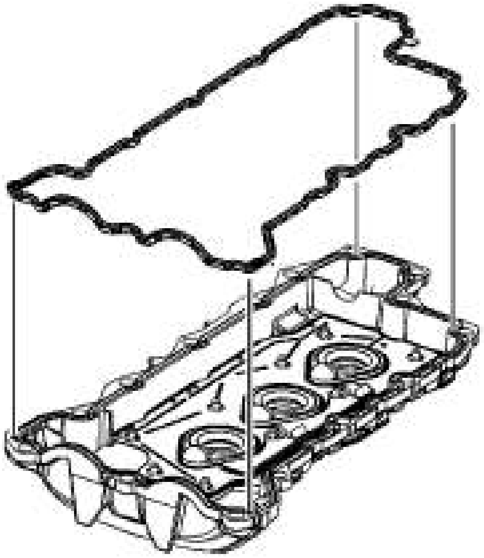
- *J 5590* Bearing and Seal Driver
- *J-25254-A* Oil Seal Installer

For equivalent regional tools, refer to Special Tools.

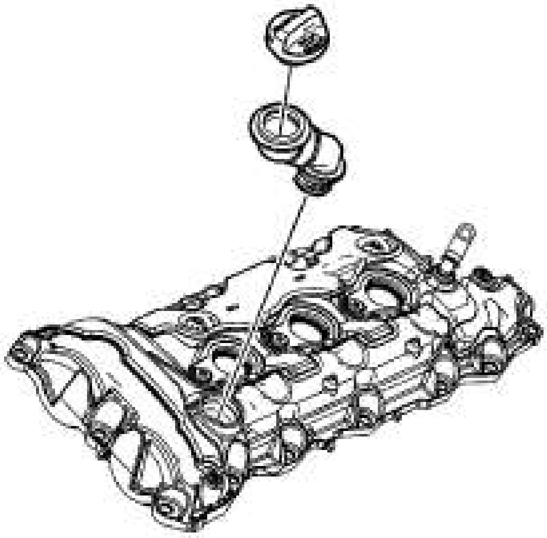
Left Camshaft Cover



1. Install the NEW left spark plug shield tube seals using the *J 5590* driver (1) and *J-25254-A* installer (2).

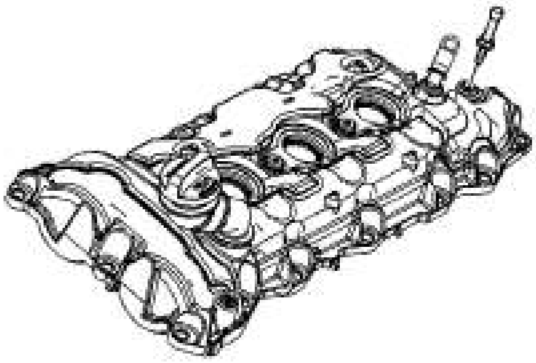


2. Install the NEW left camshaft cover gasket.

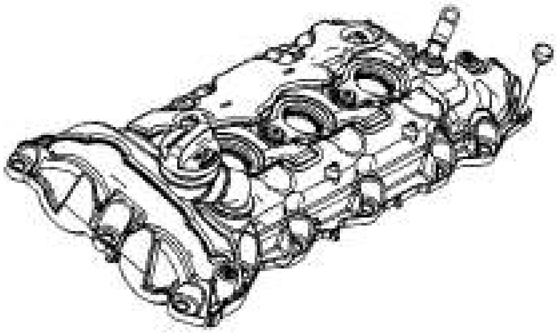


3. Install the oil fill cap.

Caution: Refer to Fastener Caution in the Preface section.



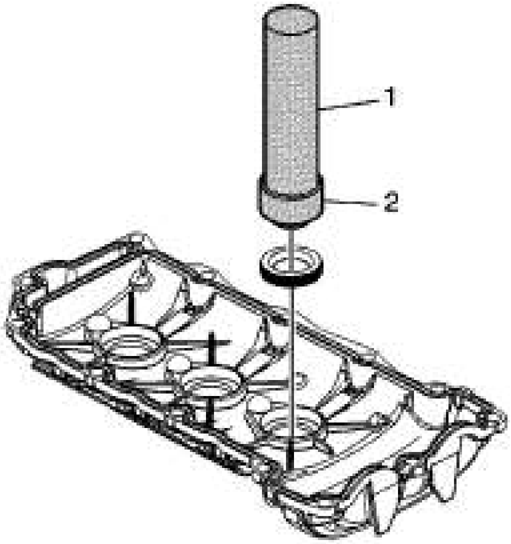
4. Install the fuel injector sight shield cover ballstud and tighten to **10 N·m (89 lb in)**.



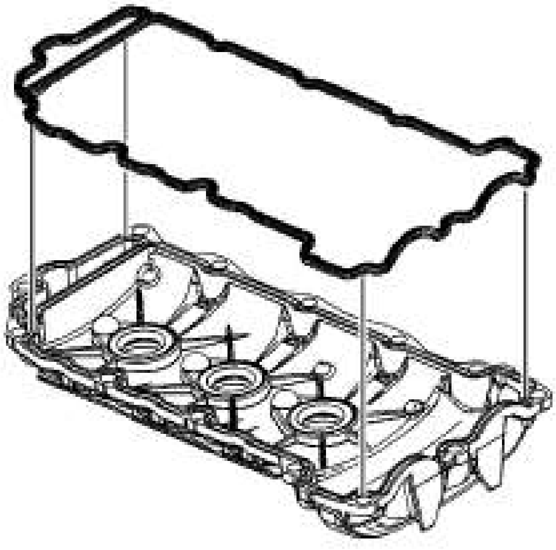
Note: The camshaft cover bolt grommet must be installed into the camshaft cover bolt hole before installing the camshaft cover bolt.

5. Install the NEW left camshaft cover bolt grommets.

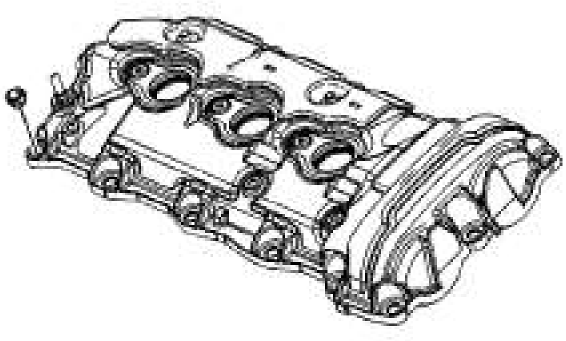
Right Camshaft Cover



1. Install the NEW right spark plug shield tube coil seals using the *J 5590* driver (1) and *J-25254-A* installer (2).



2. Install the NEW right camshaft cover gasket.



Note: The camshaft cover bolt grommet must be installed into the camshaft cover bolt hole before installing the camshaft cover bolt.

3. Install the NEW right camshaft cover bolt grommets.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977532**

Crankshaft and Bearing Cleaning and Inspection

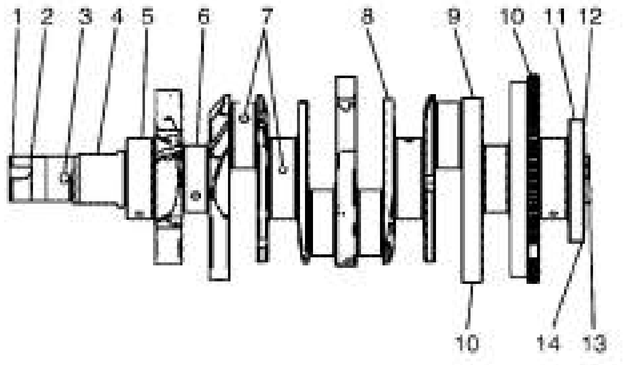
Cleaning Procedure

1. Clean the following components in solvent:
    - Crankshaft bearings
    - Connecting rod bearings
    - Crankshaft journals
    - Crankpin journals
    - Crankshaft oil passages
    - Crankshaft threaded holes

    Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the following components with compressed air:
    - Crankshaft bearings
    - Connecting rod bearings
    - Crankshaft journals
    - Crankpin journals
    - Crankshaft oil passages
    - Crankshaft threaded holes

Visual Inspection

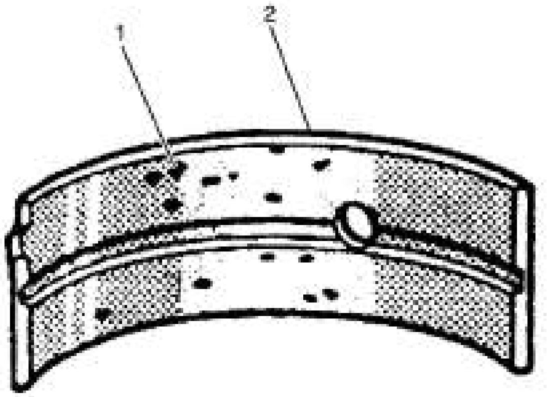


1. Perform the following visual inspections:

- Inspect the crankshaft balancer bolt hole (1) for thread damage.
- Inspect the crankshaft balancer mounting area (2) for damage.
- Inspect the crankshaft sprocket pin hole (3) for damage.
- Inspect the oil pump drive flats (4) for damage.
- Inspect the crankshaft main journals (5) for damage.
- Inspect the crankshaft connecting rod journals (6) for damage.
- Inspect the crankshaft oil passages (7) for obstructions.
- Inspect the crankshaft main bearing thrust wall surfaces (8) for damage.
- Inspect the crankshaft counterweights (9) for damage.
- Inspect the crankshaft reluctor ring teeth (10) for damage.
- Inspect the crankshaft rear main oil seal surface (11) for damage.
- Inspect the crankshaft engine flywheel mounting surface (12) for damage.
- Inspect the crankshaft pilot hole (13) for damage.
- Inspect the crankshaft engine flywheel bolt holes (14) for thread damage.

2. Repair or replace the crankshaft as necessary.

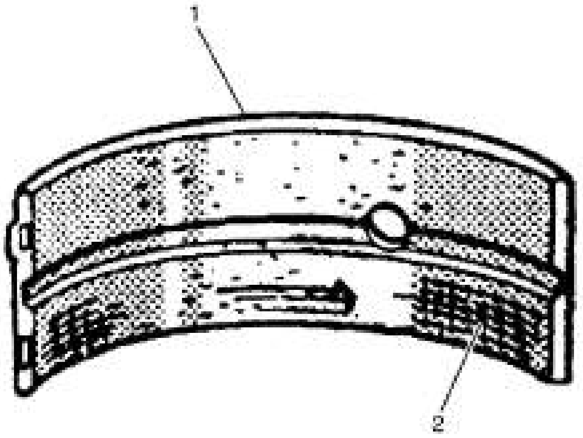
Crankshaft Bearing Inspection



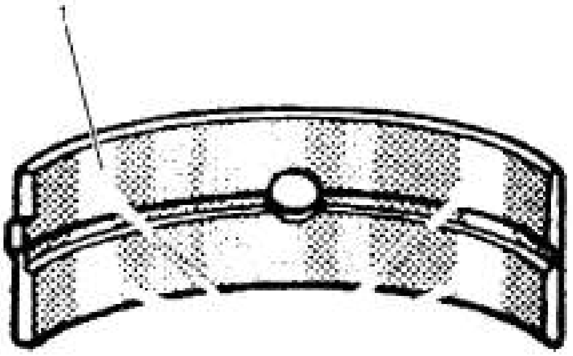
Important:

- All connecting rod and main journal bearings that have been used in a running engine must be replaced. Never re-use the crankshaft or connecting rod bearings.
- The following bearing wear conditions should be used to diagnose engine operating conditions or root cause of a condition.

1. Inspect for fatigue indicated by craters or pockets (1). Flattened sections on the bearing halves (2) also indicate fatigue.

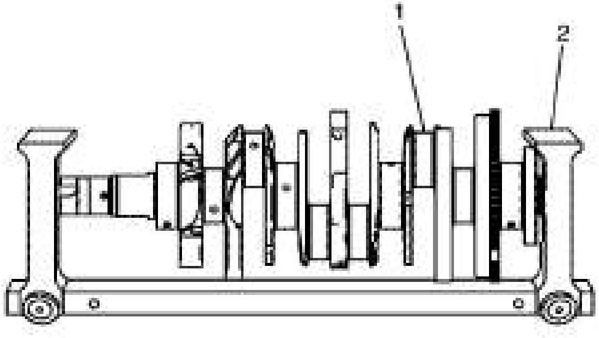


2. Inspect for scoring above acceptable tolerances or discoloration (2) on both front and back of the bearing halves (1).
3. Inspect the main bearings for dirt embedded into the bearing material.

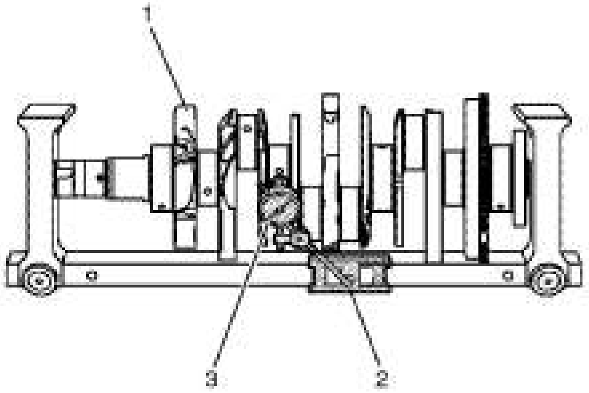


4. Inspect for incorrect seating indicated by bright, polished sections (1).

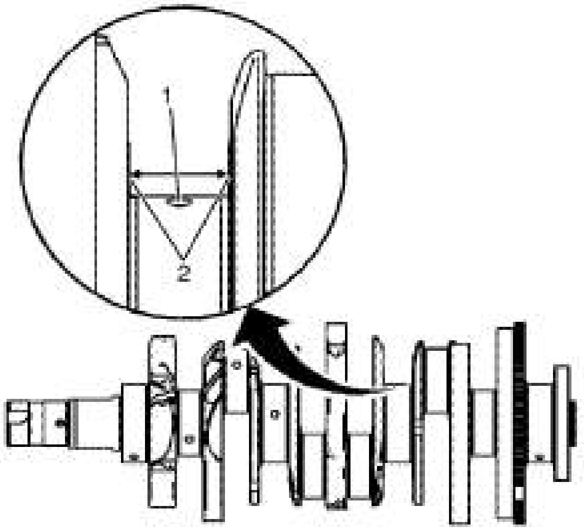
Crankshaft Measurement



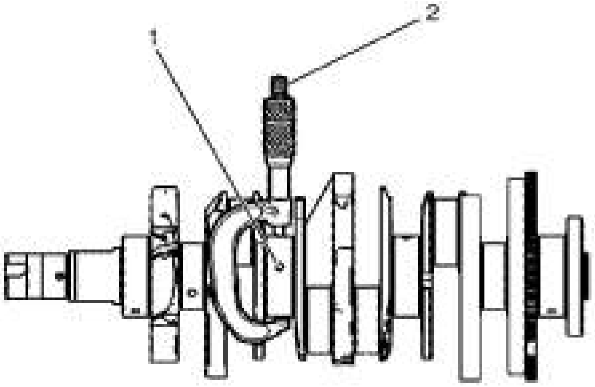
1. Using a suitable fixture (2), support the crankshaft (1).



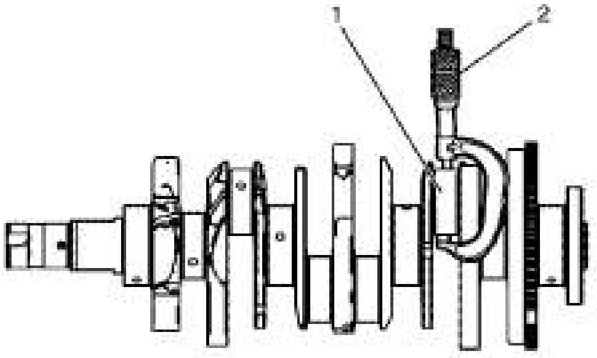
2. Set up a dial indicator (3) and magnetic base (2).
3. Rotate the crankshaft (1) to measure and record the crankshaft runout. Compare your results with the Engine Mechanical Specifications.



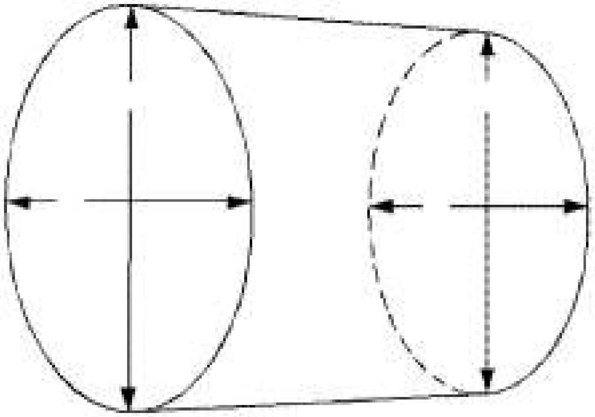
4. Measure and record the crankshaft thrust wall width (2) for wear using an inside micrometer. Compare your results with the Engine Mechanical Specifications.
5. Measure and record the crankshaft thrust wall surface (1) for runout using the dial indicator. Compare your results with the Engine Mechanical Specifications.
6. If the crankshaft journals are damaged or worn beyond specifications, the crankshaft may be ground 0.25 mm (0.010 in). There is only 1 size of oversized main bearings available for service.



7. Inspect the crankshaft main journals (1) for undersize, using an outside micrometer (2).



8. Inspect the crankpins (1) for undersize using an outside micrometer (2).
9. Compare your results with the Engine Mechanical Specifications. If the crankpin journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm (0.010 in). There is only 1 size of oversized connecting rod bearings available for service.



10. Measure the main bearing and crankpin journals for out-of-round using the following procedure:
    - 10.1. Using an outside micrometer, measure the journal at the extreme front and rear locations on the journal. Call these points A and B.
    - 10.2. Measure the journal in 2 new locations exactly 90 degrees from the first points. Call these points C and D.
    - 10.3. Subtract A from C and B from D. The differences will indicate journal out-of-round.
    - 10.4. The out-of-round should not exceed 0.004 mm (0.00016 in) maximum.

- 10.5. If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm (0.010 in). There is only 1 size of oversized crankshaft and connecting rod bearings available for service.

11. Measure the main bearing and crankpin journals for taper using the following procedure:
    - 11.1. Using an outside micrometer, measure the journal at the extreme front (A) and rear (B) of the journal parallel to the crankshaft centerline.
    - 11.2. Subtract the smallest from the largest measurement. The result will be the journal taper.
    - 11.3. If the main bearing journal taper exceeds 0.004 mm (0.00016 in), replace the crankshaft.
    - 11.4. If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm (0.010 in). There is only 1 size of oversized crankshaft and connecting rod bearings available for service.

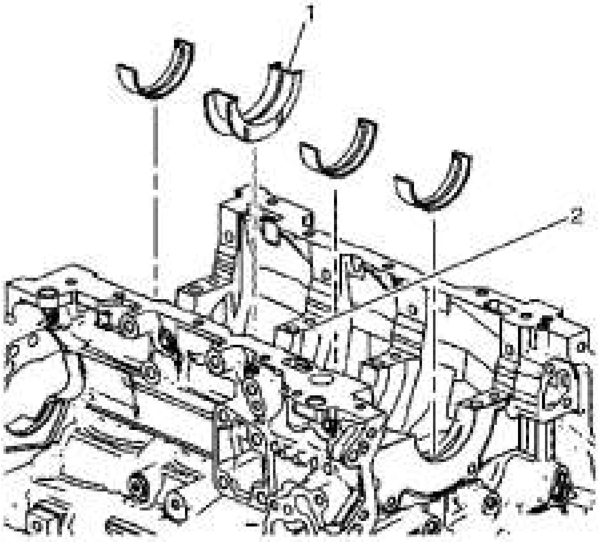
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995078

Crankshaft and Bearing Installation

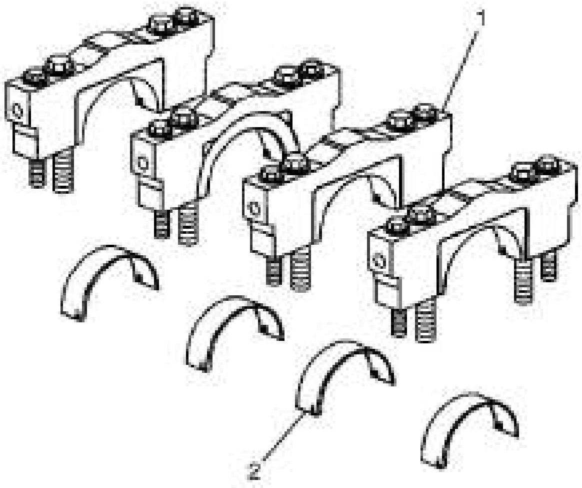
Crankshaft Bearing Installation Procedure

Important: If the crankshaft bearings have been used in a running engine, you must replace them with NEW crankshaft bearings for reassembly.

1. Clean the crankcase crank bore with a lint-free cloth.
2. Clean all the oil from the backside of new bearing halves.

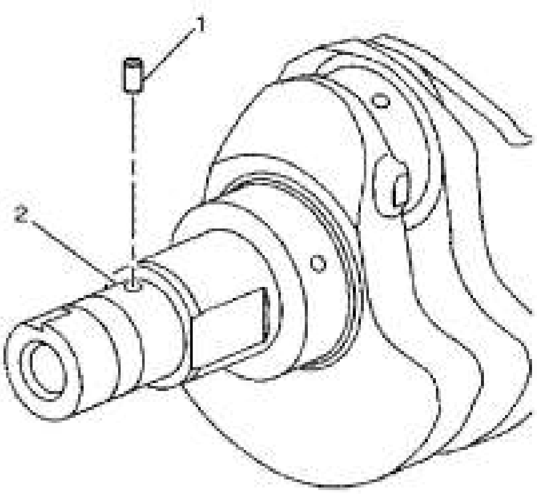


3. Install the new upper crankshaft bearings into position. The thrust bearing (1) belongs in the number 3 journal (2). Make sure that the upper bearing insert contains the oil transfer hole and groove. Roll the bearing into position so that the lock tang engages the crank slot. The bearing must fit flush with the upper crankcase.



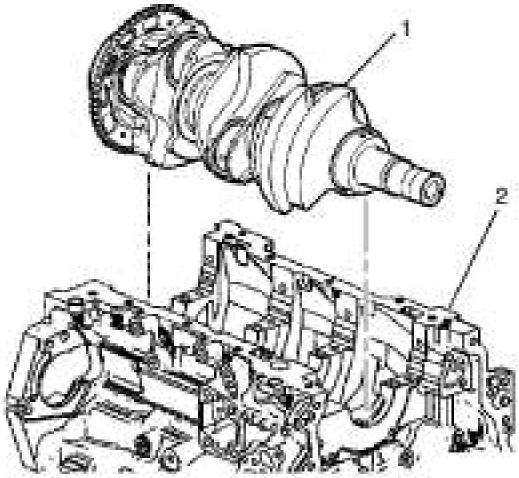
4. Install the new lower crankshaft bearings (2) into position in the crankshaft bearing caps (1). The lower crankshaft bearings (2) are identified by NO grooves or holes. The lower crankshaft bearings (2) must fit flush with the crankshaft bearing caps (1).

Crankshaft Installation Procedure



Notice: The crankshaft sprocket drive pin must be set to the proper depth. Installing the crankshaft sprocket drive pin too deep can lead to damage to the crankshaft sprocket and extensive engine damage.

1. If removed, install the crankshaft sprocket drive pin (1). Lightly tap the crankshaft sprocket drive pin (1) in place with a small soft face, bronze/plastic, hammer until it bottoms in the hole of the crankshaft (2).

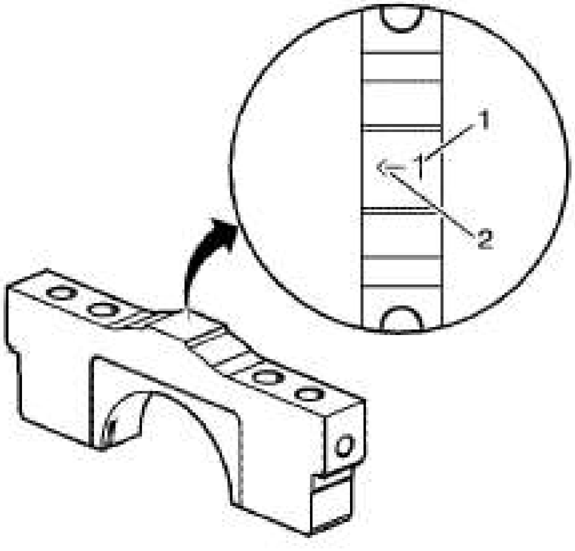


2. Gently lower the crankshaft (1) into position in the cylinder block (2).

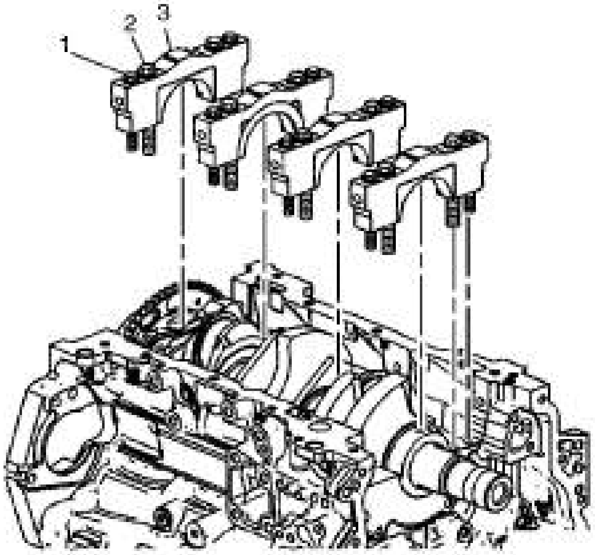
Crankshaft Bearing Clearance Measurement Procedure

Tools Required

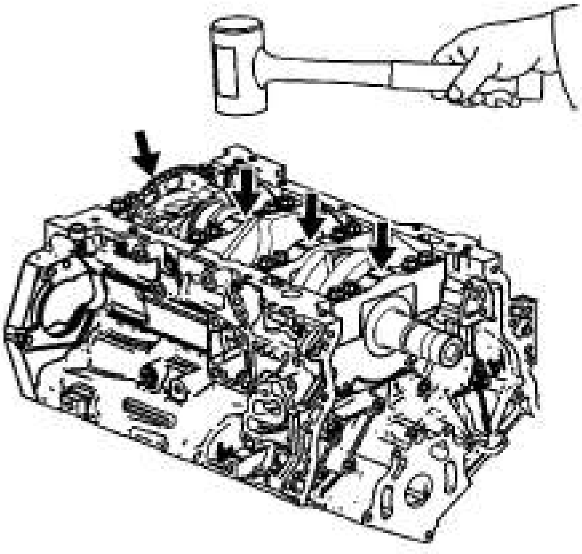
- J 6125-1B Slide Hammer Adapter
- J 41818 Crankshaft Bearing Cap Remover
- J 45059 Angle Meter



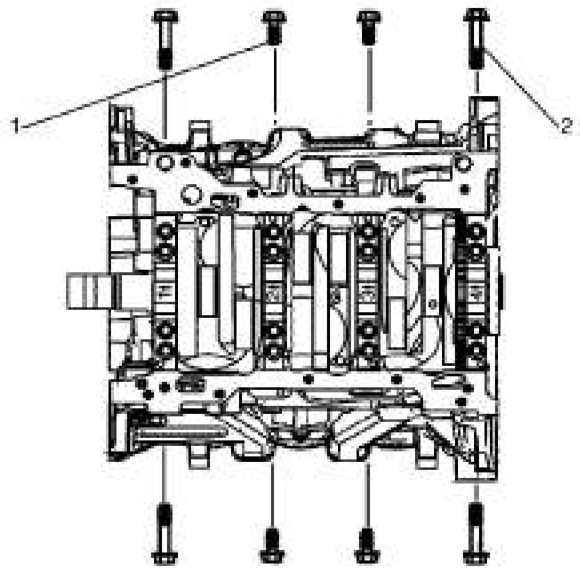
1. Place a length of fresh, room temperature plastic gauging material all the way across all the crankshaft bearing journals.
2. Identify the proper order of the crankshaft bearing caps. The crankshaft bearing caps are numbered 1 (1) through 4, with the front main bearing cap marked with the number 1. The arrow (2) is to be oriented to the front of the cylinder block.



3. Install the crankshaft bearing caps (3).
4. Loosely install the original inner crankshaft bearing cap to cylinder block retaining bolts (1).
5. Loosely install the original outer crankshaft bearing cap to cylinder block retaining bolts (2).

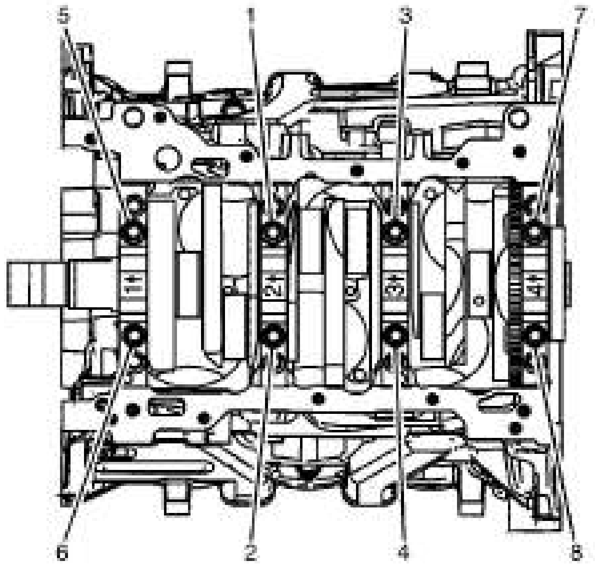


6. Tap the crankshaft bearing caps with a soft-faced hammer to help seat the crankshaft bearing caps.



7. Loosely install the original short/inner side crankshaft bearing cap to cylinder block retaining bolts (1).
8. Loosely install the original long/outer side crankshaft bearing cap to cylinder block retaining bolts (2).
9. Tighten the crankshaft bearing cap to cylinder block retaining bolts using the J 45059 in the following sequence:

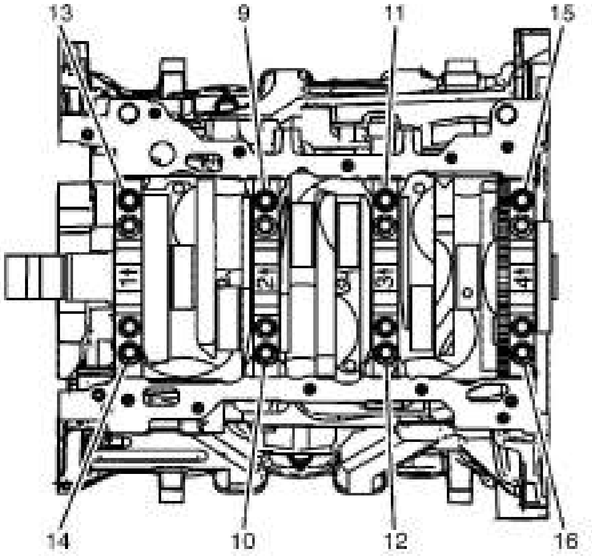
Notice: Refer to Fastener Notice in the Preface section.



10. Tighten the inboard crankshaft bearing cap to cylinder block retaining bolts (1-8).

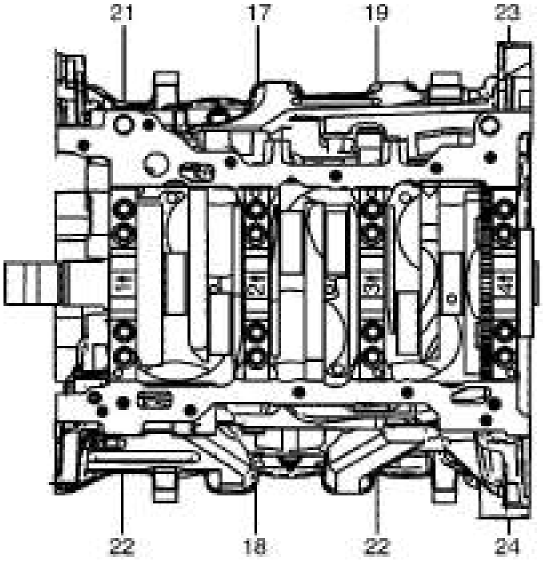
Tighten

Tighten the bolts to 20 N·m (15 lb ft) plus 80 degrees.



11. Tighten the outboard crankshaft bearing cap to cylinder block retaining bolts (9-16).

Tighten
Tighten the bolts to 15 N·m (11 lb ft) plus 110 degrees.



12. Tighten the short/inner crankshaft bearing cap to cylinder block retaining bolts (17-20).

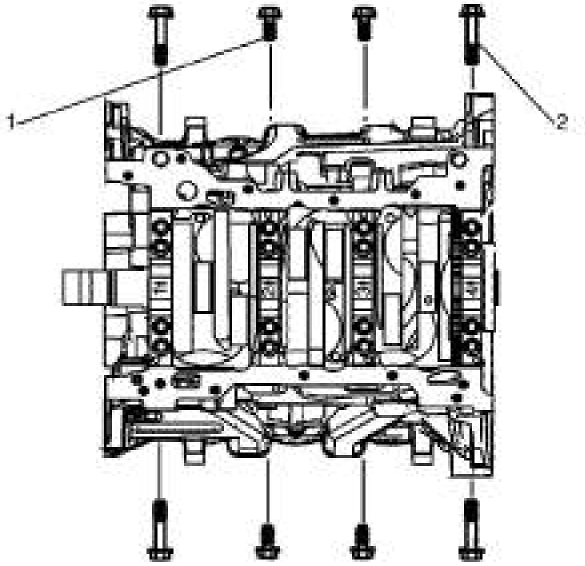
Tighten
Tighten the bolts to 30 N·m (22 lb ft) plus 60 degrees.

13. Tighten the long/outer crankshaft bearing cap to cylinder block retaining bolts (21-24).

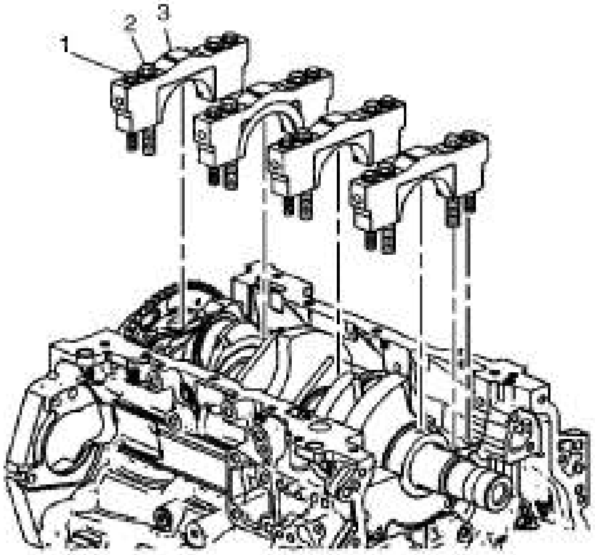
    Tighten
    Tighten the bolts to 30 N·m (22 lb ft) plus 60 degrees.

    Important: DO NOT rotate the crankshaft.

14. After reaching final torque, allow the assembly to sit for 2 minutes.



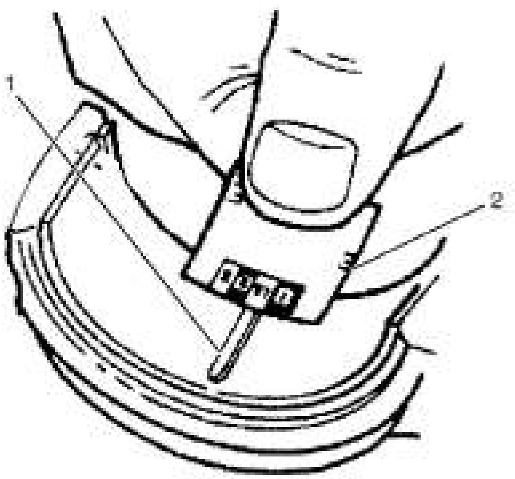
15. Remove the original short/inner side crankshaft bearing cap to cylinder block retaining bolts (1).
16. Remove the original long/outer side crankshaft bearing cap to cylinder block retaining bolts (2).



17. Remove the install the original outer crankshaft bearing cap to cylinder block retaining

bolts (2).

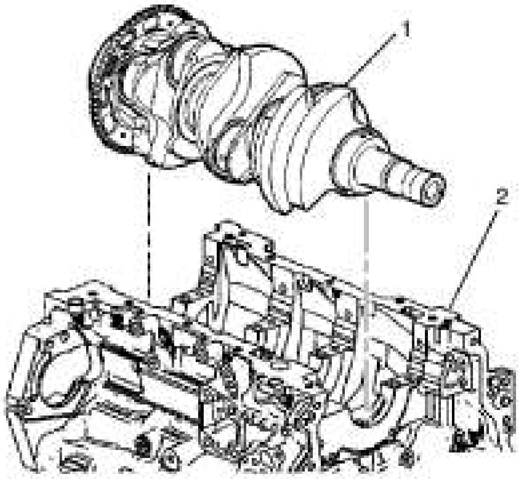
18. Remove the original inner crankshaft bearing cap to cylinder block retaining bolts (1).
19. Remove the crankshaft bearing caps (3) using the J 6125-1B and J 41818



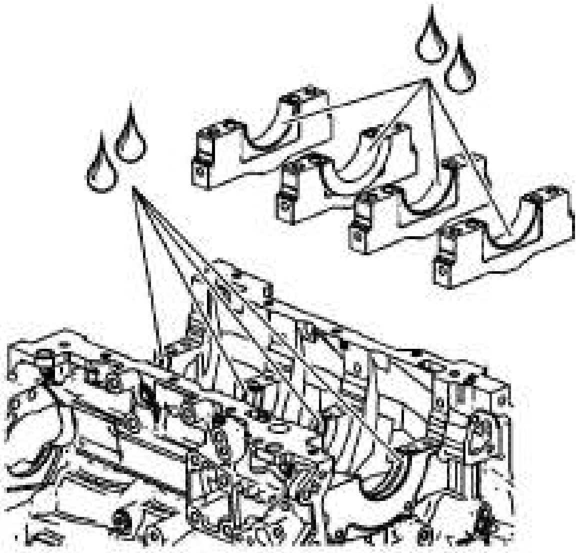
20. Determine the crankshaft bearing clearance by comparing the width of the flattened plastic gauging material (1) at its widest point with the graduation on the gauging material container (2).

Important: The crankshaft bearings CAN be reused after checking the clearance if the bearings have never been used in a running engine.

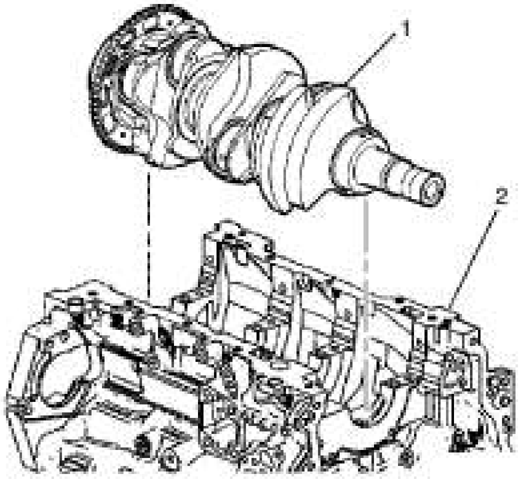
21. Compare your measurements with the engine mechanical specifications. Refer to Engine Mechanical Specifications . If the new bearings DO NOT provide the proper crankshaft to bearing clearance, inspect the following:
    - 21.1. Re-measure the crankshaft journals for the correct specified size and ensure the proper new bearings are being installed. If the crankshaft journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.
    - 21.2. Re-measure the cylinder block crankshaft bearing bore diameter to ensure proper size. The cylinder block crankshaft bearing bore is not machinable and the block must be replaced if out of specification.
22. Clean the plastic gauging material from the crankshaft bearing journals with a soft, lint-free cloth.



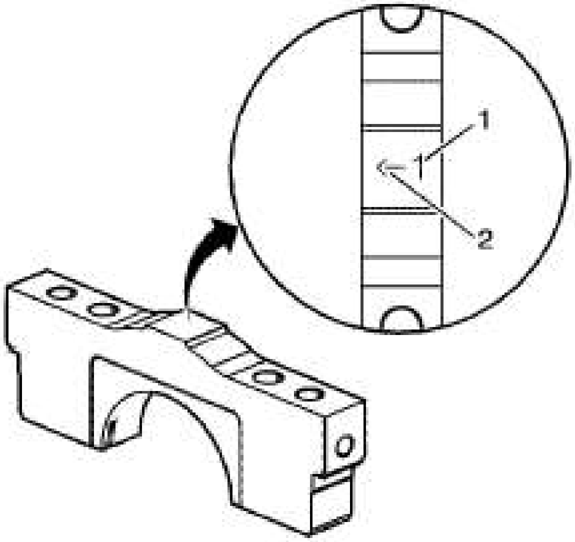
23. Lift the crankshaft (1) out of the cylinder block (2).



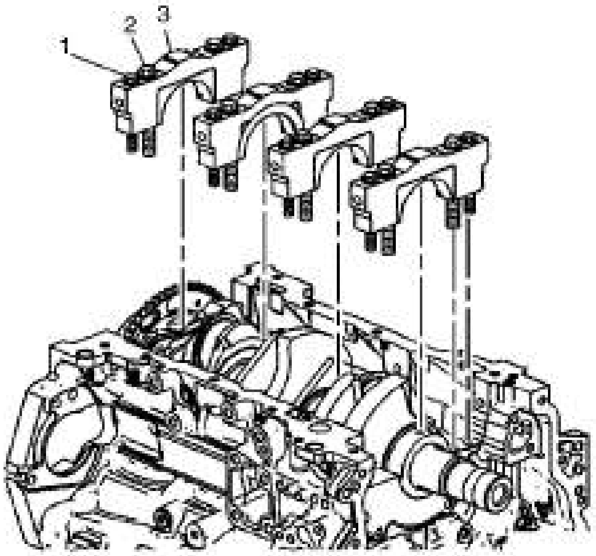
24. Apply a liberal amount of clean engine oil to the upper and lower bearing surfaces.



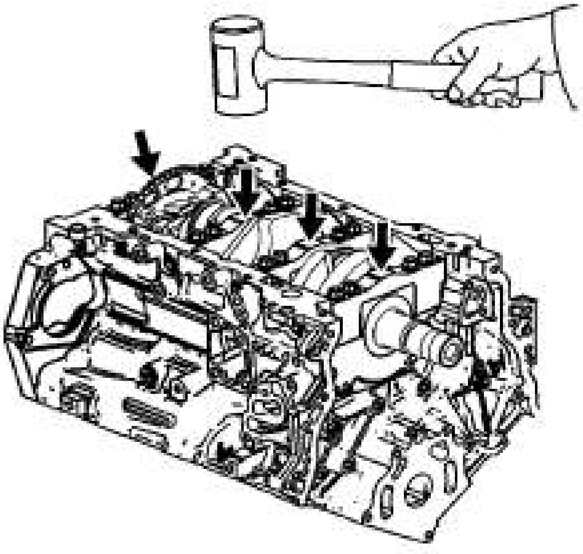
25. Gently lower the crankshaft (1) into position in the cylinder block (2).



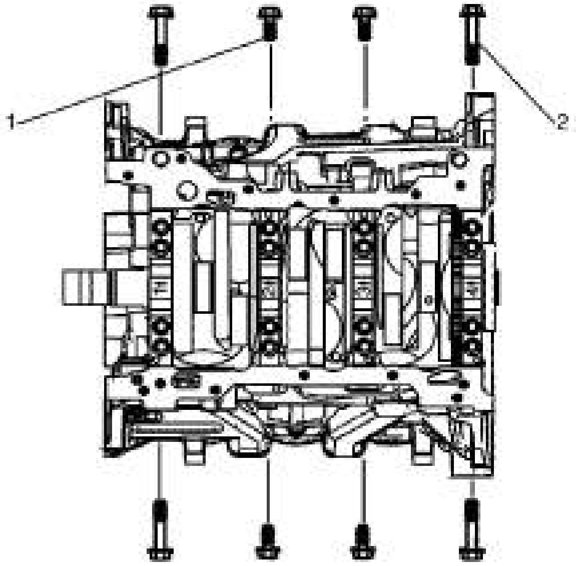
26. Identify the proper order of the crankshaft bearing caps. The crankshaft bearing caps are numbered 1 (1) through 4, with the front main bearing cap marked with the number 1. The arrow (2) is to be oriented to the front of the cylinder block.



27. Install the crankshaft bearing caps (3).
28. Loosely install the original inner crankshaft bearing cap to cylinder block retaining bolts (1).
29. Loosely install the NEW outer crankshaft bearing cap to cylinder block retaining bolts (2).



30. Tap the crankshaft bearing caps with a soft-faced hammer to help seat the crankshaft bearing caps.

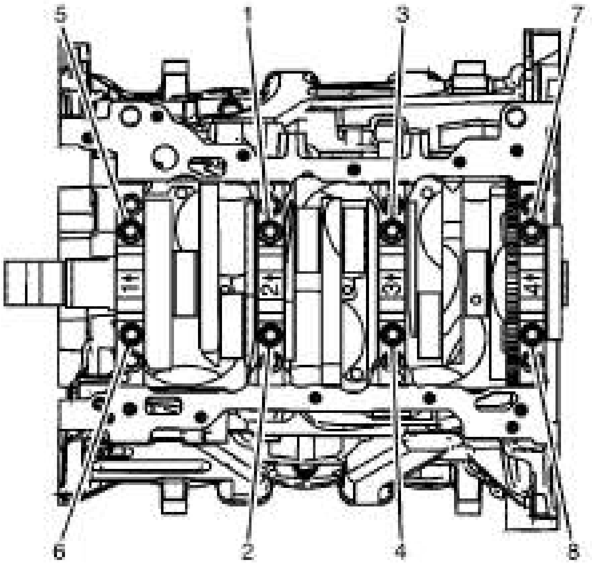


Important: The side main cap bolts originally have a sealant on the flange of the bolt head. NEW bolts must be used. If NEW bolts are not used, oil can leak from the crankcase past the bolts.

31. Loosely install the NEW short/inner side crankshaft bearing cap to cylinder block retaining bolts (1).
32. Loosely install the NEW long/outer side crankshaft bearing cap to cylinder block retaining bolts (2).

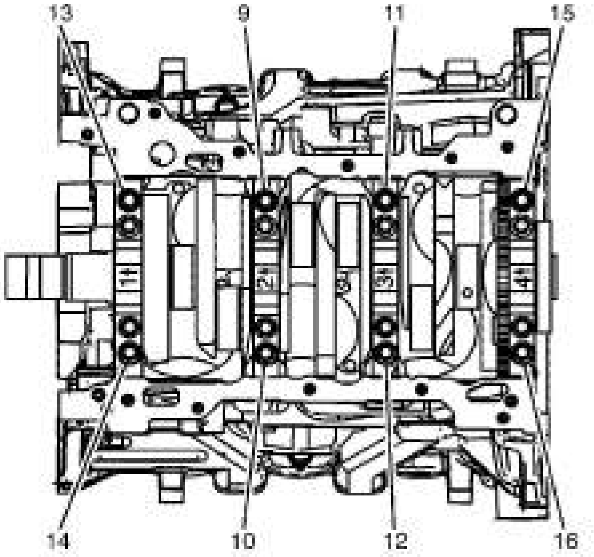
Notice: Refer to Fastener Notice in the Preface section.

33. Tighten the crankshaft bearing cap to cylinder block retaining bolts using the J 45059 in the following sequence:



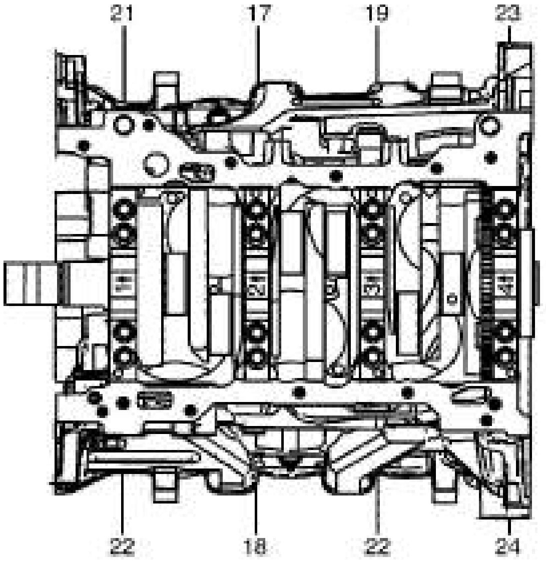
34. Tighten the inboard crankshaft bearing cap to cylinder block retaining bolts (1-8).

Tighten
Tighten the bolts to 20 N·m (15 lb ft) plus 80 degrees.



35. Tighten the outboard crankshaft bearing cap to cylinder block retaining bolts (9-16).

Tighten
Tighten the bolts to 15 N·m (11 lb ft) plus 110 degrees.



36. Tighten the short/inner crankshaft bearing cap to cylinder block retaining bolts (17-20).

    Tighten
    Tighten the bolts to 30 N·m (22 lb ft) plus 60 degrees.

37. Tighten the long/outer crankshaft bearing cap to cylinder block retaining bolts (21-24).

    Tighten
    Tighten the bolts to 30 N·m (22 lb ft) plus 60 degrees.

38. Make sure that the crankshaft turns without binding or noise.

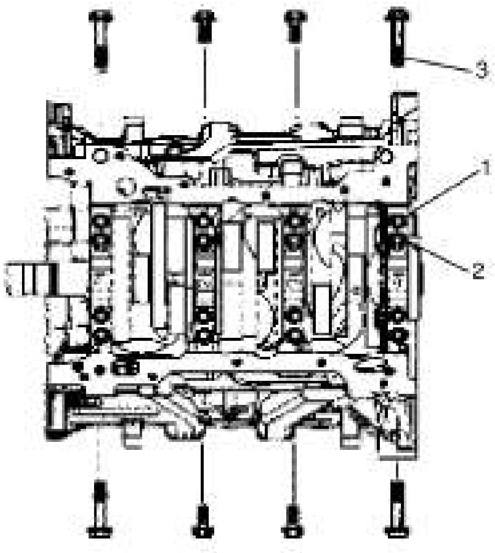
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977530**

Crankshaft and Bearing Removal

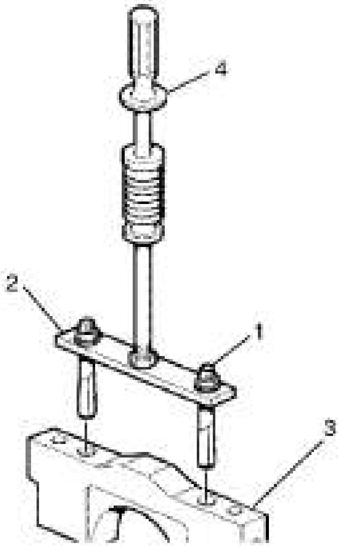
Tools Required

- J 41818 Crankshaft Bearing Cap Remover.
- J 6125-1B Slide Hammer with Adapter.

Crankshaft Removal



1. Remove the crankshaft bearing cap side bolts (3).
2. Remove the crankshaft bearing cap outer bolts (1).
3. Remove the crankshaft bearing cap inner bolts (2).



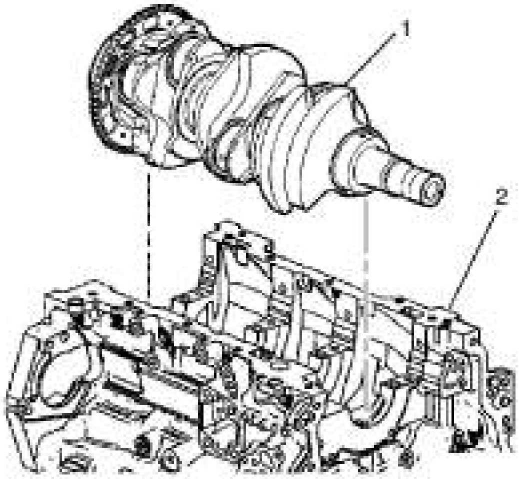
4. Install the J 41818 (2) to the inner bolt holes of the crankshaft bearing cap (3).

   Notice: Refer to Fastener Notice in the Preface section.

5. Tighten the J 41818 nuts (1).

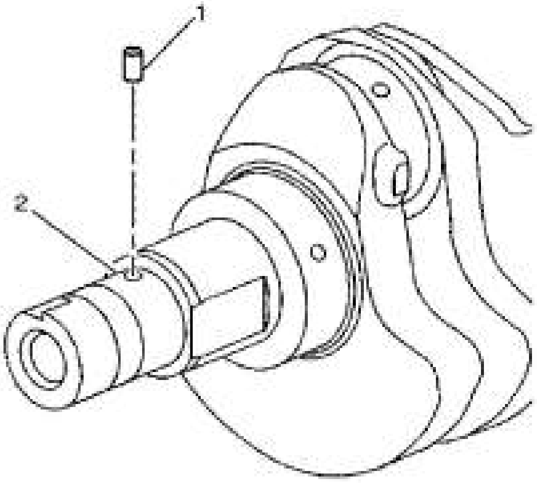
   Tighten
   Tighten the nuts to 11 N·m (97 lb in).

6. Install the J 6125-1B (4) onto the J 41818 (2).
7. Remove the crankshaft bearing cap

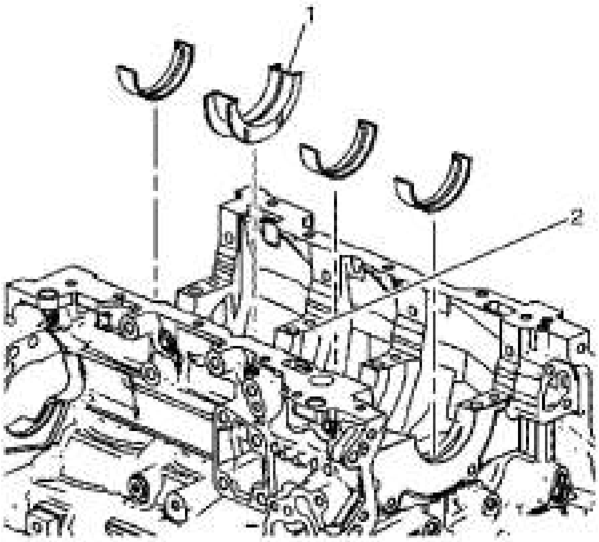


Important: Lift the crankshaft (1) straight up evenly to remove from the cylinder block (2).

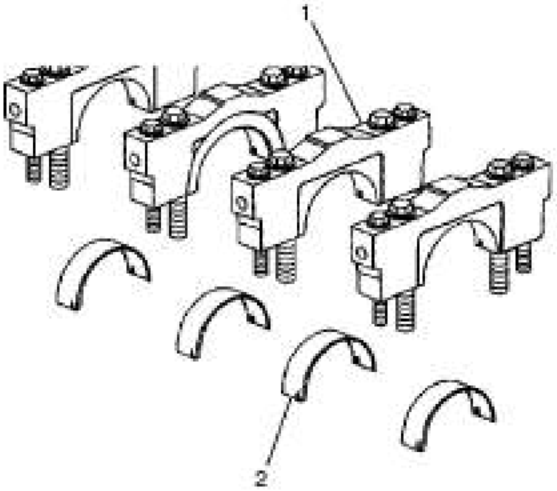
8. Remove the crankshaft (1).
9. Place the crankshaft in a secure place.



10. Remove the crankshaft sprocket drive pin (1) from the nose of the crankshaft (2), if required.
11. Prepare a piece of cardboard or equivalent, numbered 1-4 for bearing identification. Main bearing journals are numbered from the front of the cylinder block.



12. Remove the crankshaft upper bearing halves from the cylinder block. Note the position of the thrust bearing (1) at the number 3 journal (2).
13. Place the crankshaft upper bearing halves on the cardboard in the correct positions. Note that the number 3 bearing is the thrust bearing.



14. Remove the crankshaft lower bearing halves (2) from the crankshaft bearing caps (1).
15. Place the crankshaft lower bearing halves (2) in the correct positions on the cardboard.

Crankshaft Balancer Cleaning and Inspection

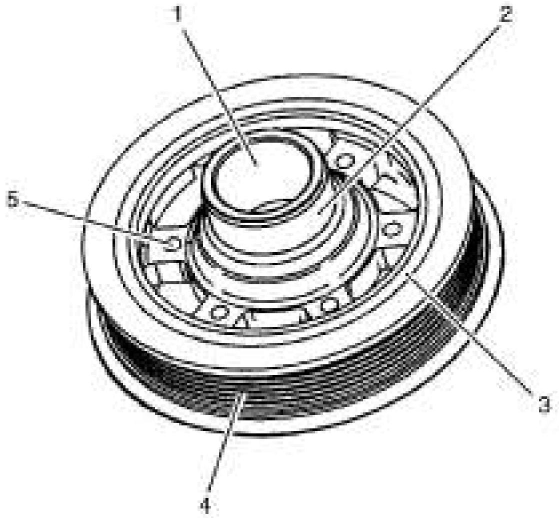
Cleaning Procedure

1. Clean the crankshaft balancer in solvent that is compatible with the rubber.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the crankshaft balancer with compressed air.

Inspection Procedure



1. Inspect the crankshaft balancer for the following:
   - Worn or damaged hub-to-crankshaft surface (1)
   - Worn, grooved or damaged hub seal surface (2).
   - Worn, chunking or deteriorated rubber between the hub and pulley (3)
   - Damaged drive belt ribs (4)
   - Damaged threaded holes (5)
2. Repair or replace the crankshaft balancer as required.

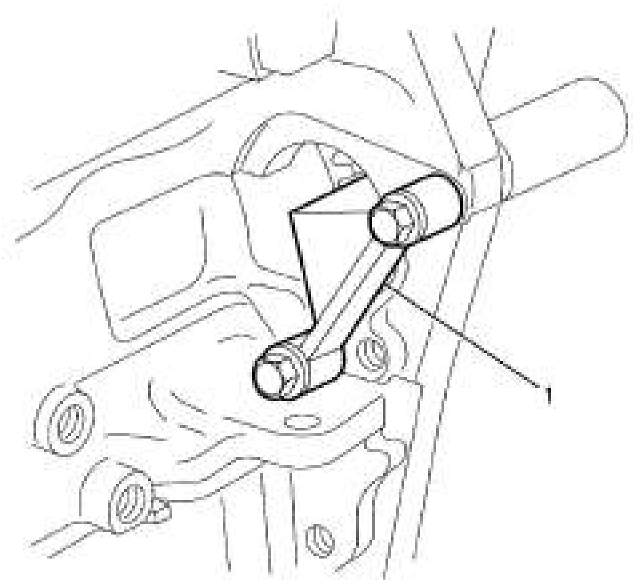
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995381**

Crankshaft Balancer Installation

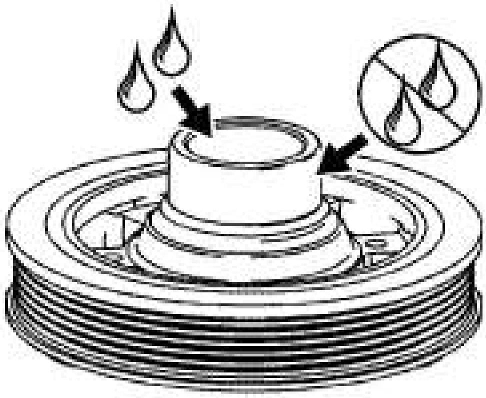
Installation - Up to xx/xx

Tools Required

- EN 46106 Engine Flywheel Holding Tool
- J 41998-B Crankshaft Balancer Installer
- J 45059 Angle Meter

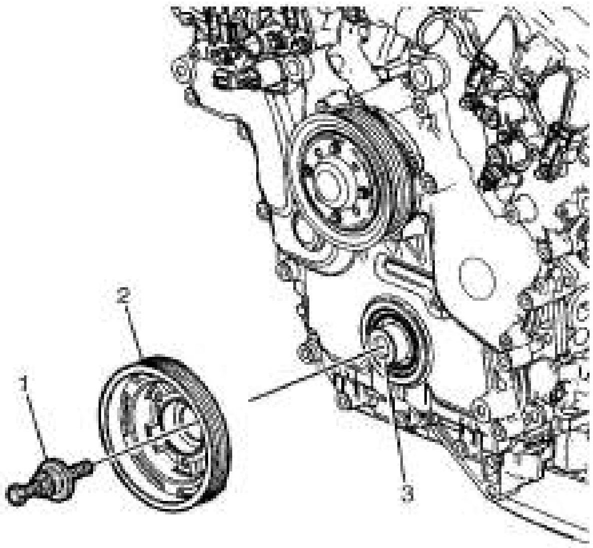


1. The EN 46106 (1) must be installed.



Important: DO NOT lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

2. Apply lubricant to the inside of the crankshaft balancer hub bore.

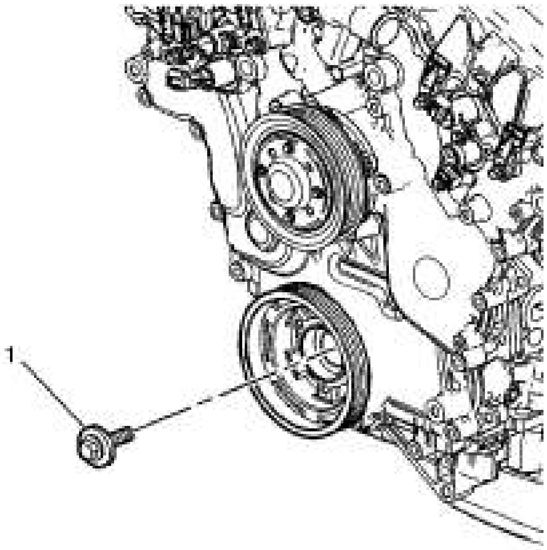


Important: Use the J 41998-B (1), nut, bearing and washer to install the crankshaft balancer (2).

Important: Make sure at least 10 threads of the J 41998-B (1) are engaged before pressing the crankshaft balancer (2) in place.

3. Thread the J 41998-B (1) in the crankshaft (3).

4. Push the crankshaft balancer (2) into position by tightening the nut on the J 41998-B (1) until the large washer bottoms out on the crankshaft (3) end.
5. Remove the J 41998-B (1).

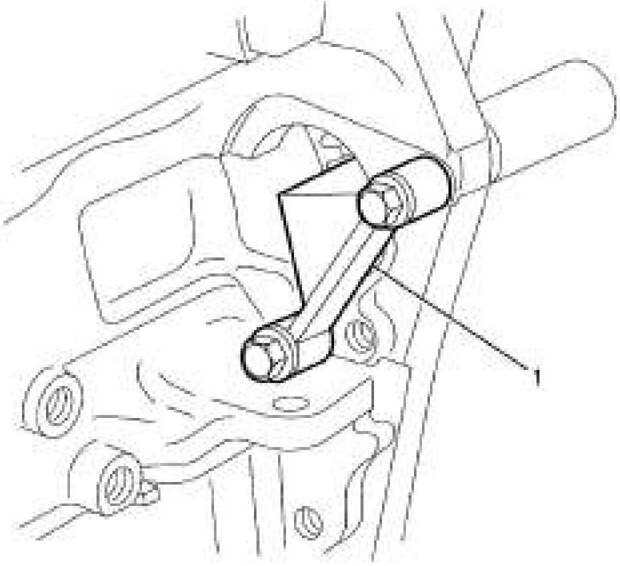


6. Install the crankshaft balancer to crankshaft retaining bolt (1).

   Notice: Refer to Fastener Notice in the Preface section.

7. Tighten the crankshaft balancer to crankshaft retaining bolt.

   Tighten
   - Tighten the bolt to 100 N·m (74 lb ft).
   - Tighten the crankshaft balancer to crankshaft retaining bolt an additional 150 degrees using the J 45059 .

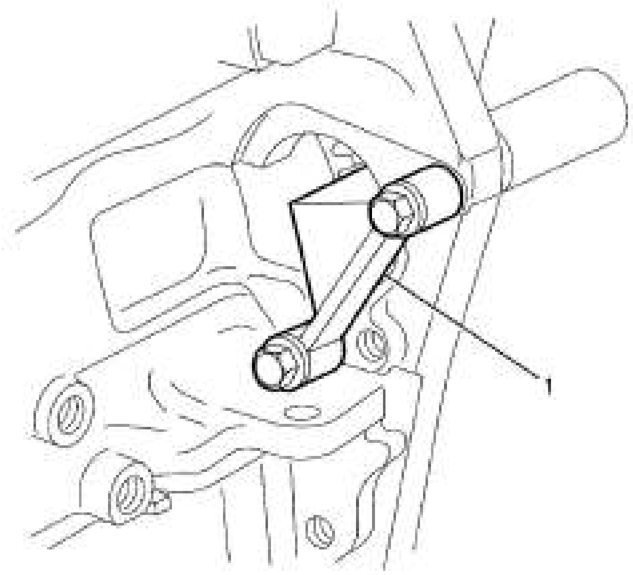


8. Remove the EN 46106 (1).

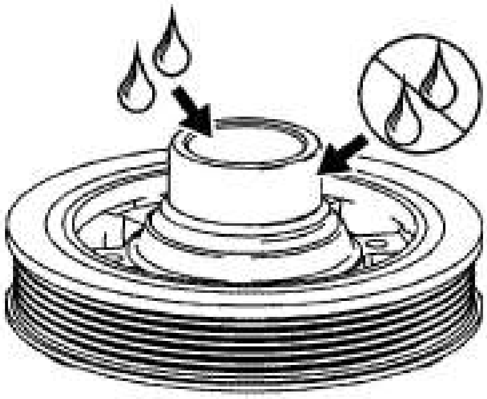
Installation After - xx/xx

Tools Required

- EN 46106 Engine Flywheel Holding Tool.
- J 45059 Angle Meter.

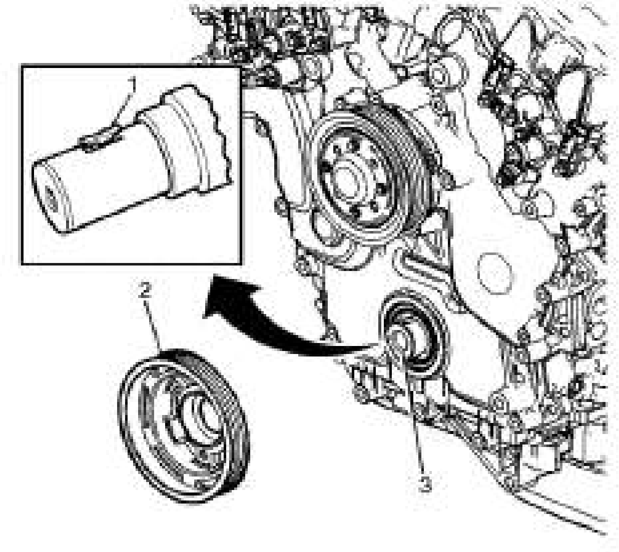


1. The EN 46106 (1) must be installed.



Important: DO NOT lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

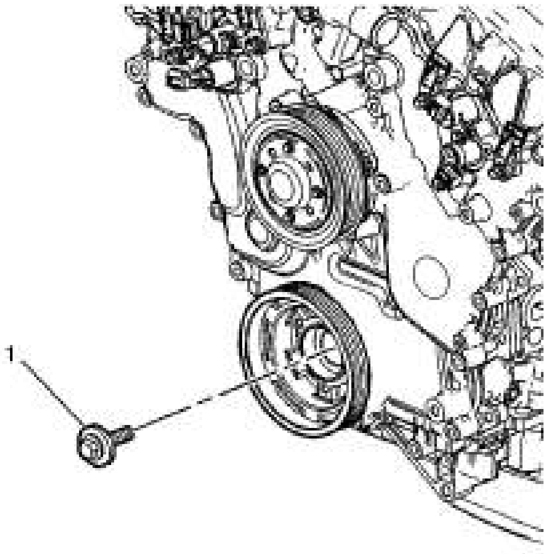
2. Apply lubricant to the inside of the crankshaft balancer hub bore.



Important: Make sure the key (1) located on the top of the crankshaft is correctly installed in the crankshaft. Failure to adhere to this may cause engine damage.

3. Install the crankshaft balancer (2) on to the crankshaft (3).

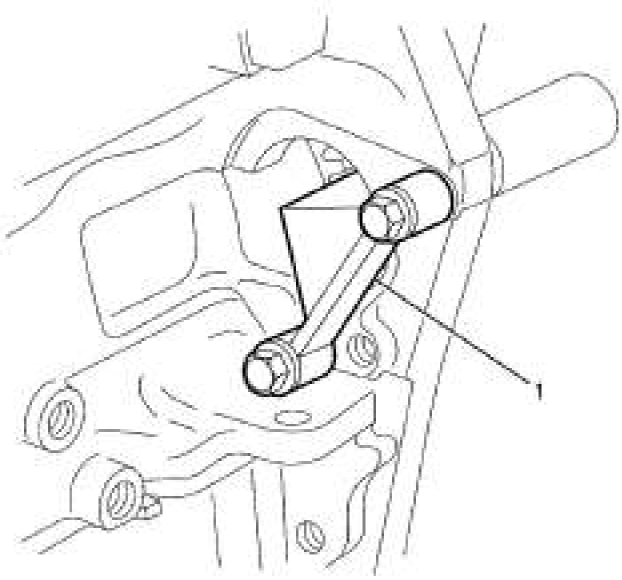
Notice: Refer to Fastener Notice in the Preface section.



4. Install the crankshaft balancer to crankshaft retaining bolt (1).

Tighten

- Tighten the bolt to 100 N·m (74 lb ft).
- Tighten the crankshaft balancer to crankshaft retaining bolt an additional 150 degrees using the J 45059 .

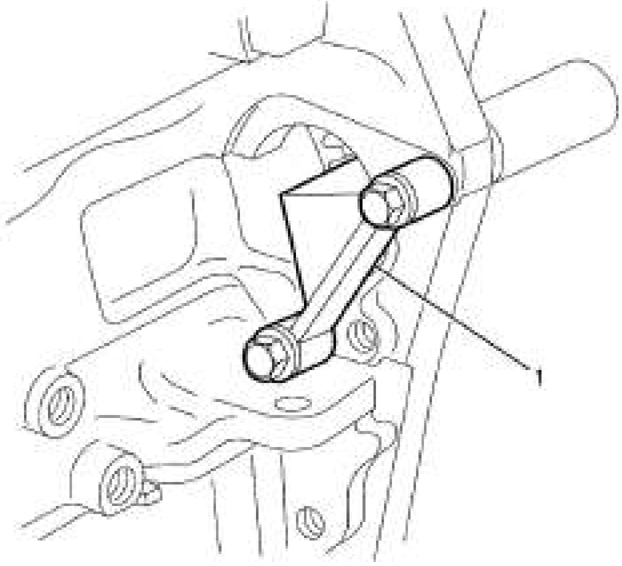


5. Remove the EN 46106 (1).

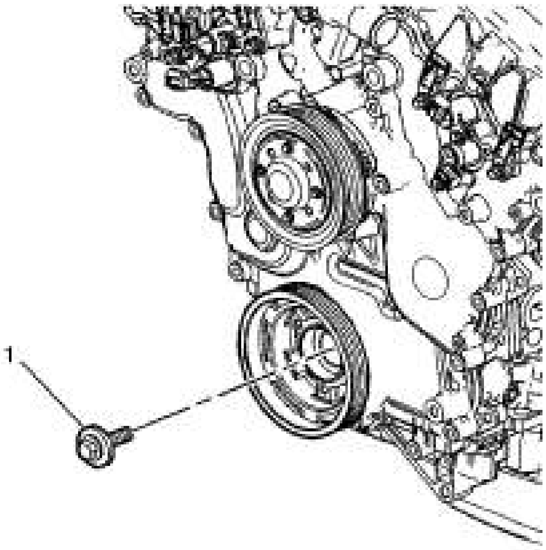
Crankshaft Balancer Removal

Tools Required

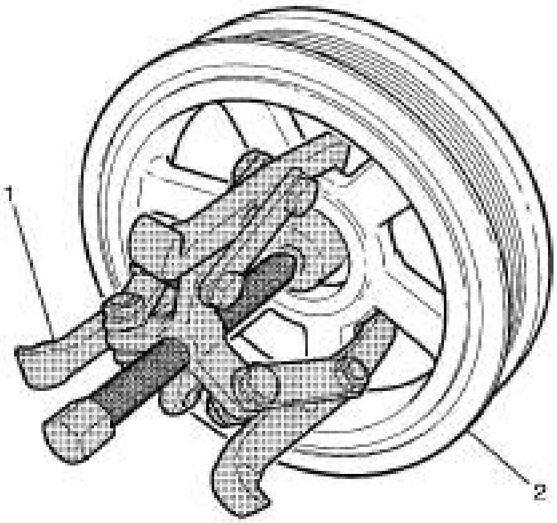
- EN 46106 Flywheel Holding Tool
- 303-642 Harmonic Balancer Puller



1. Install the EN 46106 (1) through the starter mounting hole.



2. Remove the crankshaft balancer to crankshaft retaining bolt (1).



3. Install the 303-642 (1).

   Important: Remove the crankshaft balancer off by tightening the center bolt on the 303-642 (1) until the crankshaft balancer (2) is removed from the crankshaft.

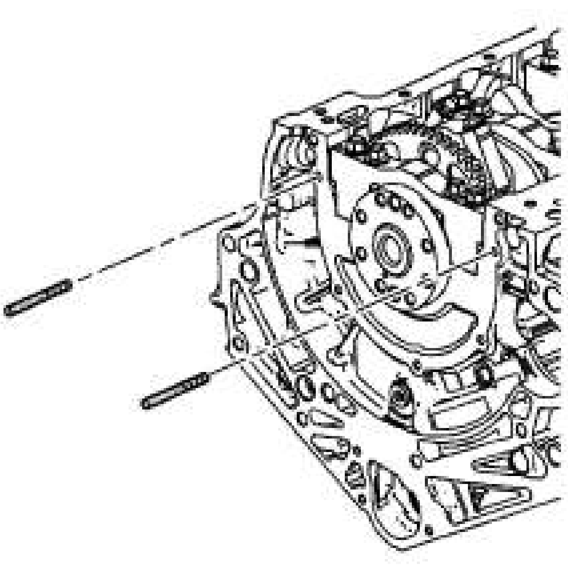
4. Remove the crankshaft balancer (2).
5. Remove the 303-642 (1) from the crankshaft balancer.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995344

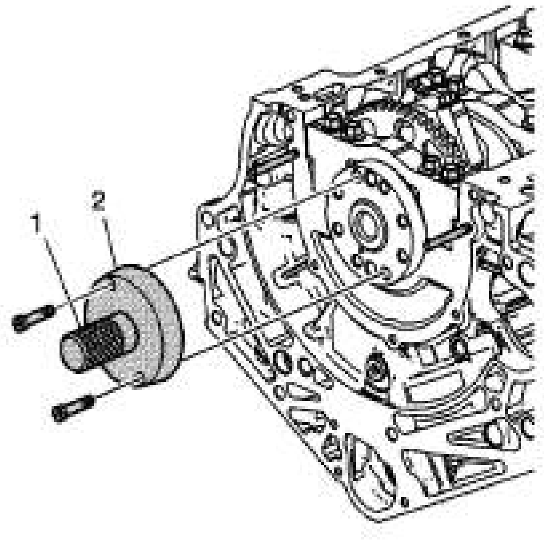
Crankshaft Rear Oil Seal and Housing Installation

Tools Required

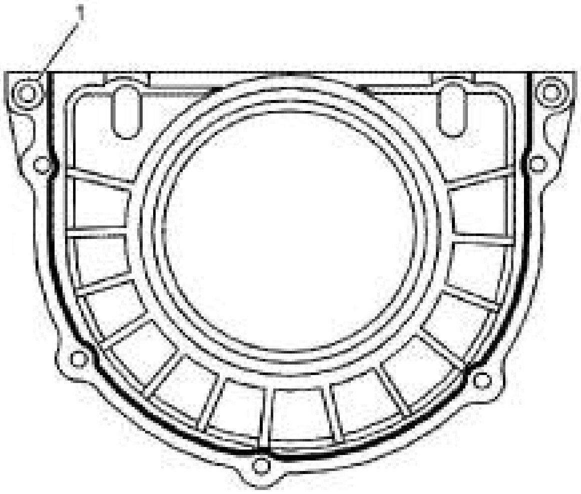
- EN 46109 Guide Pin Set
- EN-47839 Crankshaft Rear Oil Seal Installation Tool
- J 42183 Handle



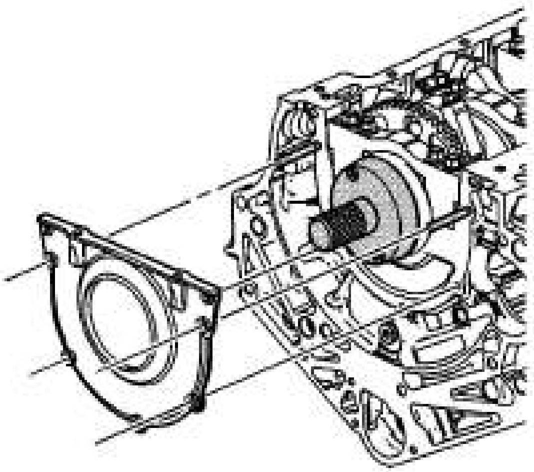
1. Install the 6 mm (0.236 in) guides from the EN 46109 into the 2 crankshaft rear oil seal housing corner bolt holes of the cylinder block.



2. Install the J 42183 (1) with the EN-47839 (2) onto the rear of the crankshaft flange.

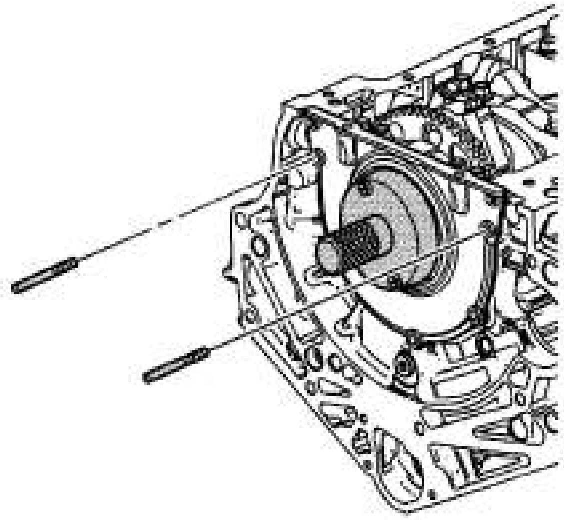


3. Place a 3 mm (0.118 in) bead of RTV sealant (1) to the NEW crankshaft rear oil seal housing as shown.



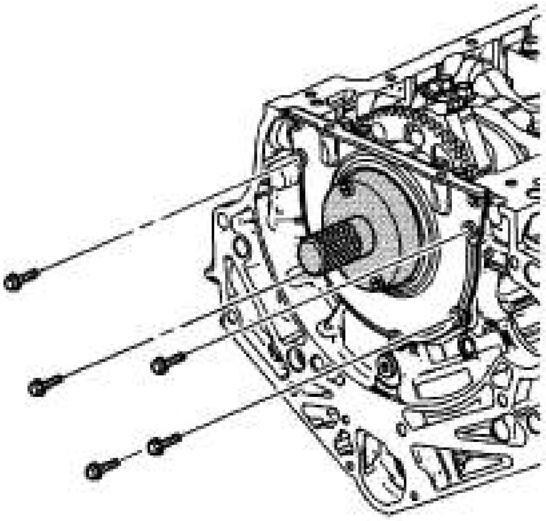
Important: DO NOT allow any engine oil on the area where the crankshaft rear oil seal housing is to be installed.

4. Install the crankshaft rear oil seal housing to the cylinder block.

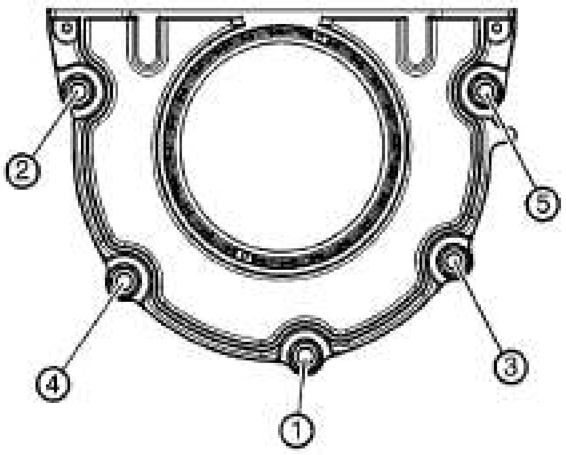


5. Remove the EN 46109 mm (0.236 in) guides from the cylinder block.

   Notice: Refer to Fastener Notice in the Preface section.

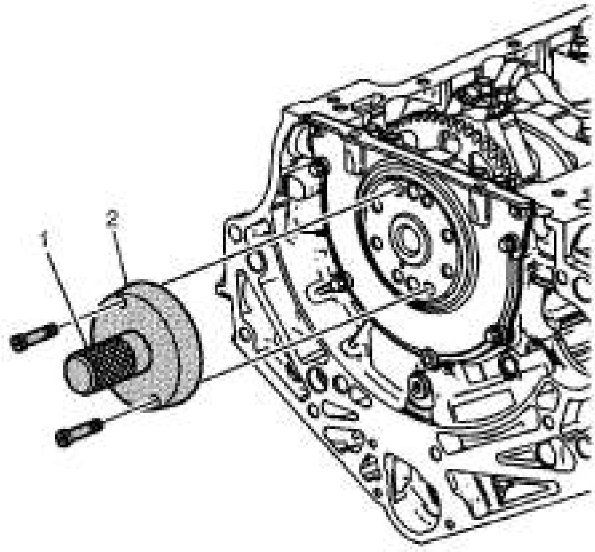


6. Install the crankshaft rear oil seal housing to cylinder block retaining bolts.



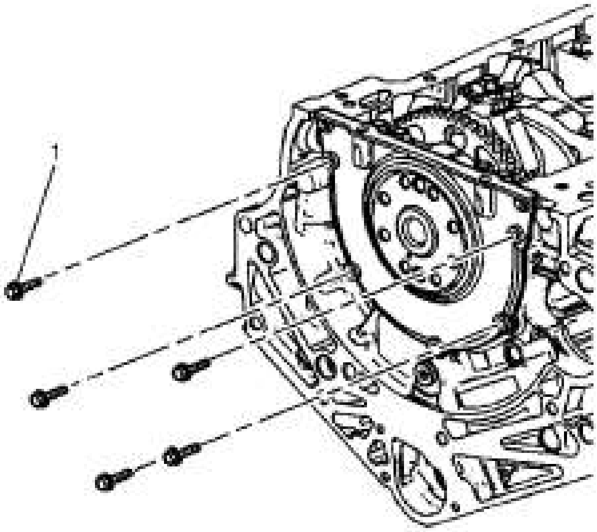
7. Tighten the crankshaft rear oil seal housing bolts in sequence.

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

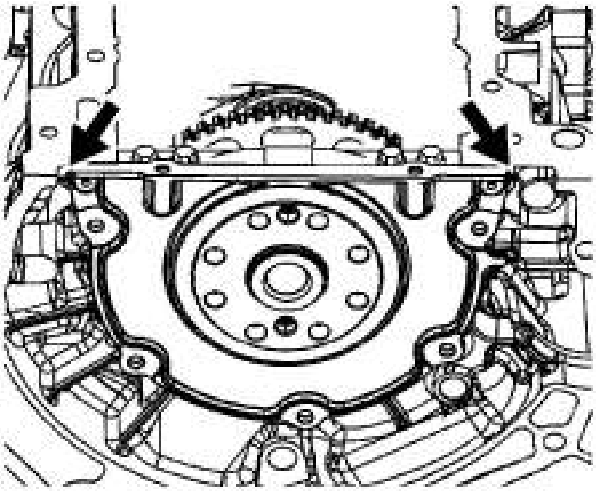


8. Remove the J 42183 (1) and EN-47839 (2) from the crankshaft flange.

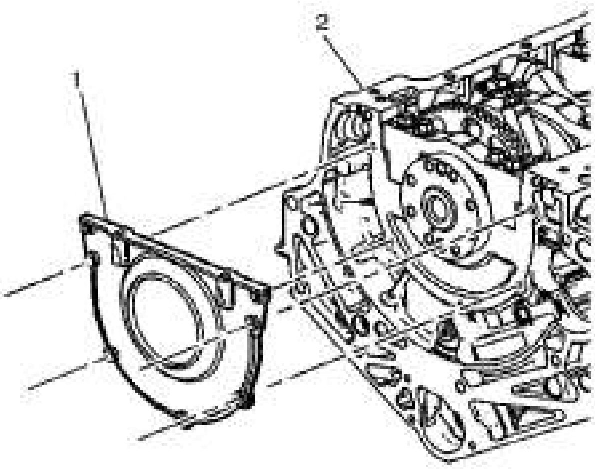
Crankshaft Rear Oil Seal and Housing Removal



1. Remove the crankshaft rear oil seal housing bolts (1).



2. Using the pry points located at the edge of the crankshaft rear oil seal housing shear the RTV sealant.



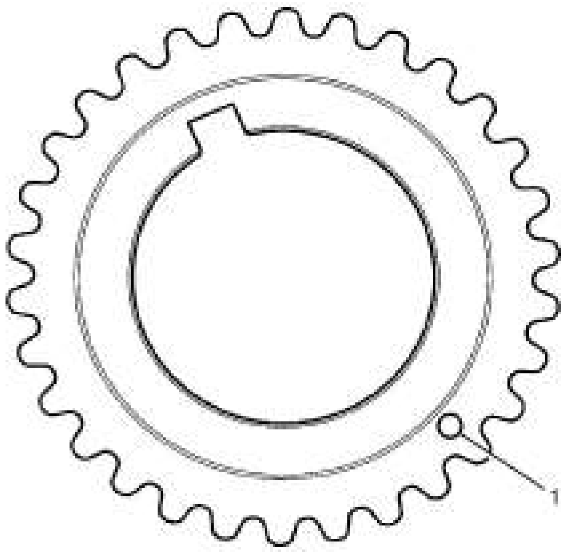
3. Remove and discard the crankshaft rear oil seal housing (1) from the cylinder block (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995363**

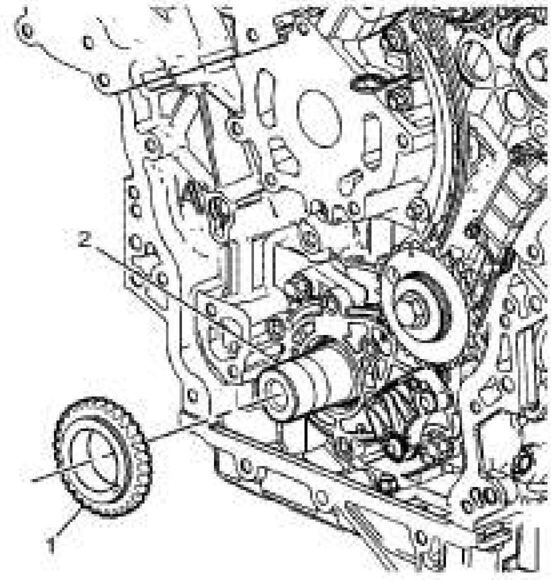
Crankshaft Sprocket Installation

Tools Required

EN 46111 Crankshaft Rotation Socket



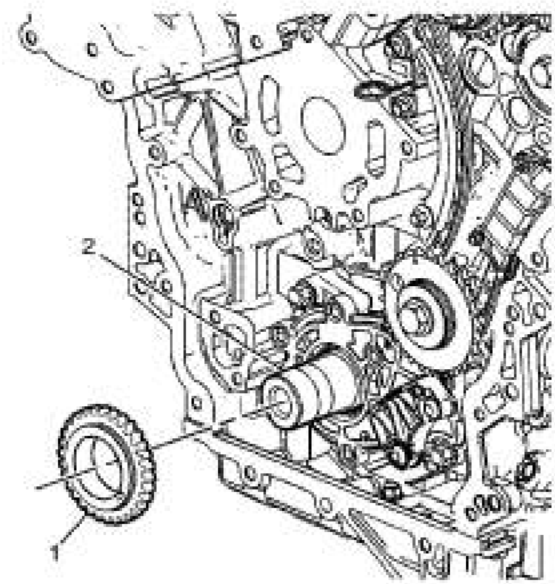
1. Make sure the crankshaft sprocket is installed with the timing mark (1) visible.



2. Install the crankshaft sprocket (1) on to the nose of the crankshaft (2).
3. Align the keyway in the crankshaft sprocket (1) with the key in the crankshaft (2).

4. Slide the crankshaft sprocket on the crankshaft (2) nose until the crankshaft sprocket (1) contacts the step in the crankshaft (2).
5. If necessary, align the crankshaft sprocket to the stage one timing drive assembly position using the EN 46111 . Refer to Camshaft Timing Drive Chain Alignment Diagram.

Crankshaft Sprocket Removal



Remove the crankshaft sprocket (1) from the nose of the crankshaft (2).

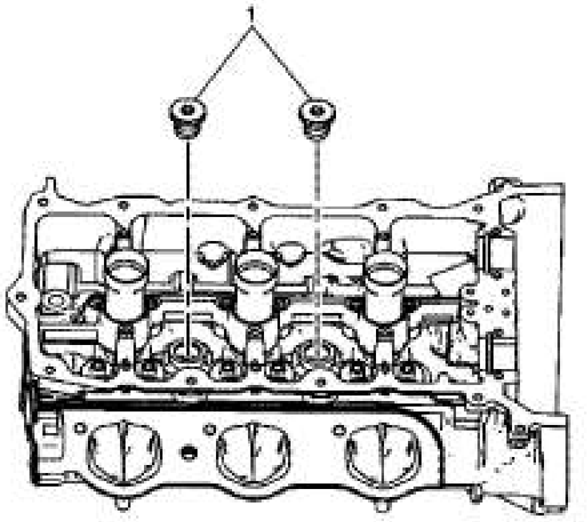
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977539**

Cylinder Head Assemble

Tools Required

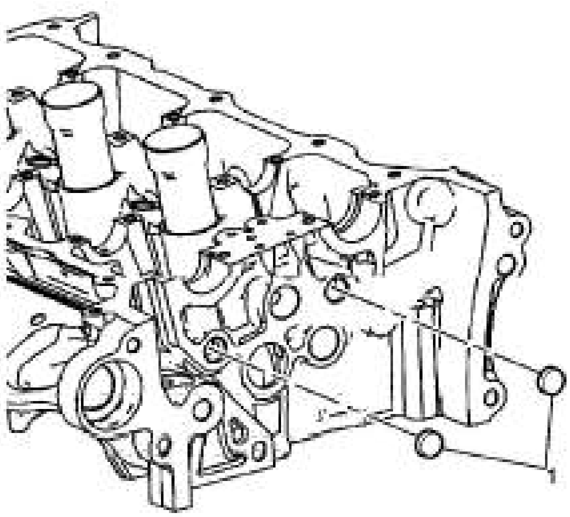
- J 8062 Valve Spring Compressor - Head Off
- EN 46116 Valve Stem Seal Remover/Installer
- EN 46117 Valve Stem Key Remover/Installer
- EN 46119 Off-Vehicle Valve Spring Compressor Adapter

Notice: Refer to Fastener Notice in the Preface section.

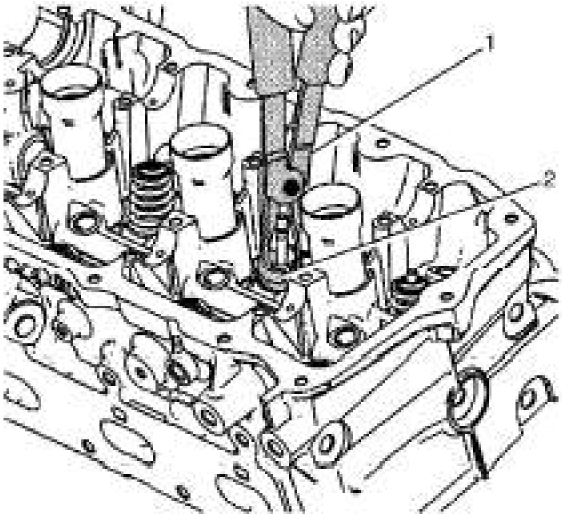


1. Install the cylinder head coolant threaded plugs (1).

   Tighten
   Tighten the threaded plug to 45 N·m (33 lb ft).



2. Install the NEW cylinder head oil gallery expansion plugs (1).



3. Place the valve stem oil seals (2) onto the guides.

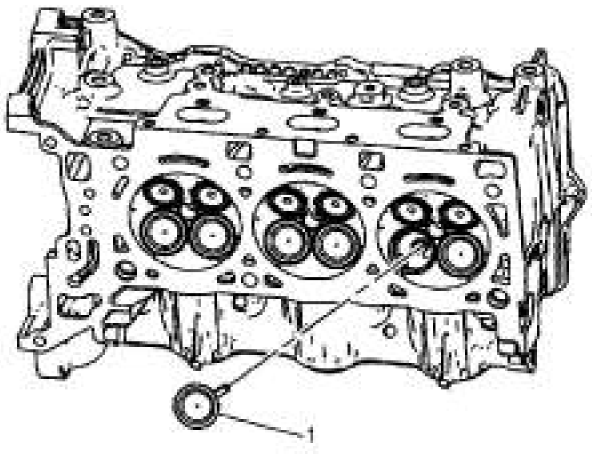
   Important: NEVER reuse a valve stem oil seal (2). Always use new seals when assembling the cylinder head.

4. Mount a new valve stem oil seal (2) using the EN 46116 (1).

   Important: Force should only be applied to the valve spring contact area of the new valve stem oil seal (2) during installation.

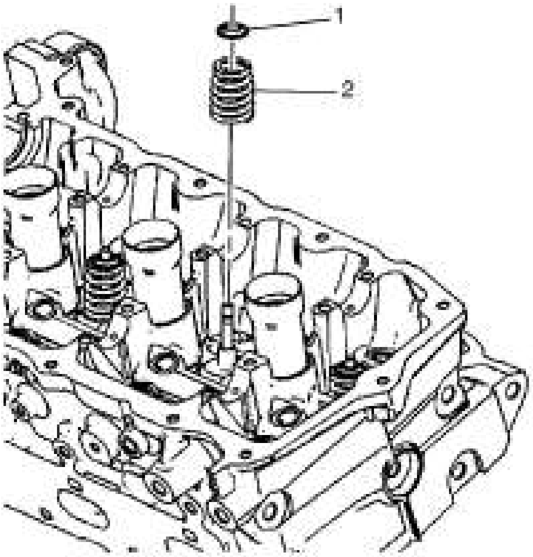
5. Push and twist the valve stem oil seal (2) into position on the valve guide until the seal positively locks on the guide using the EN 46116 (1).

6. Lubricate the valve stem and valve guide ID with clean engine oil.

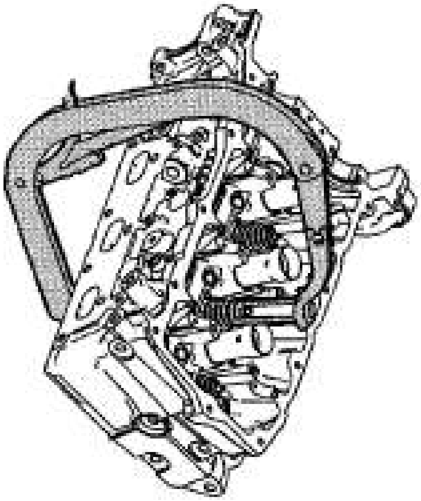


Important: The valve stem oil seal must not come loose from the valve guide when the valve is installed.

7. Insert the valve (1) into the valve guide until it bottoms on the valve seat.



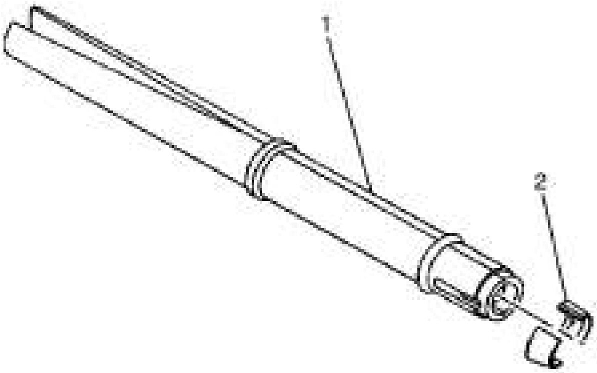
8. Install the valve spring (2).
9. Place the valve spring retainer (1) onto the valve spring (2).



Caution: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

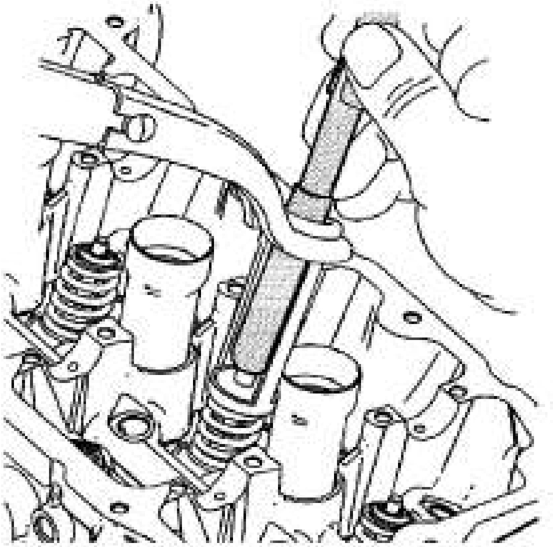
Notice: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

10. Compress the valve spring using the J 8062 and the EN 46119 .



Important: Ensure correct directional placement of valve collets (2) in the EN 46117 (1). The valve collets (2) must be installed with the tapered end towards the valve stem seal.

11. With the spring compressed, install the valve collets (2) into the EN 46117 (1).



12. Place the valve collets into position by pushing the EN 46117 downward and releasing tension on the EN 46119 and the J 8062 .
13. Verify that the valve collets are installed by placing a rag over the valve tip and tapping with a dead-blow hammer. The valve keepers and the spring should remain in place.

Cylinder Head Cleaning and Inspection

Tools Required

- EN 46122 Camshaft Position Actuator Check-Ball Valve Remover/Installer
- J 8001 Dial Indicator Set
- J 8358 Carbon Removal Brush
- J 28410 Gasket Remover
- J 42096 Valve Guide Reamer

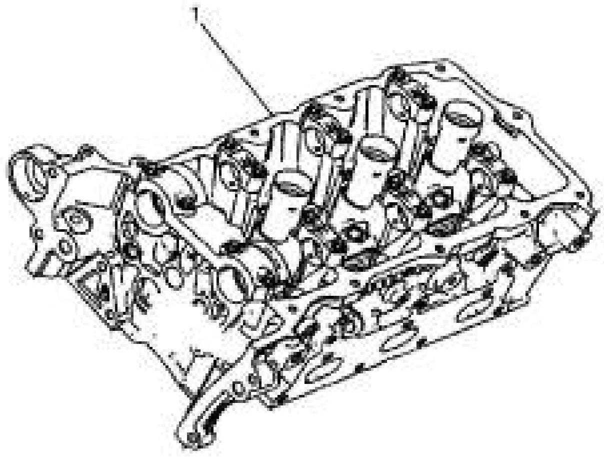
Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant using J 28410 .
2. Clean all cylinder head surfaces with non-corrosive solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

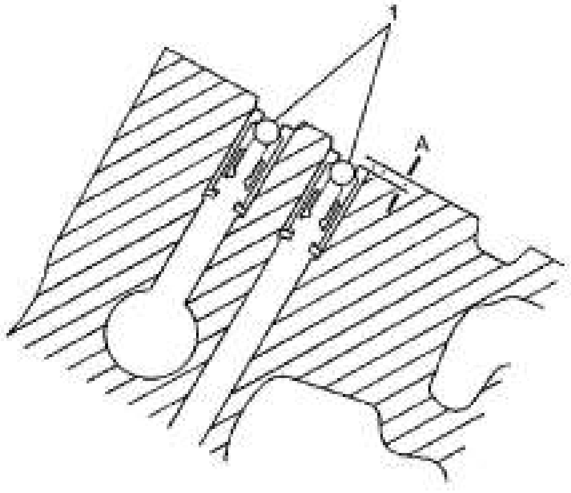
3. Blow out all the oil galleries using compressed air.
4. Remove any carbon deposits from the combustion chambers using the J 8358 .
5. Clean any debris or build-up from the lifter pockets.

Visual Inspection

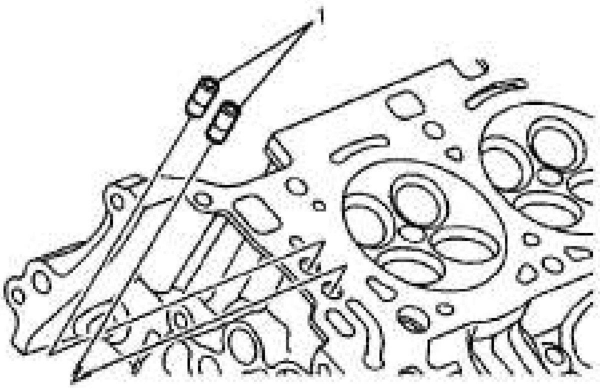


1. Inspect the cylinder head (1) camshaft bearing surfaces for the following conditions:
   - Scoring or pitting above acceptable tolerances
   - Discoloration from overheating

  - Deformation from wear above acceptable tolerances
  - If the camshaft bearing journals appear to be scored or damaged, you must replace the cylinder head. DO NOT machine the camshaft bearing journals.
2. If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head.
3. Inspect the cylinder head for the following:
  - Cracks, damage or pitting in the combustion chambers
  - Debris in the oil galleries -- Continue to clean the galleries until all debris is removed.
  - Coolant leaks or damage to the deck face sealing surface -- If coolant leaks are present, measure the surface warpage as described under Cylinder Head Measurement - Deck Flatness Inspection.
  - Burrs or any defects that may degrade the sealing of the NEW secondary camshaft drive chain tensioner gasket
  - Damage to any gasket surfaces
  - Damage to any threaded bolt holes
  - Burnt or eroded areas in the combustion chamber
  - Cracks in the exhaust ports and combustion chambers
  - External cracks in the water passages
  - Restrictions in the intake or exhaust passages
  - Restrictions in the cooling system passages
  - Rusted, damaged or leaking core plugs
4. If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is recommended.



5. Inspect the camshaft position actuator oil feed check valves (1) in order to ensure they are correctly positioned in the cylinder head. The camshaft position actuator oil feed check valve should be flush to 2 mm (0.0787 in) below the cylinder head deck surface (A).



6. Damaged, restricted or clogged check valves (1) can be replaced using the EN 46122 .

Cylinder Head Measurement

Camshaft Journal Clearance

1. Install the camshaft bearing cap in the cylinder head without the camshaft.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the camshaft cap bolts.

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

3. Measure the camshaft bearings using an inside micrometer.
4. Subtract the camshaft journal diameter from the camshaft bearing diameter. This will provide the running clearance. If the running clearance exceeds specifications and the camshaft journals are within specification, replace the cylinder head.

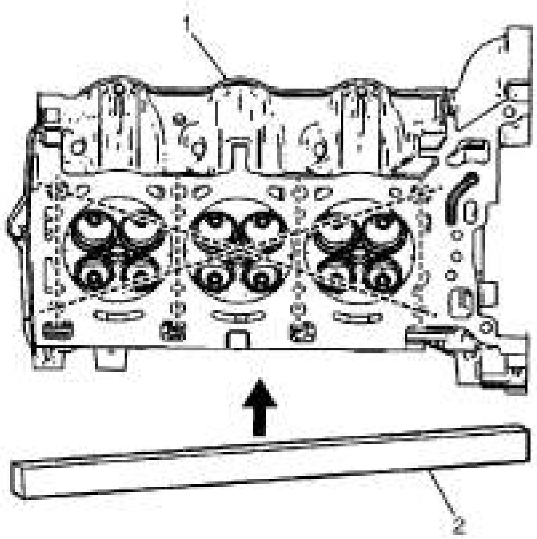
Camshaft Journal Alignment

1. Ensure the camshafts are serviceable.
2. Inspect the cylinder head camshaft bearing surfaces for any imperfections or scratches that may inhibit correct camshaft clearances. Repair minor imperfections or scratches.
3. Install the camshafts in the cylinder head.
4. Install the camshaft bearing caps.
5. Install the camshaft cap bolts.

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

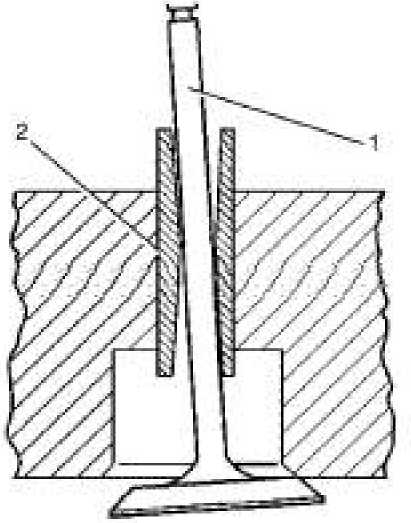
6. Ensure the camshafts spin freely in the cylinder head. If the camshaft does not run freely, replace the cylinder head.

Deck Flatness Inspection



1. Ensure the cylinder head (1) decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that may inhibit correct cylinder head gasket sealing.
3. Place a straight-edge (2) diagonally across the cylinder head (1) deck face surface.
4. Measure the clearance between the straight-edge (2) and the cylinder head (1) deck face using a feeler gage at 4 points along the straight-edge (2).
5. If the warpage is less than 0.05 mm (0.002 in), the cylinder head (1) deck surface does not require resurfacing.
6. If the warpage is between 0.05-0.20 mm (0.002-0.008 in) or any imperfections or scratches that may inhibit correct cylinder head gasket sealing are present, the cylinder head (1) deck surface requires resurfacing.
7. If resurfacing is required the maximum amount that can be removed is 0.25 mm (0.010 in).
8. If the cylinder head (1) deck surface requires more than 0.25 mm (0.010 in) material removal the cylinder head (1) must be replaced.

Valve Guide Measurement

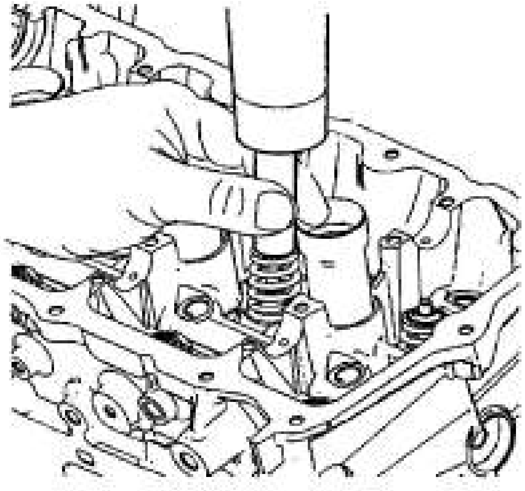


1. Measure the valve stem (1)-to-guide (2) clearance. Valve stem-to-guide clearance above acceptable tolerances may cause oil consumption above acceptable tolerances and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.
2. Clamp the J 8001 to the cylinder head at the camshaft cover rail.
3. Locate the dial indicator so that the movement of the valve stem (1) from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem (1) just above the valve guide (2).
4. Drop the valve head about 0.064 mm (0.0025 in) off the valve seat.
5. Use light pressure when moving the valve stem (1) from side to side in order to obtain a clearance reading. Refer to Engine Mechanical Specifications .
    - If the clearance for the valve is greater than specifications and a new standard diameter valve stem will not bring the clearance within specifications, the valve guide may be oversized by 0.075 mm (0.003 in) using the J 42096 . There is 1 size of oversized valve stem available for service.
    - Valve guide wear at the bottom 10 mm (0.390 in) of the valve guide is not significant to normal operation.
    - If oversizing the guide does not bring the clearance within specifications, replace the cylinder head.

Cylinder Head Disassemble

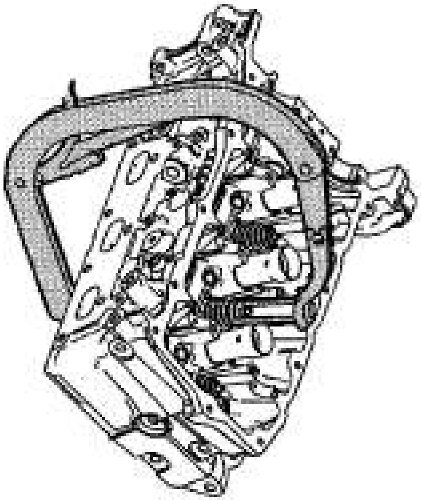
Tools Required

- EN 46116 Valve Stem Seal Remover/Installer
- EN 46117 Valve Stem Key Remover/Installer
- EN 46119 Off-Vehicle Valve Spring Compressor Adapter
- J 8062 Valve Spring Compressor - Head Off



Important: Make sure valve heads will not contact anything during the following step in order to avoid bending or damage.

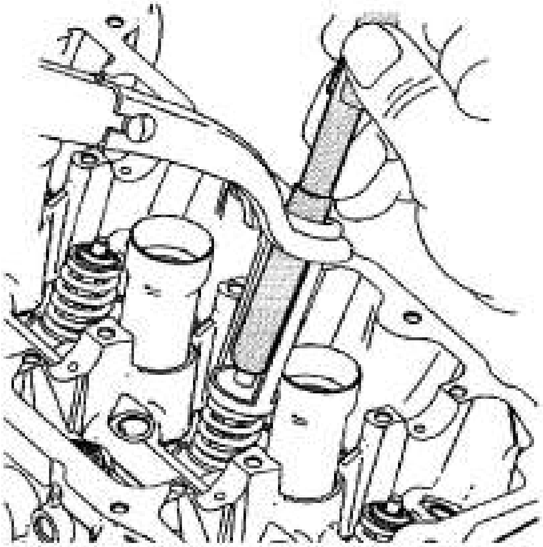
1. Using an appropriately sized deep socket and a plastic hammer, lightly tap on the valve spring retainer to loosen the valve collets.



Caution: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

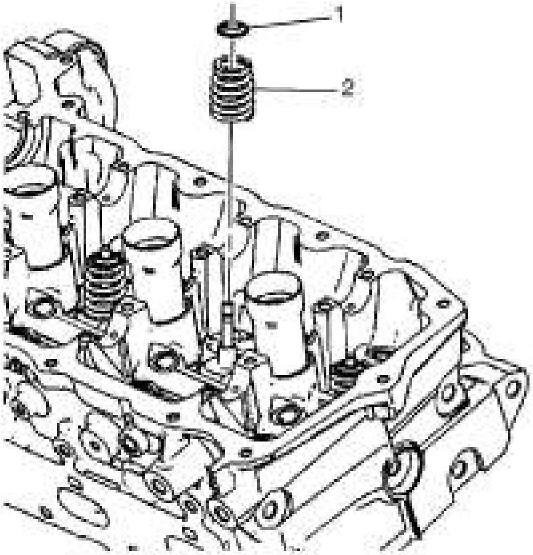
Notice: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

2. Compress the valve spring using the J 8062 and the EN 46119 .

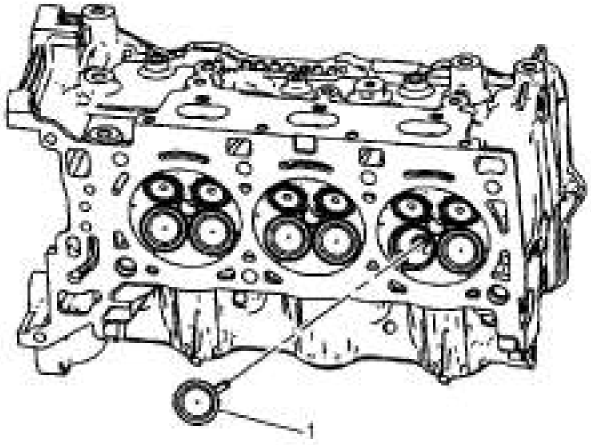


3. Use the magnet of the EN 46117 in order to remove the valve collets.

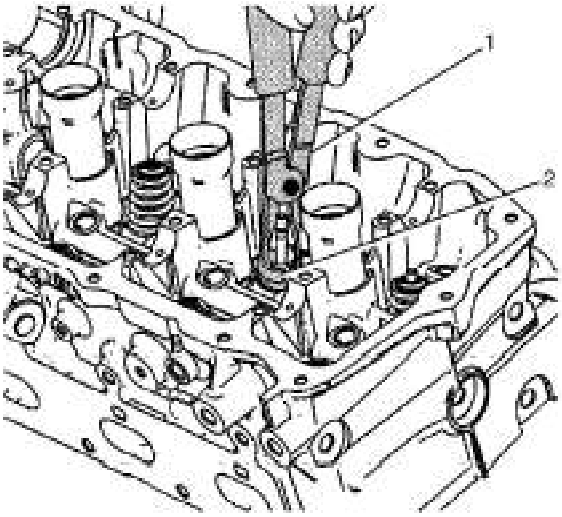
4. Remove the valve spring compressor and the adapter.



5. Remove the valve spring retainer (1).
6. Remove the valve spring (2).



7. Remove the valve (1).

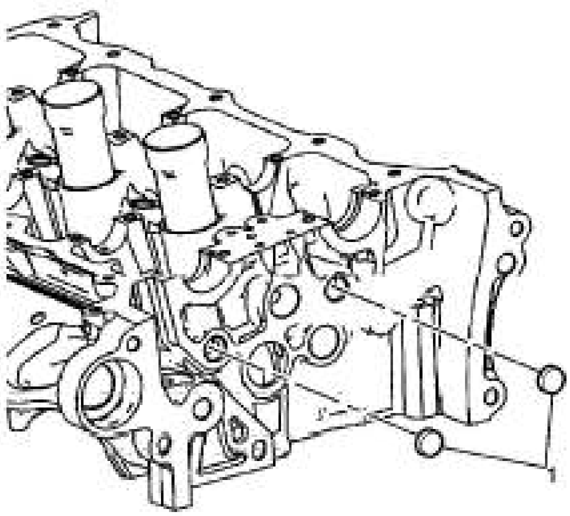


Important: NEVER reuse a valve stem oil seal.

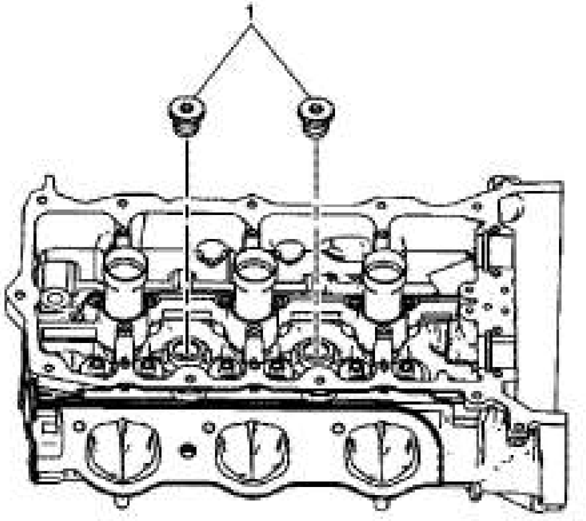
8. Remove the valve stem oil seal (2) using the EN 46116 (1).

   Discard the valve stem oil seals.

9. Repeat these procedures for the remaining valves.



10. Remove the cylinder head oil gallery expansion plugs (1).



11. Remove the cylinder head coolant threaded plugs (1).

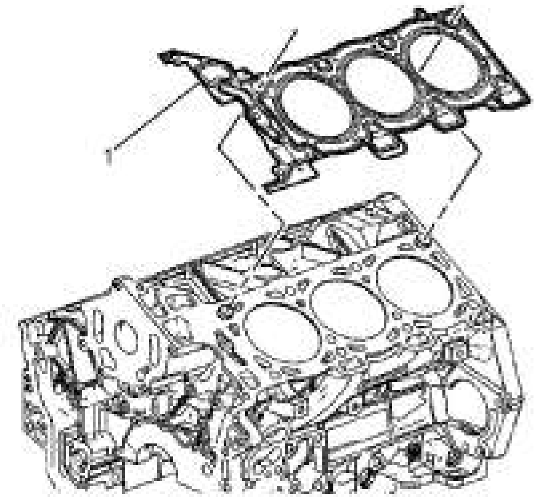
Cylinder Head Installation - Left Side

Tools Required

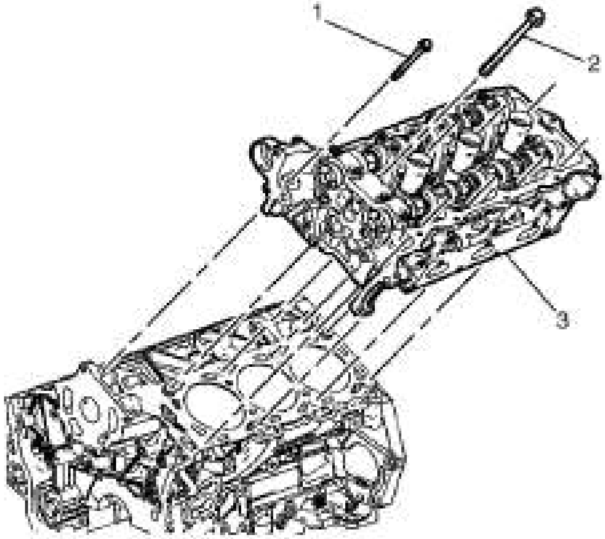
- EN 46111 Crankshaft Rotation Socket
- J 45059 Angle Meter

Important: Make sure that the crankshaft is in the timing drive assembly position using the EN 46111 .

1. Make sure the cylinder head locating pins are securely mounted in the cylinder block deck face.



2. Install a NEW left cylinder head gasket (1) using the deck face locating pins for retention.



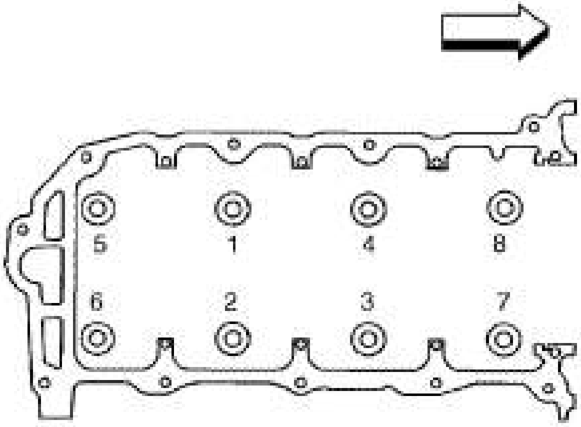
3. Align the left cylinder head (3) with the deck face locating pins.
4. Place the left cylinder head (3) in position on the deck face.

Important: DO NOT allow oil on the cylinder head bolt bosses.

Important: DO NOT reuse the old M11 cylinder head bolts.

5. Loosely install the NEW M11 cylinder head to cylinder block retaining bolts (2).
6. Loosely install the NEW M8 front cylinder head to cylinder block retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.



7. Tighten the cylinder head to cylinder block retaining bolts in the sequence shown.

   Tighten
   Tighten the M11 cylinder head to cylinder block retaining bolts a first pass in sequence to 45 N·m (33 lb ft).

   7.1. Back off the M11 cylinder head to cylinder block retaining bolts 120 degrees using the J 45059 J 45059.
   7.2. Tighten the M11 cylinder head to cylinder block retaining bolts a second pass in sequence to 30 N·m (22 lb ft).
   7.3. Tighten the M11 cylinder head to cylinder block retaining bolts a third pass in sequence an additional 150 degrees using the J 45059 J 45059.
8. Install the 2 front M8 left cylinder head to cylinder block retaining bolts (9, 10).

   Tighten
   Tighten the M8 cylinder head to cylinder block retaining bolts (9, 10) a first pass to 15 N·m (11 lb ft).

   Tighten the M8 cylinder head to cylinder block retaining bolts (9, 10) a second pass in sequence an additional 60 degrees using the J 45059 .

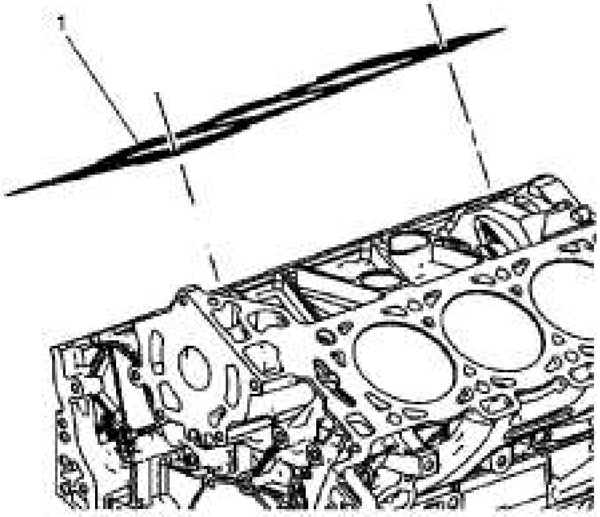
Cylinder Head Installation - Right Side

Tools Required

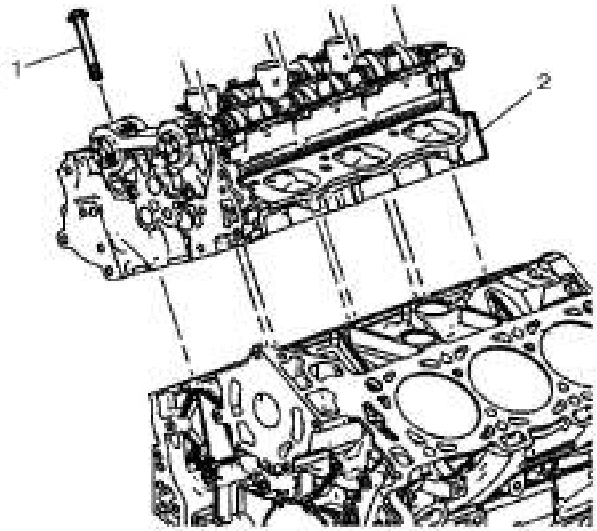
- EN 46111 Crankshaft Rotation Socket
- J 45059 Angle Meter

Important: Make sure that the crankshaft is in the timing drive assembly position using the EN 46111 .

1. Make sure the cylinder head locating pins are securely mounted in the cylinder block deck face.



2. Install a NEW right cylinder head gasket (1) using the deck face locating pins for retention.



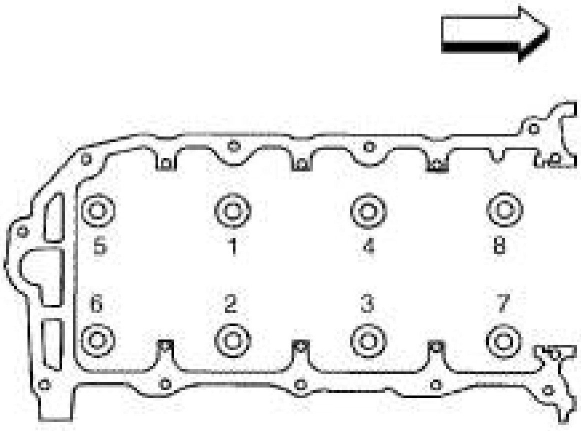
3. Align the right cylinder head (2) with the deck face locating pins.
4. Place the right cylinder head (2) in position on the deck face.

Important: DO NOT allow oil on the cylinder head bolt bosses.

Important: DO NOT reuse the old M11 cylinder head bolts.

5. Loosely install the NEW M11 and M8 cylinder head to cylinder block retaining bolts (1).

Notice: Refer to Fastener Notice in the Preface section.



6. Tighten the cylinder head to cylinder block retaining bolts in the sequence shown.

Tighten
Tighten the M11 cylinder head to cylinder block retaining bolts a first pass in sequence to 45 N·m (33 lb ft).

   6.1. Back off the M11 cylinder head to cylinder block retaining bolts 120 degrees using the J 45059 .
   6.2. Tighten the M11 cylinder head to cylinder block retaining bolts a second pass in sequence to 30 N·m (22 lb ft).
   6.3. Tighten the M11 cylinder head to cylinder block retaining bolts a third pass in sequence an additional 150 degrees using the J 45059 .

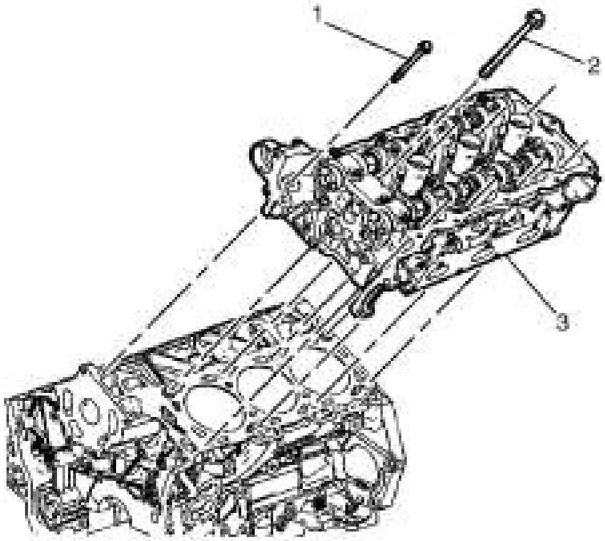
7. Install the 2 front M8 left cylinder head to cylinder block retaining bolts (9, 10).

Tighten
Tighten the M8 cylinder head to cylinder block retaining bolts (9, 10) a first pass to 15 N·m (11 lb ft).

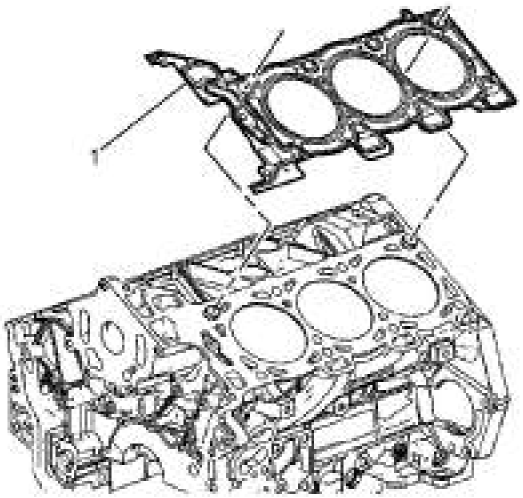
Tighten the M8 cylinder head to cylinder block retaining bolts (9, 10) a second pass in sequence an additional 60 degrees using the J 45059 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977528**

Cylinder Head Removal - Left Side

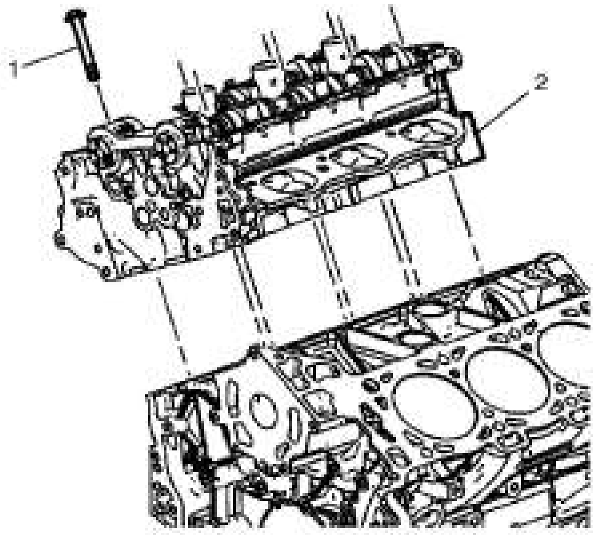


1. Remove the left bank cylinder head to cylinder block retaining bolts (1 and 2).
2. Remove the left bank cylinder head (3).

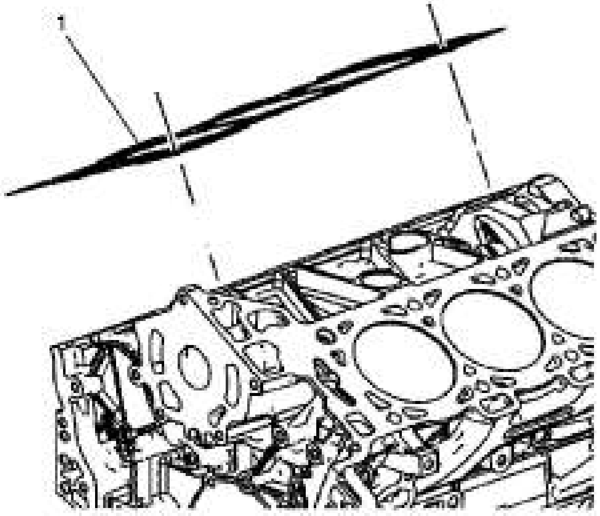


3. Remove and discard the left cylinder head gasket (1).

Cylinder Head Removal - Right Side

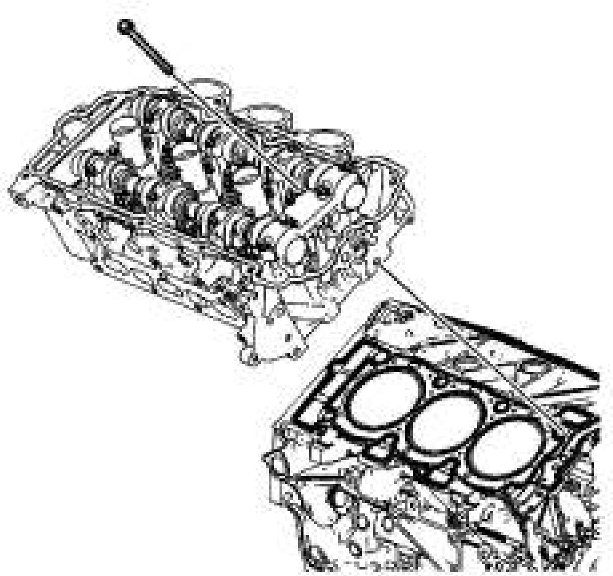


1. Remove the right bank cylinder head to cylinder block retaining bolts (1).
2. Remove the right bank cylinder head (2).

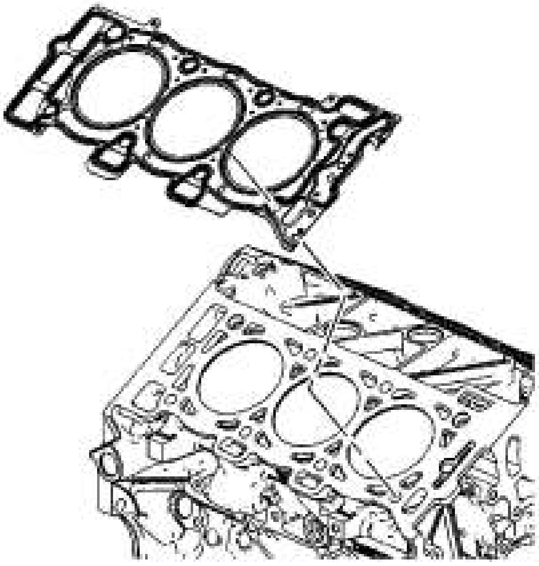


3. Remove and discard the right cylinder head gasket (1).

Cylinder Head Removal - Right Side (LLT)

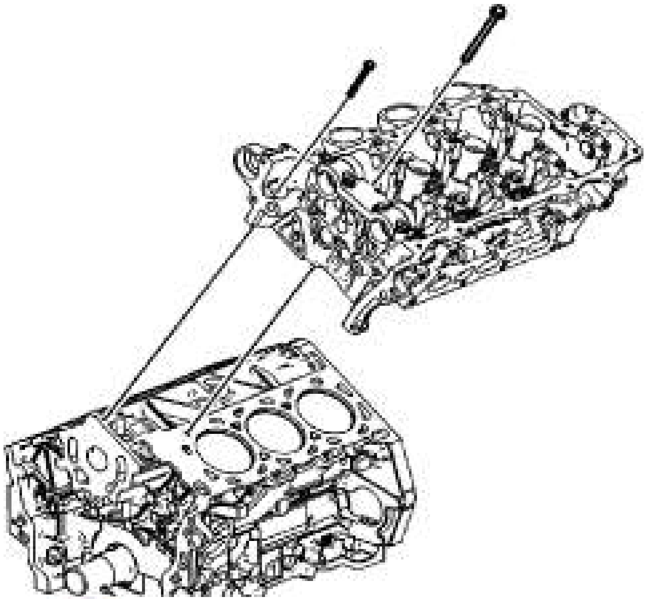


1. Remove the right cylinder head bolts.
2. Remove the right cylinder head.

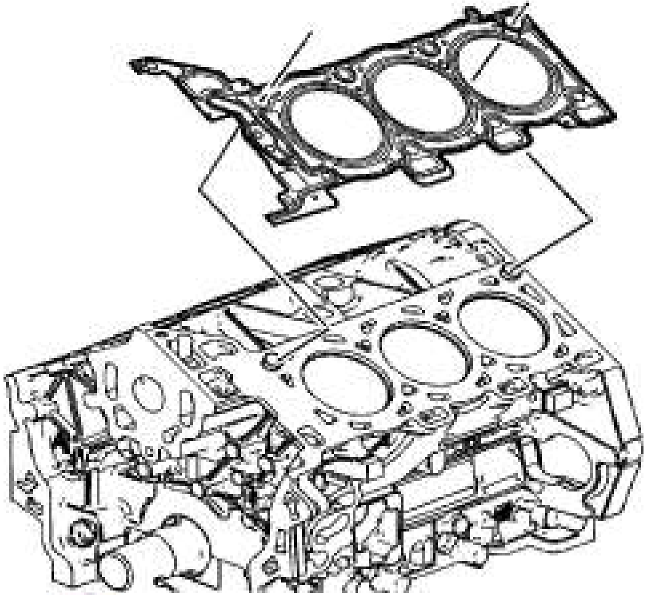


3. Remove and discard the right cylinder head gasket.

Cylinder Head Removal - Left Side (LLT)



1. Remove the two front M8 left cylinder head bolts.
2. Remove the left cylinder head bolts.
3. Remove the left cylinder head.



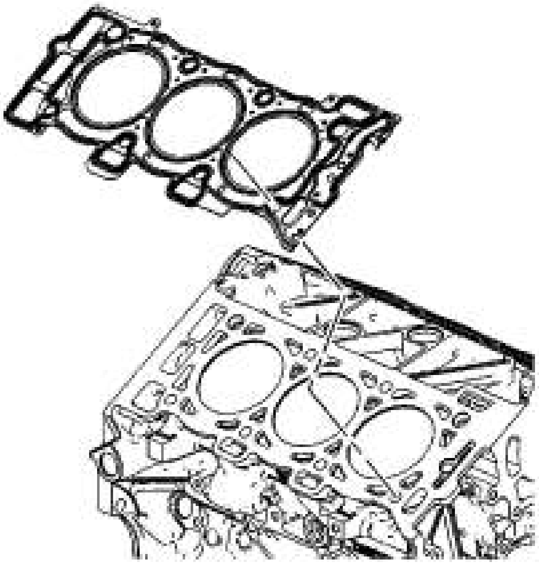
4. Remove and discard the left cylinder head gasket.

Cylinder Head Installation - Right Side (LLT)

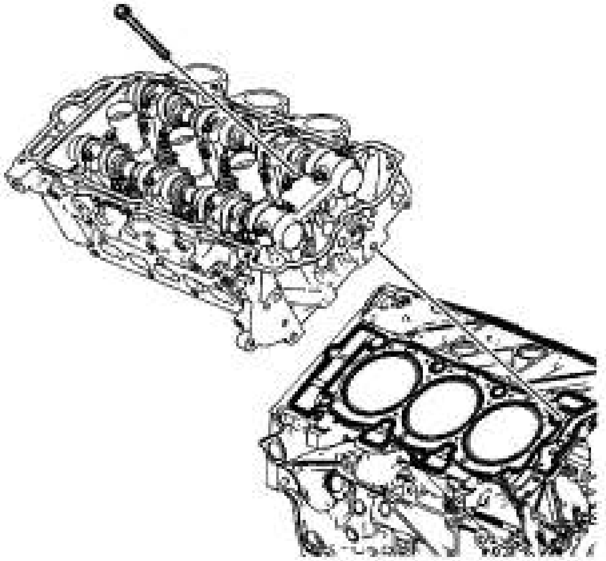
Special Tools

J 45059 Angle Meter

For equivalent regional tools, refer to Special Tools

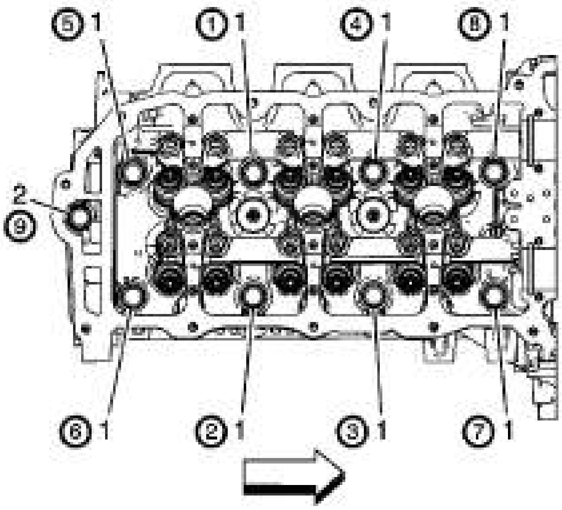


1. Ensure the cylinder head locating pins are securely mounted in the cylinder block deck face.
2. Install a NEW right cylinder head gasket using the deck face locating pins for retention.



3. Align the right cylinder head with the deck face locating pins.
4. Place the right cylinder head in position on the deck face.

Caution: Refer to Fastener Caution in the Preface section.



Note: DO NOT allow oil on the cylinder head bolt bosses.

Note: DO NOT reuse the old cylinder head bolts.

5. Install the NEW M11 cylinder head bolts (1).
   - 5.1. Tighten the M11 cylinder head bolts a first pass in sequence to **30 N·m (22 lb ft)**.
   - 5.2. Tighten the M11 cylinder head bolts a second pass in sequence an additional **150 degrees** using the *J 45059* meter .
6. Install the NEW M8 cylinder head bolt (2).
   - 6.1. Tighten the M8 cylinder head bolt a first pass to **15 N·m (11 lb ft).**
   - 6.2. Tighten the M8 cylinder head bolt a second pass an additional **75 degrees** using the *J 45059* meter .

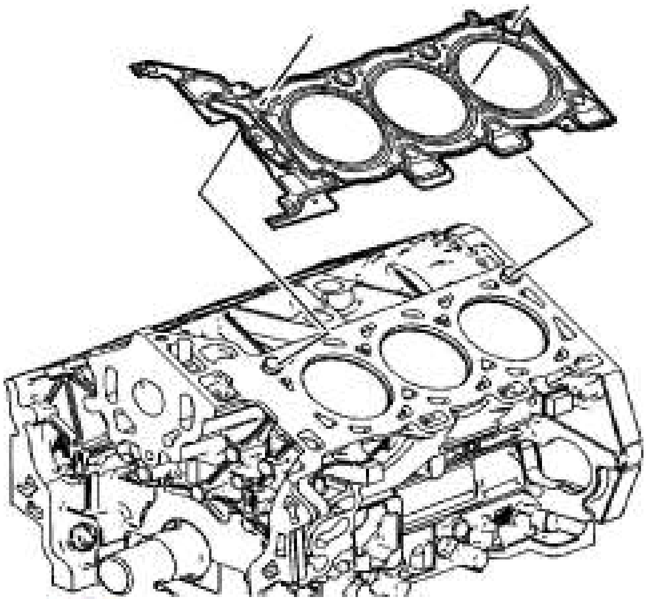
2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2134562**

Cylinder Head Installation - Left Side (LLT)

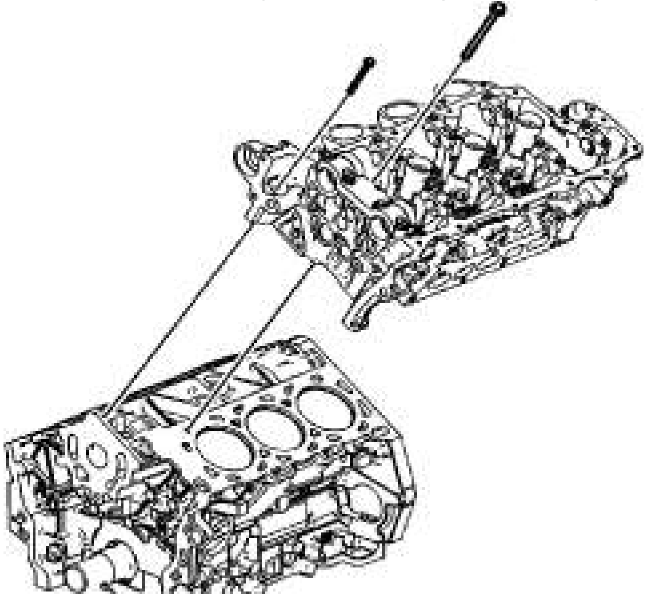
Special Tools

J 45059 Angle Meter

For equivalent regional tools, refer to Special Tools.

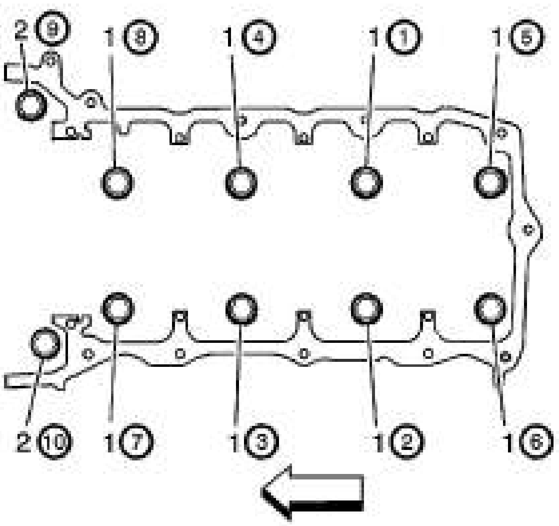


1. Ensure the cylinder head locating pins are securely mounted in the cylinder block deck face.
2. Install a NEW left cylinder head gasket using the deck face locating pins for retention.



3. Align the left cylinder head with the deck face locating pins.
4. Place the left cylinder head in position on the deck face.

Caution: Refer to Fastener Caution in the Preface section.



Note: DO NOT allow oil on the cylinder head bolt bosses.

Note: DO NOT reuse the old cylinder head bolts.

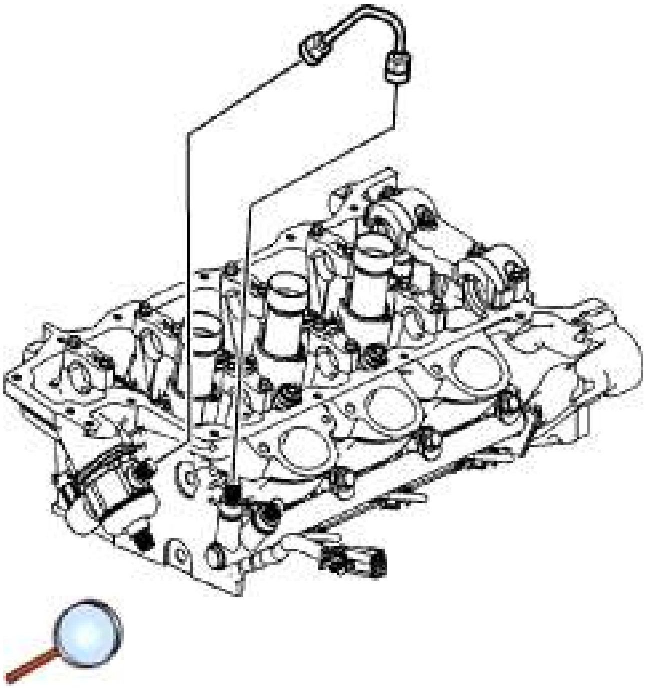
5. Install the NEW M11 cylinder head bolts (1).
   - 5.1. Tighten the M11 cylinder head bolts a first pass in sequence to **30 N·m (22 lb ft)**.
   - 5.2. Tighten the M11 cylinder head bolts a second pass in sequence an additional **150 degrees** using the *J 45059* meter .
6. Install the 2 NEW front M8 left cylinder head bolts (2).
   - 6.1. Tighten the M8 cylinder head bolts a first pass to **15 N·m (11 lb ft)**.
   - 6.2. Tighten the M8 cylinder head bolts a second pass in sequence an additional **75 degrees** using the *J 45059* meter .

Cylinder Head Disassemble (LLT)

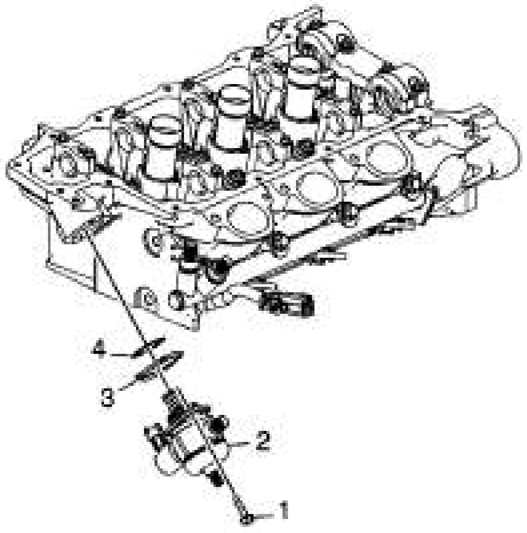
Special Tools

- *EN 46116* Valve Stem Seal Remover/Installer
- *EN 46117* Valve Stem Key Remover/Installer
- *EN 46119* Off-Vehicle Valve Spring Compressor Adapter
- *EN-46122* Camshaft Position Actuator Check-Ball Valve Remover/Installer
- *J 8062* Valve Spring Compressor - Head Off
- *J 2619-01* Slide Hammer
- *J-37281-A* Injector Remover

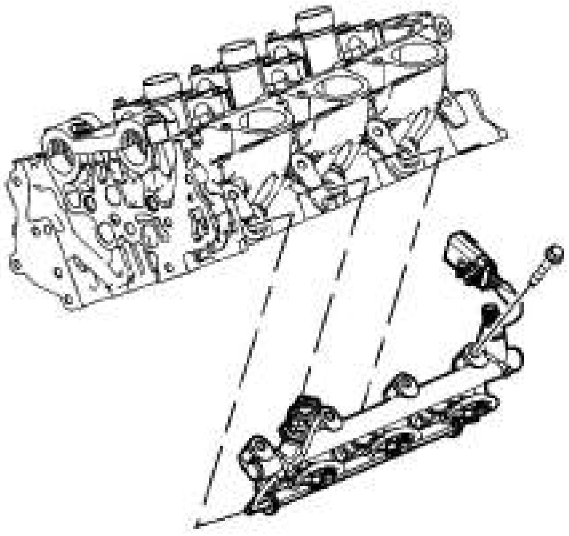
For equivalent regional tools, refer to Special Tools.



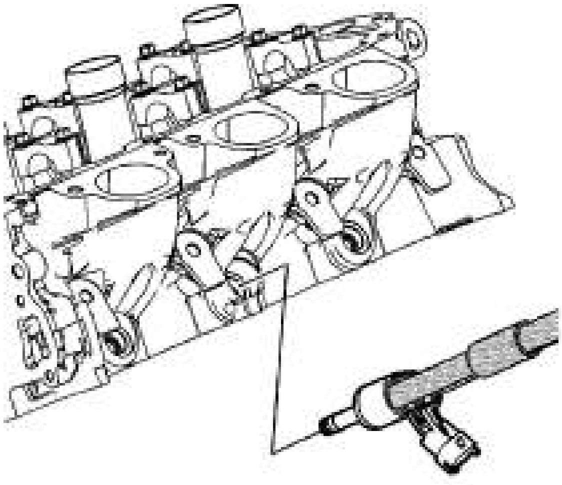
1. Remove and discard high pressure fuel line. - LH Cylinder Head



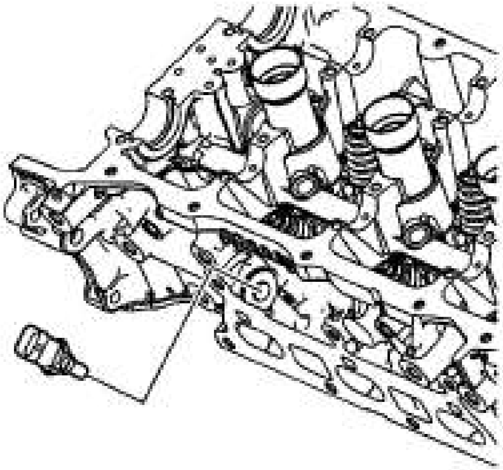
2. Remove and discard high pressure fuel pump bolts (1). - LH Cylinder Head
3. Remove the high pressure fuel pump (2). - LH Cylinder Head
4. Remove and discard the high pressure fuel pump gasket (3). - LH Cylinder Head
5. Remove and discard the high pressure fuel pump O-ring (4). - LH Cylinder Head



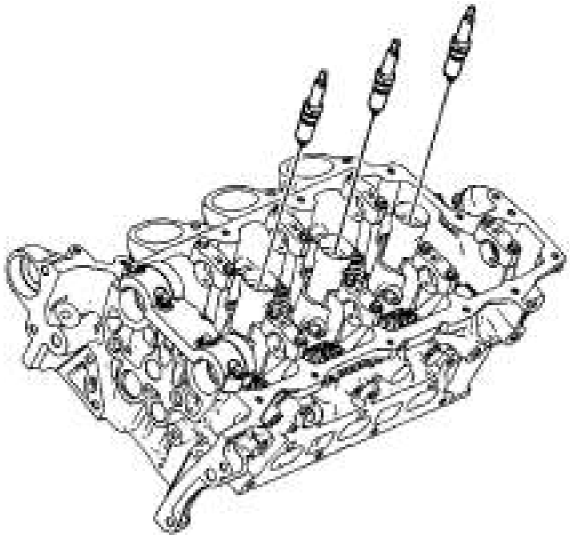
6. Remove the fuel rail bolts.
7. Remove the fuel rail and injectors.



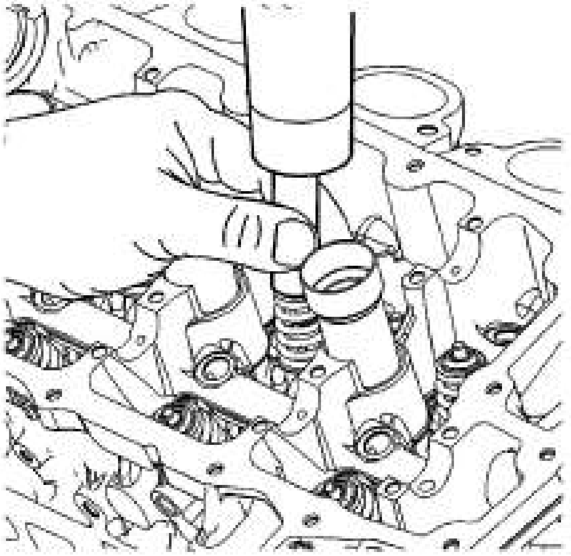
8. The injectors may stay in the cylinder head. Remove the fuel injector hold-down clamp before removing the injector.
9. Use the *J-37281-A* remover and the *J 2619-01* hammer to remove the injector.



10. Remove the engine coolant temperature (ECT) sensor. - LH Cylinder Head

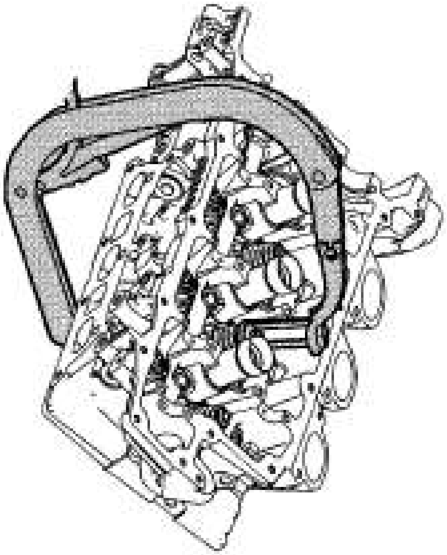


11. Remove the spark plugs.



Note: Ensure valve heads will not contact anything during the following step in order to avoid bending or damage.

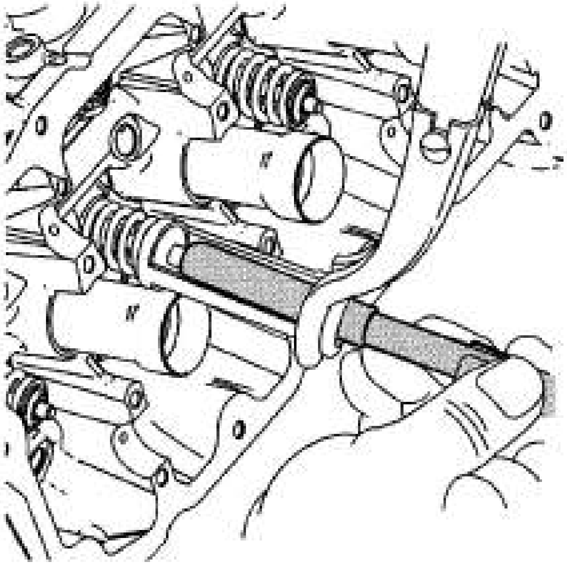
12. Using an appropriately sized deep socket and a plastic hammer, lightly tap on the valve spring retainer to loosen the valve keepers.



Warning: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

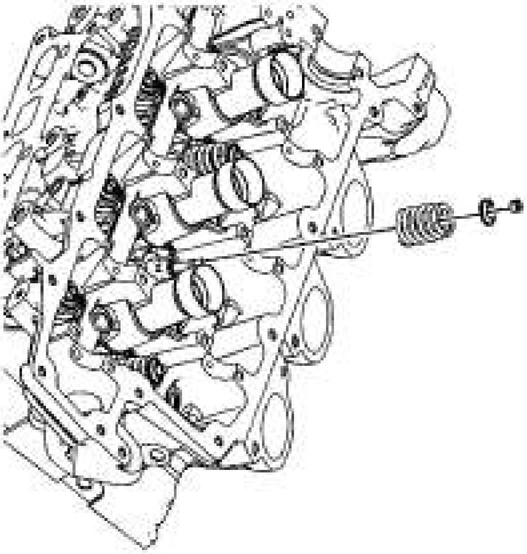
Caution: Do not compress the valve springs less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

13. Compress the valve spring using the *J 8062* compressor and the *EN 46119* adapter .

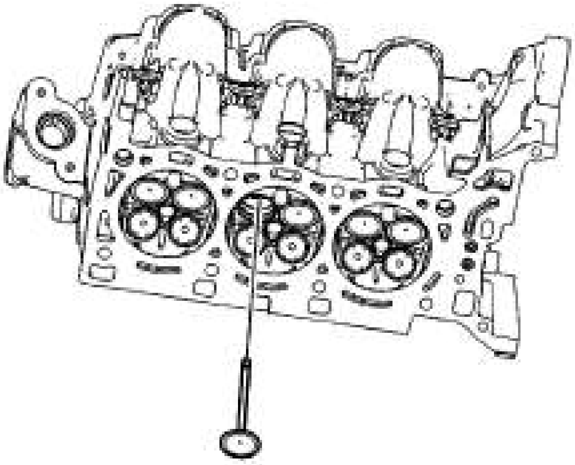


14. Use the magnet of the *EN 46117* remover/installer in order to remove the valve keepers.

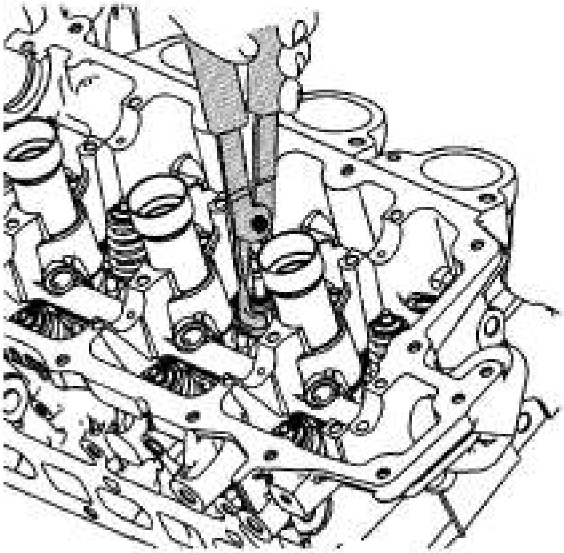
15. Remove the valve spring compressor and the adapter.



16. Remove the valve spring retainer.
17. Remove the valve spring.

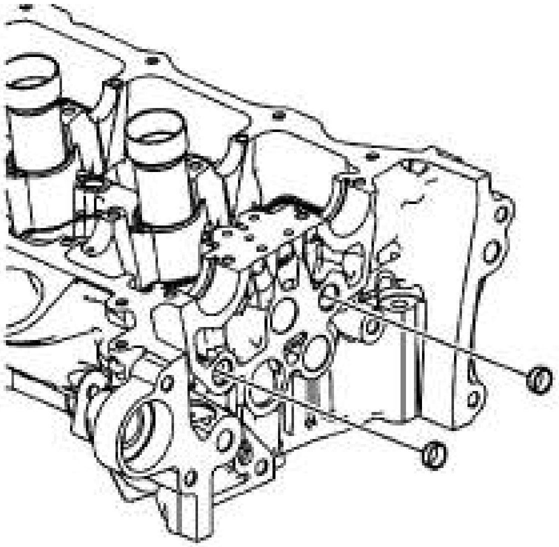


18. Remove the valve.

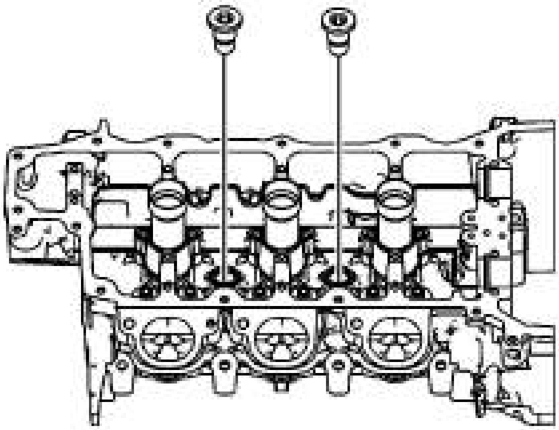


Note: NEVER reuse a valve stem oil seal.

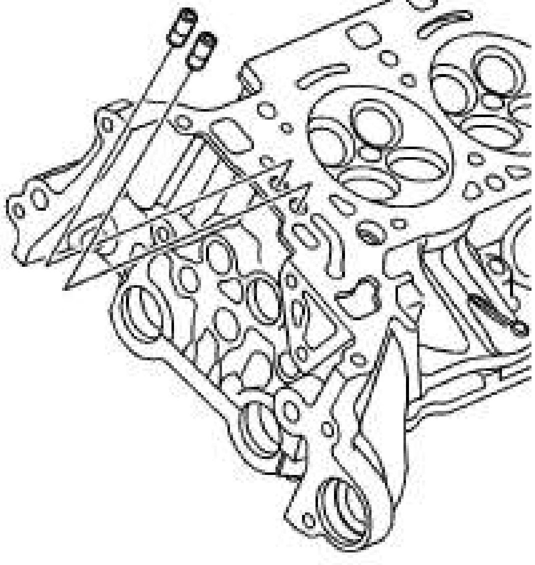
19. Remove the valve stem oil seal using the *EN 46116* remover/installer and discard.
20. Repeat these procedures for the remaining valves.



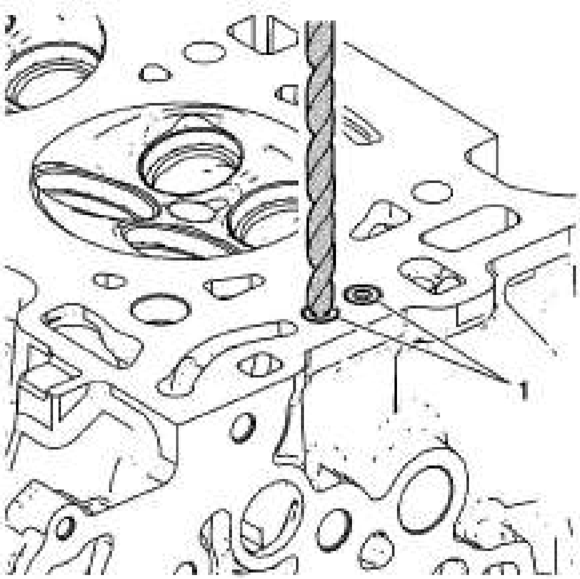
21. Remove the cylinder head oil gallery expansion plugs.



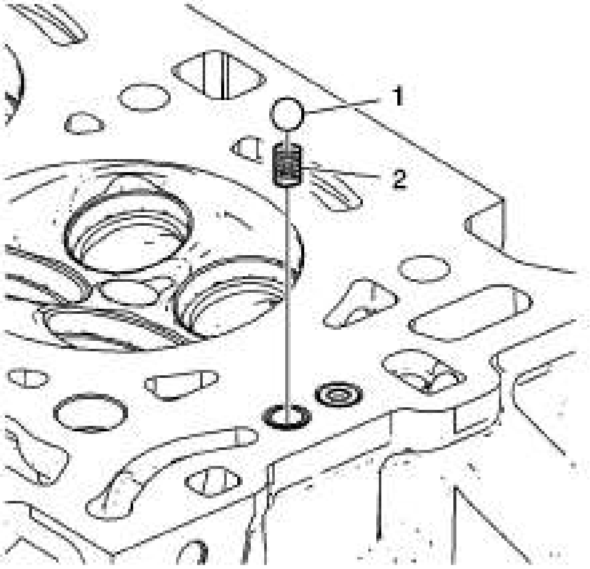
22. Remove the cylinder head coolant threaded plugs.



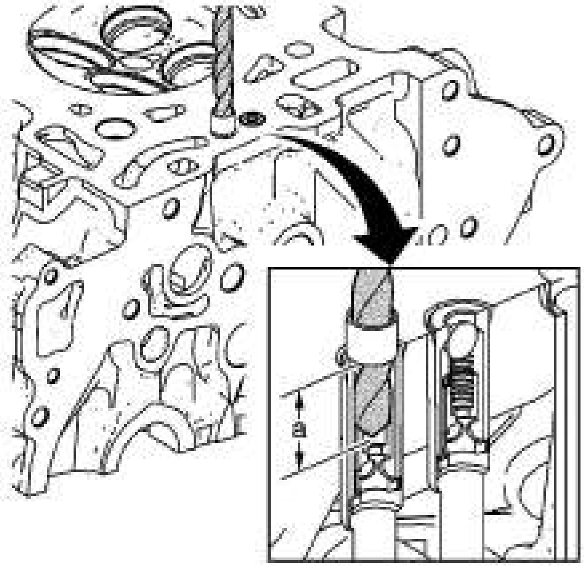
23. Inspect the camshaft position actuator oil feed check valves. Damaged, restricted or clogged check valves must be replaced.



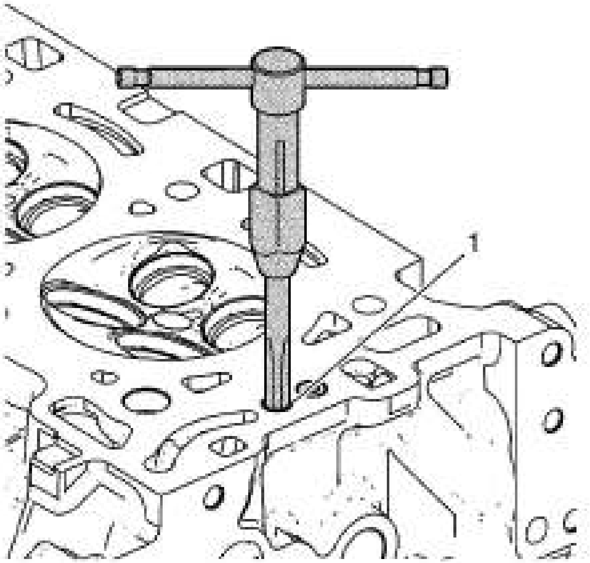
24. Place cylinder head on firm surface with check valves (1) facing up. Protect all cylinder head components and machined surfaces.
25. Using drill bit EN-46122-3, drill out top portion of check valve to expose internal check ball.



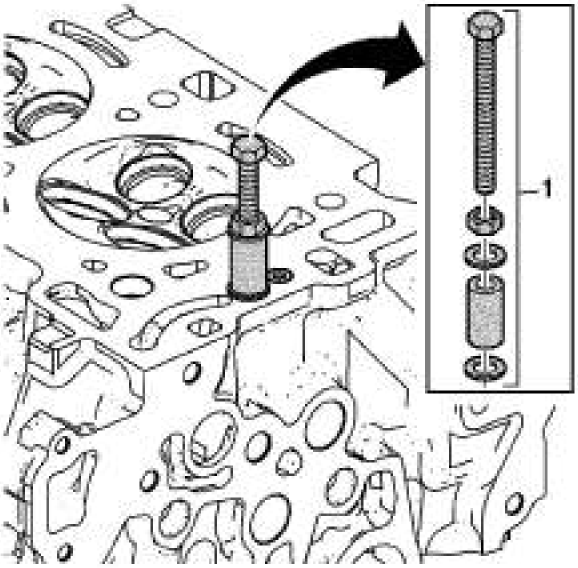
26. Remove check ball (1) and check ball spring (2) from inside of check valve.



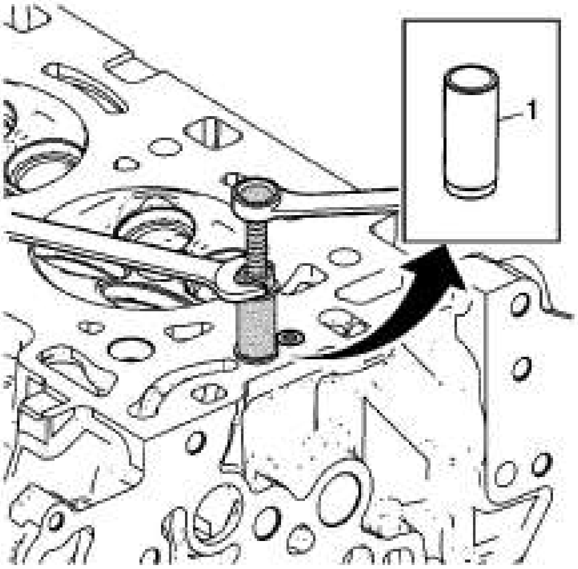
27. Continue drilling remainder of check valve sleeve to a depth of approximately 19 mm (0.75 in) (a) by placing tape on drill bit as a depth gauge. It is not necessary or desirable to drill completely through the bottom of the check valve.



28. Lubricate tap EN-46122-4 with lubricant included in *EN-46122* remover/installer . Tap drilled out portion of check valve (1) remaining in cylinder head. Tap to full depth possible until tap bottoms out in head.



29. Assemble bolt, nut, washers, and collar EN-46122-2 (1) as shown. Position collar with slightly-larger inside diameter DOWN toward the cylinder head.
30. Screw bolt by hand fully down into threaded check valve sleeve, then lightly tighten nut against washer.



31. Hold bolt with one wrench, and use another to tighten the nut until the check valve sleeve (1) is removed from the cylinder head.
32. Clean check valve bore and related passages thoroughly to remove any drilling chips or other debris.

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2135557**

Cylinder Head Cleaning and Inspection (LLT)

Special Tools

- *EN-47909* Injector Bore and Sleeve Cleaning Kit
- *J 8001* Dial Indicator Set
- *J 8358* Carbon Removal Brush
- *J 28410* Gasket Remover
- *J 42096* Valve Guide Reamer

  For equivalent regional tools, refer to Special Tools.

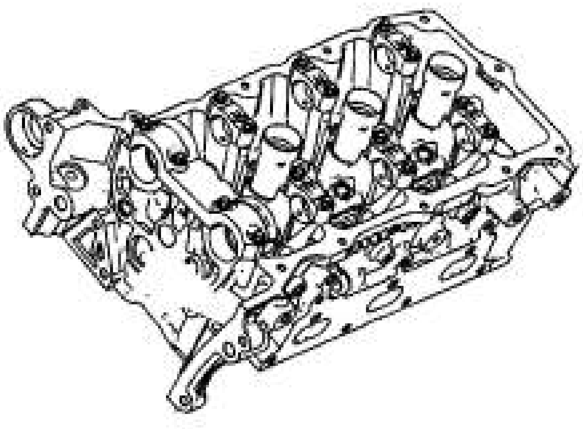
Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant using *J 28410* remover .
2. Clean all cylinder head surfaces with non-corrosive solvent.

   Warning: Refer to Safety Glasses Warning in the Preface section.

3. Blow out all the oil galleries using compressed air.
4. Remove any carbon deposits from the combustion chambers using the *J 8358* brush .
5. Clean any debris or build-up from the lifter pockets.

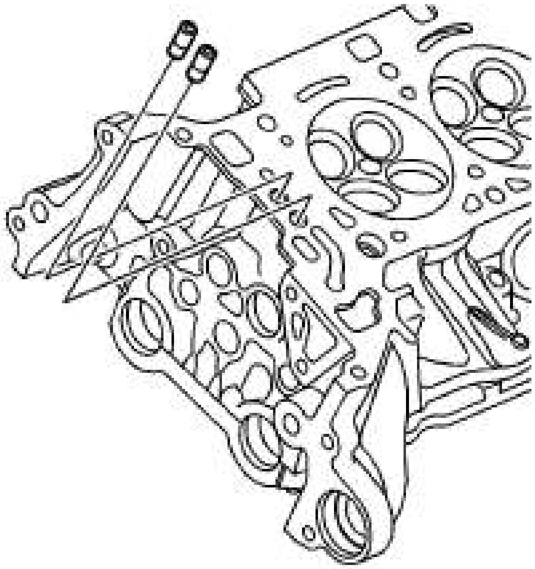
Visual Inspection



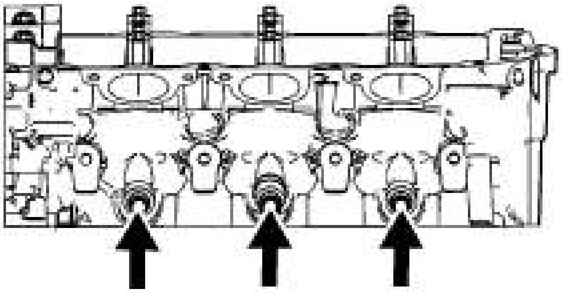
1. Inspect the cylinder head camshaft bearing surfaces for the following conditions:
   - Excessive scoring or pitting

- Discoloration from overheating
- Deformation from excessive wear
- If the camshaft bearing journals appear to be scored or damaged, you must replace the cylinder head. DO NOT machine the camshaft bearing journals.

2. If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head.
3. Inspect the cylinder head for the following:
   - Cracks, damage or pitting in the combustion chambers
   - Debris in the oil galleries -- Continue to clean the galleries until all debris is removed.
   - Coolant leaks or damage to the deck face sealing surface -- If coolant leaks are present, measure the surface warpage as described under Cylinder Head Measurement - Deck Flatness Inspection.
   - Burrs or any defects that would degrade the sealing of the NEW secondary camshaft drive chain tensioner gasket
   - Damage to any gasket surfaces
   - Damage to any threaded bolt holes
   - Burnt or eroded areas in the combustion chamber
   - Cracks in the exhaust ports and combustion chambers
   - External cracks in the water passages
   - Restrictions in the intake or exhaust passages
   - Restrictions in the cooling system passages
   - Rusted, damaged or leaking core plugs
4. If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is recommended.



5. Inspect the camshaft position actuator oil feed check valves. Damaged, restricted or clogged check valves must be replaced. Refer to Cylinder Head Disassemble.



6. Inspect the fuel rail injector bores and clean with *EN-47909* kit , if required.

Cylinder Head Measurement

Camshaft Journal Clearance

1. Install the camshaft bearing cap in the cylinder head without the camshaft.

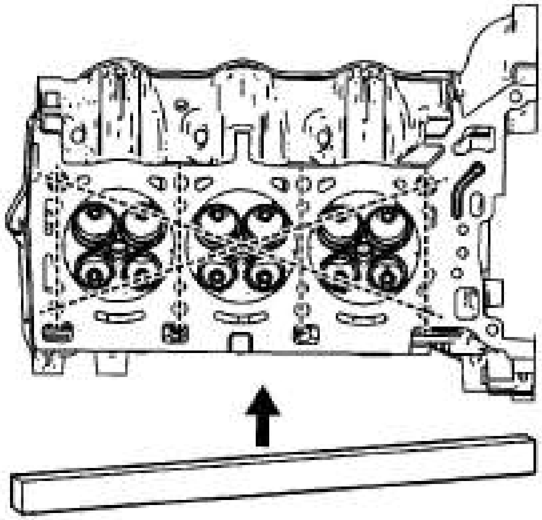
   Caution: Refer to Fastener Caution in the Preface section.

2. Install the camshaft cap bolts and tighten to **10 N·m (89 lb in)**.
3. Measure the camshaft bearings using an inside micrometer.
4. Subtract the camshaft journal diameter from the camshaft bearing diameter. This will provide the running clearance. If the running clearance exceeds specifications and the camshaft journals are within specification, replace the cylinder head.

Camshaft Journal Alignment

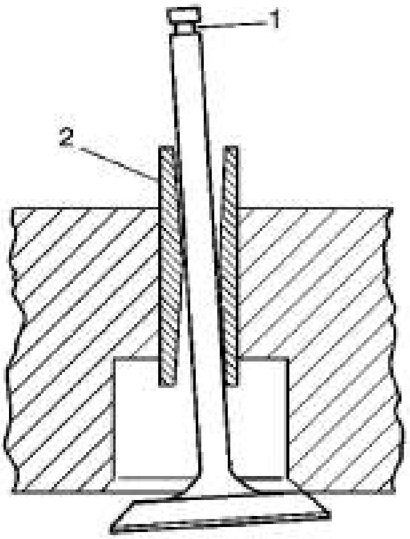
1. Ensure the camshafts are serviceable.
2. Inspect the cylinder head camshaft bearing surfaces for any imperfections or scratches that could inhibit proper camshaft clearances. Repair minor imperfections or scratches.
3. Install the camshafts in the cylinder head.
4. Install the camshaft bearing caps.
5. Install the camshaft cap bolts and tighten to **10 N·m (89 lb in)**.
6. Ensure the camshafts spin freely in the cylinder head. If the camshaft does not run freely, replace the cylinder head.

Deck Flatness Inspection



1. Ensure the cylinder head decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that could inhibit proper cylinder head gasket sealing.
3. Place a straight-edge diagonally across the cylinder head deck face surface.
4. Measure the clearance between the straight-edge and the cylinder head deck face using a feeler gage at 4 points along the straight-edge.
5. If the warpage is less than 0.05 mm (0.002 in), the cylinder head deck surface does not require resurfacing.
6. If the warpage is between 0.05-0.20 mm (0.002-0.008 in) or any imperfections or scratches that could inhibit proper cylinder head gasket sealing are present, the cylinder head deck surface requires resurfacing.
7. If resurfacing is required the maximum amount that can be removed is 0.25 mm (0.010 in).
8. If the cylinder head deck surface requires more than 0.25 mm (0.010 in) material removal the head must be replaced.

Valve Guide Measurement



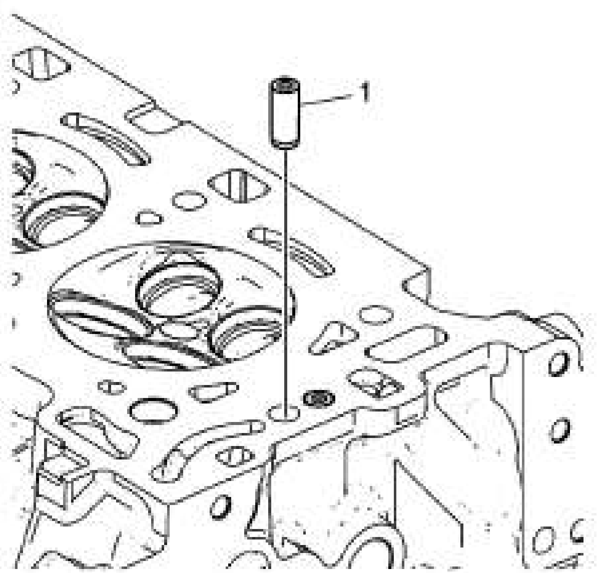
1. Measure the valve stem (1)-to-guide (2) clearance. Excessive valve stem-to-guide clearance may cause an excessive oil consumption and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.
2. Clamp the *J 8001* set to the cylinder head at the camshaft cover rail.
3. Locate the dial indicator so that the movement of the valve stem from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem just above the valve guide.
4. Drop the valve head about 0.064 mm (0.0025 in) off the valve seat.
5. Use light pressure when moving the valve stem from side to side in order to obtain a clearance reading. Refer to Engine Mechanical Specifications for proper clearance.
    - If the clearance for the valve is greater than specifications and a new standard diameter valve stem will not bring the clearance within specifications, the valve guide may be oversized by 0.075 mm (0.003 in) using the *J 42096* reamer . There is 1 size of oversized valve stem available for service.
    - Valve guide wear at the bottom 10 mm (0.390 in) of the valve guide is not significant to normal operation.
    - If oversizing the guide does not bring the clearance within specifications, replace the cylinder head.

Cylinder Head Assemble (LLT)

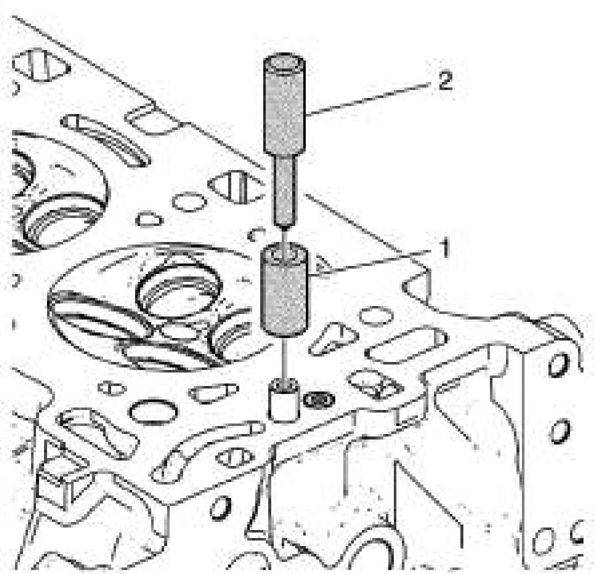
Special Tools

- *EN 46116* Valve Stem Seal Remover/Installer
- *EN 46117* Valve Stem Key Remover/Installer
- *EN 46119* Off-Vehicle Valve Spring Compressor Adapter
- *EN-46122* Camshaft Position Actuator Check-Ball Valve Remover/Installer
- *J 8062* Valve Spring Compressor - Head Off

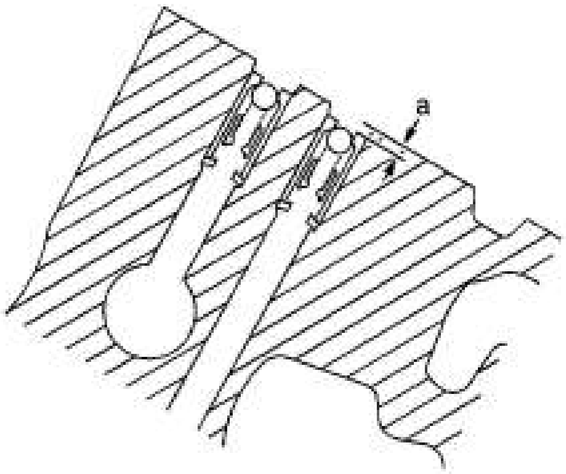
For equivalent regional tools, refer to Special Tools.



1. Use lubricant included with *EN-46122* remover/installer to lubricate outside of new check valve (1).
2. With the check ball end of the check valve facing UP, away from the head, insert the NEW check valve into the check valve bore in the cylinder head.

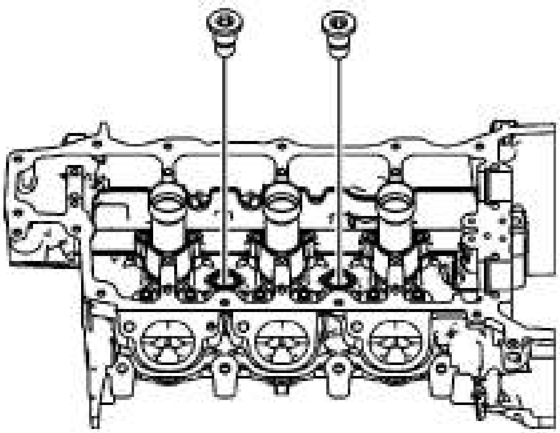


3. Place collar EN-46122-2 (1) over the new check valve with the slightly-larger inside diameter of the collar DOWN toward the cylinder head.
4. Using the driver EN-46122-1 (2), lightly tap the new check valve into place until the driver stops against the top of the collar.

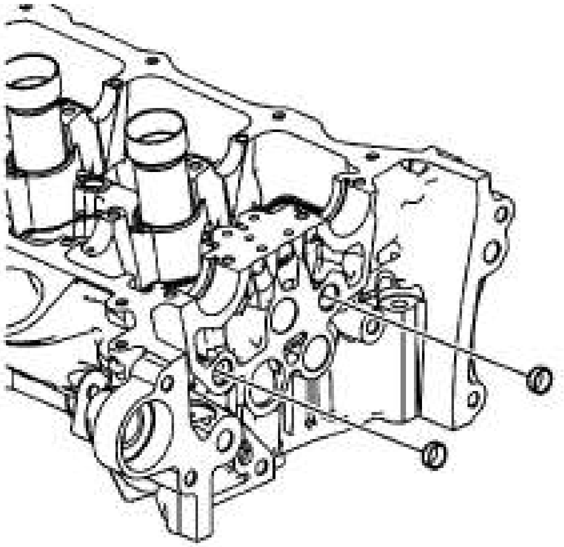


5. Inspect the camshaft position actuator oil feed check valves in order to ensure they are properly installed in the cylinder head. The camshaft position actuator oil feed check valve should be flush to 2 mm (0.0787 in) below the cylinder head deck surface (a).

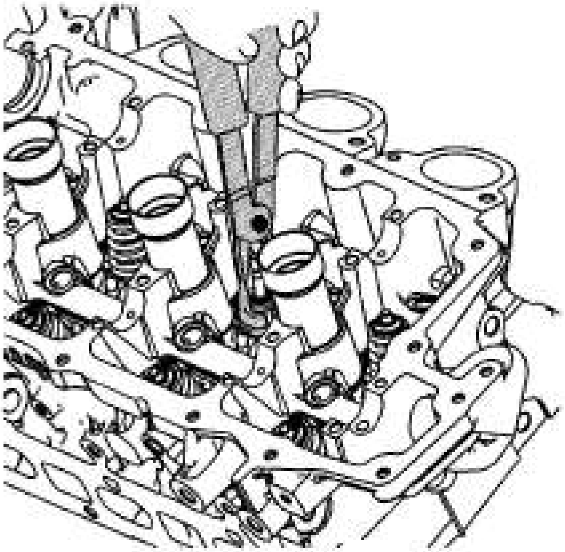
Caution: Refer to Fastener Caution in the Preface section.



6. Install the cylinder head coolant threaded plugs and tighten to **31 N·m (23 lb ft)**.



7. Install the NEW cylinder head oil gallery expansion plugs.



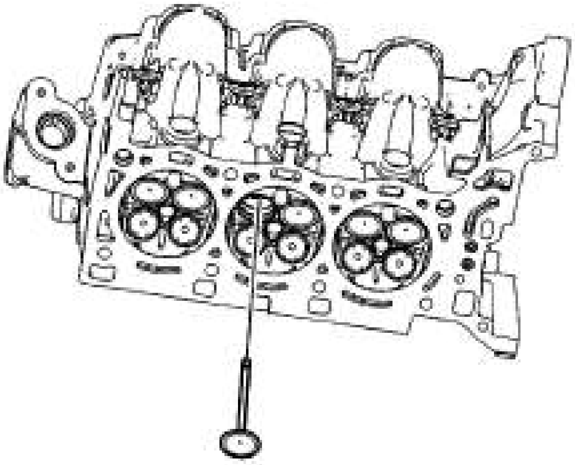
8. Place the valve stem oil seals onto the guides.

   Note: NEVER reuse a valve stem oil seal. Always use new seals when assembling the cylinder head.

9. Mount a new valve stem oil seal using the *EN 46116* remover/installer .

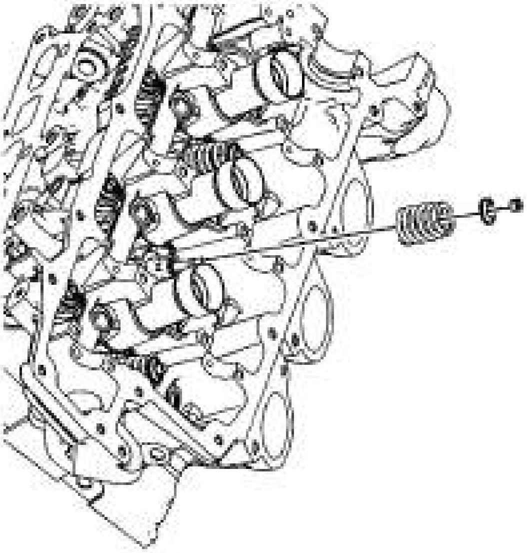
   Note: Force should only be applied to the valve spring contact area of the new valve stem oil seal during installation.

10. Push and twist the valve stem oil seal into position on the valve guide until the seal positively locks on the guide using the *EN 46116* remover/installer .
11. Lubricate the valve stem and valve guide ID with clean engine oil GM P/N 12345501 (Canadian P/N 992704) or equivalent.

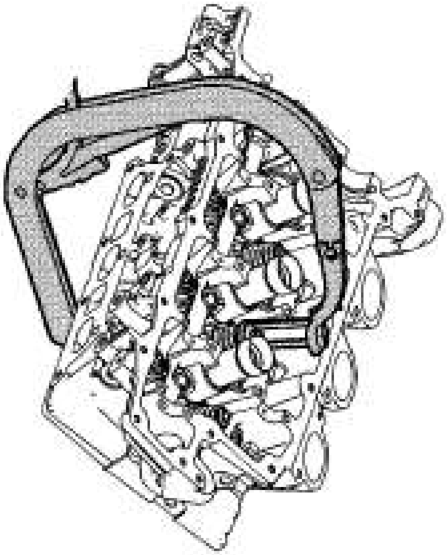


Note: The valve stem oil seal must not come loose from the valve guide when the valve is installed.

12. Insert the valve into the valve guide until it bottoms on the valve seat.



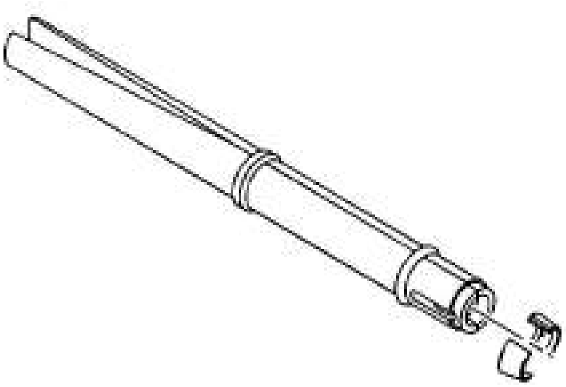
13. Position the valve spring on the spring seat.
14. Place the valve spring retainer onto the valve spring.



Warning: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

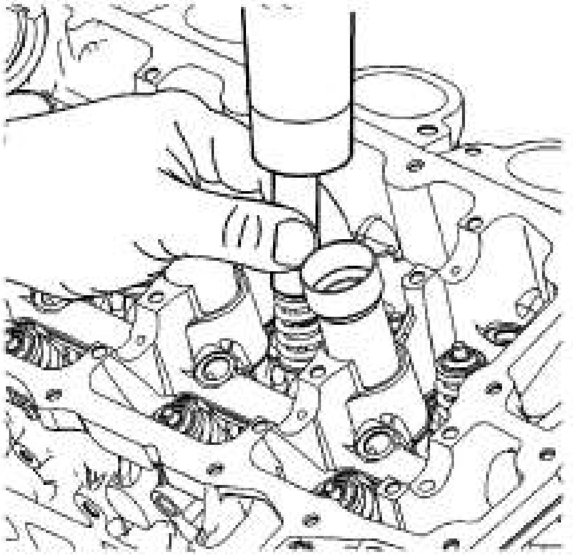
Caution: Do not compress the valve springs less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

15. Compress the valve spring using the *J 8062* Valve Spring compressor and the *EN 46119* adapter .

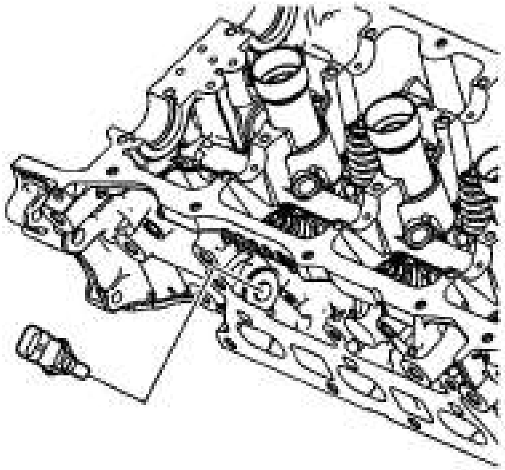


Note: Ensure proper directional placement of valve keepers in the *EN 46117* remover/installer . The valve keepers must be installed with the tapered end towards the valve stem seal.

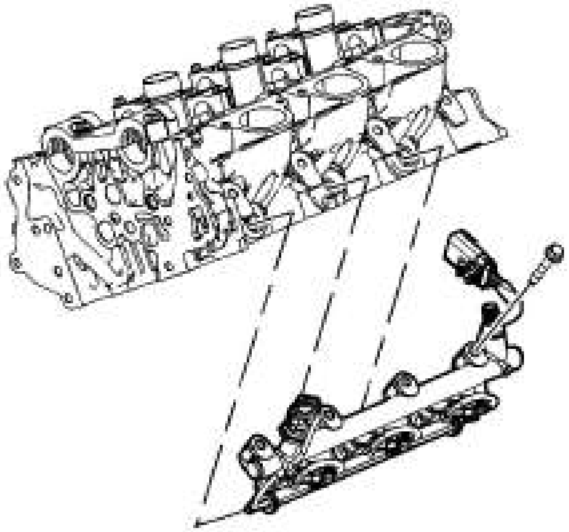
16. With the spring compressed, install the valve keepers into the *EN 46117* remover/installer .



17. Place the keepers into position by pushing the tool downward and releasing tension on the *EN 46119* adapter and the *J 8062* compressor .
18. Verify that the valve keepers are installed by placing a rag over the valve tip and tapping with a dead-blow hammer.



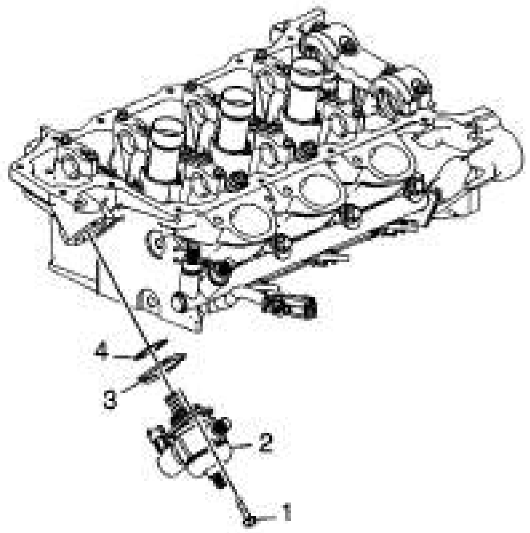
19. Install the engine coolant temperature (ECT) sensor. - LH Cylinder Head and tighten the ECT sensor to **30 N·m (22 lb ft)**.
20. Install the fuel rail with injectors into the cylinder head evenly.
21. Hand tighten the two outer fuel rail bolts to seat the injector in the injector bores.
22. Start and hand tighten the remaining fuel rail bolts.
    22.1. Tighten the fuel rail bolts in sequence to **22 N·m (16 lb ft)**.
    22.2. Tighten the fuel rail bolts in sequence a second time to **22 N·m (16 lb ft)**.



23. Lubricate the high pressure fuel pump cylinder head bore with 5W30 engine oil.

Note: Ensure that the high pressure fuel pump roller lifter is oriented properly, the camshaft is at base circle and the number 1 piston is at top dead center (TDC) on the exhaust stroke. The distance from the mounting flange surface to the camshaft at base circle should be 52 mm (2.05 in).

24. Lubricate the high pressure fuel pump roller lifter with 5W30 engine oil and install into the cylinder head bore.



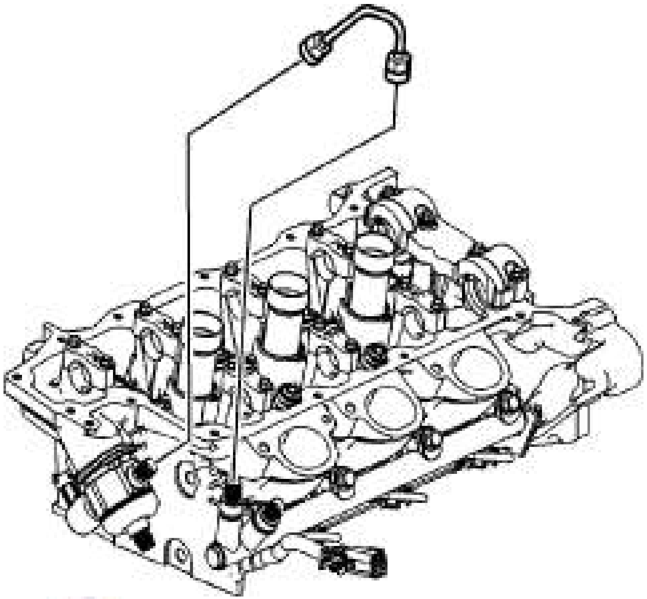
25. Install a NEW high pressure fuel pressure fuel pump gasket.
26. Install a NEW high pressure fuel pump O-ring.

Note: Ensure the plastic bolt retainers are installed in the high pressure fuel pump mounting holes before installing.

27. Install the high pressure fuel pump.

Caution: Alternately hand-tighten the fuel pump bolts one turn at a time until the pump is fully seated. Trying to draw down the pump without even side-to-side tightening may result in pump plunger damage.

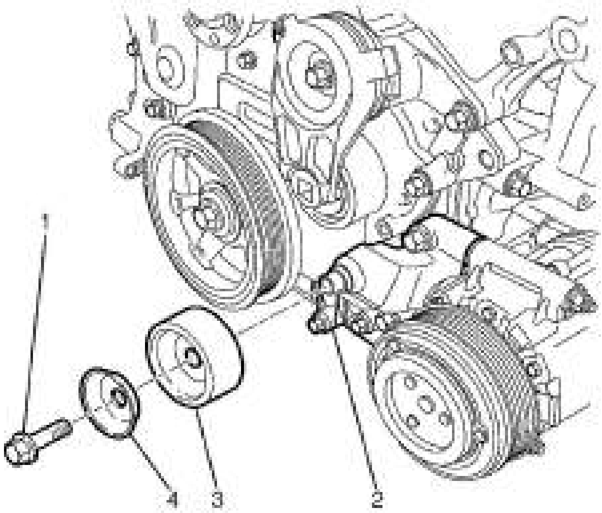
28. Start and hand-tighten the high pressure fuel pump bolts evenly and tighten the high pressure fuel pump bolts evenly to **15 N·m (11 lb ft)**.



29. Install and hand-tighten both ends of the NEW high pressure fuel line and tighten the high pressure fuel line fitting nuts to **30 N·m (22 lb ft)**.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2022811**

Drive Belt Idler Pulley Installation (With Air Condictioning)



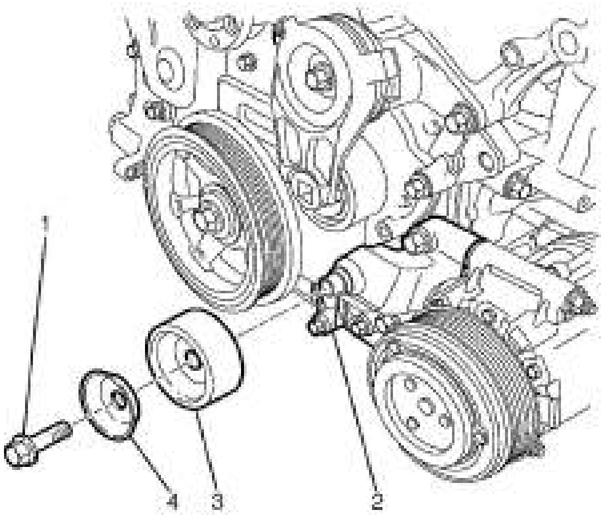
1. Install the dished washer (4) and drive belt idler pulley (3) to the accessory drive mounting bracket (2).
2. Hand tighten the drive belt idler pulley to accessory drive mounting bracket retaining bolt (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Tighten the drive belt idler pulley to accessory drive mounting bracket retaining bolt (1).

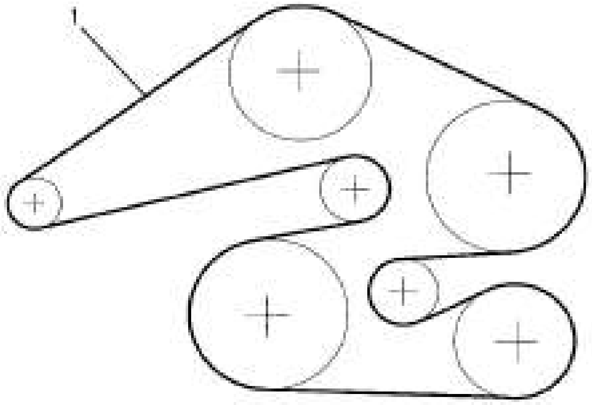
   Tighten
   Tighten the bolt to 22 N·m (16 lb ft).

Drive Belt Idler Pulley Removal (With Air Condictioning)

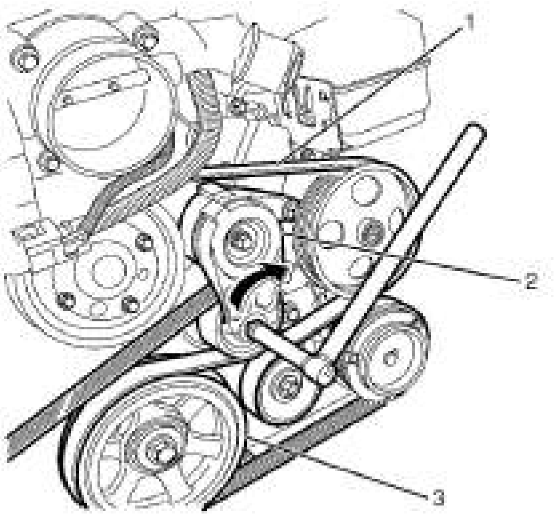


1. Remove the drive belt idler pulley to accessory drive mounting bracket retaining bolt (1).
2. Remove the dished washer (4) and drive belt idler pulley (3) from the accessory drive mounting bracket (2).

Drive Belt Installation (With Air Conditioning)



1. Install and correctly route the drive belt (1) around the following:
    - Water pump pulley
    - Generator
    - Drive belt tensioner
    - Crankshaft balancer
    - Air conditioning compressor
    - Idler pulley
    - Power steering pump



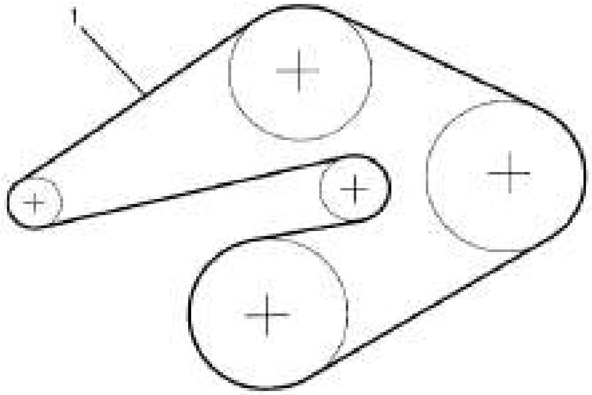
2. Using a suitable tool rotate the drive belt tensioner (2) clockwise.
3. Install the drive belt (1) to the crankshaft pulley (3).

   Important: Make sure the drive belt (1) is correctly aligned and seated into the grooves of the accessory drive pulleys.

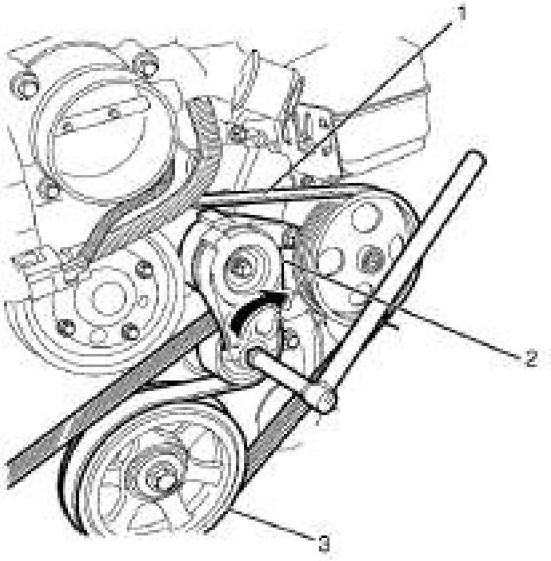
4. Slowly release the drive belt tensioner (2).
5. Remove the suitable tool from the drive belt tensioner (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 2022820

Drive Belt Installation (Without Air Conditioning)



1. Install and correctly route the drive belt (1) around the following:
   - Water pump pulley
   - Generator
   - Drive belt tensioner
   - Crankshaft balancer
   - Power steering pump



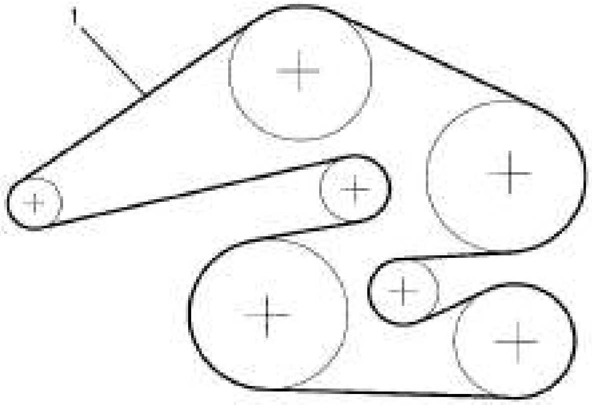
2. Using a suitable tool rotate the drive belt tensioner (2) clockwise.
3. Install the drive belt (1) to the crankshaft pulley (3).

   Important: Make sure the drive belt (1) is correctly aligned and seated into the grooves of the accessory drive pulleys.

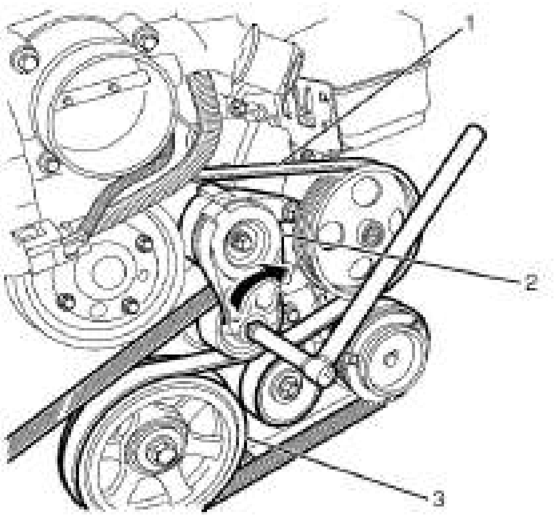
4. Slowly release the drive belt tensioner (2).
5. Remove the suitable tool from the drive belt tensioner (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2025496**

Drive Belt Removal (With Air Conditioning)



1. Note the routing of the drive belt (1).



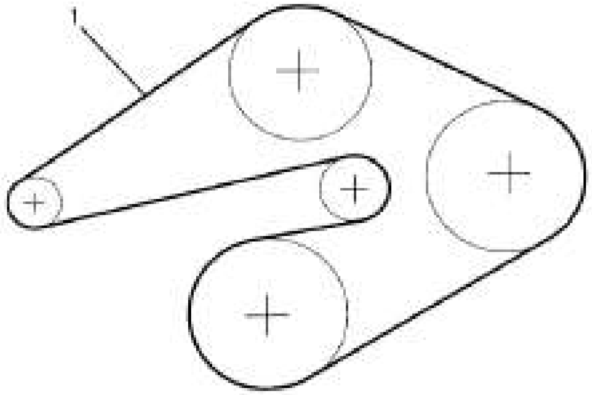
Important: Using a suitable tool rotate the drive belt tensioner (2) clockwise.

2. Rotate the drive belt tensioner (2) clockwise in order to release tension on the drive belt (1).
3. Remove the drive belt (1) from the crankshaft pulley (3).
4. Slowly release the drive belt tensioner (2).

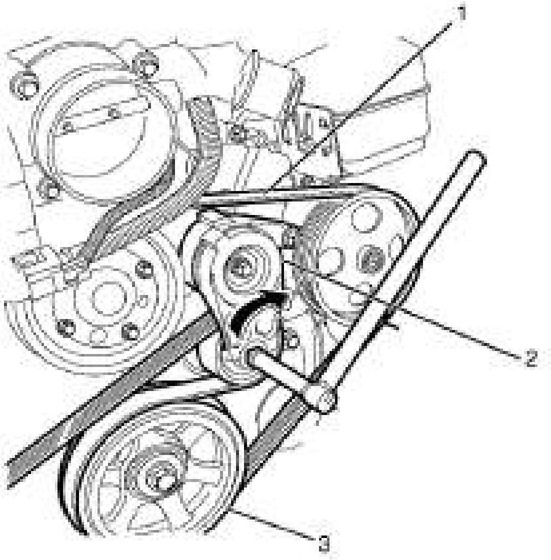
5. Remove the drive belt (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 2025497**

Drive Belt Removal (Without Air Conditioning)



1. Note the routing of the drive belt (1).

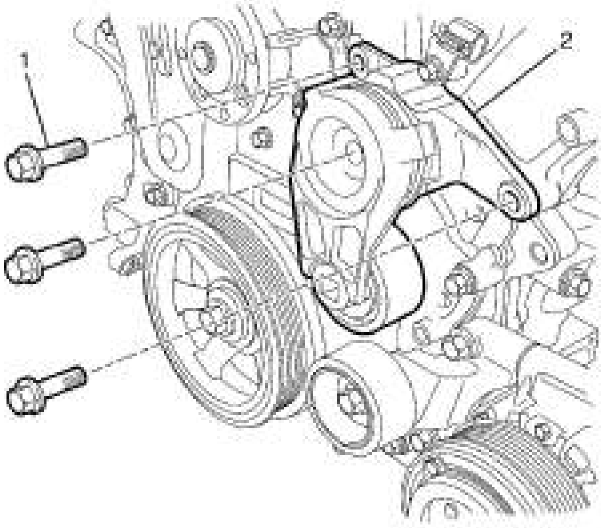


Important: Using a suitable tool rotate the drive belt tensioner (2) clockwise.

2. Rotate the drive belt tensioner (2) clockwise in order to release tension on the drive belt (1).
3. Remove the drive belt (1) from the crankshaft pulley (3).
4. Slowly release the drive belt tensioner (2).

5. Remove the drive belt (1).

Drive Belt Tensioner Installation (With Air Condictioning)



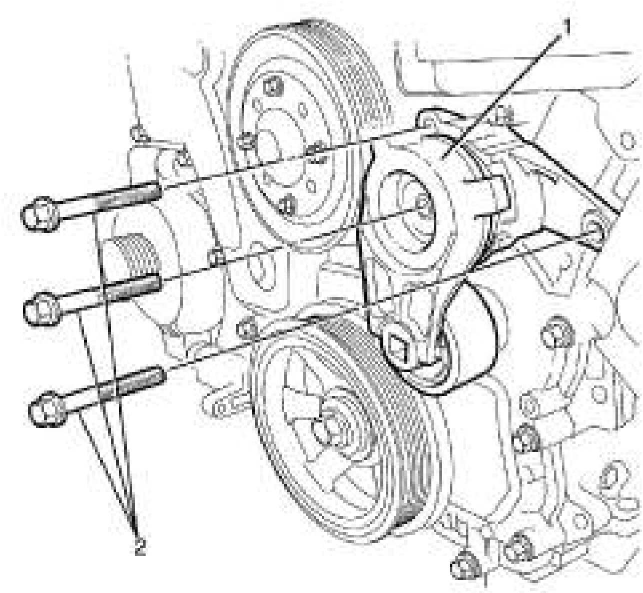
1. Install the drive belt tensioner (2) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the drive belt tensioner to engine front cover retaining bolts (1).

   Tighten
   Tighten the bolts to 22 N·m (16 lb ft).

Drive Belt Tensioner Installation (Without Air Condictioning)



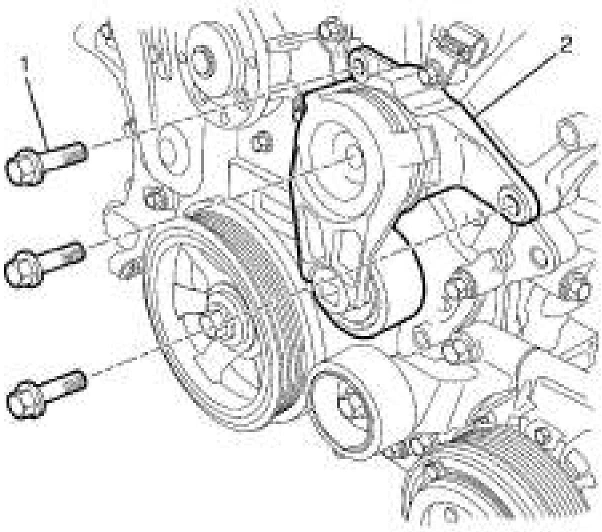
1. Install the drive belt tensioner (1) to the engine front cover.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the drive belt tensioner to engine front cover retaining bolts (2).

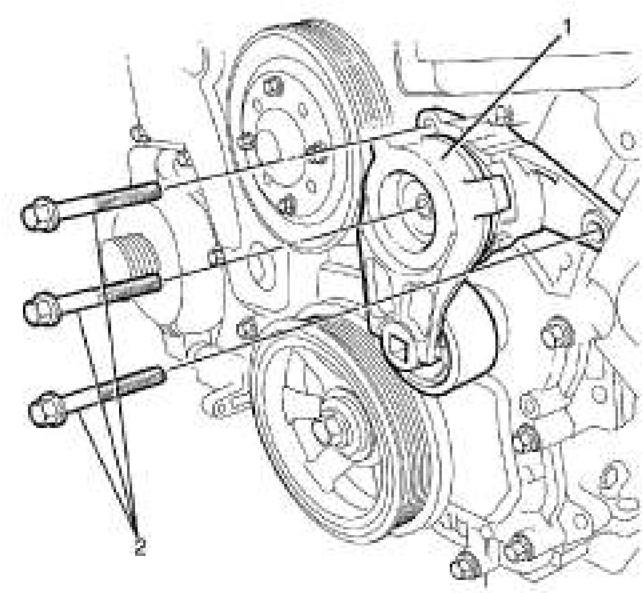
   Tighten
   Tighten the bolts to 50 N·m (37 lb ft).

Drive Belt Tensioner Removal (With Air Conditioning)



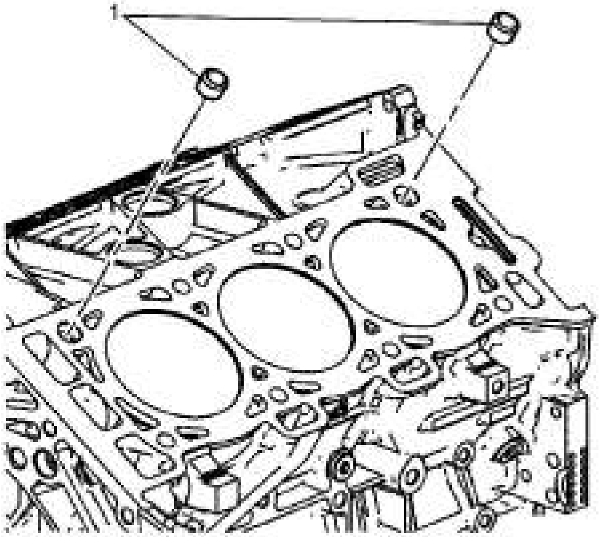
1. Remove the drive belt tensioner to engine front cover retaining bolts (1).
2. Remove the drive belt tensioner (2).

Drive Belt Tensioner Removal (Without Air Condictioning)

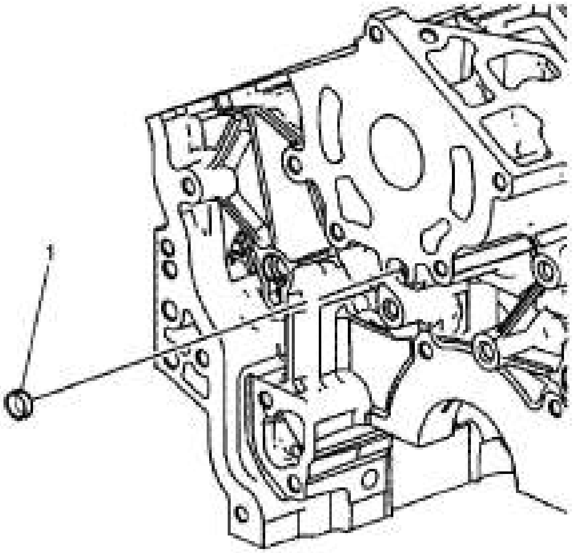


1. Remove the drive belt tensioner to engine front cover retaining bolts (2).
2. Remove the drive belt tensioner (1).

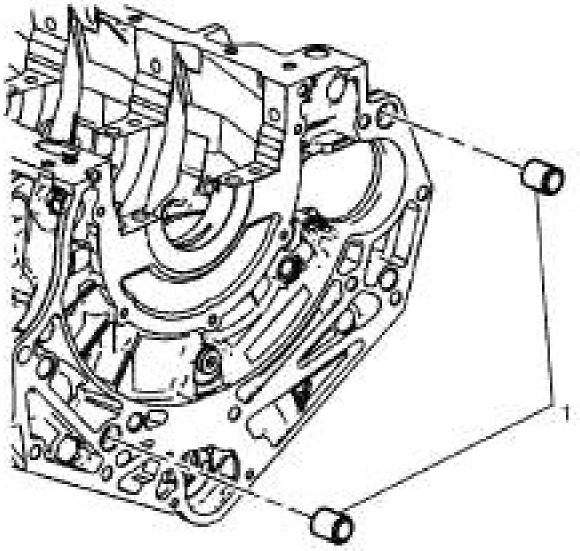
Engine Block Assemble



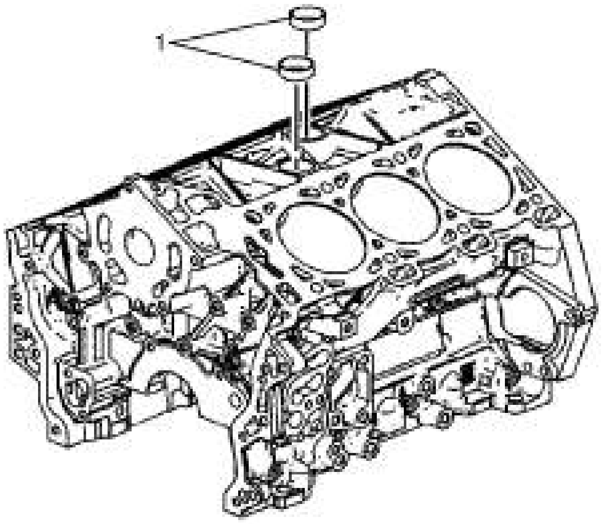
1. Install the cylinder block-to-cylinder head alignment dowels (1).



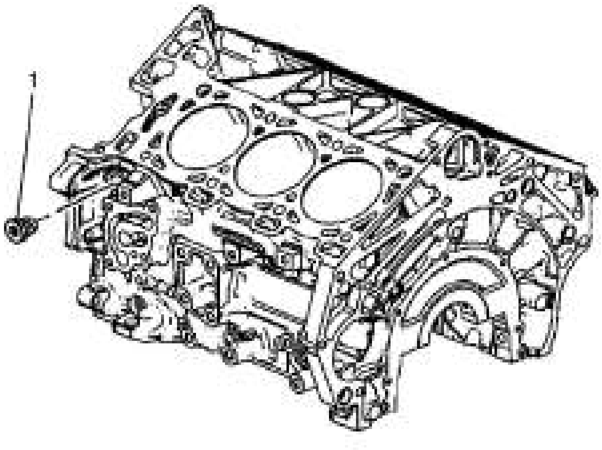
2. Install the NEW front oil gallery expansion plug (1).
3. Make sure the NEW front oil gallery expansion plug (1) is installed to the correct depth.



4. Install the cylinder block-to-transmission alignment dowels (1).



5. Apply RTV sealant on the NEW coolant expansion plugs (1).
6. Install the NEW coolant expansion plugs (1).
7. Make sure the NEW coolant expansion plugs (1) are installed to the correct depth.

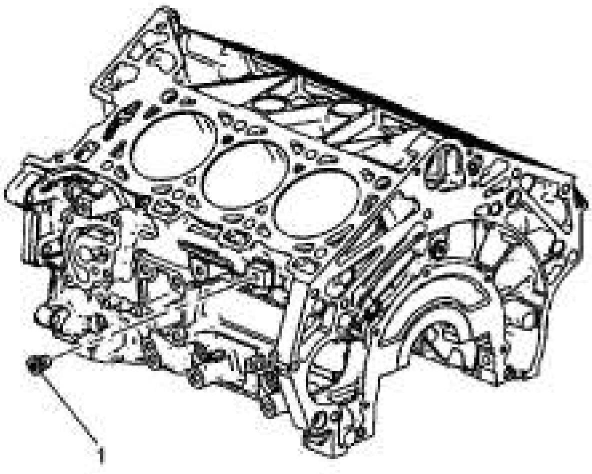


8. Apply thread sealant on the threads of the M20 left side oil gallery threaded plug (1).

   Notice: Refer to Fastener Notice in the Preface section.

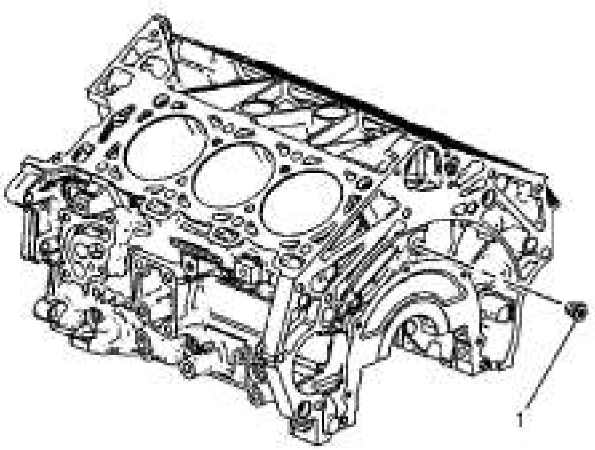
9. Install the M20 left side oil gallery threaded plug (1).

   Tighten
   Tighten the plug to 31 N·m (23 lb ft).



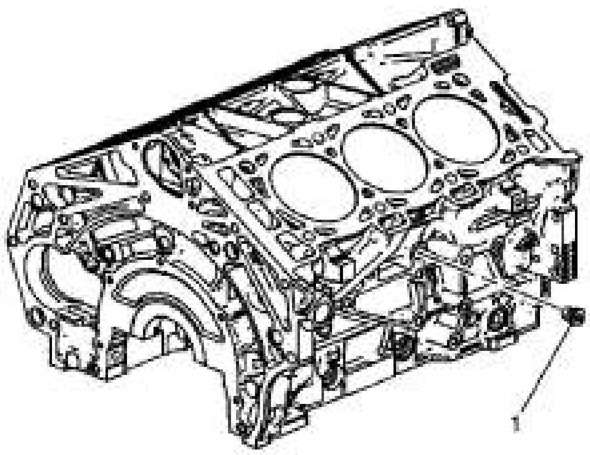
10. Apply thread sealant on the threads of the M14 left side coolant drain threaded plug (1).
11. Install the M14 left side coolant drain threaded plug (1).

Tighten
Tighten the threaded plug to 31 N·m (23 lb ft).



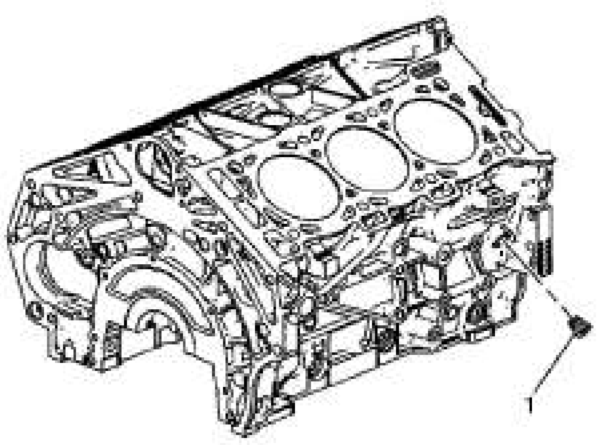
12. Apply thread sealant on the threads of the M14 rear oil gallery threaded plug (1).
13. Install the M14 rear oil gallery threaded plug (1).

Tighten
Tighten the plug to 31 N·m (23 lb ft).



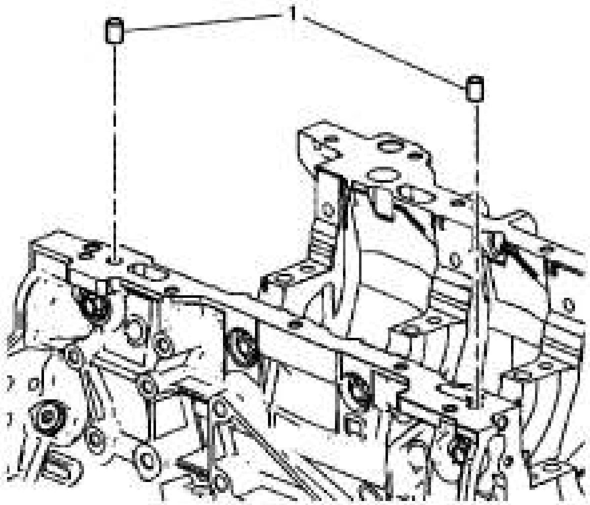
14. Apply thread sealant on the threads of the M14 right side coolant drain threaded plug (1).
15. Install the M14 right side coolant drain threaded plug (1).

Tighten
Tighten the plug to 31 N·m (23 lb ft).

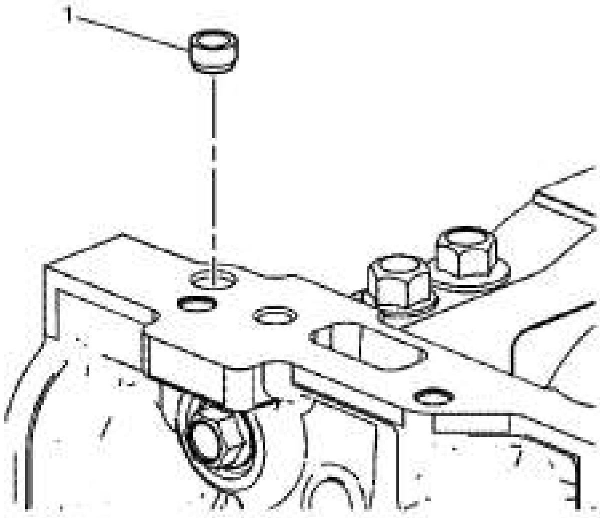


16. Apply thread sealant on the threads of the M14 right side oil gallery threaded plug (1).
17. Install the M14 right side oil gallery threaded plug (1).

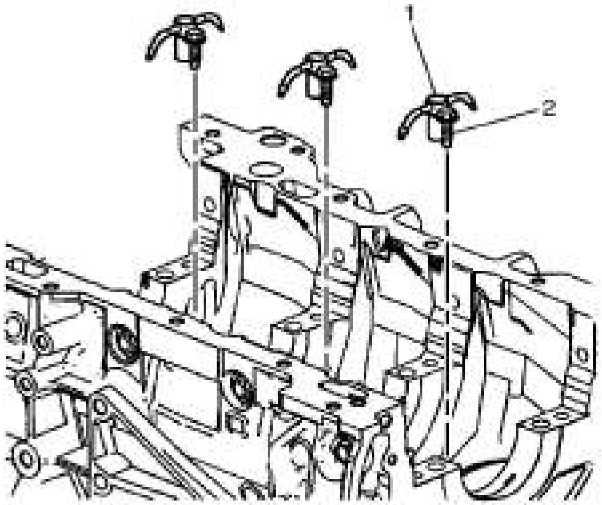
Tighten
Tighten the plug to 31 N·m (23 lb ft).



18. Install the cylinder block-to-oil pan alignment dowels (1).



19. Install the NEW right front oil pan rail oil gallery expansion plug (1).
20. Make sure the NEW right front oil pan rail oil gallery expansion plug (1) is installed to the correct depth.



21. Install the oil jets (1).
22. Install the oil jet to cylinder block retaining bolts (2).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).

Engine Block Cleaning and Inspection

Tools Required

- J 8087 Cylinder Bore Gage
- J 28410 Gasket Remover

Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant using J 28410 .
2. Clean all the following areas with solvent:
   - Sealing surfaces
   - Cooling passages
   - Oil passages
   - Bearing journals
3. Clean all threaded and through holes with solvent.

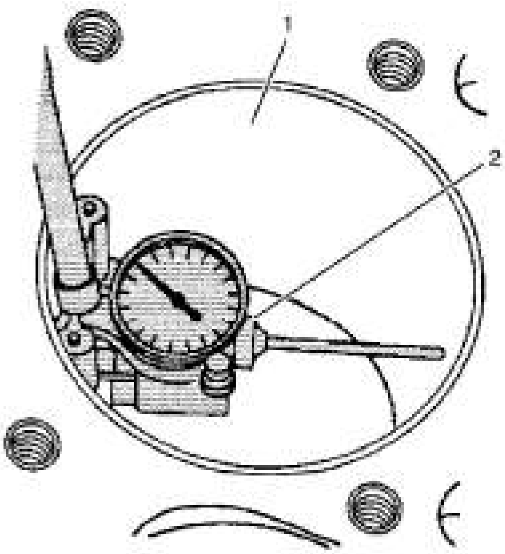
   Caution: Refer to Safety Glasses Caution in the Preface section.

4. Dry the cylinder block with compressed air.

Visual Inspection

1. Inspect the crankshaft bearings journals for damage or spun bearings. The crankshaft bearing journals are not repairable, if the crankshaft bearing journals are damaged the cylinder block assembly must be replaced.
2. Inspect the primary camshaft drive chain tensioner mounting surface on the cylinder block for burrs or any defects that may degrade the sealing of the NEW primary camshaft drive chain tensioner gasket.
3. Inspect all sealing and mating surfaces for damage, repair or replace the cylinder block assembly if necessary.
4. Inspect all threaded and through holes for damage or debris above acceptable tolerances.
5. Inspect all bolts for damage, if damaged replace with NEW bolts only.
6. Inspect the cylinder walls for cracks or damage. The cylinder sleeves are not serviced separately, if the cylinders are damaged the cylinder block assembly must be replaced.
7. Inspect the cylinder block for cracks. DO NOT repair any cracks. If cracks are found, the cylinder block assembly must be replaced.
8. Repair any damaged threaded holes. Refer to Thread Repair Specifications and Thread Repair .

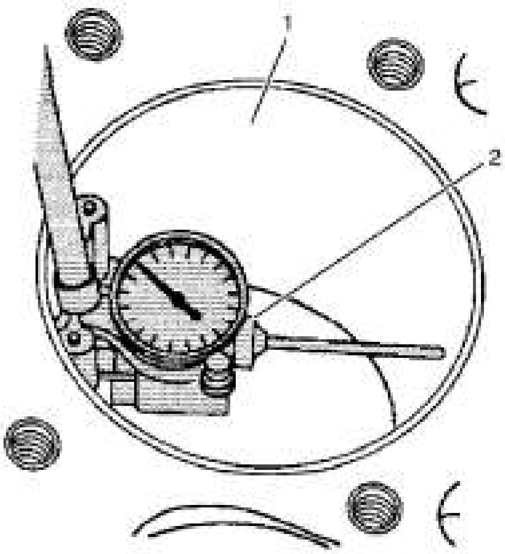
Measuring Cylinder Bore Diameter



1. Measure the cylinder bore diameter 42 mm (1.654 in) from the deck face (1) using the J 8087 (2).
2. Record and compare your results with the Engine Mechanical Specifications . If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

   If the cylinder bore exceeds specification by more than 0.25 mm (0.010 in) the cylinder block must be replaced.

Measuring Cylinder Bore Taper



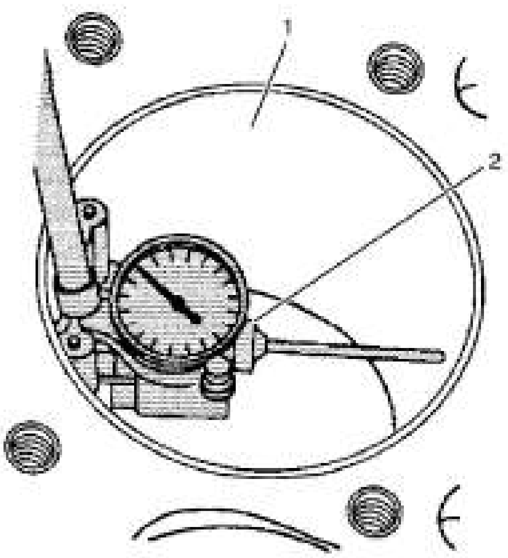
1. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft

centerline, at 10 mm (0.397 in) below the deck surface and record your measurement.

2. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centerline, at 100 mm (3.976 in) below the deck surface and record your measurement.
3. Calculate the difference between the 2 measurements. The result will be the cylinder taper.
4. Compare your results with the Engine Mechanical Specifications . If the cylinders exceed the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

   If the cylinder bore exceeds specification by more than 0.25 mm (0.010 in) the cylinder block must be replaced.

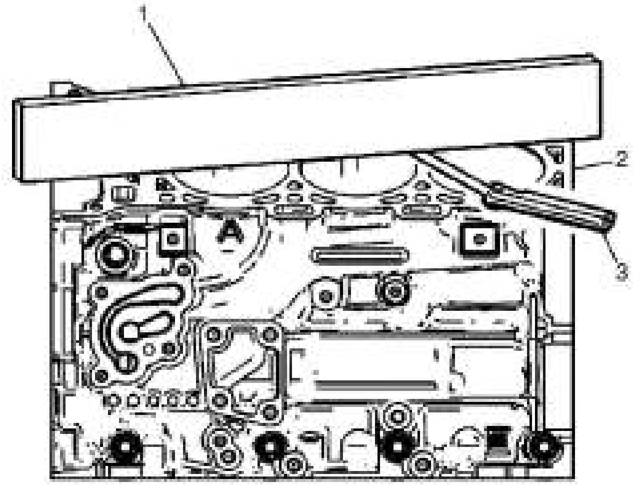
Measuring Cylinder Bore Out-of-Round



1. Measure both the thrust and non-thrust cylinder diameter at 10 mm (0.397 in) below the deck. Record your measurements.
2. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the upper end of the cylinder.
3. Measure both the thrust and non-thrust cylinder diameter at 100 mm (3.976 in) below the deck surface. Record your measurements.
4. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the lower end of the cylinder.
5. Compare your results with the Engine Mechanical Specifications . If the cylinders exceed the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

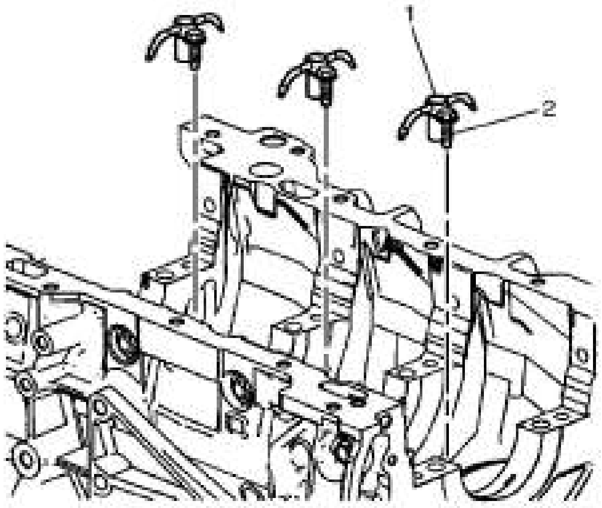
   If the cylinder bore exceeds specification by more than 0.25 mm (0.010 in) the cylinder block must be replaced.

Deck Flatness Inspection

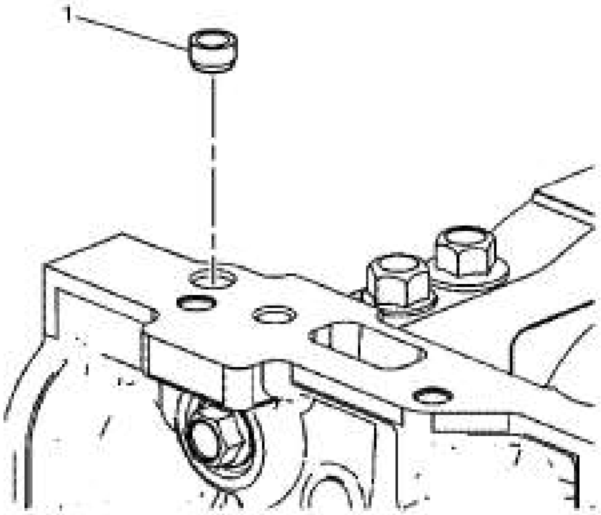


1. Make sure the cylinder block decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that may inhibit correct cylinder head gasket sealing.
3. Place a straight-edge diagonally across the cylinder block deck face surface.
4. Measure the clearance between the straight-edge and the cylinder block deck face using a feeler gauge at 4 points along the straight-edge.
5. If the warpage is less than 0.05 mm (0.002 in), the cylinder block deck surface does not require resurfacing.
6. If the warpage is between 0.05-0.20 mm (0.002-0.008 in) or any imperfections or scratches that may inhibit correct cylinder head gasket sealing are present, the cylinder block deck surface requires resurfacing.
7. If resurfacing is required the maximum amount that can be removed is 0.25 mm (0.010 in).
8. If the cylinder block deck surface requires more than 0.25 mm (0.010 in) material removal the block must be replaced.

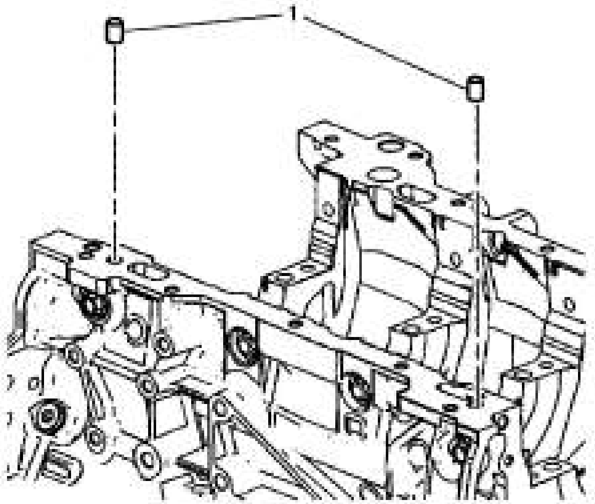
Engine Block Disassemble



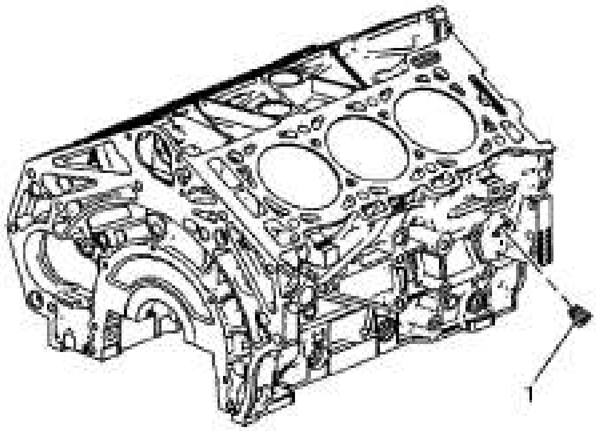
1. Remove oil jet to cylinder block retaining bolts (2).
2. Remove the oil jets (1).



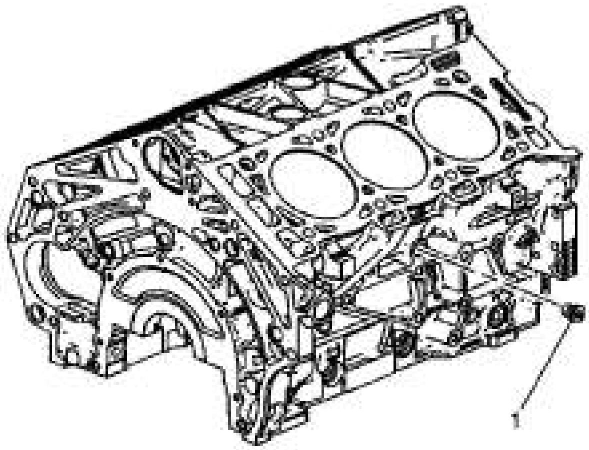
3. Remove the right front oil pan rail oil gallery expansion plug (1).



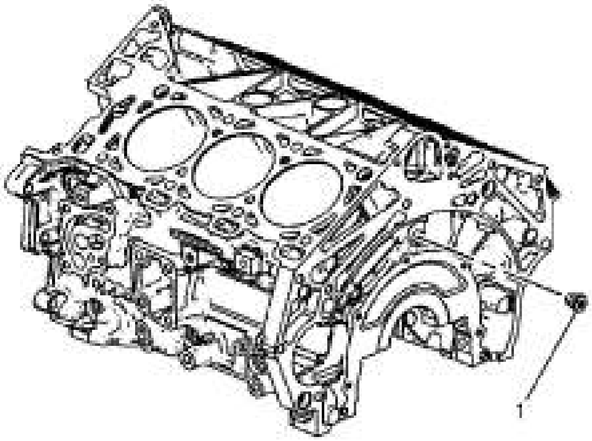
4. Remove the cylinder block-to-oil pan alignment dowels (1).



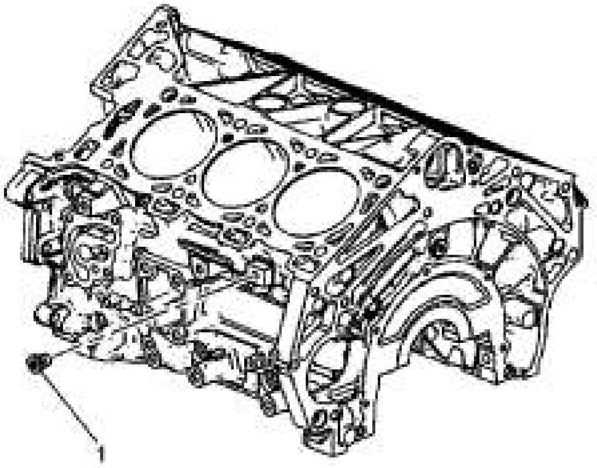
5. Remove the M14 right side oil gallery threaded plug (1).



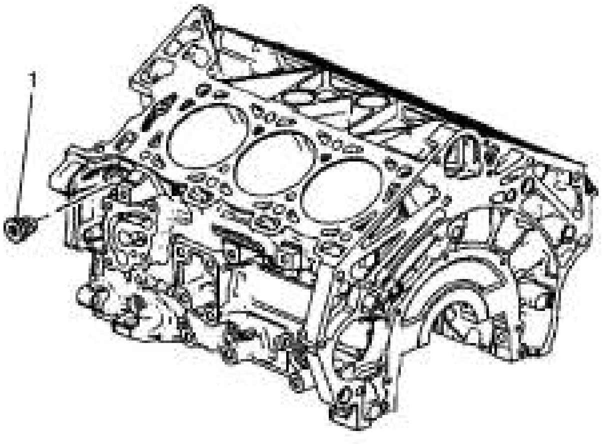
6. Remove the M14 right side coolant drain threaded plug (1).



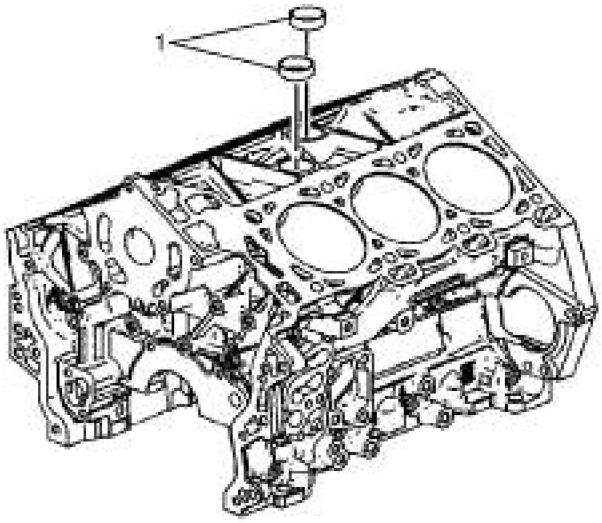
7. Remove the M14 rear oil gallery threaded plug (1).



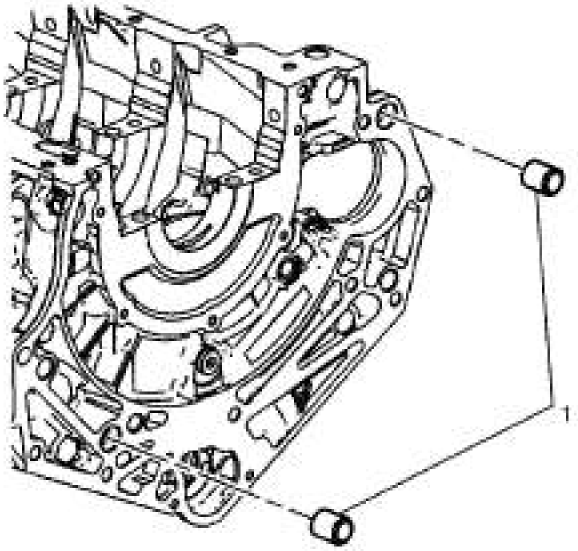
8. Remove the M14 left side coolant drain threaded plug (1).



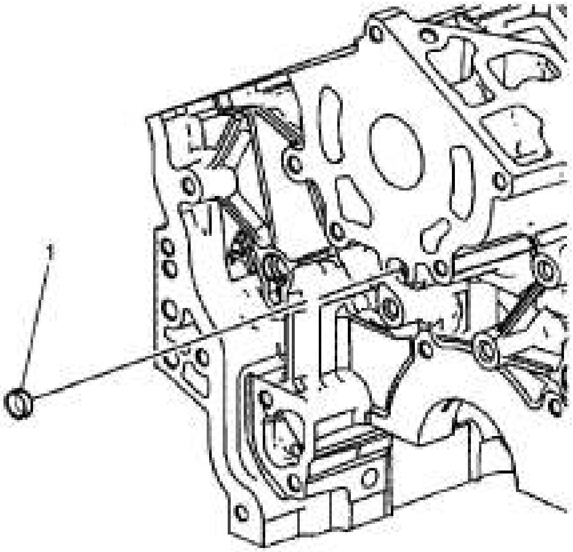
9. Remove the M20 left side oil gallery threaded plug (1).



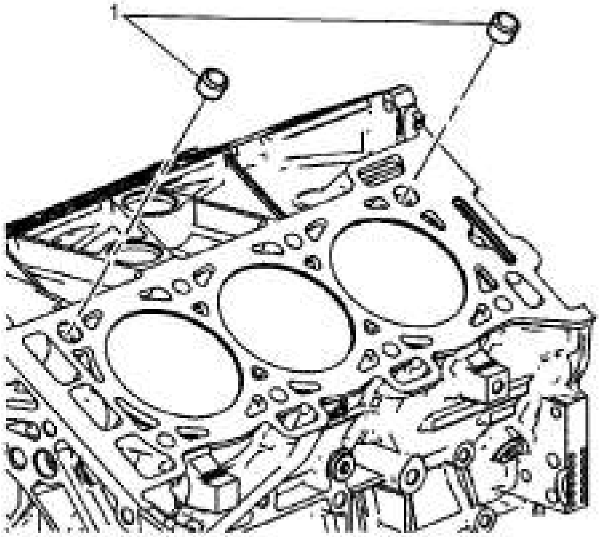
10. Remove the coolant expansion plugs (1).



11. Remove the cylinder block-to-transmission alignment dowels (1).



12. Remove the front oil gallery expansion plug (1).

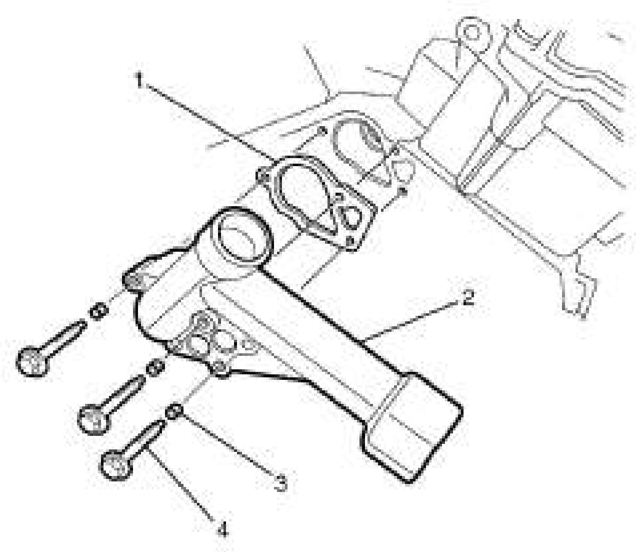


13. Remove the cylinder block-to-cylinder head alignment dowels (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1996228**

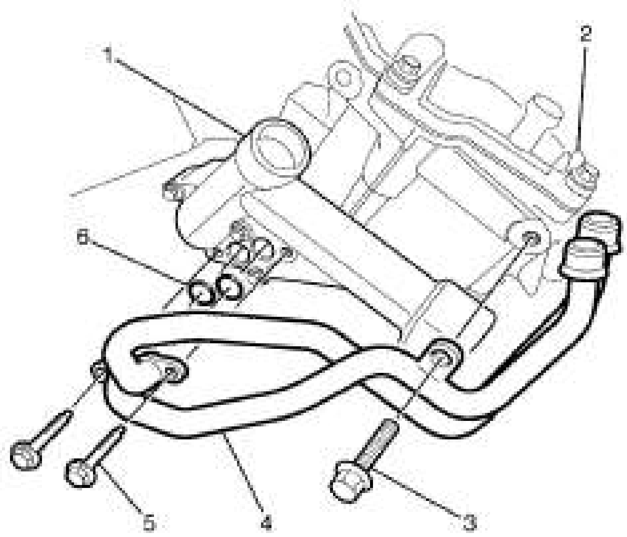
Engine Coolant Thermostat Housing Installation

Notice: Refer to Fastener Notice in the Preface section.



1. Install thermostat housing to cylinder block retaining bolts (4) ensuring a new block gasket (1) and rubber grommets (3) has been fitted.

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).



2. Install the heater pipe assembly to thermostat housing retaining bolts (5) ensuring new O-ring seals (6) have been fitted.

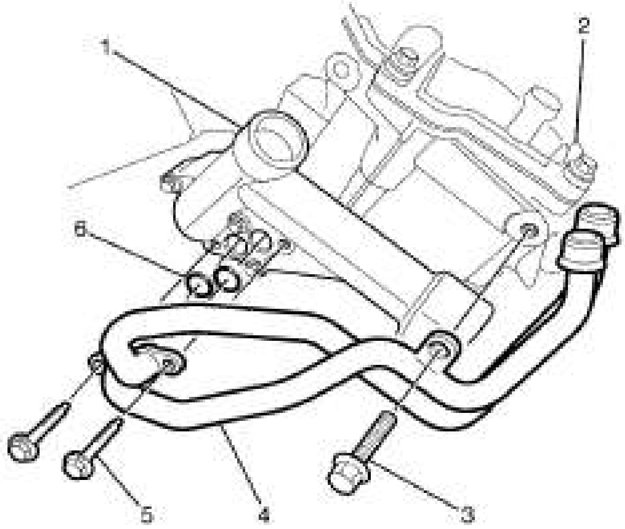
   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

3. Install the heater pipe assembly (4) to cylinder head (2) retaining bolt (3).

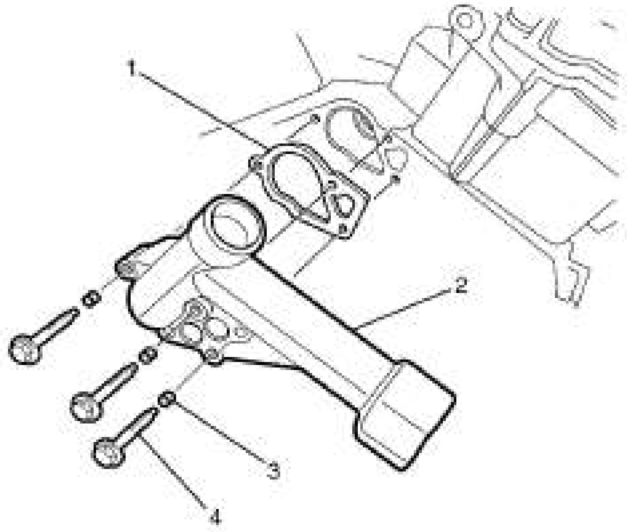
   Tighten
   Tighten the bolts to 35 N·m (26 lb ft).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1977577**

Engine Coolant Thermostat Housing Removal



1. Remove the heater hose assembly to right bank cylinder head retaining bolt (3).
2. Remove the heater hose assembly to thermostat housing retaining bolts (5).
3. Remove the heater hose assembly (4) from the right bank cylinder head (3) and thermostat housing (1).
4. Remove the O-ring seals (6).



Important: The thermostat housing has one longer bolt which is located in the upper left of the housing.

Important: When replacing thermostat housing always renew the block gasket (1).

5. Remove thermostat housing to cylinder block retaining bolts (4) and rubber grommets (3).
6. Remove thermostat housing (2).
7. Remove thermostat housing gasket (1).

Engine Flywheel Cleaning and Inspection (Automatic Transmission)

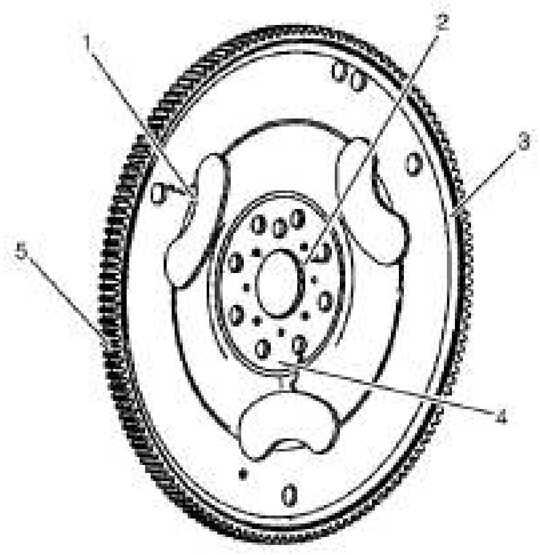
Cleaning Procedure

1. Clean the engine flywheel in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the engine flywheel with compressed air.

Inspection Procedure



1. Inspect the engine flywheel for the following conditions:
   - Stress cracks around the engine flywheel-to-torque converter mounting bolt hole locations (1) and/or engine flywheel-to-crankshaft (2 and 4)

     Important: DO NOT attempt to repair the welded areas that retain the ring gear to the engine flywheel plate. Install a new engine flywheel.

   - Cracks at welded areas that retain the ring gear onto the engine flywheel (3)
   - Damaged or missing ring gear teeth (5)
2. Replace the engine flywheel as necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1995322

Engine Flywheel Cleaning and Inspection (Manual Transmission)

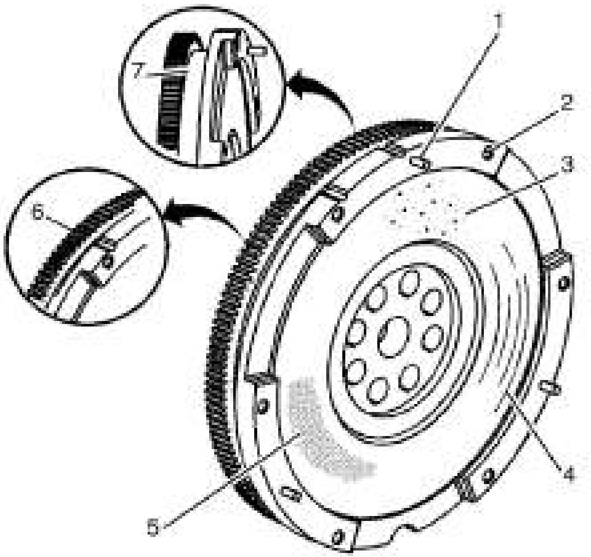
Cleaning Procedure

1. Clean the engine flywheel in solvent.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Dry the engine flywheel with compressed air.

Inspection Procedure

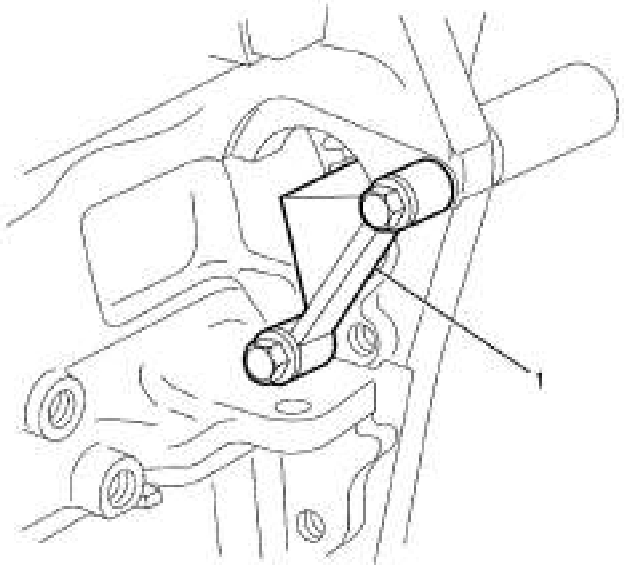


1. Inspect the manual transmission engine flywheel for the following conditions:
   - Missing and/or damaged alignment pins (1)
   - Damaged threaded holes (2)
   - Pitted surface (3)
   - Scoring or grooves (4)
   - Rust or other surface damaged (5)
   - Damaged ring gear teeth (6)
   - Loose or incorrectly positioned ring gear
   - The ring gear has an interference fit onto the engine flywheel and should be positioned completely against the flange of the engine flywheel (7).
2. Replace the engine flywheel as necessary.

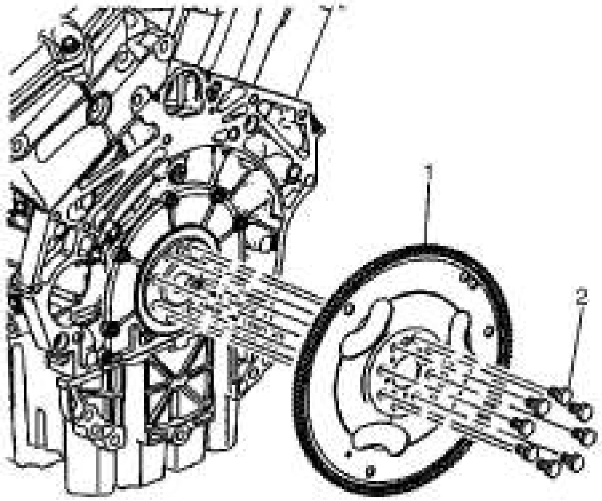
Engine Flywheel Installation

Tools Required

- EN 46106 Engine Flywheel Holding Tool
- J 45059 Angle Meter



1. Install the EN 46106 (1).



2. Place the automatic transmission flex plate (2) in position.
3. Install 2 NEW automatic transmission flex plate to crankshaft retaining bolts (1) in location at the top and bottom of the automatic transmission flex plate (2) bolt pattern allowing the automatic transmission flex plate (2) to hang in position.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the remaining NEW automatic transmission flex plate to crankshaft retaining bolts (1).

   Tighten
   Tighten the bolts to 30 N·m (22 lb ft).

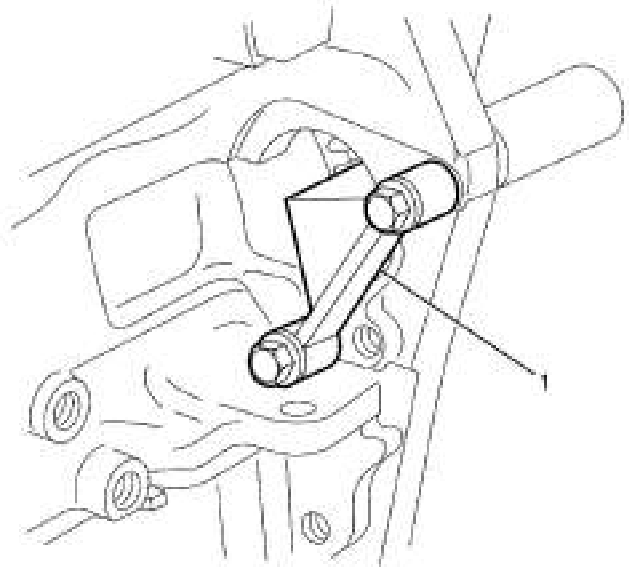
   Tighten the bolts an additional 45 degrees using the J 45059 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | Document ID: 1977652

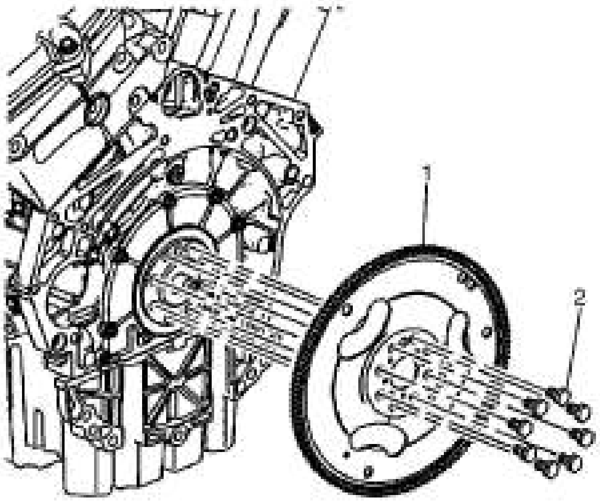
Engine Flywheel Removal (Automatic Transmission)

Tools Required

EN 46106 Flywheel Holding Tool



1. Install the EN 46106 (1) through the starter mounting hole.



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

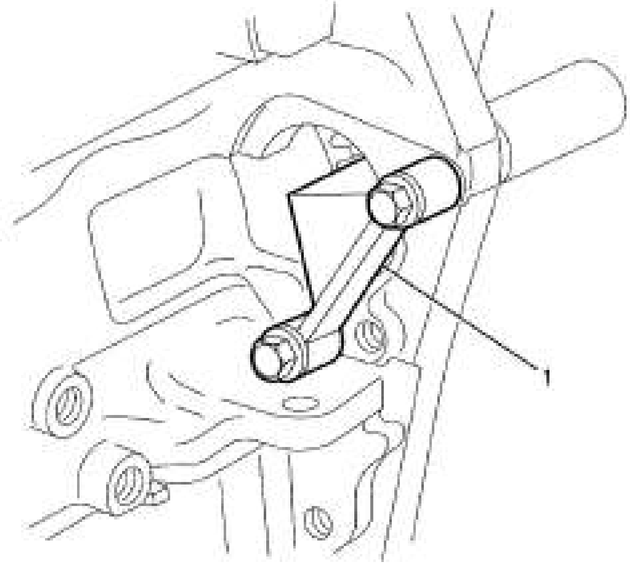
2. Remove the engine flywheel to crankshaft retaining bolts (1).
   - Discard the bolts.
   - Clean the bolt holes.
3. Remove the engine flywheel (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Mechanical - 2.8L, 3.0L, 3.2L, or 3.6L | Repair Instructions - Off Vehicle | **Document ID: 1995155**

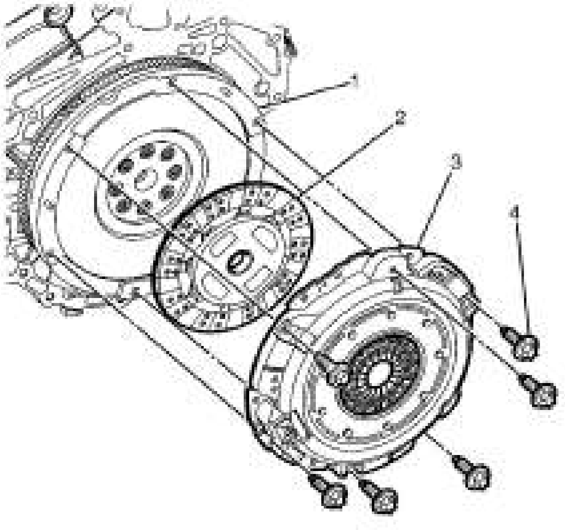
Engine Flywheel Removal (Manual Transmission)

Tools Required

EN 46106 Flywheel Holding Tool

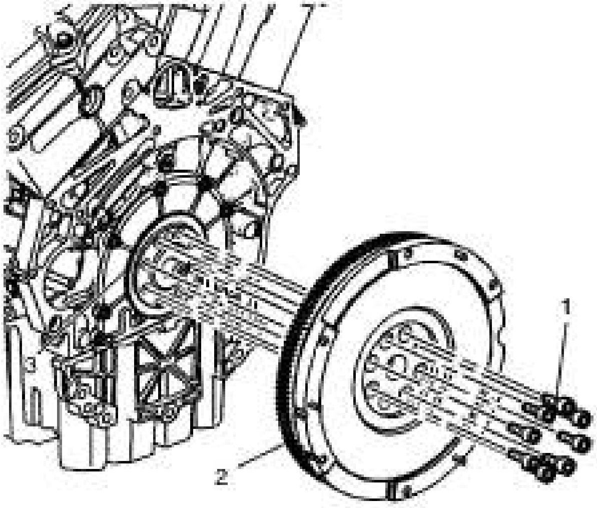


1. Install the EN 46106 (1) through the starter mounting hole.



2. Mark the relationship of the pressure plate (3) to the flywheel (1) to maintain the correct balance condition on reassembly.

3. Loosen all pressure plate to flywheel retaining bolts (4) working from opposite sides to avoid distortion.
4. Continue loosening pressure plate to flywheel retaining bolts (4) from opposite sides until all are removed.
5. Remove the pressure plate (3) and clutch driven plate (2) from the flywheel (1).



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

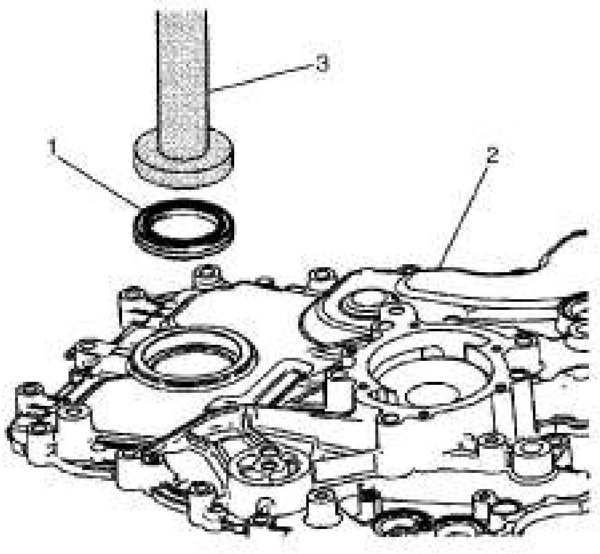
Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

6. Remove the engine flywheel to crankshaft retaining bolts (1).
   - Discard the bolts.
   - Clean the bolt holes.
7. Remove the engine flywheel (2) from the crankshaft (3).

Engine Front Cover Assemble

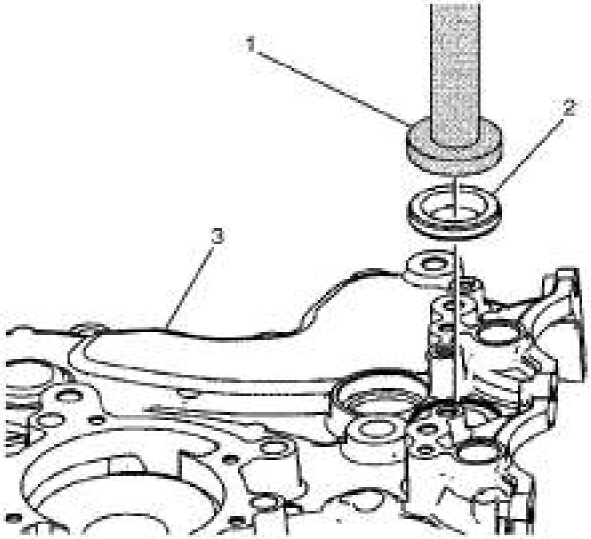
Tools Required

- EN-46103 Camshaft Actuator Valve Seal Remover/Installer
- J 29184 Oil Seal Installer



Important: DO NOT lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

1. Install the NEW crankshaft front oil seal into the engine front cover using the J 29184 .



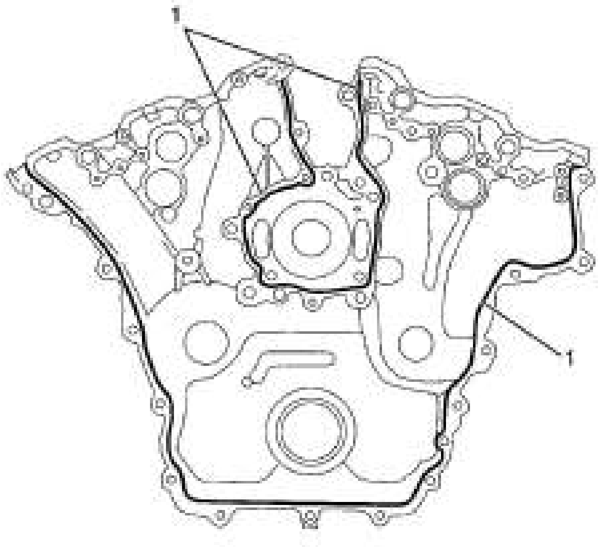
2. Install the NEW camshaft position actuator solenoid seals into the engine front cover using the EN-46103 .

Engine Front Cover Cleaning and Inspection

Tools Required

J 28410 Gasket Remover

Cleaning Procedure

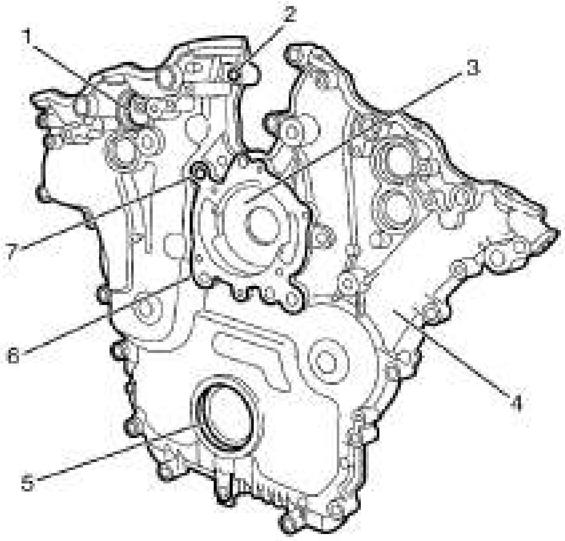


1. Remove any RTV sealant (1) from the engine front cover using J 28410 .
2. Clean out debris from the bolt holes.
3. Clean the engine front cover (1) in solvent.

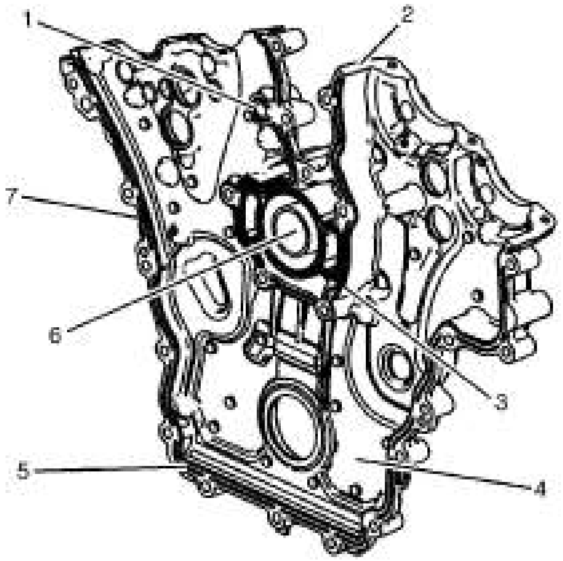
   Caution: Refer to Safety Glasses Caution in the Preface section.

4. Dry the engine front cover (1) with compressed air.

Inspection Procedure



1. Inspect the exterior of the engine front cover for the following conditions:
   - Damage to the water pump bolt hole threads (7).
   - Gouges or damage to the water pump sealing surfaces (6).
   - Damage to the crankshaft front oil seal bore (5).
   - Damage to the camshaft position actuator solenoid seal bores (1).
   - Damage to the engine front cover bolt holes (2).
   - Damage and/or corrosion to the engine coolant passage (3).
   - Dents or damage to the exterior (4).



2. Inspect the interior of the engine front cover for the following conditions:
   - Gouges or damage to the engine front cover sealing surfaces to the cylinder block (7), oil

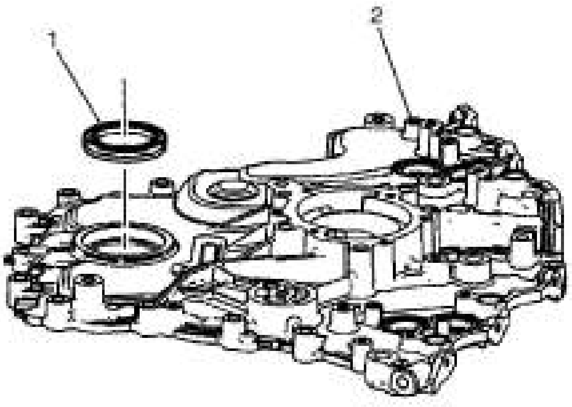
pan (5), and/or camshaft covers (2).
- Damage and/or corrosion to the engine coolant passage .(6)
- Damage to the crankshaft front oil seal bore.
- Gouges or damage to the O-ring sealing areas.
- Gouges or damage to the water pump seal area (3).
- Loose or damaged deadener plates (4).
- Damage to the engine front cover bolt holes (1).

3. Repair or replace the engine front cover as necessary.

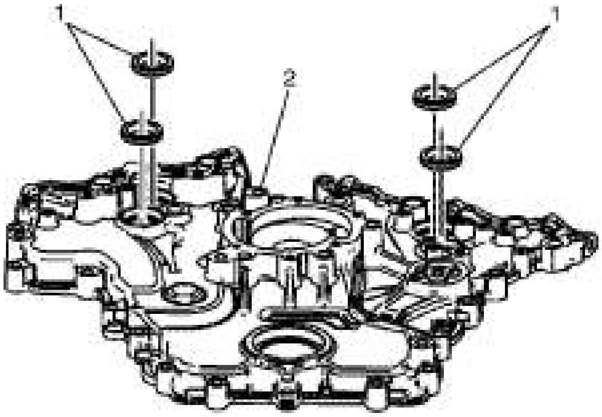
Engine Front Cover Disassemble

Tools Required

E-308 Seal Remover



1. Remove the crankshaft front oil (1) seal from the engine front cover (2) using the E-308 .

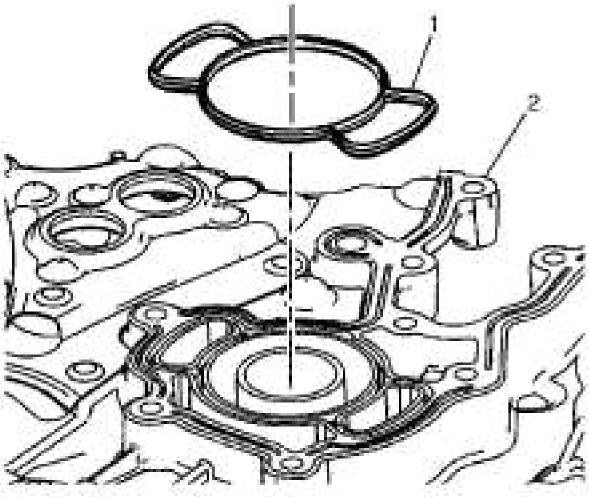


Important: LE0 and LW2 engines only have an intake camshaft position actuator solenoid.

Important: The camshaft position actuator solenoid valve oil seals (1) must be discarded whenever the camshaft position actuator solenoids have been removed from the front cover (2).

2. Remove the camshaft position actuator solenoid seals (1) from the engine front cover (2).

   Discard the seals



Important: The water pump seal (1) must be discarded whenever the water pump has been removed from the front cover (2).

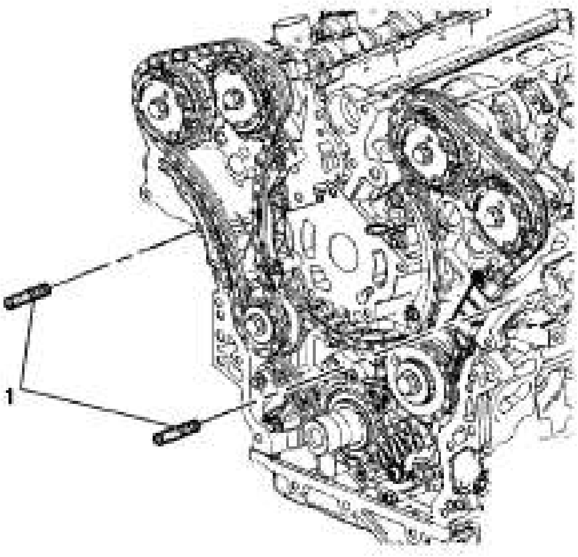
3. Remove the water pump seal (1) from the engine front cover (2).

   Discard the seal

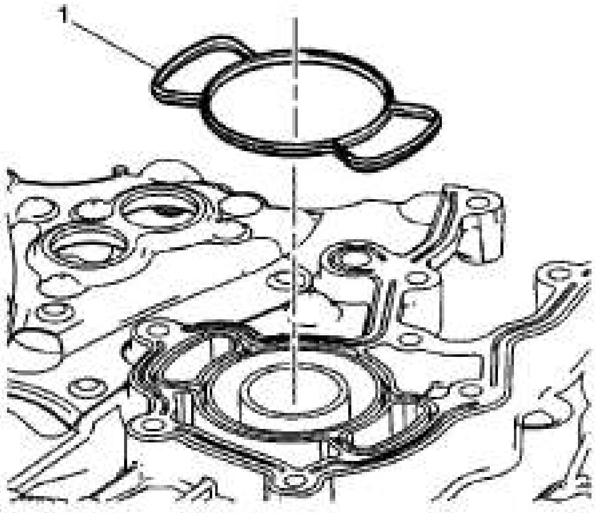
Engine Front Cover Installation

Tools Required

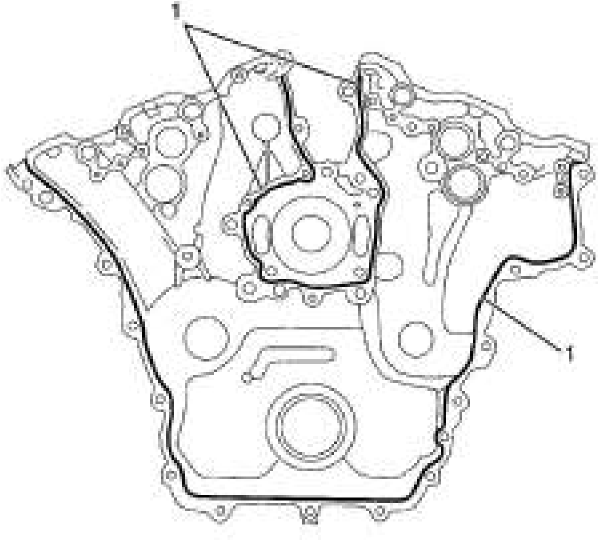
- EN 46109 Guide Pin Set
- J 45059 Angle Meter



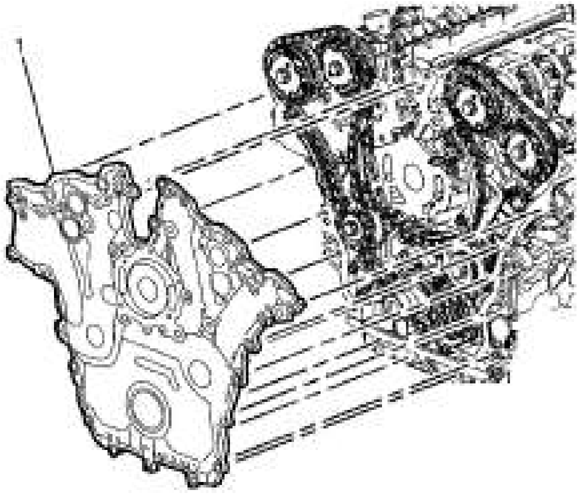
1. Install the 8 mm (0.315 in) guide from the EN 46109 (1) into the cylinder block positions as shown.



2. Install the NEW engine front cover to cylinder block seal (1).

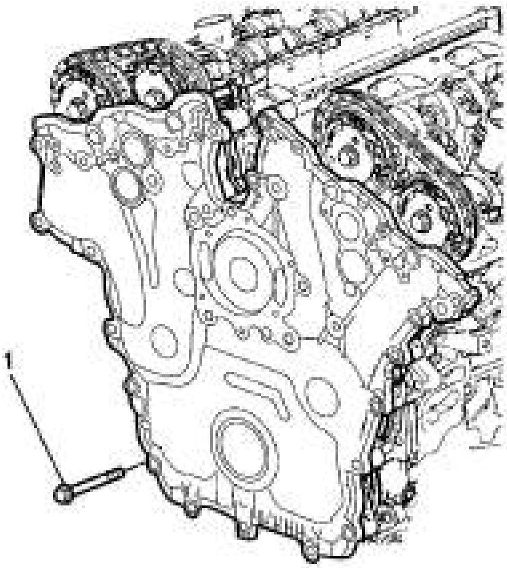


3. Place a 3 mm (0.118 in) bead of RTV sealant (1), on the engine front cover as shown.

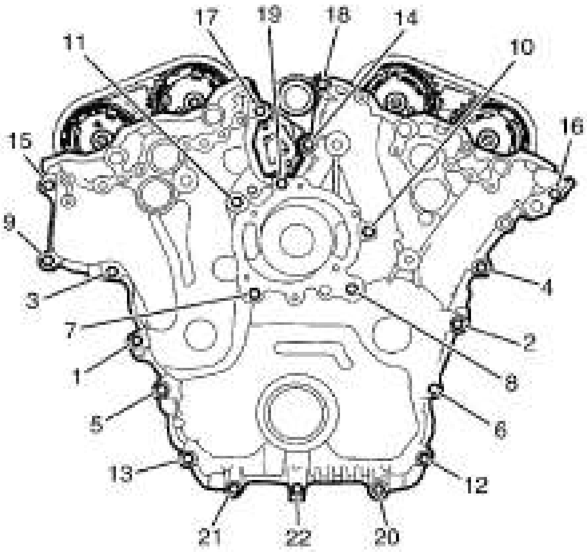


4. Place the engine front cover (1) onto the EN 46109 and slide into position.
5. Remove the EN 46109 from the cylinder block.

Notice: Refer to Fastener Notice in the Preface section.



6. Hand start all the engine front cover to cylinder block retaining bolts (1).

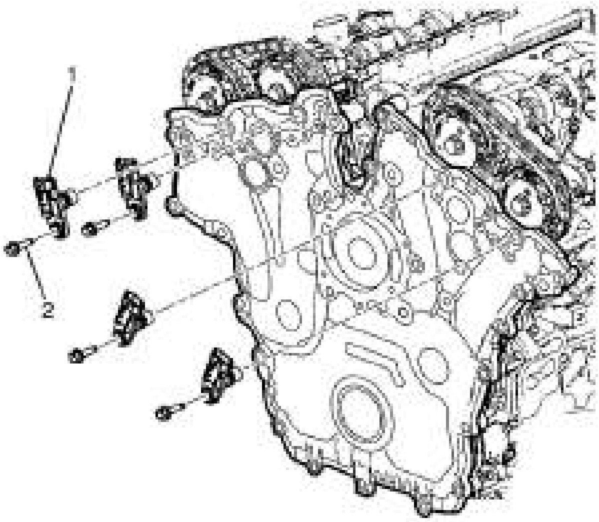


7. Tighten the engine front cover to cylinder block retaining bolts in the sequence shown.

   Tighten
   Tighten the bolts a first pass in sequence to 20 N·m (17 lb ft).

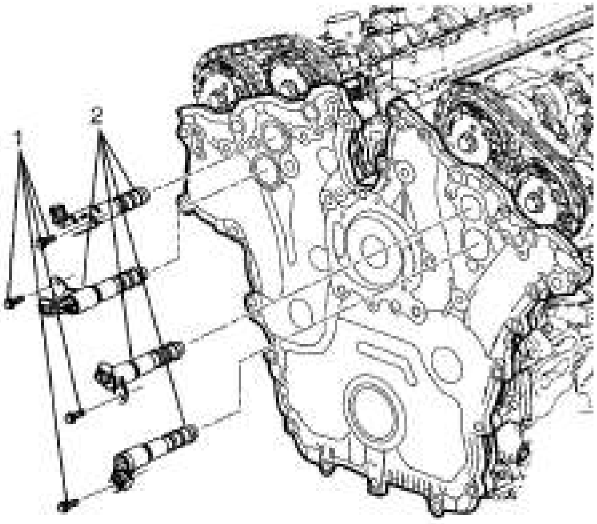
   Tighten the bolts a second pass in sequence an additional 60 degrees using the J 45059 .

8. Install NEW O-rings on the camshaft position sensors.



9. Install the camshaft position sensors (2).
10. Install the camshaft position sensor to front cover retaining bolts (1).

    Tighten
    Tighten the bolts to 10 N·m (89 lb in).



Important: LE0 and LW2 engines only have intake camshaft position actuator solenoids.

11. Install the camshaft position actuator solenoids (2).
12. Install the camshaft position actuator solenoid to front cover retaining bolts (1).

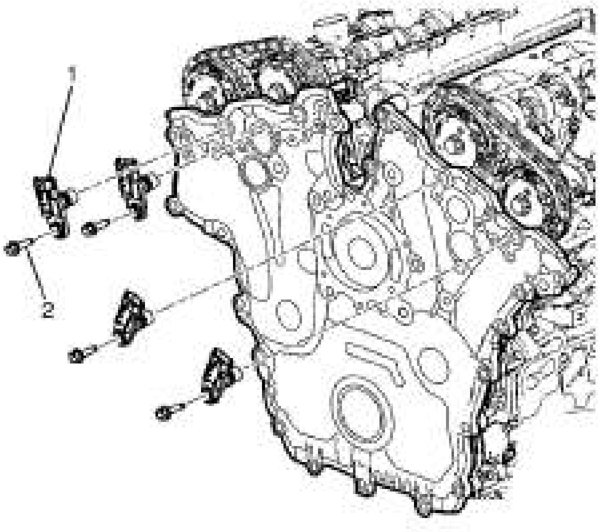
Tighten

1. Tighten the bolts to 10 N·m (89 lb in).
2. Tighten the bolts a second pass in sequence an additional 60 degrees using the J 45059 .

Engine Front Cover Removal

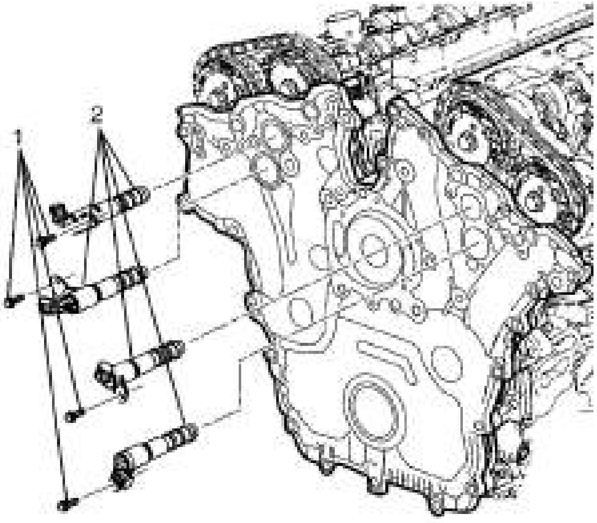
Tools Required

- EN 46105 Camshaft Locking Tools
- EN 46111 Crankshaft Rotation Socket



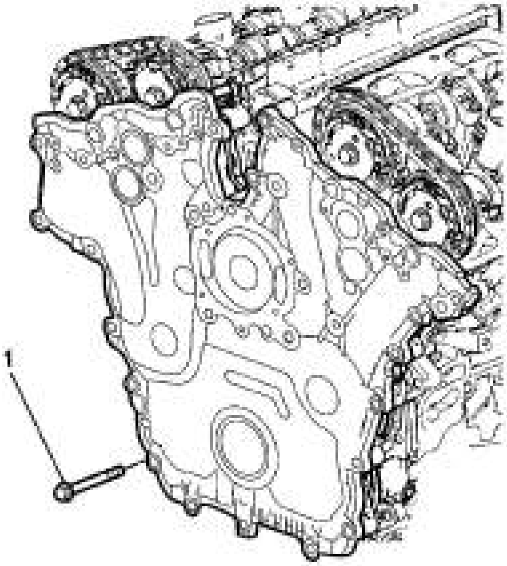
Important: LE0 and LW2 engines only have an intake camshaft position sensor.

1. Remove the camshaft position actuator sensor to engine front cover retaining bolts (2).
2. Remove the camshaft position sensors (1).

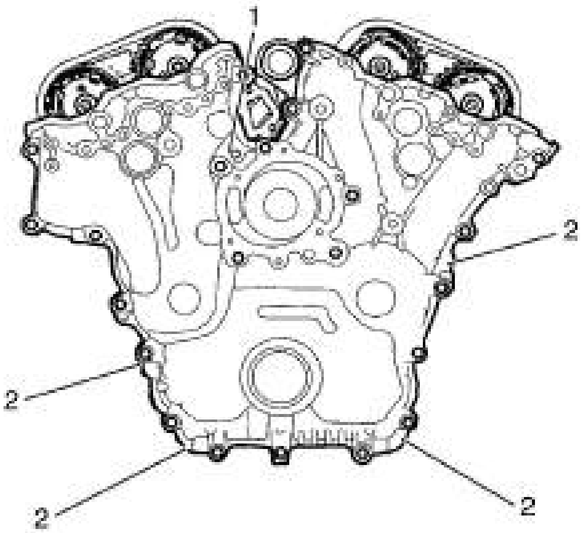


Important: LE0 and LW2 engines only have an intake camshaft position actuator valve.

3. Remove the camshaft position actuator valve to engine front cover retaining bolts (1).
4. Remove the camshaft position actuator valves (2).

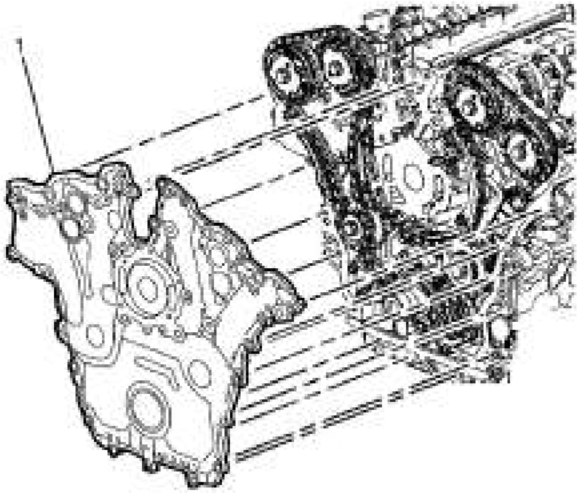


5. Remove the engine front cover to cylinder block retaining bolts (1).

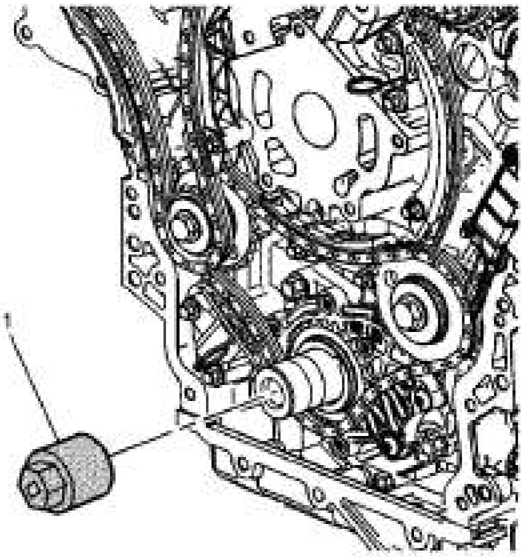


Notice: Do not pry between the engine front cover and the camshaft position sensors or the camshaft position actuators in order to separate the RTV. Use the pry points and a bolt in the jackscrew hole in order to remove the engine front cover. Damage to the camshaft position sensors or the camshaft position actuators may occur if the camshaft position sensors or the camshaft position actuators are used to pry against in order to remove the engine front cover.

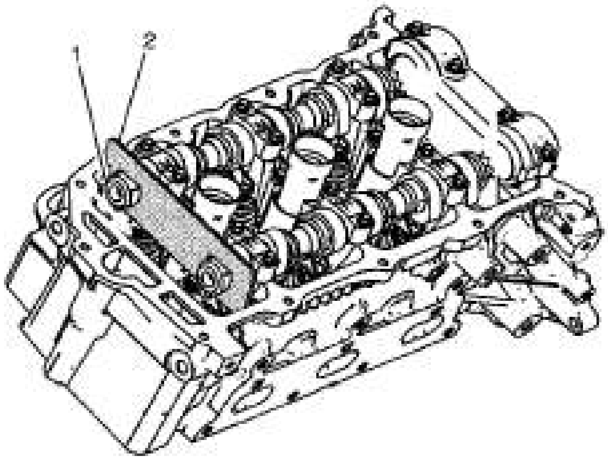
6. Loosely install a 10 x 1.5 mm bolt in the jackscrew hole (1).
7. Using the pry points (2) located at the edge of the front cover and the jackscrew, shear the Room Temperature Vulcanizing (RTV) sealant.



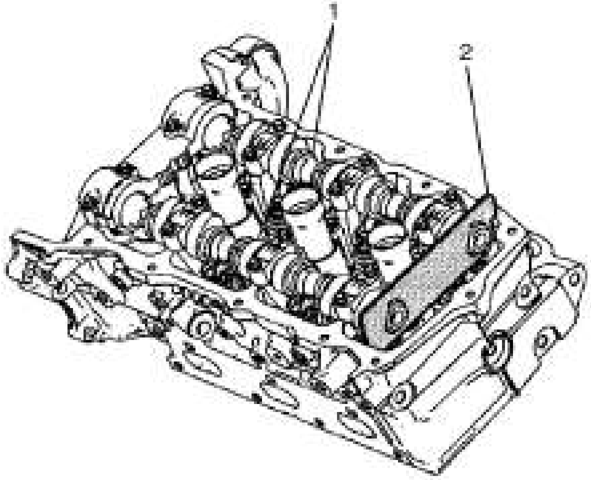
8. Remove the engine front cover (1).



9. Using the EN 46111 (1), rotate the crankshaft until the left cylinder head camshafts align with the EN 46105 and the right cylinder head camshafts align with the EN 46105 .



10. Install the EN 46105 (2) onto the rear of the right hand camshafts (1).



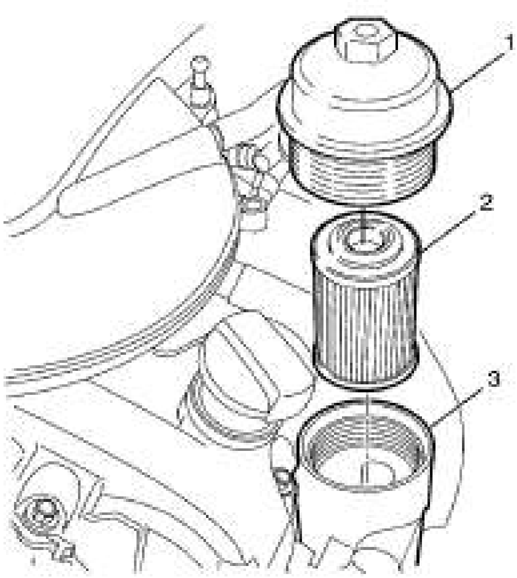
11. Install the EN 46105 (2) onto the rear of the left hand camshafts (1).

Engine Prelubing

Tools Required

J 45299 Engine Preluber

Important: A constant and continuous flow of clean engine oil is required in order to properly prime the engine. Be sure to use an approved engine oil as specified in the owners manual.

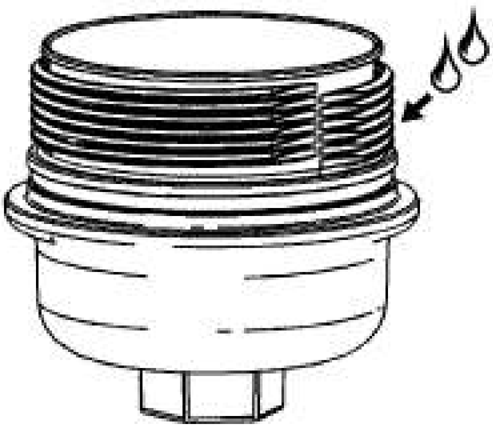


Important: Use a six-point socket to remove the oil filter cap (1).

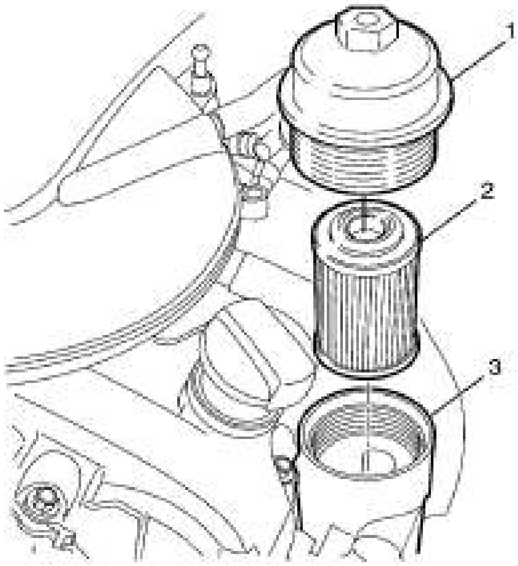
1. Remove the oil filter adapter cap (1) from the engine oil filter adapter (3).
2. Remove the oil filter cartridge (2).

   Discard the oil filter cartridge (2).

   Notice: Refer to General Repair Instructions in the Preface section.



3. Lubricate the oil filter cap threads with clean engine oil.



4. Install the NEW oil filter cartridge (2).

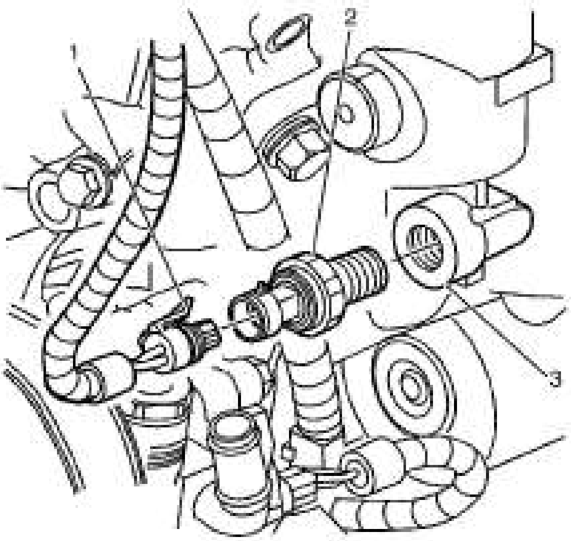
Notice: Refer to Fastener Notice in the Preface section.

Notice: Refer to General Repair Instructions in the Preface section.

Important: Use a six-point socket to install the oil filter cap.

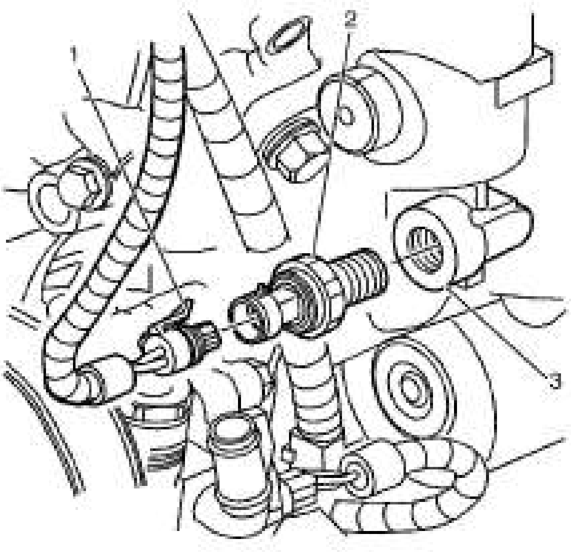
5. Install the oil filter adapter cap (1) to the engine oil filter adapter (3).

Tighten
Tighten the oil filter cap to 25 N·m (18 lb ft).



Important: A constant and continuous flow of clean engine oil is required in order to properly prime the engine. Be sure to use an approved engine oil as specified in the owners manual.

6. Remove the oil pressure sending unit (2) from the oil filter adapter (3).
7. Disconnect the oil pressure sending unit electrical connector (1).
8. Install a 14 x 1.5 mm adapter to the oil filter adapter (3).
9. Install the flexible hose to the adapter and open the valve.
10. Pump the handle on the J 45299 in order to flow a minimum of 1-1.9 liters (1-2 quarts) of engine oil. Observe the flow of engine oil through the flexible hose and into the engine assembly.
11. Close the valve and remove the flexible hose and adapter from the oil filter adapter.

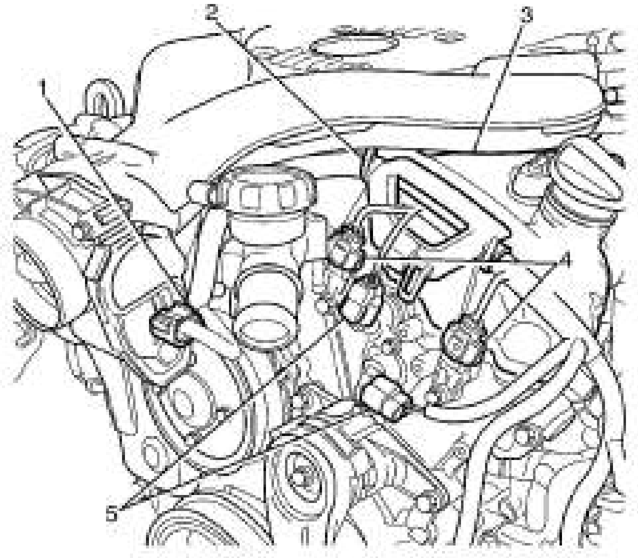


12. Install the oil pressure sending unit (2) to the oil filter adapter (3).

    Tighten
    Tighten the oil pressure sending unit to 20 N·m (15 lb ft).

13. Connect the oil pressure sending unit electrical connector (1).
14. Top-off the engine oil to the correct level.

Engine Wiring Harness Assembly Installation

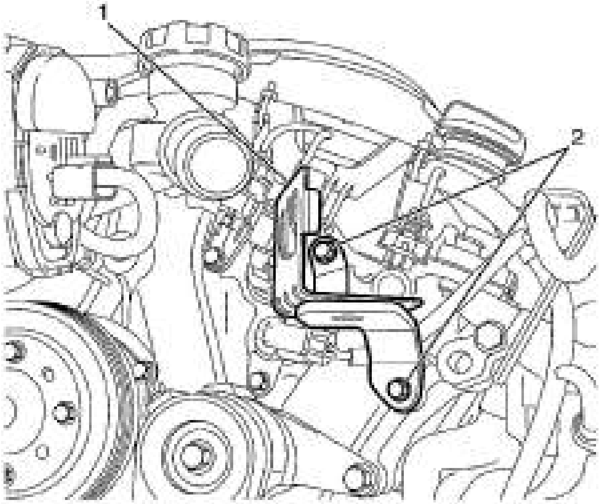


Important: Attach the engine wiring harness bracket (2) to the locating clip lug on the left bank camshaft cover (3) to avoid an induced rattle condition.

1. Attach the engine wiring harness bracket (2) to the left bank camshaft cover (3).
2. Connect the throttle position sensor electrical connector (1).

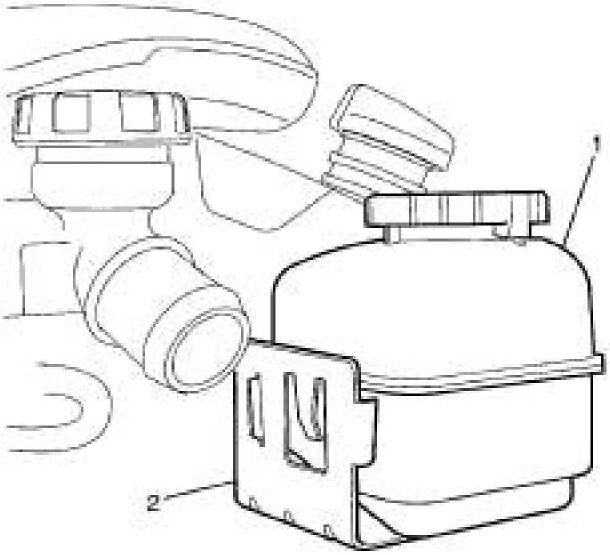
Important: LE0 and LW2 engines only have intake camshaft position actuator solenoids.

3. Connect the left bank intake and exhaust camshaft position actuator solenoid electrical connectors (5).
4. Connect the left camshaft position sensors electrical connectors (4).



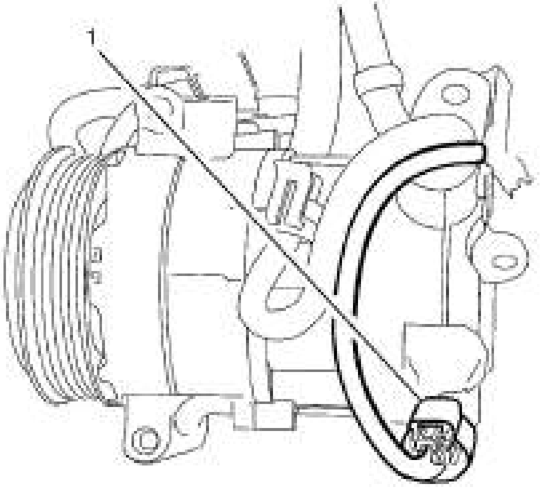
5. Install the power steering fluid reservoir bracket (1).
6. Install the power steering fluid reservoir bracket to engine front cover retaining bolts (2).

Tighten
Tighten the bolts to 9 N·m (80 lb in).

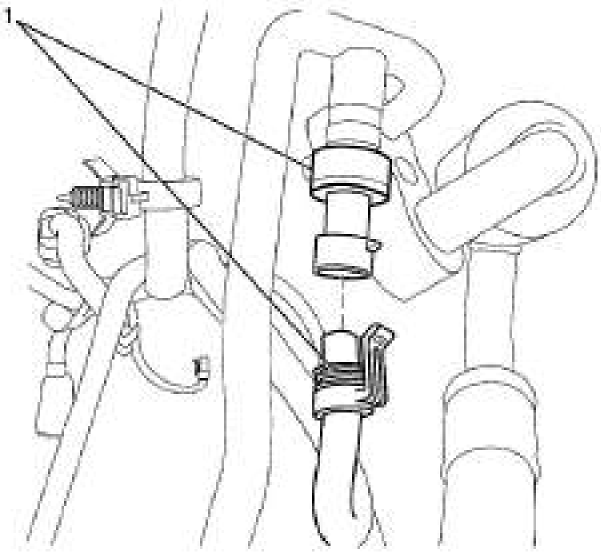


Important: Make sure the power steering reservoir (1) and the the locking tang on the power steering reservoir bracket (2) are engaged to avoid an induced rattle condition.

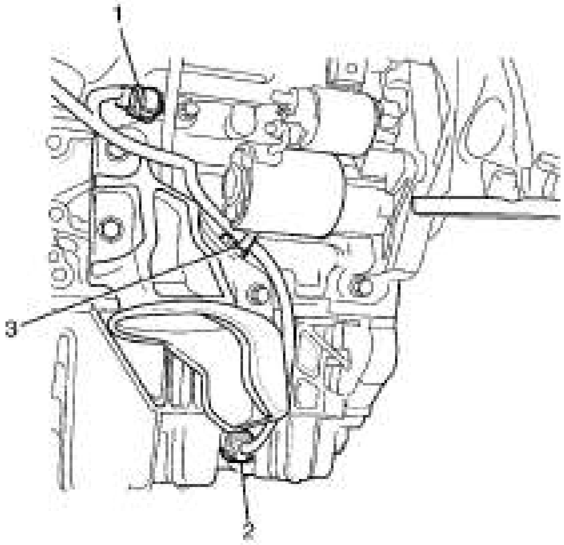
7. Install the power steering fluid reservoir to the power steering fluid reservoir bracket.



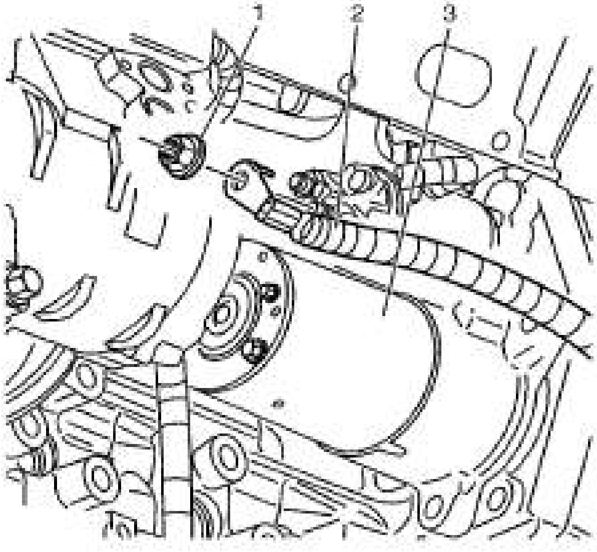
8. Connect the A/C compressor electrical connector (1).



9. Connect the A/C pressure transducer electrical connector (1).



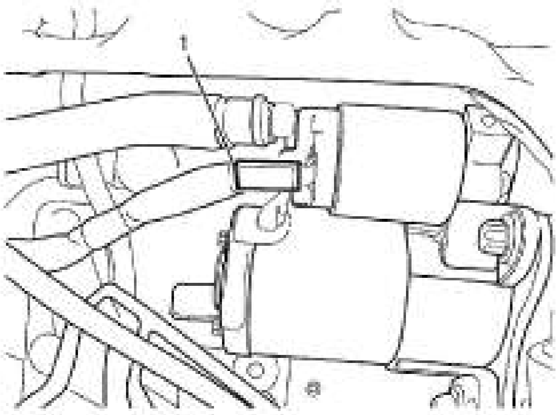
10. Attach the engine wiring harness to cylinder block retaining lug (3).
11. Connect the oil level sensor electrical connector (2).
12. Connect the left bank knock sensor electrical connector (1).



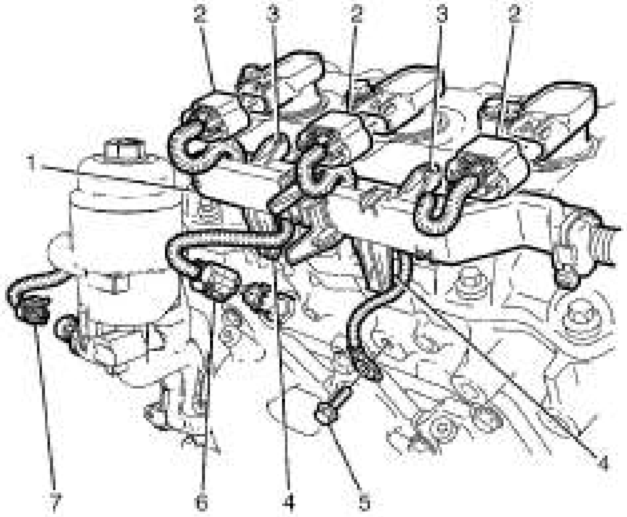
13. Install the battery cable harness to starter motor retaining nut (1).

    Tighten
    Tighten the nut to 20 N·m (14 lb ft).

14. Connect the battery cable harness (2) to the starter motor (3).



15. Connect the starter motor electrical connector (1).

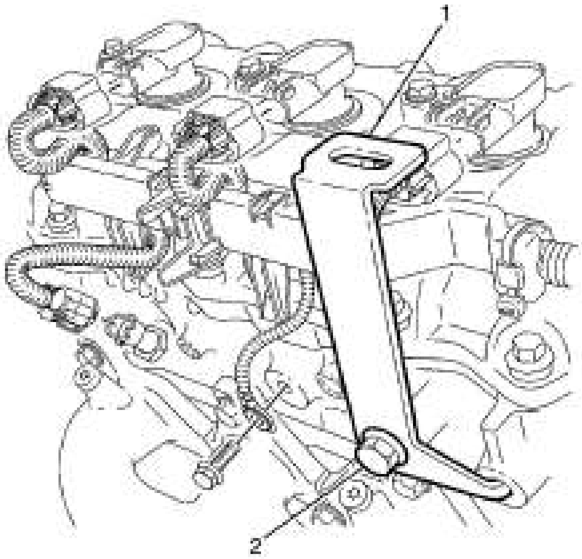


Important: Attach the engine wiring harness (1) clips to the right bank camshaft cover clips (4) and lugs (3) to avoid an induced rattle condition.

16. Attach the engine wiring harness bracket (1) to the right bank camshaft cover lugs (3).
17. Connect the oil pressure sensor electrical connector (7).
18. Connect the coolant temperature sensor electrical connector (6).
19. Install the engine wiring harness ground and engine wiring harness ground to left bank cylinder head retaining bolt (5).

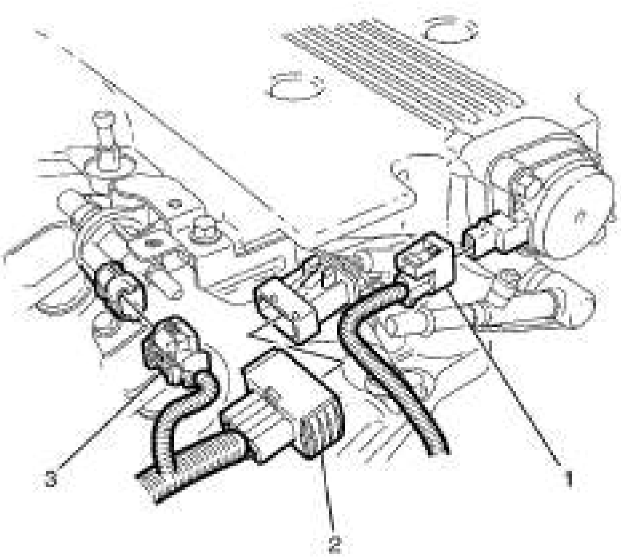
Tighten
Tighten the bolt to 10 N·m (89 lb in).

20. Connect the left bank ignition coil electrical connectors (2).

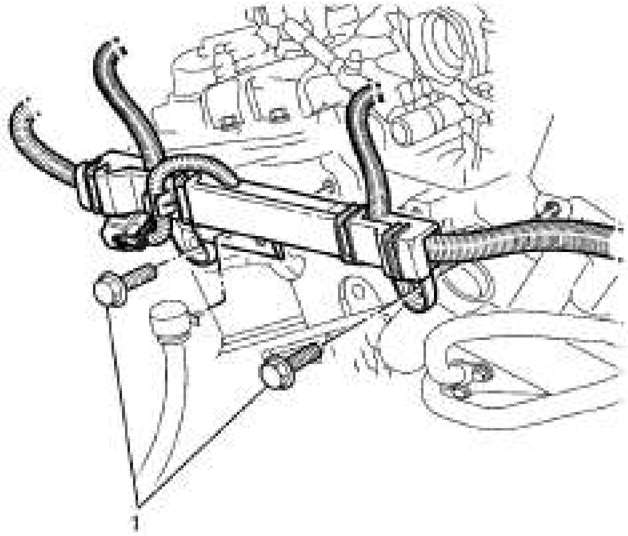


21. Install the engine cover bracket (1).
22. Install the engine cover bracket to cylinder head retaining bolt (2).

Tighten
Tighten the bolt to 35 N·m (26 lb ft).

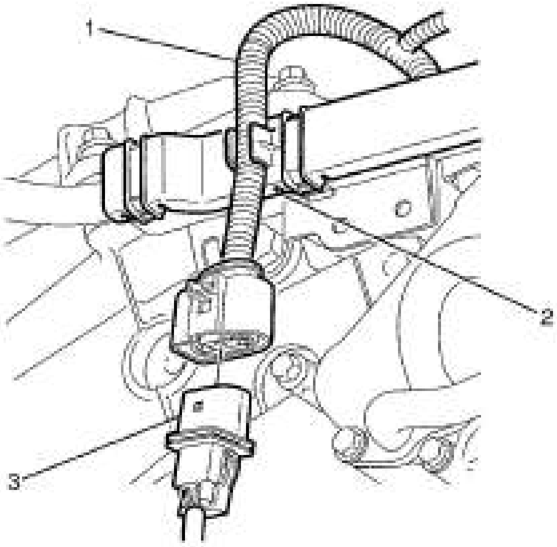


23. Connect the purge solenoid electrical connector (3).
24. Connect the injector harness electrical connector (2).
25. Connect the Intake Manifold Runner Control (IMRC) electrical connector (1).

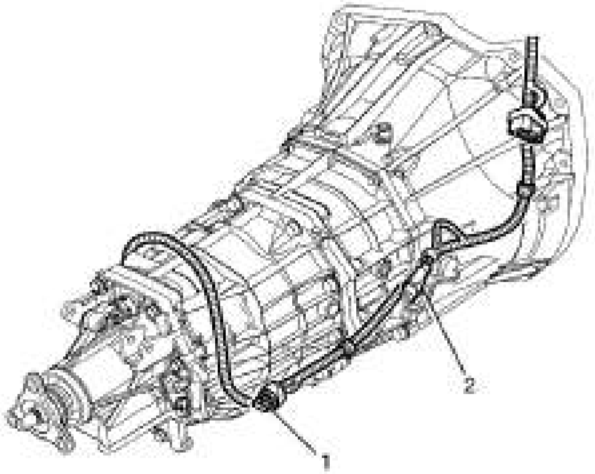


26. Install the engine wiring harness bracket to cylinder head rear retaining bolts (1).

    Tighten
    Tighten the nut to 40 N·m (30 lb ft).

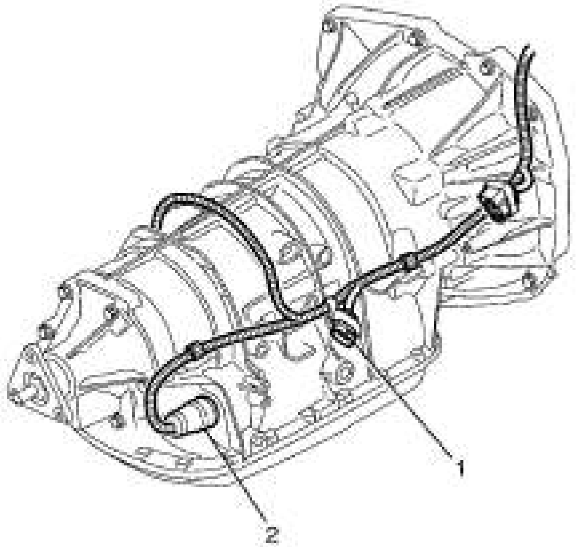


27. Attach the left hand Heated Oxygen Sensor 1 electrical harness (1) to the engine wiring harness bracket (2).
28. Connect the left hand Heated Oxygen Sensor 1 electrical connector (3).



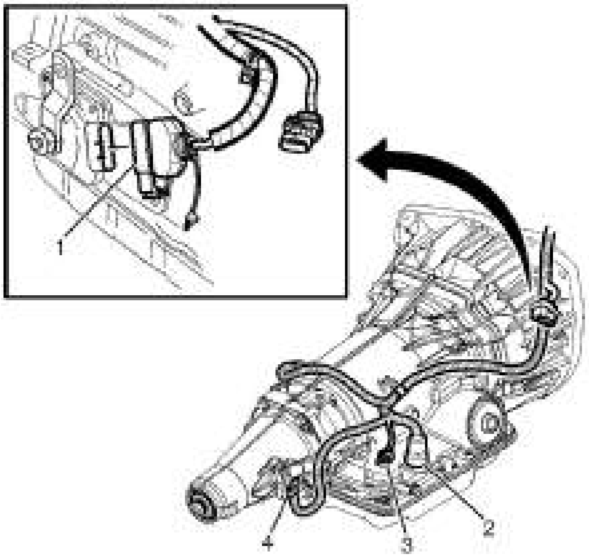
Important: This step and graphic refer to the 6 speed manual transmission only.

29. Connect the right hand Heated Oxygen Sensor 1 electrical connector (1).
30. Connect the reverse switch assembly electrical connector (2).



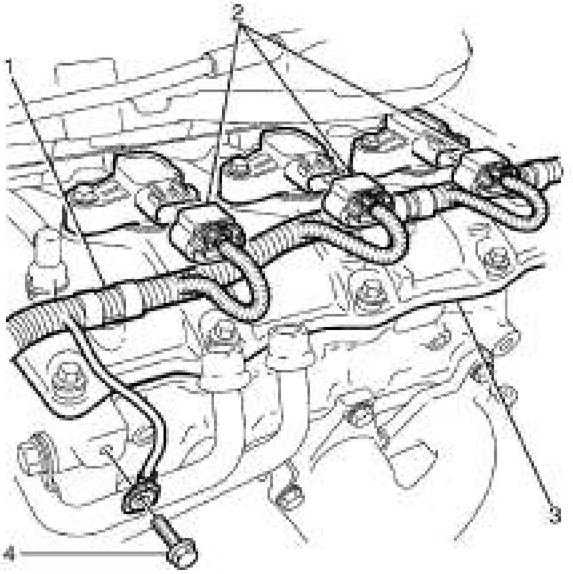
Important: This step and graphic refer to the 5 speed automatic transmission only

31. Connect the right hand Heated Oxygen Sensor 1 electrical connector (1).
32. Connect the main transmission electrical connector (2).



Important: This step and graphic refer to the 4 speed automatic transmission only

33. Connect the right hand Heated Oxygen Sensor 1 electrical connector (2).
34. Connect the main transmission electrical connector (3).
35. Connect the vehicle speed sensor electrical connector (4)
36. Connect the park/neutral switch electrical connector (1).

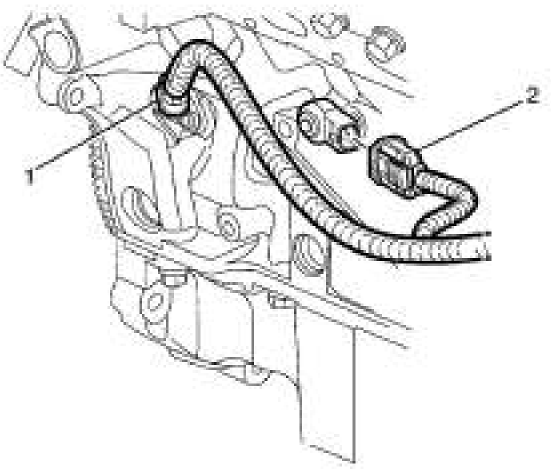


Important: Attach the engine wiring harness (1) clips to the right bank camshaft cover (4) to avoid an induced rattle condition.

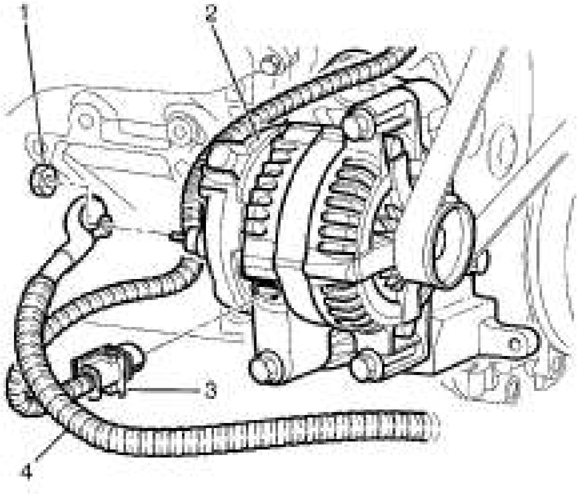
37. Attach the engine wiring harness (1) to the right bank camshaft cover (3).
38. Install the engine wiring harness ground to right bank cylinder head rear retaining bolt (4).

Tighten
Tighten the bolt to 10 N·m (89 lb in).

39. Connect the right bank ignition coil electrical connectors (2).

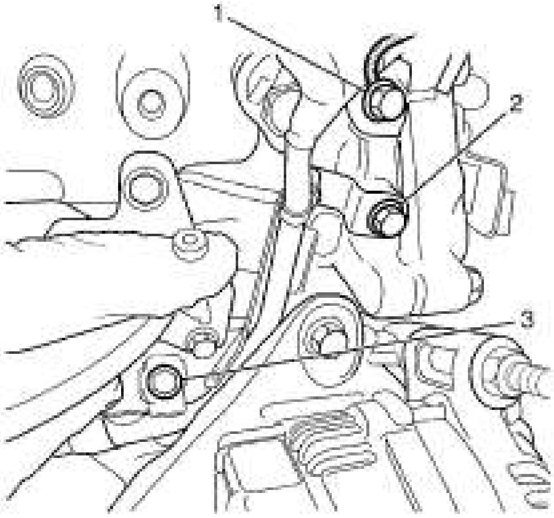


40. Connect the crankshaft position sensor electrical connector (1).
41. Connect the right bank knock sensor electrical connector (2).
42. Install the alternator and mounting bracket. Refer to Generator Installation .



43. Connect the alternator battery harness connector (3).
44. Connect the battery positive cable (4) from the alternator (2).
45. Install the battery positive cable to alternator retaining nut (1).

Tighten
Tighten the nut to 13 N·m (115 lb in).



46. Install the engine wiring harness bracket to cylinder block retaining bolt (3).

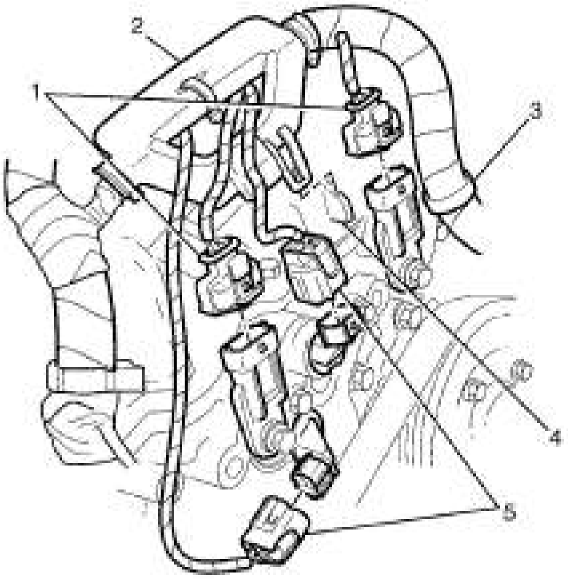
    Tighten
    Tighten the nut to 10 N·m (89 lb in).

47. Install the engine wiring harness bracket to right bank cylinder head retaining bolt (2).

    Tighten
    Tighten the nut to 10 N·m (89 lb in).

48. Install the engine wiring harness ground to right bank cylinder head front retaining bolt (1).

    Tighten
    Tighten the nut to 10 N·m (89 lb in).



Important: Attach the engine wiring harness bracket (2) to the locating clip lug on the right bank camshaft cover (4) to avoid an induced rattle condition.

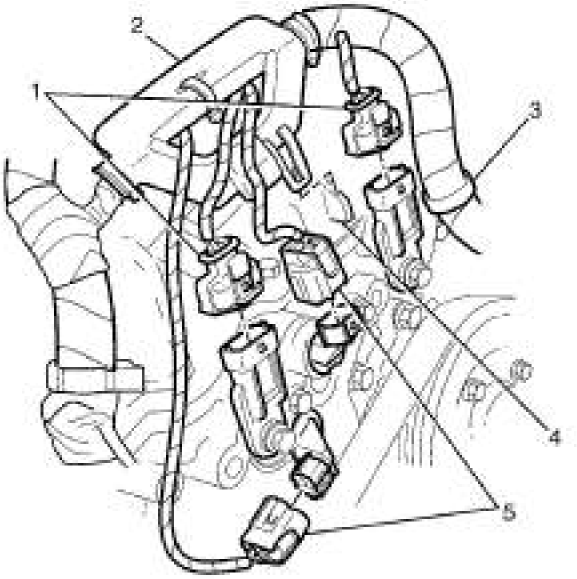
49. Attach the engine wiring harness bracket (2) from the right bank camshaft cover (4).
50. Attach the engine wiring harness to cylinder head retaining lug (3).

Important: LE0 and LW2 engines only have intake camshaft position actuator solenoids.

51. Connect the right bank intake and exhaust camshaft position actuator solenoid electrical connectors (5).
52. Connect the right camshaft position sensors electrical connectors (1).
53. Install the engine covers. Refer to Engine Cover Replacement .

Engine Wiring Harness Assembly Removal

1. Remove the engine covers. Refer to Engine Cover Replacement .



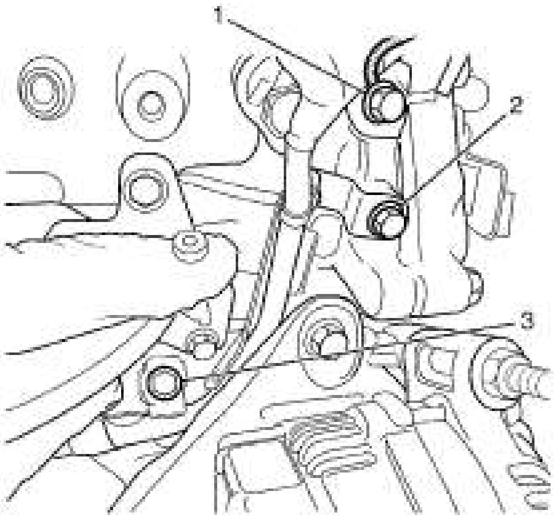
2. Disconnect the right camshaft position sensors electrical connectors (1).

Important: LE0 and LW2 engines only have an intake camshaft position actuator valve.

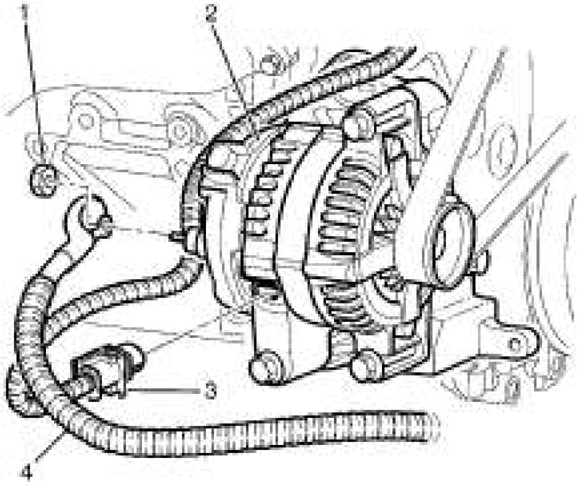
3. Disconnect the right bank intake and exhaust camshaft position actuator valve electrical connectors (5).
4. Detach the engine wiring harness to cylinder head retaining lug (3).

Important: Use a suitable tool to detach the engine wiring harness bracket (2) from the locating clip lug on the right bank camshaft cover (4) then slide the engine wiring harness bracket (2) upwards to detach from the right bank camshaft cover (4).

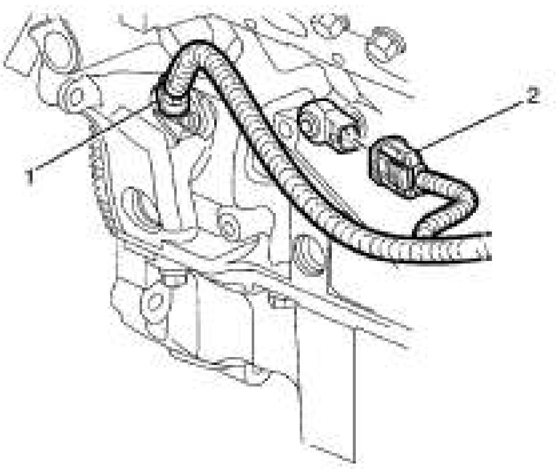
5. Detach the engine wiring harness bracket (2) from the right bank camshaft cover (4).



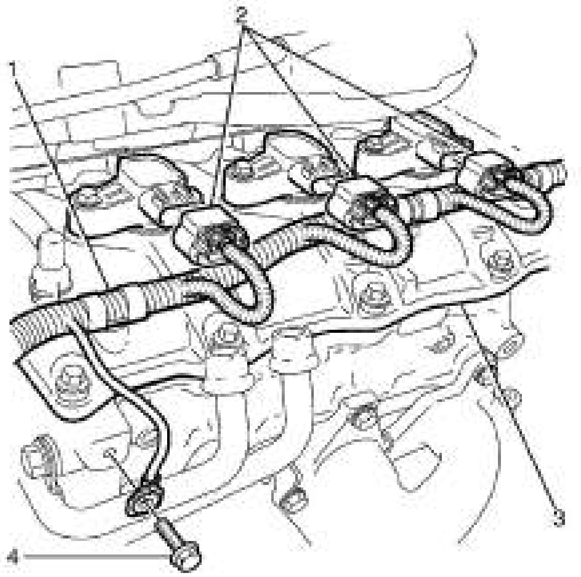
6. Remove the engine wiring harness ground to right bank cylinder head front retaining bolt (1).
7. Remove the engine wiring harness bracket to right bank cylinder head retaining bolt (2).
8. Remove the engine wiring harness bracket to cylinder block retaining bolt (3).



9. Remove the battery positive cable to alternator retaining nut (1).
10. Disconnect the battery positive cable (2) from the alternator (3).
11. Disconnect the alternator battery harness connector (4).
12. Remove the alternator and mounting bracket. Refer to Generator Removal .



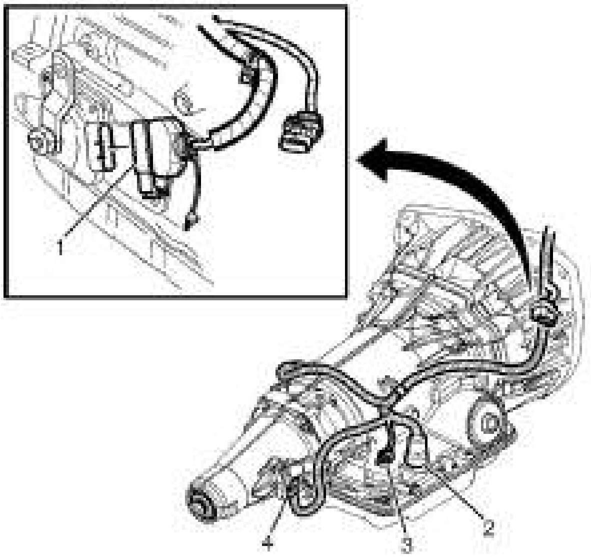
13. Disconnect the right bank knock sensor electrical connector (2).
14. Disconnect the crankshaft position sensor electrical connector (1).



15. Disconnect the right bank ignition coil electrical connectors (2).
16. Remove the engine wiring harness ground to right bank cylinder head rear retaining bolt (4).

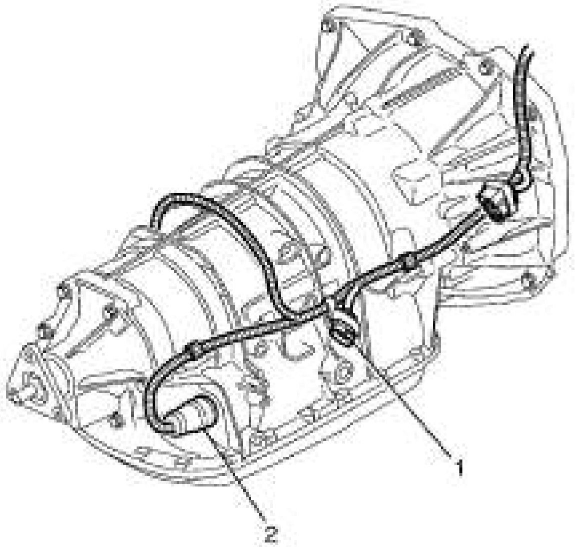
Important: Use a suitable tool to detach the engine wiring harness (1) clips from the right bank camshaft cover (4).

17. Detach the engine wiring harness (1) from the right bank camshaft cover (3).



Important: Steps 19 - 22 refer to the 4L60E 4 speed automatic transmission only

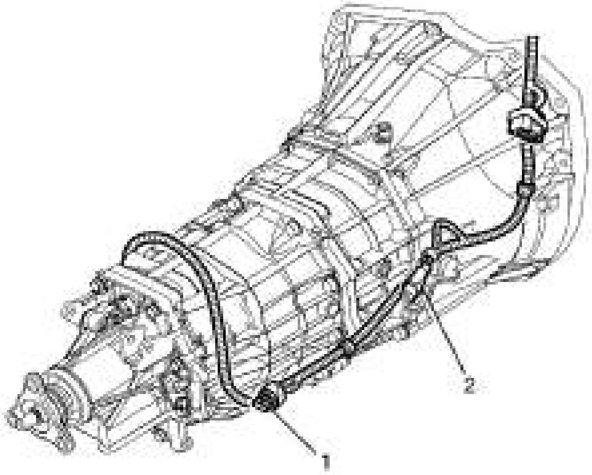
18. Disconnect the right hand Heated Oxygen Sensor 1 electrical connector (2) if still connected after engine removal.
19. Disconnect the main transmission electrical connector (3).
20. Disconnect the vehicle speed sensor electrical connector (4)
21. Disconnect the park/neutral switch electrical connector (1).



Important: Steps 24 and 25 refer to the 5L40E 5 speed automatic transmission only.

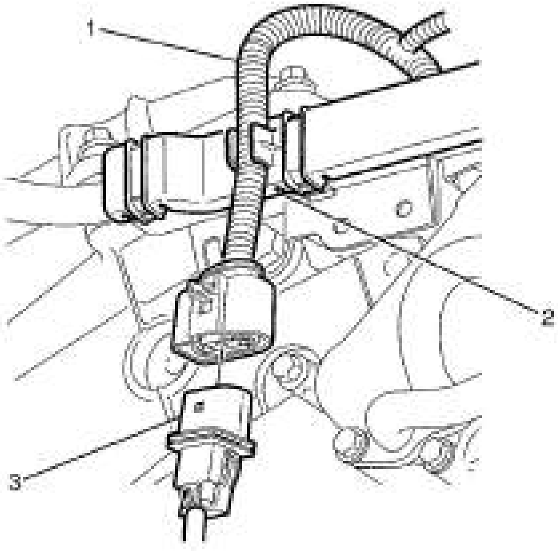
22. Disconnect the right hand Heated Oxygen Sensor 1 electrical connector (1) if still connected after engine removal.

23. Disconnect the main transmission electrical connector (2).

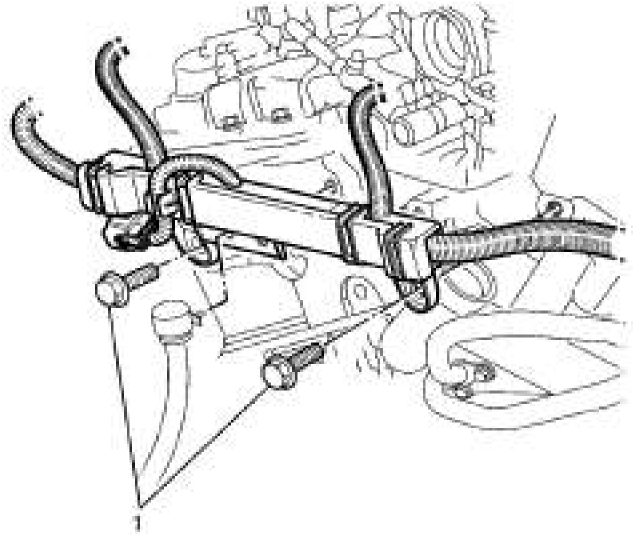


Important: Steps 27 and 28 refer to the D173 6 speed manual transmission only.

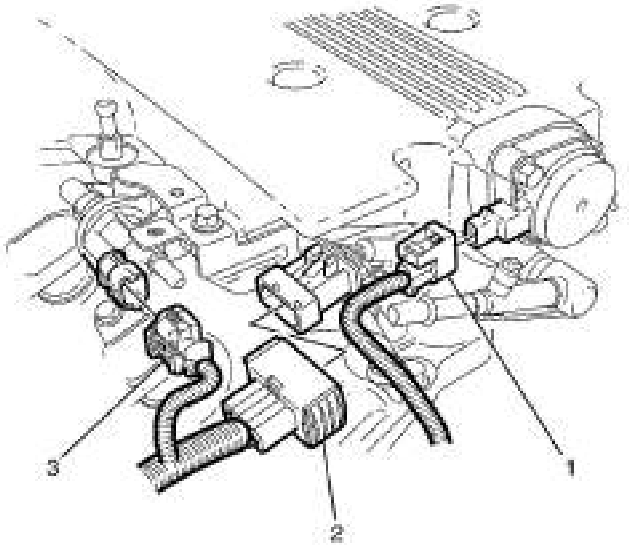
24. Disconnect the right hand Heated Oxygen Sensor 1 electrical connector (1) if still connected after engine removal.
25. Disconnect the reverse switch assembly electrical connector (2).



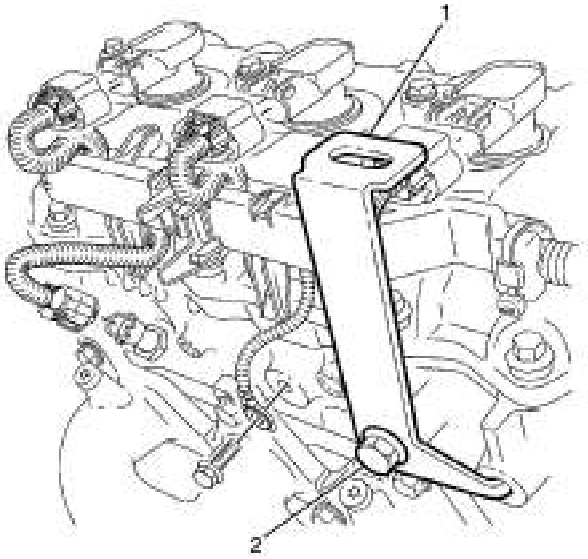
26. Disconnect the left hand Heated Oxygen Sensor 1 electrical connector (3) if still connected after engine removal.
27. Detach the left hand Heated Oxygen Sensor 1 electrical harness (1) from the engine wiring harness bracket (2).



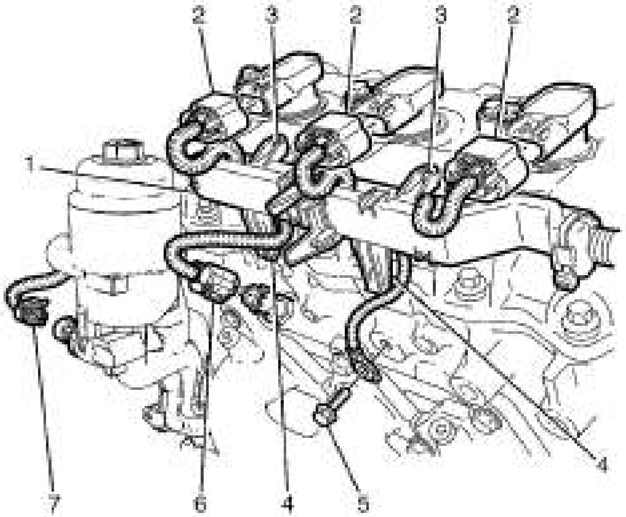
28. Remove the engine wiring harness bracket to cylinder head rear retaining bolts (1).



29. Disconnect the Intake Manifold Runner Control (IMRC) electrical connector (1).
30. Disconnect the injector harness electrical connector (2).
31. Disconnect the purge solenoid electrical connector (3).



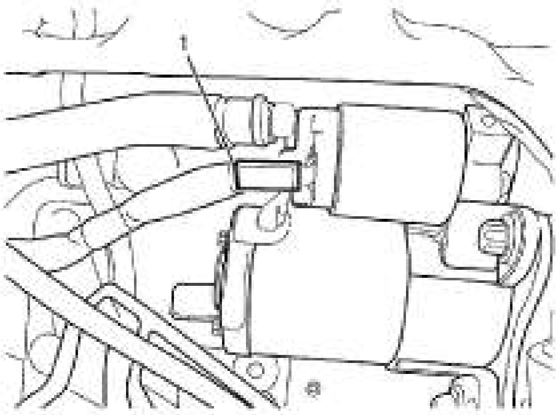
32. Remove the engine cover bracket to cylinder head retaining bolt (2).
33. Remove the engine cover bracket (1).



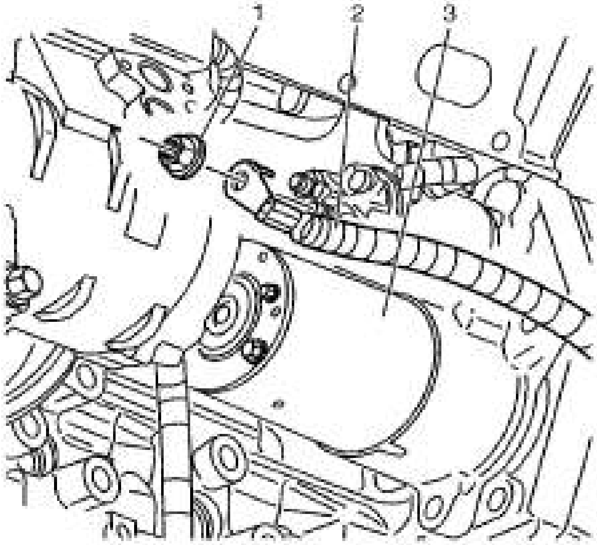
34. Disconnect the left bank ignition coil electrical connectors (2).
35. Remove the engine wiring harness ground to left bank cylinder head retaining bolt (5).
36. Disconnect the coolant temperature sensor electrical connector (6).
37. Disconnect the oil pressure sensor electrical connector (7).

Important: Use a suitable tool to detach the engine wiring harness (1) clips from the right bank camshaft cover clips (4) then lift upwards to detach the engine wiring harness (1) from the right bank camshaft cover lugs (3).

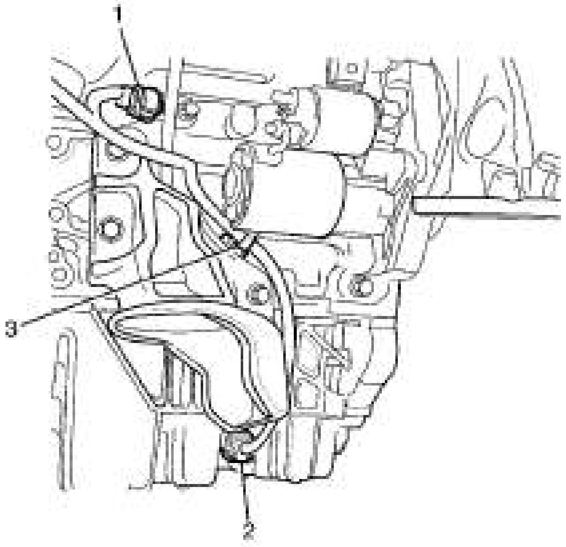
38. Detach the engine wiring harness bracket (1) from the right bank camshaft cover lugs (3) and position aside.



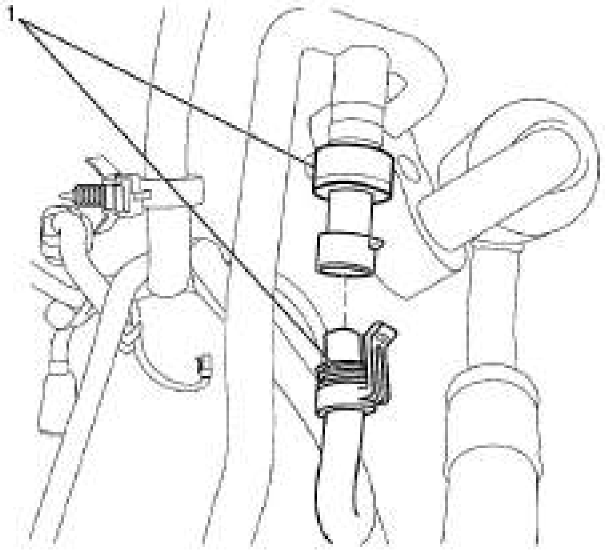
39. Disconnect the starter motor electrical connector (1).



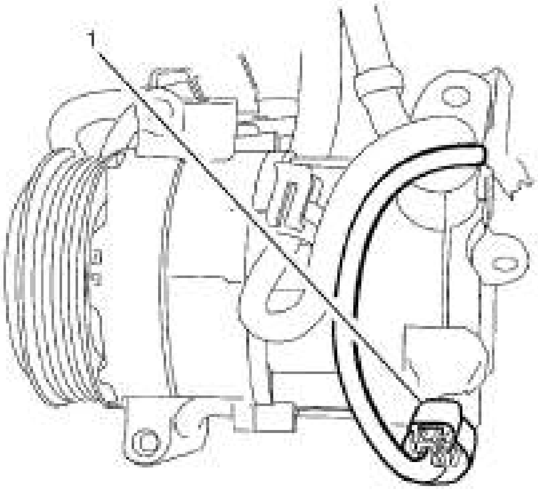
40. Disconnect the battery positive cable (2) from the starter motor (3).
41. Remove the battery positive cable to starter motor terminal retaining nut (1).



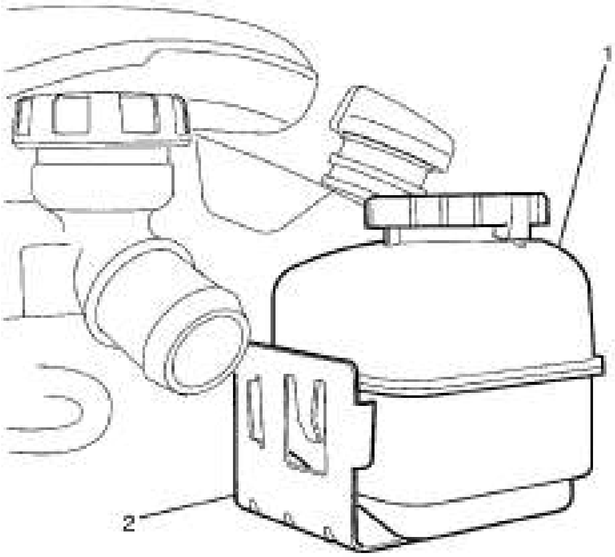
42. Disconnect the left bank knock sensor electrical connector (1).
43. Disconnect the oil level sensor electrical connector (2).
44. Detach the engine wiring harness to cylinder block retaining lug (3).



45. Disconnect the A/C pressure transducer electrical connector (1).



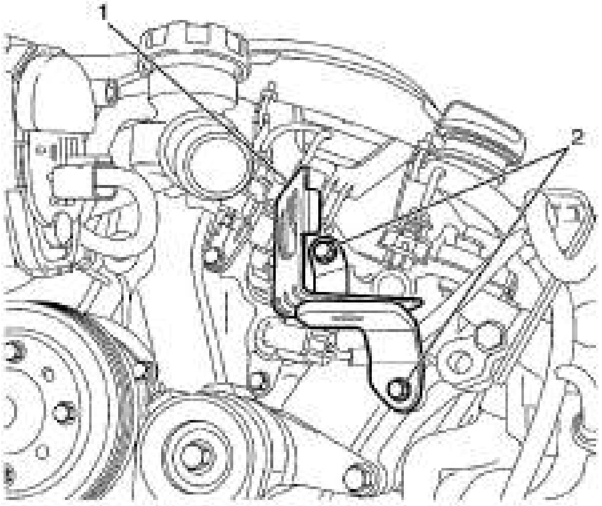
46. Disconnect the A/C compressor electrical connector (1).



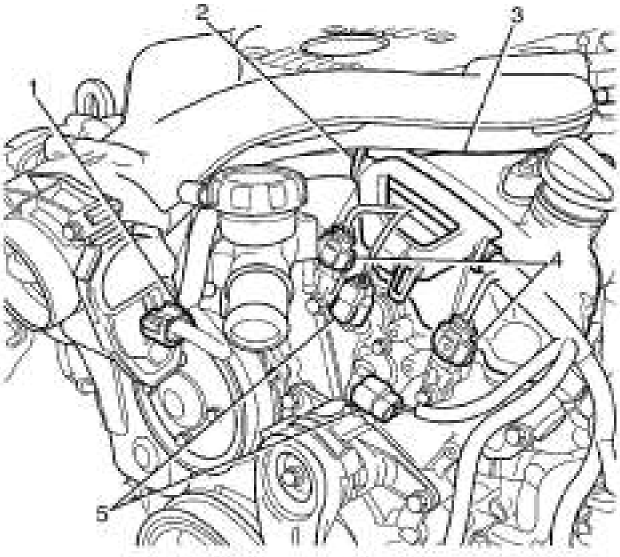
Important: DO NOT disconnect the power steering pipes or drain the power steering fluid.

Important: The locking tang on the power steering reservoir bracket (2) must be released before removing the power steering reservoir (1). Release the locking tang on the power steering reservoir bracket (2) with a suitable tool.

47. Separate power steering fluid reservoir (1) from the power steering fluid reservoir bracket (2).
48. Reposition and secure the power steering fluid reservoir away from the power steering fluid reservoir (1) bracket (2).



49. Remove the power steering fluid reservoir bracket to engine front cover retaining bolts (2).
50. Remove the power steering fluid reservoir bracket (1).



51. Disconnect the left camshaft position sensors electrical connectors (4).

Important: LE0 and LW2 engines only have an intake camshaft position actuator valve.
